15621. (*Chairman.*) Are there any of these demonstrations which it is desirable in your view to use

before students, in which it is also necessary in order to complete the demonstrations, that the animal should be allowed to survive?—Only under Certificate B.

15622. Are there any which you use by way of demonstration to students?—No.

15623. There are no experiments used by you for demonstrations to students, in which the animal is not put to death before it comes to?—No, unless indeed, for instance, you want to show the students some points in regard to paralysis. Supposing, for instance, you had an experiment in which you divided one half of the spinal cord antiseptically and then dressed the wound, and allowed the animal to recover from the anæsthetic and it healed up, and you showed that animal to the class, say in three week's time, I could conceive that that is a demonstration which would be considered useful to students certainly as demonstrating the symptoms produced by paralysis of one-half the spinal cord.

15624. When it had been shown a second time to the students the animal would be put to death?—Yes, afterwards.

15625. Do you know of that demonstration having been made?—No.

15626. So far as you know, they have all been cases in which the animal has died under anæsthesia?—Yes, every one.

15627. (*Sir Mackenzie Chalmers.*) They must be, under the statute at present?—Yes.

15628. (*Chairman.*) You have already told me that you have never heard of any demonstrations except where the animal had died under the anæsthetic?—That is so, but I am proposing that the whole of that should be repeated.

15629. I am talking rather of the present practice?—Quite so.

15630. Then pharmacology is the next subject?—Yes. Pharmacology is the science of the action of drugs—at the present moment the student is taught *materia medica*, to recognise drugs, but he is only told their action, and if students in Pharmacology were made to perform practical experiments, for instance on an isolated frog's heart, they would receive valuable information. I give one example. I take the two alkaline metals, potassium and sodium; they are almost exactly alike, they are spoken of as simply alkalis, and yet their physiological action on the heart is absolutely different. If a student perform the simple experiment of irrigating a frog's heart with a solution of one and then a solution of the other, he would see that their drug action was totally different. And the same could be said of a great many drugs, and especially of drugs that act on the heart. I think that a student ought to see all those in action on an isolated frog's heart or even on a mammalian heart before he goes into the hospital to give them to human beings.

15631. Would the action be different to such an extent as to make it dangerous to use the one as a remedy precisely as they use the other?—The actual dose depends of course upon many factors.

15632. It would depend on the dose?—Yes, entirely. Then the next subject in which I suggest that students should be taught from experiments upon animals is the one in which I am personally most interested, namely, surgery. The Commission are well aware that at the present moment the only practical teaching in surgery that a student receives, except by what amounts to his experiments on human beings is from operations on a dead body, and those from the anatomical point of view are lamentably few in number. I am referring to the well-known fact also of course that the supply of dead bodies is too scanty in London. But that operating upon a dead body is practically only the revision for the student of his anatomical knowledge. It does not teach him the science of surgery, that is the operating on living tissues, which is a totally different thing. I say the texture and the method of dealing with the live tissue is quite different from that in dealing with the dead tissue; and from the ethical point of view it seems to me that it is not moral for students to gain their knowledge on man when they can perfectly well gain it on a lower animal on an anæsthetised lower animal. In that sense I would bring the use of animals for education in surgery on to exactly the same level as the use of animals for food. What is justifiable for the one is justifiable for the other. Then as regards Section 3 again of the Act, Sub-section (6) relating to manual dexterity I suggest ought to be repealed. It says "experiments shall not be performed for the purpose of obtaining manual skill," that is precisely the reason I think why they should be performed by a student; he ought to obtain his manual skill by operating on the lower animal and not on man.

Sir V. Horsley, F.R.S., F.R.C.S. 13 Nov. 1907.

15633. To what class of student would you restrict it if you restrict it at all?—This all comes to students in their last two years of the curriculum.

15634. The whole curriculum lasting how long?—The whole curriculum lasting nominally five years; it usually lasts six years. Before a student for instance received a hospital appointment he certainly should do such a course.

15635. And what age would a student be in his last two years; is there any minimum age?—Yes, there is a minimum age, but on the average he would be about 22, from 21 to 23 years of age.

15636. (*Sir Mackenzie Chalmers.*) Before he gets a hospital appointment?—Yes. That means before he is qualified you see, because practically now we do not admit any students to hospital appointments until they are qualified. It is part of their surgical education. It is always very difficult to understand why some of these sections and sub-sections were introduced into this Act, even when you read the Report of the Commission of 1876; and that one in particular I feel sure must have got in somehow under the impression that students would practice on animals without anæsthetics or something of that sort.

15637. (*Chairman.*) Did not the Royal Commission report in favour of that?—I forget. I do not remember the point. But it is in the Act, and I suggest that it should be repealed. Moreover, I am not speaking now without the fact of this method of teaching having been already in operation; it is in operation at the John Hopkins Hospital, Baltimore, perhaps the most advanced school of medicine.

15638. You mean the method that you are advocating?—Yes; it is the most advanced school of medicine and teaching students operations upon animals which they compel them to execute in precisely the same way as they will subsequently operate on a human being. Professor Harvey Cushing, at the John Hopkins Hospital, has now a building for this practical work; perhaps I may show you a photograph of the students equipped as they are (as we all are now for modern operations) and performing the operations on animals (*handing in the same*). The usefulness of this is greatly enhanced by the fact that Dr. Cushing has copied the constitution of our Brown Institution here in London, that he has also instituted hospital wards as part of the building for animals, rooms for the care of the animals, and in that way the poorer classes in Baltimore bring diseased animals to the laboratory to be thus operated upon by the students and cared for in the animals hospital.

15639. (*Mr. Ram.*) In the interests of the animals?—In the interests of the animals.

15640. For curative purposes?—Yes; of course, very often the work is also combined with the requirements of the physiological laboratory. If, for instance, a physiologist wishes to investigate a stomach which has a fistulous opening in it, then it is made under these circumstances in this laboratory, and the animal is transferred to the Physiological Department when the fistula is healed.

15641. (*Chairman.*) In this laboratory of Dr. Cushing's is there a professor or doctor or anyone in charge of the students present in the room?—Yes, a demonstrator.

15642. Some responsible person?—Certainly.

15643. (*Sir Mackenzie Chalmers.*) Who is responsible for seeing that the anæsthetics are properly administered?—Yes, I am coming to the question of anæsthesia directly.

15644. (*Chairman.*) I merely meant in a case like this, where the students work and are allowed to learn their profession upon animals by experiment, do you say that there it is conducted under some responsible head?—Yes, it is conducted most strictly, like any other practical class, and the demonstrator sees to it. The different students are told off to act in different ways; one to act as anæsthetist, another to take the notes, another to do the operation, two or three more to act as dressers, and so forth. They are all told off, and they keep records of all their work. Then, in association with that point, is the

Sir V. Horsley, F.R.S., F.R.C.S.

13 Nov. 1907.

very important question which has just been raised of anæsthesia. I wish to draw the attention of the Commission to the fact that the risk of death from anæsthesia has always been justly looked upon as a great reproach, and I wish to express my personal opinion that it is purely a matter of knowledge of the dose required, and that as regards the education of students in anæsthetising patients no one ought to be allowed to render a human being unconscious before he has had practice on animals.

15645. What is it that he has to study in it particularly?—The signs of danger, the signs of an overdose with an anæsthetic drug. He can observe all these points on animals exactly as in man. I may say that as regards the investigation of this subject (the actual dose) that is now under the consideration of the British Medical Association, which I represent, and that they have already spent on this subject over £500 to try and determine the exact dose which shall render a person unconscious to pain and at the same time shall not put his life in any danger.

15646. Is there any ascertained scale of the difference between the doses. If you have ascertained it for a man is there any scale that is ascertained to be the proper dose for a rabbit?—It is apparently the same. The percentage of chloroform in the atmosphere breathed that leads the heart to fail or the respirator centre to fail is apparently very much the same in whatever animal. I am speaking now, of course, of warm-blooded animals like man.

15647. Is that a recent discovery?—Yes.

15648. (*Sir Mackenzie Chalmers.*) It is not the same amount but the same proportion you mean?—Yes, the same proportion, not the same amount. The difference of weight, of course, comes in there. You have to poison so much per lb. weight.

15649. (*Chairman.*) That is what I understood from other witnesses. I did not quite follow your answer?—I wish to say that in reading this evidence which has been offered to the Commission I am struck with the extraordinary ignorance that prevails even now on the question of anæsthetising animals. Over and over again witnesses have spoken as though anæsthetising an animal was a totally different thing from anæsthetising a human being. It is nothing of the kind. We have even had revived before this Commission the absurd statement made thirty years ago that you could not keep a dog under chloroform for I forget what the limit was—two hours, or something of that sort. You can keep it under chloroform for a week if you only take the trouble. I have kept an ourang under ether for eight hours, and I would keep a dog or any other animal under an anæsthetic as long as you wish.

15650. By under an anæsthetic, you mean in a condition in which it does not suffer pain?—Absolute unconsciousness to pain. And that, from one's personal experience in the human subject, of course, applies to chloroform as well as to ether, and it applies to morphia—those three narcotics.

15651. You think that that ought to be practised upon animals before anyone practises it on human beings, and that the student's experience gained upon animals is an education, and a complete education, for applying it to man?—I do.

15652. (*Dr. Wilson.*) But the knowledge gained about anæsthesia is never certain—is never complete—because you admit that there are experiments going on now?—But the experiments which are going on now are refinements in order to water down, as it were, the limit. We want to extend the margin of safety without encroaching upon the consciousness to pain. I look, therefore, upon the importance of teaching anæsthesia by experiments upon animals as quite equal to the importance of teaching manipulative dexterity and the recognition and handling of tissues in ordinary surgical operations. Before leaving that point, may I also draw attention to the fact that the anæsthetic substances used in surgery fall into two classes—the respirable, and those which are injected as liquids, such as morphia, for instance, in solution. The action of the respirable gases on the body, and the use of vapours in anæsthesia really date back as long ago as Priestly's experiments on mice with oxygen.

15653. (*Chairman.*) You mean the Dr. Priestly of 100 years ago?—Yes. The idea that invisible gases affected the body was established in that cost by Priestly on mice, and then followed the experiments by Davy on nitrous oxide; those were experiments on men. But again that was a respirable gas. Then we come down to ether and chloroform; but, as regards ether, the real discoverer of the anæsthetic action of ether, Morton, the American, made experiments on dogs. He very quickly, and, I should have said, if I might venture to say so, on slender evidence applied it to man, but he made experiments on dogs, and so did Flourens also. I would accordingly propose that all such experiments with new drugs should always be made on dogs rather than upon man. The next point in my *précis* is the question of new operations in surgery. I shall show directly that many of the operations which are performed now are based entirely on experiments on animals; but I would like to point out that from the ethical and moral point of view, it seems to me that this is an absolutely essential procedure, which ought to be adopted before any new operation is carried out for the reason that if a new operation upon an organ or tissue of the body is performed, no one can foretell what will be the immediate consequences to the animal as a whole. This not only applies to the operation, but it also applies to the actual details of execution. For instance, in operations upon the alimentary canal, the mere handling of the organ to be operated upon, the mere handling of the bowel, for instance, the method of inserting stitches, and so forth—all that comes in as essentials in execution of the operation, and that having to be learnt *de novo*, I suggest ought to be done upon an animal and not upon man. There can be very little doubt that some of the anti-vivisection agitation relating to so-called experiments in hospitals actually bears upon this very point. The anti-vivisection party say that it is immoral to try a new operation, or a new drug, upon a human being in a hospital. They call it an experiment. But, then, they also say it is immoral to do it upon an animal. The only conclusion, of course, is that there should be no more new operations and no more new drugs used in the endeavour to relieve suffering or avert disease. It seems to me an absolute *impasse*, and that if attempts have been made upon patients in hospitals, it has been because a physician or surgeon thought he had a new idea, and wished to put it in practice for the relief of humanity.

15654. I do not think that we have had any witness, so far as I remember, who has come before us from either side who has said that no new drug ought to be employed in the case of a patient.

15655. (*Sir William Collins.*) The distinction was between voluntary and involuntary. I do not know whether you deal with that?—Yes, of course, I do recognise that.

15656. You did not mention it in your *impasse*?—No.

15657. That would be the retort that would be made, I suppose? Probably you will deal with it?—Yes, of course, a very great many investigators have swallowed a great many drugs—Simpson, in inhaling chloroform, for instance.

15658. (*Chairman.*) You were meaning whether the patient's consent was obtained?—Yes, I quite see the point.

15659. That would be the case in an operation; in the case of a drug he could not form any opinion. He might form an opinion whether he would rather die or suffer the risk of pain?—Yes, of course. I have seen a physician propose to a patient, and say, "Here is a remedy that has been suggested; I do not know what its effect is. Will you try it?"

15660. But in the case of an absolutely ignorant person who knew nothing whatever about it?—He probably would not consult him.

15661. He would leave himself in your hands, or you would assume that he had left himself in your hands if you were really doing it not for experiment but with a view of curing him?—Yes, quite so. I gathered that one witness at Question 6077 was rather brought to that conclusion. He said that all experiments were immoral. It was Mr. Graham. He was brought down finally to the point that if there was any serious pain afterwards the remedy might be tried on an animal. It seems to me that is begging the question. The thing is either moral or immoral, and I venture to suggest that any new operation, any new operative method or procedure ought to be tried on an animal before it is tried on man.

15662. That question was with reference to an operation on an animal?—Yes. Then we come to Part III. of my *précis*.

15663. With reference to this I see the first head you wish to speak of is about antiseptic surgery?—Yes.

15664. I do not know whether you have read the evidence that Dr. Bantock gave the other day?—No, I have not seen it. I should like to read it very much.

15665. I am a little afraid of speaking of these scientific subjects which I do not understand, and of misrepresenting anybody, but he generally seemed to think that surgery as practised now aseptically was nothing but a return to the practice of any really careful surgeon before Lord Lister's views about antiseptic surgery were promulgated. What would you say with regard to that?—The answer to that, of course, is extremely simple; that in the practice of the so-called careful surgeon of 40 or 50 years ago, there occurred numerous deaths from pyæmia, septicæmia, erysipelas, hospital gangrene, and so forth, and those do not occur now. Consequently the practice of that careful surgeon was not modern aseptic surgery at all, and for a very good reason—he did not know his danger, he did not know that it was not merely sufficient for him to wash his hands; he did not know that he had to exclude every avenue of entry of microbes into the wound. It is wholly incorrect to make a statement of that sort.

15666. I think Dr. Bantock's view was that microbes did not cause the disease?—Oh, very well.

15667. That microbes were possibly existing in the body, and became active by reason of the disease, but were not the cause of the disease?—That is auto-infection. Of course, we know that is not true. The vast majority of infection in surgical cases comes from outside, that is introduced into the wound.

15668. We have had a large body of skilled evidence against Dr. Bantock's views, but I was not going into the whole of his views—merely that he seemed to think that Lord Lister had discovered and recommended the antiseptic treatment, and that it had proved a complete failure, and that then they had had resort to aseptic surgery, and he said that aseptic surgery in his view was nothing more than what careful surgeons did before Lord Lister touched the matter?—I am sorry to say that, in my opinion, that is absolutely a perversion of the actual position. As I say, I began my surgical work in 1876, just after the introduction of the antiseptic system; consequently I have seen the whole thing develop, and I affirm that our present practice is nothing but the logical outcome of Lister's teaching 35 years ago. That is to say, Lord Lister taught that you had to exclude the microbes from the wound; apparently they were in the air, and were ubiquitous; you had therefore to employ antiseptic substances to kill them, as they fall into the wound, and that was the reason why he employed the spray for one thing and antiseptic lotions for another—that you could not trust (because the whole thing is a question of trust now that the whole of modern surgery is a constant anxiety to a surgeon), the condition of your instruments, and your dressings also, unless they were saturated with antiseptics. But Lord Lister himself said over and over again that inasmuch as these precautions were exceedingly irksome to the surgeon, he would be only too delighted to get rid of them, and no one was more delighted than he when it was shown that the risk of infection from the air was so slight that certainly the use of lotions was enough to avert it, and, therefore, away went the spray. But that was always Lister's own position, and always has been.

15669. I gathered from other medical witnesses that that was what you would probably say. I do not think that Dr. Bantock's views were largely supported by any evidence we have had before us, but still, as he is an eminent surgeon, I thought I should like to ask you?—May I add on this very matter of technique in experimenting the investigations which have been made on animals with regard to infection from the peritoneal cavity, because most of the controversy has arisen over the surgery of the peritoneum. Our ideas now about the physiological action of the peritoneum and its resistance to microbes and infection have entirely altered in the last ten years, and consequently our technique has been altered with regard to the use of antiseptics with regard to the peritoneum. I do not think I need labour the point. Of course I have seen, as I said before, the absolute disappearance from my hospital, University College, of certain diseases—they have gone. Anybody who would be asked now to write an article on pyemia or blood-poisoning in a dictionary of surgery, could not do it; the diseases are gone; and that is wholly due to the introduction and the proper execution of antiseptic surgery. Then, in regard to the saving of pain, the invention of antiseptic surgery has saved a degree of pain which is absolutely incalculable. I believe that it has saved more pain than anæsthetics. I suppose that most of us have been operated upon at one time or another, and one knows that the pain of a wound only lasts for about forty hours, and with a wound that has been well made it is a perfectly tolerable pain. After that, in the healing, there is no pain. But when I was a student a simple case like the removal of a breast for cancer used to have painful dressings for six or eight weeks, and amputations still more. If an amputation now is not healed in a week you blame yourself or the house surgeon. Fortunately we very rarely do amputations now owing to Lord Lister again—very rarely indeed; but in the old days amputations used to go on for a couple of months of very painful dressing.

15670. What is it that renders the dressing unnecessary?—The immediate healing; the complete exclusion of microbes from the wound, and therefore immediate healing of the tissues.

15671. The immediate healthy healing?—The immediate healthy healing, so that the saving of pain by the introduction of the antiseptic system, for which, of course, we also have to thank M. Pasteur, as well as Lord Lister, is enormous. Then, as a third point, the antiseptic system has led to the discovery of new operative treatment; it has led to the discovery of absolutely new operations, by which condition are now perfectly easily and safely treated by surgery which before, when I was a student, were looked upon as hopeless.

15672. You connect antiseptic surgery with experiments on animals?—Entirely, from beginning to end. Because, you see, until you could show that a microbe had a toxic or destructive effect on animal tissues there was no basis for antiseptic surgery. It was Pasteur's work by experiments on animals which proved that point. It was the crucial proof that was requisite. And the Anti-Vivisection Society, in their opposition to antiseptic surgery and their repeated quotation of Lawson Tait, for instance, show, I think, a distinct lack of moral feeling. Anybody who could oppose the means of relieving humanity and relieving the lower animals by a means so simple in execution as antiseptic surgery, I think, cannot be actuated by proper moral feeling. I have seen over and over again Mr. Lawson Tait's name mentioned in this connection. I am not here in any way to answer for Mr. Lawson Tait, who is dead now, of course, but I would like to point out his action in regard to the question of the institution of the Pasteur Institute in his country, Mr. Coleridge informed the Commission that no Pasteur Institute was established. If he means that no institute like the Pasteur Institute in Paris was established, then that statement is contrary to the fact, because the British Institute of Preventive Medicine, now called the Lister Institute, is a Pasteur Institute of the same class, established on the Embankment.

15673. When was it founded?—The committee for its founding, I think, was instituted in 1891. At any rate, a meeting was held in 1893 in favour of it at Birmingham, and as I was very keenly interested in the subject from a public point of view, I went to that meeting. Mr. Lawson Tait attended that meeting, and the first resolution was: "That the members of the medical profession in Birmingham and district cordially approve of the objects of the British Institute of Preventive Medicine." "Mr. Lawson Tait said that he fully assented to the resolution, feeling that, while he objected to a certain class of surgical investigations, bacteriological experiments on animals had proved of great value."

15674. That shows that he did not agree with Dr. Bantock's views about microbes?—Evidently not, and yet he is quoted very widely.

15675. (*Sir Mackenzie Chalmers.*) By Dr. Bantock?—Yes, and by Surgeon-General Thornton.

15676. (*Dr. Wilson.*) That is about the surgical point of view of the question, I think—Lawson Tait's surgical point of view, not the bacteriological point of view?—But surgery is applied bacteriology, is it not?

15677. Not altogether?—I should say it was.

15678. (*Mr. Ram.*) You will find at the bottom of page 625, Dr. Bantock was asked, "Was Mr. Lawson Tait practically on the same lines with yourself?—(A.) Almost absolutely"?—That lies between Dr. Bantock and Mr. Lawson Tait.

Sir V. Horsley, F.R.S., F.R.C.S.

13 Nov 1907.

15679. (*Chairman.*) And the views of Lord Lister on both the subjects of bacteriology and surgery have been generally adopted, not only in England, but over the whole Continent?—Yes, over the whole civilised world—everywhere.

15680. You now come to the question of the surgery of the nervous system?—That, of course, again is a very typical instance of the influence of experiments on animals. There is no special surgery of the nervous system, it is simply the application of Lord Lister's principles to the treatment of diseases of the nervous system, and consequently the basis of it is a question of diagnosis. I wish to put to the Commission that there is not a single function of the nervous system, the principle of which we know now, which is not derived from experiments on animals; all our fundamental knowledge of the different parts of the nervous system is derived from experiments on animals. I would like also to point out, to begin with (because it is a point that will have to come up several times), that frequently in the history of medicine the greatest mistakes have been made because people have endeavoured to reason from structure to function, and have endeavoured, by mere anatomical investigation, to guess at function. That has led to the worst mistakes. With regard to the nervous system, Aristotle, you remember, said that the function of the brain was to temper and soothe the heart, it was to cool the heart; and it was nothing but the experiments of Galen, simply opening the rigid box of the skull and showing that the brain was as hot as the heart, that got rid of that idea. That mistake, of course, has been repeated again and again. And then again, if you take the experiments of Bell on the nerve roots, the nerve roots, of course, were known to Galen, but their function was not dissociated until Bell did it, and then only in the case of one root. But his language is very striking. What he did was to expose the roots in a rabbit, and as he had no electrical means of stimulation, he touched the two roots, first one with a point of a knife, and then the other, and he found that if he touched one there was no movement as the result—but if he touched the other, immediately there was a movement of the muscles; in other words, that the two things had different functions.

15681. This was, of course, without anæsthetics?—Yes. He says: "I now saw the meaning of the double connection of the nerves with the spinal marrow." Of course he did. The thing had been known to anatomy certainly (Galen lived in the second century, A.D.), for 1,600 years, but it was not until an actual physiological experiment was done that the investigator now saw the difference between the two things. I always think that is a most striking demonstration of the absolute value of experiment. And as regards Bell's position, which has been referred to again and again in the evidence, the facts are extremely simple. Bell did a great many experiments. If you look at his original pamphlet of 1811 (which is in the library of the Royal Society) it is very interesting; it is covered with manuscript notes of his experiments on the brain, the respiratory centres, and a great many other experiments.

15682. On animals?—Yes, he notes over 100 that he did, and as long as he was investigating the physiological side of nature he made discoveries. He gave it up, and he then later become involved in a certain amount of controversy, because Magendie and the French physiologists by their experiments discovered the function of the other root, the sensory root. They proved that it was sensory by stimulating its central end, which is again the only way of discovering its function. And then Bell, unfortunately, entered on a priority discussion, and in a good deal of feeling said he did not owe anything to his experiments. I have forgotten the exact words—at any rate, he repudiated his experiments. As a matter of fact, at that time he was doing nothing, and was adding nothing to science. From the moment that he gave up experiments on animals, he equally gave up his contributions to science. As I am speaking about Bell, may I just allude to a point that I have raised a little lower down about neuralgia, namely, that it was Bell's experiments on the facial nerve, which is a motor nerve, as contrasted with his experiments on the fifth nerve, which also goes to the face, but is a sensory nerve, which saved people from having unnecessary operations performed upon them for neuralgia. But it was not until he made this experiment on a donkey that the difference of function between these two nerves was understood at all. Anatomically they had been known, of course, again for something like 1,600 years. Then I wish to draw the attention of the Commission to the fact that as regards investigation of the anatomy of the nervous system, by far the most illuminating way of doing this now is the method of Marchi. The method is very simple. The animal is anæsthetised; the portion desired to be investigated is excised by a little operation of a minute puncture (or more extensive, if necessary), made in it, the wound is closed, it heals in a few days, and the animal is kept for three weeks alive, apparently in perfect health; it is then killed, the brain is taken out, hardened and stained in a particular way with osmic acid. The result of that is that the nerve fibres degenerate from the injured spot, and when the brain is hardened and stained in this particular method, only those degenerated fibres stain jet black, all the rest form a pale yellowish brown background. The result is now that if we make a small lesion in the front of the brain, and there is a fibre going all the way down the nervous system, we can trace it all the way down to its very end. A single fibre is a thing which, of course, is absolutely microscopic, and until this method was devised our knowledge of the bundles of fibres which connect different parts of the nervous system was to a large extent surmise, because the fibres interlace so that you could follow one fibre—it was absolutely impossible. But now by this method, the degeneration method, as it is called, we have a means of investigating the anatomical structure of the nervous system which is unrivalled and is already adding every day, as researches come in, enormously to our knowledge. So that anatomy, which rather misled us in regard to the functions of the nervous system, is now actually being helped from the physiological side. That is rather interesting in this matter of experiments on animals.

15683. You apply both the experiments on the living animal and anatomy of the dead body afterwards?—Yes.

15684. And its condition?—Yes. Then, of course, the surgical treatment of nervous disease includes operations on the brain, operations on the spinal cord and operations on the nerves. In the case of operations on the brain, for instance, you realise that this is a question of being able to treat disease within a closed cavity; you cannot examine the part; you have to form your opinion as to what is going on entirely from your knowledge of the physiology of the brain, and that we owe, of course, in the greatest measure to the discoveries of the late Professors Hitzig and Fritsch, and in our country Dr. Ferrier. That has all happened since 1870, and we are now able to cure epilepsy, we are able to cure abscess of the brain, and we are able to cure tumours of the brain. These conditions, abscess and tumour of course being invariably fatal and causing blindness, severe pain, vomiting, and so forth. Then in operations on the spinal cord the same thing prevails. In fact, the first operation on the spinal cord I am responsible for, so that I know the history of that subject. The technique of that operation I owe entirely to experiments on animals, and I am very glad of the present opportunity to repeat what I have said on that subject. Then as regards operations on the peripheral nerves, I have already referred to Bell's operative treatment of neuralgia as being guided entirely by his experiments on animals. Then we come to the great subject of nerve suture. Injuries to nerves now of course we deal with successfully by dividing the nerves again and sewing them together in various manners; and the initial work bearing upon that subject was carried out by Flourens, who was the first to my knowledge to make experiment on animals, to suture nerves together, to investigate their function.

15685. About when was that?—I have not got the exact date; I think about 1845, but I can find it out.

15686. Professor Langley was giving us some evidence yesterday about the joining of nerves, and the history of it, and he spoke of that knowledge as having been extended a good deal at the present time?—Yes, enormously. I pass from the nervous system to the alimentary canal, because operations on the stomach and intestines are now done on a very large scale, with great benefit to man, and this is being extended to the lower animals, for obstructions of various kinds, and for cancer and tumours generally. The first direct experiments—this is an instance of direct investigation for a surgical purpose—were made by Barischewsky. That was in 1875, but I would like to point out that Barischewsky himself was already indebted to the experiments of Lembert in 1836, who, by his experiments on dogs, showed what had always

been the weakness of this department of surgery, the correct manner of applying a suture. I only mention that again to emphasise what I said about the teaching of students, that the actual technique even in such a minutia as the passing of a stitch ought to be done by experiment first. Then our own observer and great surgeon, Travers, in 1821 had made similar experiments, but in 1875 Barischewsky showed a remarkable series of experiments on dogs, in which he had extirpated portions of the bowel, and proved the detailed technique, whereby dogs could be got to survive. Following upon his work, in the next year, Gussenbauer and Winwarter made direct experiments on joining the stomach and the bowel of the same kind; and then Billroth, on the strength of these experiments, performed the first successful excision of cancer of the stomach, and that really inaugurated not only the operations for the extirpation of the disease but also operations for the anastomosis of different parts in the canal, getting round obstructions and removing dilatations, and so forth. While speaking on this question of the surgery of the intestinal canal I should like to make a remark with regard to fistulæ, because here again constantly the anti-vivisection party represent that it is an exceedingly painful proceeding to make a fistula on a dog to connect one of its ducts or its bowel with the external surface, and to let it heal up. The historical case, of course, of Beaumont, of Alexis St. Martin, is always against that. Every case of colotomy, cancer of the bowel, is of course a direct negation of that assertion, and yet it is repeated, and has been repeated before this Commission.

15687. What is repeated?—That a fistulous opening between the bowel and the surface of the skin causes pain, and that the making of a fistula causes pain. I would like to point out that by one method of making operations to relieve the bowel the wall of the bowel is sewn up to the surface—I am speaking now of an operation on man, of course—the bowel is not immediately opened. Three or four days later you slit open the bowel, and the patient is not conscious of it in the least. You can cut open the bowel, you can cut open the stomach, and the patient not be aware that you have touched him.

15688. Without anæsthetics?—Yes. It is an entire misrepresentation to suggest that animals with fistulæ are suffering pain, although they are kept alive for months, of course, very often. But that was rather in passing. I now come to No. 4—surgery of the thyroid gland. I choose that subject also because it is one that I am personally interested in, and therefore, perhaps, know more about; and here again it is most interesting to see how anatomy misled, and, in fact, hindered, investigation, because even the great anatomist, Luschka, as late, I think, as 1880, suggested that the thyroid gland really was of no service, and that it might have been put by the Creator in the neck from cosmetical reasons to pad it out, exactly like a bolster, for support. Of course he was unaware that Schiff, as long ago as 1859, had made experiments on the extirpation of the thyroid gland, and had shown that it was not an accidental structure, but that it was an organ which was necessary to life. Then the rest of the history of the subject also is interesting, because it shows the necessity of experiments on animals for the direct scientific proof of a biological fact. Sir William Gull, and more especially Dr. Ord, had shown that certain patients exhibited symptoms resembling the cretins in Switzerland, and that this could come on them, as it were, as a disease; and Dr. Ord described that the thyroid gland was diseased in these cases. He had one autopsy. Then Professor Kocher had noticed the same thing in his operations on the thyroid gland, but it was suggested universally, and especially in this country, that this was a disease of the sympathetic nervous system, and that if it had occurred in surgery of the neck it was because the sympathetic nerve in the neck had been damaged during the operation. A Committee was appointed, and I was appointed to make the crucial experiment of removing the thyroid gland in a monkey, in order to see whether that was the cause, or whether it was due to damage of the nerves in the neck; and my experiments proved that it was due to the loss of the thyroid gland. The cost of the work was partly defrayed by the Royal Society and by the British Medical Association. This was 22 years ago. I also suggested, in consequence of these results, that we ought to graft a healthy gland into people as a means of cure. I had no opportunity of doing that myself, but it was done abroad with apparent success. The result of these experiments and of his own researches led Dr. George Murray, of Newcastle, to suggest that we could compensate for the loss of the gland by injecting the juice of the gland, the secretion of the gland, and that was the beginning of the successful treatment of myxoedema and sporadic cretinism. In ordinary typical cases of myxoedema the people lose their hair, they become stupid, the subcutaneous tissues are swollen, and so forth. After treatment their hair begins to grow again, and they recover their mental activity and resume their work, as you will see (*handing in Murray's Book with Examples*). The thyroid gland, I should say in parenthesis, has no duct, and that was the reason no doubt why it was looked upon as unimportant; but in those days people did not know what we know now, that there is a whole chapter in physiology on internal secretion which was not dreamt of when I was a student, and that these researches and others of even a more striking character on the suprarenal body by Professor Schafer and Dr. Oliver, as I say, have opened up a whole new field of work, which certainly would occupy several laboratories alone; so that both from the practical point of view in medicine and surgery, and from the physiological point of view, these experiments on animals have been of very considerable service. That is all I propose to lay before you as mere examples of direct advantage accruing from experiments on animals. I hope the Commission recognise that I have only touched on three or four, and that one could spend a great many days on that subject. I now come to a rather more personal point, because I see that a great deal has been made of it in the evidence laid before the Commission, which is also connected with what I have been stating—namely, Part IV., Experiments on Animals in Relation to Surgical Shock and Incomplete Anæsthesia. In the first place, with regard to surgical shock, it is probably not recognised by the public that in getting rid of blood-poisoning Lord Lister had left practically only one cause of death from operations. There is practically only one cause of death from operations, and that is shock, or collapse; it is the one thing we dread. We never expect a patient to die nowadays from the operation unless an accident has occurred, or if they die from this shock. The importance of this was obvious as long ago as 1895, and Dr. Crile, who is Professor of Surgery now in Cleveland, Ohio, came to University College to study British surgery, and, being naturally interested in the question of shock, I suggested to him that we ought to know more precisely what was the condition of the circulation, as the result of an operation performed in the ordinary way. He therefore commenced under my guidance at University College an investigation, which, I understand, also has been put in evidence here, which I notice has been described as "a series of tremendous experiments," as "very horrible experiments"—in fact, all sorts of adjectives—"repulsive," "loathsome," "filling decent people with disgust and horror," and so on.

15689. Are you referring to some evidence given before us?—Yes, all those adjectives have been applied to these experiments of Dr. Crile's.

15690. (*Sir Mackenzie Chalmers.*) By what witness?—Chiefly by Mr. Coleridge, but in some of the questions that I saw they were described as seeming to be very terrible, and so forth. Anyone who is not a surgeon, of course, might naturally apply such expressions to any surgical procedure. In surgery many things are repellent—naturally repellent—but, of course, we do not hesitate from completing an operation because it is unpleasant. If we did surgery would be in a bad way. What I wish to point out is that there is nothing unusual about these experiments of Dr. Crile's. What he describes as manipulations, in ordinary language are exactly what we do upon the human being. I notice that Mr. Coleridge, for example, selected two things. I will select those two also.

15691. (*Sir Mackenzie Chalmers.*) Are you referring to pages 182 and 183?—No, I think it was in his introductory statement—pouring boiling water into the abdomen, on page 146, Question 10265, in answer to Colonel Lockwood. I should like to begin here: "From the dog we can learn courage, constancy," and so on; "it is the weight of its spleen, or the pressure of its blood, which elicits his curiosity, and he digs into its living body in his horrid quest. I desire to bring before the Commissioners the sixteen experiments performed by Dr. Crile in Sir Victor Horsley's laboratory, in one of which the foot of a dog was

Sir V. Horsley, F.R.S., F.R.C.S. 13 Nov. 1907.

Sir V. Horsley, F.R.S., F.R.C.S.

13 Nov. 1907.

deliberately crushed 'under incomplete anæsthesia.'" Then follow the adjectives to which I have referred; and a little lower down: "The knowledge of what will happen to a dog when its feet are crushed in pincers and boiling water is poured into its inside seems to me as a layman, as remote from any practical service to humanity," and so on. To anyone who is completely ignorant of surgery and the difficulties of surgery these things may, no doubt, seem extraordinary, but I will take those two points—the crushing of a dog's foot with pincers, and the pouring of boiling water into the abdomen. Taking, first, the crushing of the dog's foot with pincers, that is an ordinary description of what we call tarsectomy.

15692. (*Chairman.*) Is tarsectomy an operation performed on man?—Yes, exactly. I was just about to say that a fortnight ago I operated on a young fellow whose leg had been severely smashed in Canada, and the bones of his foot were all welded together, and fixed on to the rest of his leg—absolutely welded on by callus in such a way that he could not walk. It was necessary, therefore, to perform a partial tarsectomy. If I were to describe that operation in this sort of language I should say a large gash was made in the side of the foot, that a stragulus was seized with pincers and was crushed with other cutting pincers, and was dragged out; then other portions of the bone were similarly crushed with pincers, and the wound was closed. In that case the patient survived. In these cases of Dr. Crile's, the foot was similarly gashed open, if you like, the bones were crushed with pincers in a precisely similar way, but the animal did not survive. These experiments were all done under a licence, and the animal was anæsthetised from beginning to end of the experiments, and its death is described by Dr. Crile in his paper in each instance, and he often made a *post-mortem* examination.

15693. What was the object of the experiment on the dog?—In an operation on the periphery of the body (the foot, ends, limbs, and so on), from accidents in manufactories, the crushing of the bone has been known from the time Pirogoff, the great Russian surgeon, to be a fertile source of shock—surgical shock—so that the first thing to do in investigating shock was to devise some operative procedure such as we do upon man, which should involve the cutting of bone. All cutting of bone is crushing or sawing. Therefore you have these descriptions here of Dr. Crile's of repeatedly crushing bones and sawing bones. He sawed one bone six times, I think. That is in order to imitate on the lower animal what we do on man, and yet they are spoken of as something phenomenal—something extraordinary.

15694. (*Mr. Tomkinson.*) With a view of seeing whether that operation would be likely to be fatal?—No; with a view of seeing what effect it produced on the circulation. These tracings give you the state of the circulation as registered by the blood pressure in a mercurial manometer. If you got an indication of fall of blood pressure it would mean that the patient was becoming subject to what we call surgical shock, and, therefore, you must alter your procedure; you must do something to avert it. That was the object of the experiment—to investigate the effect of blood pressure, so that in all these cases he records respiration, effects on respiration, and effects on blood pressure.

15695. (*Chairman.*) But supposing there was a fall of blood pressure, there would be more danger of collapse?—Yes, certainly.

15696. Supposing you do find at a certain point of your operation on a dog that collapse ensues, or threatens to ensue, how do you apply the knowledge that you gain by that experiment to a human being—what is the benefit to mankind?—By trying on the dog further remedies. For instance, Dr. Crile tried an injection of strychnia and an injection of adrenalin to artificially raise the pressure, and all those things we use nowadays invariably in the operating theatre; no operating theatre is complete without them.

15697. I understand that you selected this particular operation with a view to studying shock and how to avoid it?—Yes.

15698. And you selected this particular operation on the dog because the same operation on mankind was found to be one which frequently involved collapse?—Yes, crushing bones and sawing bones.

15699. Finding collapse or symptoms of collapse in a dog, you then tested remedies?—Yes; that is the whole point exactly. Now let me take the other point, because apparently more has been made of that. What are the words? "The knowledge of what will happen to a dog when its feet are crushed in pincers and boiling water is poured into its inside," and so on. As regards the application of boiling water to intestines probably no one is aware of what is done to a human being in many respects. The use of the actual cautery, of the hot iron, or flame, on the effect of which, again Dr. Crile experimented, is very common, that is to the public. But I do not think it is known to the public that a jet of scalding steam is injected into the womb of a woman for certain forms of inflammation.

15700. Under anæsthetics?—Yes, of course, and it is also injected to stop violent hæmorrhage when you are operating on the liver. These procedures are carried out, and what we must know is how far is it safe and justifiable to use such things.

15701. Are all these things under anæsthetics in the case of an animal?—Yes, everything; and to my mind it is perfectly ridiculous to select a set of experiments on an animal which are parallel to what is done on man and hold them up to reprobation. I do not care whether Mr. Coleridge or anybody else reprobates a thing if one is conscious that one is only fulfilling a moral duty—namely, investigating the causes of suffering, and the means of alleviating it and preventing disease.

15702. And without inflicting pain on the animal?—Precisely; without inflicting any pain.

15703. Assuming that reasonable and proper care is used with the anæsthetics?—Certainly, the same moral principle that one applies in this case as, of course, in the case of the education of students. If an animal is anæsthetised, and is kept anæsthetised until it dies, it does not matter morally what you do to it. I repudiate entirely the comments passed upon these researches, and I repudiate entirely the personal allegations of Mr. Coleridge against Dr. Crile's character. At Question 10285 he says: "I want to show that the personal taste of Dr. Crile does not prevent him from torturing animals." Now, in 1899 Dr. Crile proved in the New York press that these statements of Mr. Coleridge regarding him were untrue.

15704. Which statements?—That he had made unnecessary and cruel painful experiments upon animals without anæsthetics, and that the words "incomplete anæsthesia" meant that the animal was conscious of pain.

15705. (*Sir Mackenzie Chalmers.*) If you are dealing with that, I think we ought to call your attention to Mr. Coleridge's evidence at page 182, beginning at Question 10938?—Yes, and 10939: "Would you accept his own explanation?—Certainly not; of course not." I am quite aware that he does not accept it.

15706. May I also call your attention to Question 10947 and Question 10949?—Yes, quite so; I have read it. Of course, Mr. Coleridge accepts nothing.

15707. (*Mr. Ram.*) And Question 10951?—Yes, quite so; he accepts nothing. But my point is that he repeats these charges again and again after they have been publicly proved to be incorrect. I want to point out that his personal allegation against Dr. Crile is wholly unjustifiable in view of Dr. Crile's refutation of the accusation in 1899; that is eight years ago.

15708. (*Chairman.*) To come back to what you did not quite finish, Mr. Coleridge says at Question 10285: "In Experiment CXXXIII. we find these words . . . . 'experiment lasted 2½ hours. Flame was applied to the dog's paw, and we are told in the control experiments, as well as in this, the dog was not under full anæsthesia. In the former the animal struggled on application of the flame'"?—Quite so.

15709. You were going to say something as to whether there was incomplete anæsthesia?—I come to that a few minutes later.

15710. Perhaps, as I have read that statement, you would not mind answering it now?—The statement there that the dog was not under full anæsthesia means that some reflexes were present, and that is certainly probable—the withdrawal of the leg on application of the flame; but that dog was perfectly unconscious to pain.

15711. Were you present at the operation?—No, but Dr. Crile says so in his introduction to his paper. He says that all these experiments were done on animals anæsthetised.

15712. He says: "We are told in the control experiments, as well as in this, the dog was not under full anæsthesia." Do you know by whom he is told?—No, that is Mr. Coleridge.

15713. I gather that he is told in this very account. Is that the account given in Experiment CXXXIII.?—I will look it up.

15714. (*Mr. Ram.*) In the following answer to Question 10288, you will see: "The animal did not take the anæsthetic well, and the entire experiment was made under complete anæsthesia"?—Here is Experiment CXXXIII. What happened was that the flame was applied before and after. It begins: "Fox-terrier, weight 15 kilos," and so forth, "Chloroform and ether anæsthesia." It was under chloroform and ether. Then "applied Bunsen's flame to the paw" before and after he had injected the sheaves of certain nerves in the leg with cocaine.

15715. (*Sir Mackenzie Chalmers.*) Keeping up the general anæsthesia?—Keeping up the general anæsthesia. And then he says, "in the control experiments as well as in this, the dog was not under full anæsthesia. In the former the animal struggled on application of the flame; after the injection of cocaine he did not," showing that the cocaine paralysed the nerves. That was the point of that experiment.

15716. (*Chairman.*) The nerves which produced what you say were reflex movements?—Yes.

15717. (*Dr. Wilson.*) But "struggled" would imply more than reflex movements?—Oh, no.

15718. Persistent struggling?—It depends upon what you mean. Do you mean simple struggling, or a purposive movement?

15719. Purposive movement—struggle?—Purposive movement and struggle are not the same at all. People struggle violently, and they require several people to hold them down sometimes in an operation, but that is quite a different thing from purposive movement.

15720. That is from the effect of the anæsthesia?—No—during an operation. But to return to my point, my point is that although these experiments have been treated in this way as something particularly outside the ordinary, they are not so—that they are what they were deliberately intended to be in the original purpose of the investigation, a repetition of procedures performed upon the human being which are capable of producing shock; and, if so we ought to know how that shock was produced.

15721. (*Chairman.*) There is another passage which I think it would be well if you would explain in answer to Question 10289 about ten lines down; there is a description given by Dr. Crile himself, I presume, of an operation in your laboratory?—Yes.

15722. Then he says: "Under incomplete anæsthesia crushing the foot caused a very sharp rise, followed by an equally sharp decline of pressure. This was repeated several times." What does "incomplete anæsthesia" mean there?—What it means here is that the anæsthesia was not so deep as to exclude a reflex effect upon the blood pressure. The sharp rise and sharp fall are the rise and fall of blood pressures which are produced when you stimulate the central end of any sensory nerve.

15723. I call your attention to those statements because certainly, to an uneducated mind, as mine is in these matters, reading that a particular operation was performed under incomplete anæsthesia, and that an action likely to cause pain was followed by a sharp rise, would imply that there was not sufficiently complete anæsthesia to prevent pain—that pain was felt?—That is the whole point in regard to the meaning of the word "incomplete."

15724. It is important to explain that as the evidence will be read by many persons, I dare say, who will not understand any more than I do the technical language of surgery?—Quite so. I want to devote now a certain portion of my evidence to that subject alone, namely, incomplete anæsthesia, because here again the amount of ignorance that prevails on this subject is very great. By the term "incomplete anæsthesia" we do not mean that the object of the operation or experiment, as the case may be, is conscious of pain at all. All that we mean is that its nerve centres are not so poisoned that it is not capable of making various demonstrations, even reflex acts. Another expression for the same thing that is very frequently used is "light anæsthesia," or very light anæsthesia.

Sir V. Horsley F.R.S., F.R.C.S. 13 Nov. 1907.

15725. Are those common and well-understood terms among surgeons?—Very.

15726. Would any surgeon reading this account understand it in the sense that you are giving to us?—Certainly. A surgeon, Mr. Berry, was reading a paper last night on the removal of goitres, and he insisted that anæsthesia should be very light, and that it should be such, that the patient could be roused even to vomit. The real thing is that hitherto owing again I suggest to want of knowledge, the anæsthesia in most operation cases has been far too deep—of that we are quite certain in ordinary surgery; and the introduction of the method of giving chloroform by known doses, to which I referred before, has brought us now to find that during an operation you can very often give no anæsthetic at all for eight or ten minutes, and, in the case of a child, for twenty minutes. The person will remain sound asleep and absolutely indifferent to pain. Then comes the question, when are you to give him any more? In answer just now to a Commissioner, I said that my guide is what I call a purposive movement. If I see a movement which is not a simple reflex withdrawal, or that sort of thing, if I see a movement which seems to have a more purposive character, I always at once order the anæsthetic to be increased. It is perfectly easy to recognise.

15727. Do you wait for a purposive movement, or do you anticipate it in any way?—Frequently we wait for it. If there is any evidence of shock, if there is any reasonable evidence of shock, we wait for it. People admitted into hospitals with a leg completely smashed do not usually suffer pain. A man may have his leg completely crushed by machinery up to the middle of his thigh, and as a rule he is not in pain; he is simply lying there absolutely shocked, perfectly conscious—he will talk to you all about it, but not exhibiting any sign of pain. And, further, there are many factors during anæsthetisation which have yet to be worked out, and this "incomplete anæsthesia" is a degree of anæsthesia under which it is only safe to perform some operations, on the tongue, the throat, and so forth. As a great deal has been made on this point of "incomplete anæsthesia," and an immense amount of evidence has been laid before the Commission, I should like to take the subject up again.

15728. (*Chairman.*) You were going to refer to some instances of error or misstatement about incomplete anæsthesia?—Yes. This is really a much wider question than a mere mistake as to the degree of unconsciousness to pain, because, as a matter of fact, the anti-vivisection party have preserved their existence wholly, I think, on the assumption that cutting operations are performed in England without the employment of anæsthetics, or with a very inadequate employment of anæsthetics. I would like to point out that this subject dates from 1899, when the first attack was made upon Dr. Crile—that in 1899 Mr. Paulton, in the House of Commons, asked a question of Sir Matthew White Ridley, which conveyed the assumption that experiments of this kind were done. In 1899 Mr. Coleridge attacked Dr. Crile at the Home Office, and after he had been fully informed by the Home Office as to the meaning of this term "incomplete anæsthesia," he then wrote to several surgeons, and asked them a question about incomplete anæsthesia, and he informed this Commission that he wrote exactly in the terms in which the Home Office had written to him. As a matter of fact, he did not write exactly in the terms of the letter of the Home Office, because he omitted the all important sentence which defined this term "incomplete anæsthesia." And the result was that he deceived these surgeons into thinking that it was suggested that operations were done upon human beings in hospitals without adequate narcosis. Subsequently they found out (but not until 1902) the manner in which they had been deceived, and the way in which it all came out was so striking that I venture to lay it before you. In 1902 Mr. Coleridge issued to the public a letter, addressed as follows. It was addressed to ladies: "Dear Madam,—This catalogue, which I respectfully ask you to look at, has been translated

Sir V. Horsley, F.R.S., F.R.C.S.

13 Nov. 1907.

from the German. In reproducing it thus, I have followed the immortal injunction:—

. . . 'Nothing extenuate,
Nor set down aught in malice.'

I place it, therefore, in your hands, and leave it to exercise its influence upon your heart. If it lead you to feel that anything is better than that such things should be, if it lead you to know, beyond the reach of gainsay, that pitifulness is a higher thing in the sight of God than knowledge thus obtained, you will send me your help, great or little, according to your means, that I may do what I can as effectively as you make me able, to put an end to these unspeakable deeds, and I shall continue to be your and the poor animals Ever faithful servant,—Stephen Coleridge." That letter is fixed into a catalogue, which is a translation of the German catalogue of an ordinary surgical instrument maker, who makes physiological apparatus for holding animals. In that letter nothing is said about these animals being fixed in this way on tables and boards under anæsthetics. There is not a word about the use of anæsthetics. I have had that catalogue sent to me over and over again by ladies, asking what this means. And it is all part of this constructive misstatement, that experiments are done in England without anæsthetics. This particular instance, I think, is the most immoral really, of any act of the anti-vivisection party, because the "Times," in 1902, published a serious article upon it, drawing attention to it, and subsequently a correspondence arose in which I took part, and in which we appealed to Lord Llangattock, the Duke of Portland, and several bishops who had supported the issue of this misleading document to withdraw it. They have not done so. And it does seem really a terrible condition of things, that persons holding such high authority should lend themselves to the issuing of a statement of that sort.

15729. A statement suggesting that all this is done in England and without anæsthetics?—Yes. Then, further, this misrepresentation is still going on; some 50,000 copies of this apparently have been circulated. It was corrected, as I said before, in 1902, and Mr. Coleridge stated to this Commission, at Question 10559, that where he was shown anything which was wrong he liked to correct it. I may say in parenthesis that he has never corrected anything which he has been shown repeatedly was incorrect, nor has he ever apologised; but that is only in passing. I simply mention this to show that since 1899 there has been this systematic campaign. From Mr. Coleridge's evidence we now know that he bases it all on his reading of Certificate B. His reading of Certificate B is that Certificate B enables workers in this country to do experiments without anæsthetics or to do them in completely—that is to say, that he was pleased to speak of an initial operation and then of the rest of the experiment. Neither the Home Office nor the scientific workers in this country have recognised such a distinction as regards any cutting operation. And as regards the actual term narcosis, anæsthesia, and so forth, it has always been interpreted by the workers to mean unconsciousness of pain, therefore, whatever phenomena are observed (struggling, the corneal reflex, change in pupils, change in vaso-motor pressure), they are all phenomena which obtain with the animal unconscious of pain. As I said before, this is an important subject, because it has led to the production of this wholesale misrepresentation—to that misrepresentation being still supported by certain persons who would not wittingly, of course, support an immoral Act, who as leaders of the anti-vivisection party (take Bishop Mitchinson, for instance, and the Duke of Portland), were appealed to in 1902, in the public press, to withdraw their support from Mr. Coleridge's letter and catalogue; but they have, nevertheless, continued to give their support. It is not surprising, therefore, that this matter has come before this Royal Commission, and I shall be very glad, in cross-examination, to answer any points in relation to it. I have done my duty, I think, in laying before you a succinct statement of the way in which this particular point has been pressed. And so we come to the last part of my *précis*, the existing Statute of 1876, its administration by the Home Office, and suggestions for its amendment. The Statute itself, of course, naturally, as it is 30 years old, is no longer quite up to date; and it was originally constructed by some one, of course, who was evidently not a scientific physiologist or pathologist, because it might have been very much simplified. In the first place, I take it that the principles of licensing and registration will both be preserved; there is no objection to them, and they certainly must be a satisfaction to the public, therefore they will be preserved. The only question comes to be a consideration of how they can best be regulated. In the first place, as regards special conditions in the licence, assuming that a man has been given a licence, I notice that Mr. Coleridge made several so-called charges against the Home Office. It is not my purpose, of course, to go through those; it seemed to me that they were all baseless; but there was one particular charge, in which he mentioned my name frequently, and therefore we may as well turn to that.

15730. (*Sir Mackenzie Chalmers.*) I was going to ask you upon the tenth charge, which is the specific one?—Yes, I will now enter upon it, Question 10645.

15731. It begins earlier?—Yes, he begins it in his opening statement.

15732. He begins in the last words of Question 10262, on page 145, in the first column; he there formulates the charge: "I am here to charge the Home Office officials"?—These are his words: "(10) I am here to charge the Home Office officials with placing a certain vivisector year after year beyond the reach of the safeguards erected by the Act' (that is the important sentence) "to protect animals from illegal treatment by licensees, by giving him permission to vivisect in private places, thereby placing him beyond the possibility of legal inspection; because by clause 10 of the Act of 1876 the Inspector has no right of entry into, or inspection of, any unregistered place." We will leave that, because that will come up again afterwards. Then the next question is: "What is the name of that particular person? (A) Victor Horsley." Then, again, here is further detail of it at Question 10645, on page 170, in the second column.

15733. And then the next day it comes on again?—Yes, at 11089, page 190. I should like to read the words in the first part of his answer to Question 11089: "We say that there is no reason in the world why Sir Victor Horsley should be placed by the Home Office outside the possibility of inspection." That is my point. I say that that charge against the Home Office is wholly and utterly baseless. There is no foundation for it in real fact. The facts are these: On the 10th November, 1893, I received a letter from the Home Office in answer to an application of mine for leave to do two experiments away from a laboratory, in a private house. These experiments were the inoculation of blood from a patient suffering from filaria sanguinis hominis. This is a particular worm which discharges its embryos into the blood of a patient at night time. The embryos do not come into the blood until about 10 o'clock at night, and they flourish in the blood when the patient is lying half unconscious or unconscious in sleep, and when he wakes in the morning and begins to move about, these embryos disappear again, hence the only time you can get the living embryos is in the night, so that it is necessary to do this inoculation in the night time. All the laboratories are closed at night, and Sir Patrick Manson, for whom I was going to do the inoculation, brought the patient to a private house for me to do it. As a matter of fact, we examined the man's blood, and we found that he had no embryos in his blood, or hardly any, the reason being that he had injured the lymph glands in which the parent worm was living, which had caused inflammation, and had caused the death of the parent worm, and there was an end of the experiment and there was an end of the whole matter, because I have never done any experiment in any unregistered place at any time in my life before or since. As regards the action of the Home Office, their action has always been perfectly clear. They have never given me any such leave as has been alleged to you. May I read their first letter? "I am directed by the Secretary of State to acknowledge the receipt of your letter of the 9th inst. respecting permission to inoculate two monkeys at your private house, if possible, in pursuance of the licence held by you for the performance of experiments under the Act 39 and 40 Vict., c 77, and, in reply, I am to acquaint you that the Secretary of State will, under the circumstances, consider the experiments proposed as experiments to be performed under your licence, which will be treated as current." "I am to add that a special condition will be appended to the licence, exempting these particular experiments from the condition restricting the performance of experiments to the specified places." In other words, the Home Office knew exactly what I proposed to do to inoculate

monkeys with this infected blood and nothing more, and they gave me leave to do that and no more, so that it was an absolutely restricted state of things.

15734. Was a certificate given with it?—No, I only obtained that letter.

15735. But there was a condition imposed, was there not, that you should report?—I am now coming to explain that. That was on the 10th of November, and on the 21st of November, my licence being due for renewal, I sent it in, and when the Home Secretary renewed the licence he said, "The following condition has been added to your licence. 'And whereas the said licensee was authorised on the 10th day of November, 1893, to perform certain experiments at 25, Cavendish Square, in the County of London, I hereby vary the first condition of the said licence, so that the said licensee may perform experiments at such place or places as may be necessary, provided he report to the inspector on each occasion that he performs any experiment at other than the registered places as authorised by his licence.'" The reason why that permission was given at all was that Sir Patrick Manson and I had not time between the 10th and the 21st of November to do the experiment. I mentioned that to the Home Office, and they gave me this condition, but you will observe that when I proposed to do an experiment at all I was to report it to the Inspector, and my original permission was only to do two experiments, and finally, no experiments have been done under these permissions at all.

15736. (*Chairman.*) The operation which you intended to do, if the patient had been suitable, would have been taking some blood from the patient?—Yes, and just injecting it with a hypodermic syringe into a monkey.

15737. And you would draw it out with the patient's consent?—Yes, and then just inject it into the monkey like a vaccination.

15738. That was the whole operation?—That was the whole thing, but what I wanted to do here was to produce documentary evidence that the Home Office had not given me, to use Mr. Coleridge's words, unrestricted leave to do experiments when I liked, where I liked, and what I liked. They never did anything of the kind, because, in the first place, the nature of the experiment was strictly defined, and, in the second place, I was to give notice to the Inspector if I did anything at all.

15739. (*Mr. Ram.*) Before you leave that, on page 170, Mr. Stephen Coleridge refers to this condition, and quotes a letter that he wrote to the Home Secretary in the middle of the second column on that page: "I wrote to the Home Secretary on the 25th of July, 1905, and I said: 'On page 27 there is a note' (I was then alluding to the yearly report), 'which runs thus: Sir Victor Horsley could also perform experiments at such places as might be necessary for the purpose of his experiments.'" Do you know whether on that page 27 which is there quoted there was the limitation that you have just told us of that you were to report?—No, there was not. Here is page 27, and there was no such statement of limitation (*handing in the same*).

15740. (*Sir Mackenzie Chalmers.*) That is the return?—Yes, that is a copy of the Inspector's return.

15741. (*Mr. Ram.*) Again on the same page, at Question 10654, it is suggested that your licence was withdrawn, or your leave was withdrawn in an illuminating way, as he puts it, just before this Royal Commission was appointed. Can you tell us when it was withdrawn?—No, I have not kept it. The matter was certainly referred to when the licence was renewed at the beginning of 1906, when the Home Secretary said that he did not propose to continue the condition. That is all so far as I remember. I have not kept that letter, but the leave was not withdrawn in any special way at all. With every letter that we receive the Home Secretary puts down such-and-such conditions, and if they are conditions which are no longer necessary or are not operative, he just withdraws them when the licence is sent in for renewal.

15742. But at this time, as I understand, there was no object in your having leave to perform experiments in any private house?—Not in the least.

15743. (*Chairman.*) Mr. Coleridge describes the withdrawal in this way: "It is a very remarkable thing that, contemporaneously with the knowledge in the Home Office that there would be a Royal Commission, this leave was withdrawn from Sir Victor Horsley to vivisect where he liked and beyond the reach of inspection"?—That statement, you see, is absolutely untrue. I never had leave to vivisect where I liked, or beyond the reach of inspection. The Home Office never gave me that leave, and that statement is wholly untrue.

15744. The leave that they gave you was for two operations only?—Yes.

15745. And you never used it?—It was for two inoculation experiments only, and I never used it.

15746. (*Mr. Ram.*) In respect of which you were to report?—In respect of which I was to notify the Inspector before I did it.

15747. (*Mr. Tomkinson.*) You never did those two experiments?—No.

15748. They were only inoculations?—Yes.

15749. They were not vivisections at all?—No.

15750. (*Chairman.*) Did the Home Office write to you and say that that condition was no longer in force?—The Secretary of State did not continue it.

15751. How long after it had been given you?—A long time—about seven years.

15752. (*Sir Mackenzie Chalmers.*) Did you come across any other cases of *filaria sanguinis hominis* afterwards?—No, we did not.

15753. I suppose the probability is that the condition was kept open because you might have come across another case?—Yes, quite so; I never took any more notice of it. It was only obtained for a special occasion, and I never bothered about it any more.

15754. I suppose these cases are very rare in England?—Extremely rare.

15755. You may wait some years before you get another suitable case?—Yes.

15756. Is that the disease which produces elephantiasis?—Yes, it is. That brings me at once to the certificate system, because, on looking through the so-called charges against the Home Office, and casting my memory back now over the Act—because, as I said before, it really extends over all my professional knowledge—I can trace any difficulties with the administration, and I can trace special cases in which the anti-vivisection party have made capital, in a large measure to the certificates, and if you please I would like to mention points on each certificate in exemplification of my meaning, and then I would like to conclude by pointing out why the certificates are not necessary at all, and why they only complicate legislation on the subject.

15757. (*Chairman.*) Will you please do so?—In the first place, Certificate A, the inoculation certificate, says that the experiment is going to be done without anæsthetics, and yet it is an inoculation experiment. When I was Secretary to the Government Committee on Rabies it was my business to inoculate rabbits through a little trephining operation. I gave them an anæsthetic in order to make that trephining operation to do the inoculation, but Mr. Erichsen, Sir John Erichsen, as he was afterwards, told me that was violating the Act, because I was giving these animals an anæsthetic, and I reported them under Certificate A, which said that the experiment was done without anæsthetics; and he said that my conduct under Certificate A ought to be that I should do the trephining operation on the rabbit without anæsthetics. I pointed out to him that it might be a breach of the law, but that it was an absolutely absurd position. I suggest that this is a difficulty that crops up from time to time. I know of other experimenters who have performed rather considerable inoculations, who have always given the animal an anæsthetic, but, owing to the hide-bound wording (unnecessarily hide-bound, of course) of the Act of Parliament, it happens that that action of the experimenter conflicts with the Act.

15758. Is that in the Act or in the form of certificate?—In the form of certificate. I beg your pardon.

15759. (*Sir Mackenzie Chalmers.*) The only thing would be that you would do it under Certificate B. If you had Certificate B there would be no difficulty?—But then it is not classed as an inoculation experiment.

15760. That may be scientifically wrong, but practically for you to do that under the existing Act you would be recommended to take out Certificate B as well?—Yes.

Sir V. Horsley, F.R.S., F.R.C.S.

13 Nov. 1907.

15761. You would do the operation under anæsthetics, and the animal would be allowed to recover from the anæsthetic for the purpose you wanted?—Yes. I now come to Certificate B, and as regards Certificate B, I once more would draw attention to Question 10319. Mr. Coleridge in his evidence endeavoured to persuade the Commission that the practical administration of Certificate B was (as is shown in Question 10,319, page 150, in the middle of the second column) that the operator would do the cutting operation then the fixing on the apparatus, and then he would go on making his observations, not giving the animal any more anæsthetic. I have seen a great deal of experimental work in this country, and such an idea has never, to my knowledge, entered the head of any experimenter, and I am perfectly certain it was never in the mind of the Home Secretary in issuing the licence and certificates to us. The whole idea of administering of Certificate B was that an animal which was going to have a cutting operation performed upon it should be under an anæsthetic from the beginning of the operation until the dressing was applied and the animal removed to its cage, exactly the same as with a human being; and on that idea alone has Certificate B been worked. Then I will leave Certificate B. We come to Certificate C. Certificate C is, of course, a special certificate that is required for demonstration to students. As I have pointed out, I think it is absolutely unnecessary. A person who is duly licensed and registered is perfectly fit to demonstrate to students; he does not require any guarantee in the shape of Certificate C. Then Certificate D was constructed in consequence, apparently, of the original drafting of the Act, which made this extraordinary statement that "Experiments may be performed not only directly for the advancement by new discovery of physiological knowledge, or of knowledge which will be useful for saving or prolonging life or alleviating suffering, but for the purpose of testing a particular form of discovery alleged to have been made," and so on, "on such certificate being given as in this Act mentioned that such testing is absolutely necessary for the effectual advancement of such knowledge." That presupposes two things: In the first place, that you can repeat a former experiment absolutely; and in the second place, that such repetition ought to have the special sanction of the Home Secretary. Now, that is wholly contrary to science. No man has ever repeated an experiment without learning something additionally new. You cannot perform an experiment absolutely identically like the previous one. You perform it on a different animal; you invariably learn something new. However closely you attempt to approximate the factors of the experiments in the two cases, you do not get an absolutely identical result, and in that way a great many extremely useful discoveries have arisen. Then as to the necessity of having special permission to extend work, it seems to me that that is contrary to the whole spirit of the Act, which, after all, was to promote the further discovery of physiological knowledge. So that this certificate for so-called repetition experiments is unnecessary, and is contrary really to the progress of scientific work.

15762. (*Chairman.*) Would you suggest some amendment to this, or strike it out altogether?—I would strike it out altogether—repeal it altogether. It is not only not necessary, but it is also contrary to the fact. It was evidently inserted in the Act by someone who had no knowledge of physiological experimentation. That is what I mean. I suppose Lord Playfair was responsible in a great measure for the drafting of this Act, and he was a chemist—he was not a physiologist; but whoever was responsible evidently in many respects was not a physiologist—he did not know the actual conditions surrounding experiments on animals. Then we come to Certificate E, and although I have no charge to bring against the Home Office, I did not say that I had no charge to bring against the Home Secretary. Certificate E, I take it, is never applied for now. Certificate E proposed to allow experiments on dogs and cats without anæsthetics—those are the words. Now, when Mr. Matthews was Home Secretary he insisted on Certificate E being filled up by all the experimenters who wished to use dogs and cats, and we protested. We went to him as a deputation—Sir James Paget, Sir Andrew Clarke, and myself. We pointed out to him that this placed experimenters in an entirely false position; that they did not do experiments on dogs and cats without anæsthetics, that if the Home Office wished to know when dogs and cats were used they could be notified, but that to compel us to sign a paper which was not true seemed to us most unjust; and we asked him, therefore, to withdraw Certificate E. I am sorry to say that Mr. Matthews refused, and it was not until we came under the enlightened *régime* of Mr. Asquith that this question was settled; because we made exactly the same representation to Mr. Asquith, and he immediately said, "Certainly, I recognise the injustice," and he constructed the Certificate EE to take the place of Certificate E, which was exactly the same certificate only it left out the words "without anæsthetics." I mention this to the Commission to show that as regards the plenary power of the Home Secretary under the Act—although as a rule, of course, it is worked extremely wisely—there may be examples, like that of Mr. Matthews, in which it may be worked extremely badly. I think the Commission ought to have the fact before them.

15763. (*Mr. Ram.*) Did Mr. Matthews give any reason for adhering to this Certificate E?—No; he simply wrote a letter in which he regretted that he was unable to comply with the wishes of the deputation. We never had any reason from beginning to end. It was evidently simply a matter of internal administration, because Mr. Asquith drafted Certificate EE, and we have worked under it ever since. But I point out that that occurred in 1888.

15764. (*Chairman.*) You mean Mr. Matthews's refusal?—Yes, and that the statistics consequently of the experiments on animals then were not correct. For instance, when I was called upon (and I know many other experimenters when they were called upon) to send in this Certificate E, struck out the words "without anæsthetics," and I certainly had the document returned to me twice, and sent it in again twice. I would not sign the original Certificate E, and ultimately it was allowed with the words struck out by myself.

15765. (*Sir Mackenzie Chalmers.*) So that now in all cases the certificate shows the fact—namely, that experiments on dogs and cats have to be performed under anæsthetics?—Yes; the working now is perfect. There is nothing to complain of at all. But I only mention it to show how the certificate system as a Schedule to the Act of Parliament is liable to misapplication, especially in regard to any physical science, considering that physical science is always altering and advancing. Then the last certificate, F, is another of these special certificates. It is really absurd, of course, that a special certificate should have to be got for experiments on ungulates or special ungulates. It is contrary to science.

15766. (*Chairman.*) What is contrary to science there?—For any one class of animal to be selected in contradistinction to the whole animal world. We ought to have general permission to do experiments on any kind of animal. There is no reason why any one animal should be, as it were, removed from the sphere of the Act.

15767. (*Mr. Ram.*) You may do it on a cow, but not on a horse without getting Certificate F?—Exactly. It is absurd from a scientific point of view—I mean, of course, it was not absurd to those who drew it up. So, summing it all up, I suggest to the Commission that these certificates, which give endless trouble to fill up, are really of no use. Then, of course, the question arises, what use is made of them at the present time, and how are you going to meet it. Very important use is made of them at the present time. The Home Secretary must know, both for his own information what is going to be done in research—he must know what is going on during the research, and he must know what the results of the research are, for his own information, as I said, and also for report to the House of Commons. Now we need not trouble about the middle point, what is going on during the research, because that is provided for by the system of inspection; but as regards the first point, all that is necessary is to do what is actually done at the present time, to insert on the application for the licence that the applicant proposes to do such and such experiments on such and such animals in such and such a way. It covers all that. Then when it comes to the collection of statistics for report to the House of Commons, that depends simply and solely on the form. The present form that we fill up at the end of the year could very easily be expanded in this sort of way: You could have the first column "Class of Experi-

ments—(1) Animals killed before recovery from anæsthetic; (2) Animal allowed to recover from anæsthetic; (3) Animals inoculated." That really covers the whole ground as a matter of fact. Then the next column would be "Number of Experiments Performed"; the next "Number in which Pain was Observed to Occur." Third, "Animal Employed." In a simple form of that kind you have all the facts which are supplied by those certificates, and in a form which would make their being collected and reported upon extremely simple and easy. So that the certificates are wholly unnecessary. They have led to misunderstanding, and they give great trouble to the applicants who have to get them signed and filled in. And, further, Mr. Matthews added another difficulty; that was the restriction as to their numbers or their duration. It is perfectly ridiculous that the Home Secretary, who is very rarely a scientific man, should say whether ten experiments or twenty experiments are necessary for research, and yet that is done every time.

15768. (*Chairman.*) Of course he does not act without some advice?—Well, my lord, when Mr. Matthews put these restrictions of time and number on the certificate form I suppose he was advised to a certain extent by the Inspector, and so on; but, at the same time, the investigator himself does not know how many experiments may be necessary.

15769. I dare say that is so. I was only pointing out that the Home Secretary does not rely solely on his own scientific knowledge?—Yes, I beg your pardon. I see your point.

15770. (*Sir Mackenzie Chalmers.*) You mean that it has this disadvantage: that the person applying has to apply for an extra number of experiments, more than probably would be necessary for him to perform?—Quite so, and not only that, but one other condition that was devised (I have forgotten how long ago it was—it arose out of Mr. Matthews' regulations) was that the investigator might do, say, 20 experiments, but after ten he was to report to the Inspector, but the fact that the Inspector knew that those ten had been done made no difference to the research under the present system of record keeping that we have of experimental work; all this is very much simplified; because some years ago, when Mr. Ritchie was Home Secretary (Lord Ritchie as he was afterwards), the blue form on which the experiments were recorded was given up, really I think in answer to a protest of mine, namely, that the investigator ought not to be put to the trouble and annoyance of having to write all the records of experiments twice over; and Mr. Ritchie then made a standing regulation that the records of all the experiments were to be open for the visit of the Inspector as, of course, they are. Consequently these details, which are inserted on the certificates, and under which the certificates were allowed to be obtained are always available. Therefore that is another reason for regarding the certificates as unnecessary, a waste of time, giving great work in the office, and leading to misunderstanding.

15771. (*Chairman.*) You would have a licence and no certificates?—Yes, a licence drafted in the way I have suggested, and a form of return to be filled up by the investigator at the end of the year would cover the whole ground. Then as regards the plenary power of the Home Secretary, that would remain, of course, and he would insert any special conditions on the licence which he thought necessary.

15772. Permanent conditions, do you mean, or special conditions?—They would last for a year, because the licence always expires at the end of the current year.

15773. Suposing he wanted to give you a licence for inoculating two monkeys, how would he deal with that?—He would endorse it on your licence; he would ask you to return the licence, and endorse it on the licence.

15774. You must have some special application for it?—Yes, that is an ordinary letter.

15775. (*Sir Mackenzie Chalmers.*) Then you would eliminate the advisory bodies in that way. At the present time certificates are given by outside bodies of scientific people?—No, they would have their place in the granting of the original licence; and, of course, they would be the people to appeal to as to whether the investigator was a fit person to conduct the investigation which he proposed to do. Now their advice is sought really three times over for the same thing. If a man gets a licence and Certificates A, B, and E E, which is about the average, they really sign the same thing three times over. It is quite unnecessary.

Sir V. Horsley, F.R.S., F.R.C.S.

13 Nov. 1907.

15776. (*Chairman.*) Does that exhaust your *précis*?—If you please.

15777. (*Dr. Wilson.*) What body would you recommend to advise the Home Secretary, then, as to the need of new experiments in the field of research, instead of the Association for the Advancement of Medicine by Research?—I really have not thought of it. I do not know of any body at this moment that I could name.

15778. Would you object to the General Medical Council, for example, as the advisory body?—I should object very strongly. I was a member of the General Medical Council myself. It is not at all a body that could do it. You cannot call them together, except at fixed times. Of course, the personnel, as personnel, would be all right naturally; many of them are teachers and know the requirements of education.

15779. But through a Committee of that body could it not be done?—Certainly. The expense question you know in the General Medical Council is always a very difficult one.

15780. Yes, of course, that would have to be met in some way. May I ask whether you are appointed by the Council, or a Committee of the Council of the Association to appear?—The Council.

15781. It may be conceded that the vast majority of the medical profession are in favour of experimentation on animals, but do you think that they take that view just because they thoroughly know the subject, or are they influenced by the experiments they have seen in the class rooms?—The vast majority of them, only from their general knowledge up to about ten years ago. Men qualified during the last ten or fifteen years have seen the experiments, of course, but there are many schools now that do not show experiments at all, and I do not think they teach well either.

15782. I see you allude to the huge total which has been expended by the Association during recent years in the form of grants in aid of research?—Yes, and scholarships.

15783. Do not these grants tempt some of our best students to go in for research, and some of the ablest young men who are just starting in practice?—They enable many who could not otherwise afford it to do so, the scholarships especially.

15784. Then there is the Ernest Hart Fellowship?—Yes, the Ernest Hart Scholarship for Public Health, three scholarships of £150 a year for general science, and then about £400 is expended in grants.

15785. With reference to these grants—I know that all the results of the investigations in the fields of research have appeared in the "British Medical Journal," but has any compendium ever been made to enable one to judge of the advantages that have been gained?—Not that I know of. I remember years ago some considerable number of researches were collected in a little volume, but that has not been done for many years.

15786. Is it not the fact that many of its students who obtain these scholarships go to Continental schools to complete their studies?—They often do.

15787. And there they become imbued, of course, with the doctrines there taught?—Yes.

15788. And is it not also the fact that the majority of the teachers in medical schools are selected from those young men who go to Continental schools?—Certainly.

15789. And should I be right in stating too that almost all the leading articles on questions of research that appear in medical journals, or even in the daily papers, are inspired by these young enthusiasts—because the older men can rarely speak or write on the subject?—I do not know what articles you refer to.

15790. I mean articles on research that you see constantly in medical papers and in the daily papers too—medical research?—Yes, I daresay. I do not know what articles you are referring to at the present moment.

15791. I want to get at this—how medical opinion with regard to these questions is moulded really?—Oh, I see. I cannot tell you. I should have said that the medical opinion was simply the expression of the

Sir V. Horsley, F.R.S., F.R.C.S.

13 Nov. 1907.

general scientific knowledge of the profession at the time.

15792. I will put it in this way: Though the consensus of medical opinion may be in favour of continuing experimentation on animals, do not you think that the consensus of medical opinion is always a somewhat unreliable court of appeal?—Do you mean, is it possible that the medical profession are mistaken on this point?

15793. Some may be?—That, of course, is very difficult to say. I do not personally think that they can be mistaken on the point, because one sees the present position of scientific research is nothing but the logical outcome of all knowledge that has been going on for centuries. It has not begun recently; it has been going on since the time of Galen; it is all one continuous evolution. I cannot believe that the medical profession are mistaken on a matter like that, at least it does not seem to me quite reasonable.

15794. Talking about this consensus of medical opinion, do you think that if your proposal to operate on dogs to teach students practical surgery, as they do at the John Hopkins Hospital, Baltimore, were submitted to a plebicite of the profession you would obtain a large majority in favour of it?—I do not know. I think probably I should obtain a majority, certainly. And I have not limited the number of animals to be operated on to dogs at all; on the contrary, I have always held the view that the sheep was an animal that particularly lent itself for students' work. The arteries in sheep are the same size as our arteries, the circulation in many respects is the same. The difficulties of operating upon it are the same. The sheep is really a very good animal for research; it is only a question of cost.

15795. Should I be right in saying that beyond setting an occasional fracture or dealing with a rare accident the general practitioner nowadays is seldom called upon to display any surgical skill at all?—Pardon me, the discovery of the antiseptic system has completely revolutionised medical and surgical practice. In old days surgical practice used to be reserved to so-called operating surgeons. General practitioners nowadays do all operations—many of them do very large operations—such as extirpation of the kidney. That has all altered even within my time. General practitioners operate very largely in cottage hospitals all over the country.

15796. Yes, if they are connected with hospitals?—Naturally, if they have hospital practice they continue it in their general practice.

15797. I mean in general practice?—I mean in general practice.

15798. You contend, do you not, that the recognition of tissues, their texture and treatment in practical surgery can only be taught on the living body?—Yes, I say it can only be adequately taught in that way.

15799. And that for the purpose experiments on living animals are essential?—Yes.

15800. You have been talking about Listerism. Surely the revolt against the use of the carbolic acid spray which constituted the leading feature of antiseptic surgery was not brought about by experiments on animals. Because there was a revolt against the use of the carbolic spray?—No, there was no revolt against the use of the carbolic spray at all. The question was whether it was necessary to have this disinfection of the air. It was shown by experiments that air was not toxic to the degree it was believed to be: that organisms present in the air to a large extent were moulds and fungi, which were not particularly poisonous to animals; that the organisms which were dangerous to animals and to man were those which were carried in on instruments, and for that reason people began to risk leaving off the spray, and gradually it was left off altogether. But the spray was not the leading feature of the antiseptic surgery at all.

15801. It was one of the leading features, was it not?—No, it has often been described as part of the ritual, but that is by ritualists. Surgeons are not ritualists—at least, they ought not to be.

15802. Now, as to the value of experiments on animals in teaching or acquiring technique, is it not the fact that some of our leading surgeons, such as the President of the Royal College of Surgeons, who gave evidence before the Commission, and the President of the Royal College of Surgeons, Ireland, have never themselves operated on animals?—Yes, I believe it is. They gained their experience by learning on man.

15803. Then I am going to quote Sir Frederick Treves. Has he not stated that the experiments on animals that he himself made to improve his technique in abdominal surgery rather led him astray?—No; that statement of Sir Frederick Treves has often been quoted and misquoted, and his final correction of it in the "Times" was to the effect that in one particular case, one particular form of experiment, he learnt nothing from it.

15804. (*Sir William Collins.*) Can you refer to the date in the "Times"?—I cannot.

15805. You can put it in?—Yes, I will get it. He has often been twitted with it by the Anti-vivisectionist party.

15806. (*Dr. Wilson.*) Now as to experiments for teaching students physiology, do you agree with the views expressed by Dr. Waller in his address at the meeting of the British Association, not the British Medical Association?—I was there at Leicester.

15807. That "the province of vivisection, essential as it was, was a very narrow and restricted province indeed, in the domain of physiology," and that vivisection was, in fact, an infinitesimal fraction of practical physiology?—That passage from Dr. Waller's address, taken by itself, may be easily misunderstood. What Dr. Waller meant was that in the work of the physiologist in his laboratory and in his class rooms, the actual amount of vivisection he did was extremely small. And so it is; the total net work done by a physiologist in his ordinary routine rarely includes an experiment on an animal of a nature which might be termed vivisection, compared with the mass of his other work. But it all depends upon the investigator. If you are making a research, for instance, in the nervous system in the way I have just indicated, tracing out the track by the Marchi method, you would make, perhaps, ten vivisections; it would take you ten months to work up that material microscopically.

15808. You maintain, I suppose, that experiments on dogs are necessary for teaching?—Absolutely essential. Not necessarily for teaching alone.

15809. I mean for the physiological class-room, of course?—Do you mean for original research or for teaching? They certainly are necessary for demonstrating certain things.

15810. For teaching physiology?—For the students to use them as material, certainly for some experiments they must use dogs; for others, cats and rabbits will do; for others, frogs and so on; it depends upon the experiment.

15811. Because Professor Gotch stated here that for two years he had not used living dogs for teaching purposes, and Dr. Pembrey admitted before the Commission that during all this year, at least, he had not vivisected any animals at all before his class. From that you would rather criticise the efficiency of the teaching?—Certainly I would.

15812. You yourself have, I know, carried out a large number of experiments on animals in connection, first, with Pasteurism, and also as you say, with respect to brain surgery and the physiology of the thyroid gland?—Yes.

15813. Of course, after what you have said, I need hardly ask you whether you have ever had any reason to doubt the efficacy of the Pasteurian treatment for hydrophobia?—Oh, no, not the slightest—not since the Report of the English Committee.

15814. When they have to propagate the virus at the Pasteur Institute; do they propagate it from rabbit to rabbit?—Yes, from rabbit to rabbit.

15815. Do they use dogs at all now?—I do not know whether they occasionally do. But that is not the animal used for propagation of the virus; the animal used is the rabbit.

15816. From rabbit to rabbit?—From rabbit to rabbit entirely.

15817. So that there does not seem to be any need of introducing a new virus, as it were?—No.

15818. But the symptoms of rabies as seen in the rabbit bear no resemblance to rabies in the dog?—It is a very interesting thing—it all depends upon the rabbit. You may take twenty rabbits, as you know if you have kept rabbits, and one or two will be quite

playful and even bite, and when you inoculate those rabbits, a rabbit which is naturally excitable will bite as viciously as a rabid dog. And so will a guinea-pig. I have had a guinea-pig inoculated with rabies fly at me exactly the same as a rabid dog will. The majority of rodents simply become paralysed in the hind legs, they have the paralysed form of rabies and not the excitable form. But it depends upon the animal.

15819. Then would you go so far as to say that the Pasturian treatment of hydrophobia has been so firmly established on experimental and logical lines that it can never be successfully discredited; is that your strong feeling?—Certainly.

15820. That was my opinion at one time, too, but I have rather doubted it since?—I have not the slightest doubt. I devoted a very long time to working out the accurate statistics at the time of the Government Commission, and considering that the Pasteur system has reduced the death rate from 15 to ·3 per cent it is such a margin of difference that I never can have doubt.

15821. Statistics can be made to prove or disprove almost anything. Of course, you know a great many patients, over 1,200 cases have been enumerated, have died either during or immediately after treatment—I mean within the time stated by Pasteur?—Who collected those statistics? It was Dr. Luteaud. That evidence was certainly not received by anyone who knew the facts. But there is the evidence which the English Committee collected for themselves, you know. They went over to France, and I myself was over there for two months hunting up the cases which had been treated, and hunting up the authenticity of the rabidity of the dogs, and there is no doubt that the death-rate then that Pasteur obtained was about 1.5, if I recollect right. Since then it has been brought down to 0·3, which is a very usual death-rate of a preventive inoculation.

15822. And you believe that there is very little pain inflicted on the rabbit by it?—Yes. I have seen rabbits completely paralysed in their hind legs, and beginning to be paralysed in their fore legs, eating and looking about absolutely unmoved. It is a kind of painless paraplegia in the rabbit evidently. Human beings only suffer, of course, when they get the spasm and the apprehension of dying from an inevitably fatal disease, you know; that is the suffering of hydrophobia.

15823. A few questions with regard to the functions of the thyroid gland and the diseased conditions connected with it. Of course, you yourself have performed many operations on monkeys and dogs?—Yes.

15824. Am I right in stating that an exceedingly large number of experiments have also been performed by others engaged in this research?—Yes.

51825. Am I also right in assuming that though the initial operation, the removal of the gland or part of the gland, may be carried out painlessly, the conditions induced may be often accompanied with very considerable pain?—Oh, dear, no.

15826. When the animal wastes?—No.

15827. There is no pain at all?—No; but the animals run through the same category of symptoms as the myxœdema and cretinism patients; they become more and more stupid and idiotic; they are not sensitive to their surroundings at all.

15828. Can it be said that after all these experiments on the thyroid and parathyroid glands the functions of these glands are perfectly understood now?—Of course not; they will not be understood in our lifetime. It is impossible.

15829. Has it not been pretty fully established by the experiments of Professor Swale-Vincent and Jolly that the functions of these glands appear to differ very widely in different classes of animals?—I showed that myself a good many years ago. When you say that they differ very widely there must be no misunderstanding on this point. They differ in degree but not in kind. It is only a question of degree.

15830. And myxœdema is believed to be due to a diseased condition of these glands, is it not?—Yes, certainly.

15831. Did not Professors Vincent and Jolly find that none of the monkeys from which they removed the glands showed the slightest symptoms of myxœdema?—In Vincent and Jolly's experiments particularly, many of their animals did not show anything at all.

15832. No signs of myxœdema?—No, I am not sure, when I say no signs that they analysed the connective tissues. I do not think they did; but, at any rate, the animals did not present the very obvious signs.

Sir V. Horsley, F.R.S., F.R.C.S.

13 Nov. 1907.

15833. May I ask whether that has been your experience, too?—Yes. I have had monkeys that did not show anything at all.

15834. Has there not all through these experiments been a great discrepancy in the results obtained by different observers?—No.

15835. And therefore in the inferences to be drawn from them?—No. There have been discrepancies as in every new subject. Every pioneering investigation is sure to arouse other investigations, and new facts come to light which were not explained by the conclusions of the first investigation, and consequently so-called discrepancies have arisen. That is the ordinary concomitant of the results of scientific work, and it only requires our waiting 20, 30, 40, or 50 years to get the real truth.

15836. Then the only outcome of it all, so far as any remedy is concerned, has been the discovery of the value of the thyroid gland or extract in the treatment of myxœdema and cretinism?—Yes, if you apply the term "only" to it. I should have thought it was a good deal for the sake of humanity to get rid of the symptoms of myxœdema and cretinism, if you have ever seen them.

15837. But are cases of myxœdema and cretinism ever completely cured?—Oh, certainly.

15838. Completely cured?—Certainly, and that is not the end of it. For instance, to cure cancer of the thyroid gland by an operation it is absolutely essential to take out the whole gland. If you take out the whole gland you would make the patient myxœdematous, but if you give them the thyroid they do not become myxœdematous. In other words, the thyroidal treatment under those circumstances has enabled you to remove the cancer, which was a fatal disease.

15939. Then, gain, with respect to demonstrations that sort?—Yes, I have grafted in a case of that sort successfully.

15840. After cancer?—Yes.

15841. After the removal of the cancer?—No, after the total removal of the gland for parenchymatus goitre. I have dealt with cancer cases in the way I suggest by giving thyroid, I have not grafted in cancer cases.

15842. Then in regard to brain surgery, have these numerous experiments on animals assisted largely in that respect?—The successful operative treatment of the brain and spinal cord is wholly due to experiments on animals. As I explained, the technique is simply Listerism, but the application of the technique to a particular spot in the nervous system is entirely the result of physiological research.

15843. But the results of an operation, for example, on a tumour of the brain or abscess of the brain are not very satisfactory still?—There is a great deal to be done in the way of improving them of course.

15844. That is to say the mortality is still very high?—No, but the surgical treatment is imperfect often because the cases come too late. Diagnosis is very imperfect still, and cases are referred for operation which ought to have been operated upon a year before, and that sort of thing.

15845. Did not Professor Oppenheim, of Berlin, state at the meeting of the Medical Congress at Moscow a few years ago that "brain localisation is often most doubtful; the diagnosis of brain abscess from brain tumour is often, if not always, quite impossible?"—Yes he may have made that statement ten years ago. He has recently published with Professor Borchhardt a certain series of cerebral tumours, in which he diagnosed them successfully, and Professor Brochhardt removed them successfully by surgery. I should think Oppenheim would not repeat now what he said at Moscow ten years ago.

15846. You are clearly of opinion, of course, that experiments on animals must still be carried on with regard to assisting in this field of surgery also?—Yes, very much, and assisting also, you understand, in the study of the anatomy of the nervous system, because the Marchi method is revolutionising our method of studying the nervous system and anatomy. We are, of

Sir V. Horsley, F.R.S., F.R.C.S.
13 Nov. 1907.

course, not only employing experiments on animals for localisation in that way.

15847. Apart from cases of injury, does not the diagnosis of any brain mischief, such as tumour or abscess, rest mainly on the physician?—Yes.

15848. And when a surgeon is called in, such as yourself, of course you yourself diagnose and inquire into the case before deciding on an operation?—Yes.

15849. And share the responsibility in that way?—Yes, most essentially.

15850. Now just a question or two with regard to those experiments of Dr. Crile, and I must confess that they have always been rather terrible reading to me?—When you use the word "terrible," I think that any mutilation of a human being or an animal is conceivably terrible in one sense, but it seems to me unreasonable to apply the term to an operation on an animal, and to deny the term to an operation on a human being. If it is terrible to one, it is terrible to the other.

15851. But you see in the one case the operation is necessary?—I say it is necessary on the animal.

15852. You say it is necessary on the animal to enable you to operate on a human being. That is the position you take up?—Yes, quite, it is necessary in both cases.

15853. Then as some of those experiments were carried out in your laboratory, of course you would be perfectly prepared to carry them out yourself, if necessary?—Certainly.

15854. And, as you have said, you believed they were all painless?—Yes, absolutely.

15855. No matter how ambiguous the language Dr. Crile used?—Quite so, no matter what his language.

15856. And you are of opinion that more experiments even of this kind are still required?—Undoubtedly.

15857. But granting, for example, that a dog is endowed with the same relative amount of vital resistance as a healthy human being, is it logical to infer that a diseased man on whom an operation has to be performed with his vitality lowered often almost to breaking point by suffering, could survive the same degree of surgical shock which is inflicted on a dog which is not diseased at all? I mean that the two subjects on which you operate are in an entirely different condition. I am supposing a diseased human being and a healthy dog?—I do not quite follow you, I am afraid. They are not in an entirely different condition at all, because, for instance, taking the diseased human being, his heart is working along at the same rate as usual. His blood pressure is, as a rule, up to the average, and so forth.

15858. There is not the same amount of vital resistance to death as in the case of a healthy animal?—No, possibly not.

15859. Would not that rather tend to what is called somewhat daring surgery sometimes, just because one sees an animal survive a terrible experiment, would you expect that a human patient may survive the same amount of shock under an operation?—Certainly. Because there is not any operation that I can think of at the present moment that has been performed experimentally on an animal, such as the removal of the kidney, or the removal of a portion of the liver, which has not been equally performed on a human being. In other words, the parallelism between such operations on animals and man is absolutely close. Even through every stage of the operation, and the effects produced, the parallelism is absolutely close.

15860. But as regards shock, you do not know that unknown quantity of vital resistance in the patient and in the dog?—But, pardon me, that does not come in, because you start with a patient with certain vital resistance—a man, for instance—and supposing that during the operation you discovered that his blood pressure was falling, you recognise that, and you treat it.

15861. Is it not the practice to hold an inquest in all cases of death in hospital from anæsthesia?—Yes, it is in England; it is not in Scotland.

15862. They do not hold inquests at all there?—No, they do not hold any public inquiry. They do in England.

15863. Is it not sometimes very difficult to determine whether a patient dying on the operating table dies from the mere shock of the operation or from the anæsthetic?—That, of course, is purely a medical point. Personally, I have never seen anybody die from shock on the operating table. I have seen people die, as I considered, from an overdose of chloroform. That is my personal opinion. If you ask me whether it would be possible to differentiate between the two, that is a very difficult question.

15864. So that, of course, you contend that continuous experimentation is still necessary?—It is bound to go on. It will go on as surely as we go on round the sun.

15865. And also, in respect to drugs and doses?—Still more. There I think we have neglected pharmacology disgracefully. There is hardly a university that has got a pharmacological laboratory. They are beginning to found them now.

15866. Just to take one drug, as an example, about which you have spoken and written very strongly—alcohol—have there not been many experiments performed upon animals, to say nothing of experiments that man has performed upon himself?—Yes, a great many.

15867. And still there is no consensus of opinion in the medical profession about the dietetic or pharmacological value of alcohol?—These are two different points, of course. First, as regard the dietetic value, I should have said that there was a very considerable consensus of opinion in the medical profession that alcohol was not a food—I mean in the proper sense of the word, a food without any adverse effects—I should have said that that was an absolutely accepted position. Then, again, as regards the position of alcohol as a drug, as I have shown, the general consensus of opinion of the medical profession now is, not to use it as a drug, but to use other drugs instead, because they have a less injurious effect, like strychnine, and so forth, and heart tonics, and one thing and another, which can be employed with better advantage to the patient than alcohol. So that the general consensus of opinion of the medical profession at the present time is rather to give up using alcohol as a drug, because they have got other and better means at their disposal.

15868. (*Mr. Tomkinson.*) I think you began by stating that all pursuit of knowledge was moral, and that any obstruction raised to the acquisition of that knowledge was immoral?—I feel that.

15869. Do you carry the former to its logical conclusion, that, irrespective of all results, knowledge must be pressed forward. To give an illustration of what I mean, supposing there were no such things as anæsthetics, do you hold that we should be justified in experimenting in surgical and other operations on the animal world for discovery?—Yes. In old days, before anæsthetics were discovered, I think the old surgeons were quite justified in making the experiments that they did, and they made a great many useful experiments to discover new operations and new facts, in which I think they were quite satisfied.

15870. You think that we are justified in exploiting the animal creation in that respect?—Yes, provided that we treat them as humanely as we treat ourselves.

15871. You mean that, because in old days it was necessary to perform amputations and other terrible operations without anæsthetics, it was, therefore, justifiable to perform the same operations on animals for the pursuit of knowledge?—Yes, in those days, quite.

15872. You said that you considered that anti-vivisectors who accepted and availed themselves of the results of these experiments and of the knowledge gained thereby were themselves *participes criminis*, and at least illogical—in fact, were guilty of complicity with the very thing which they condemn?—I think so.

15873. But I suppose you would admit that probably in the majority of cases the patient is entirely ignorant of how the treatment has been obtained?—Yes.

15874. And moreover the assumption is from your point of view that the same discovery could not have been made otherwise than by experiments on animals?—Certainly.

15875. But I suppose you are aware that it is very much contested in some quarters whether the same results could not have been arrived at, and the same

discoveries made by other methods than by experiments on animals?—I know that that has several times been asserted, but the fact remains that the thing was discovered by experiments on an animal, and it is no good saying afterwards: "I could have discovered it in some other way." For instance, it was once said of the circulation by Mr. Tait that anyone with a syringe and a dead body could have discovered the circulation of the blood. A statement like that, of course, is monstrous in itself, but I rather think that is the sort of thing that you refer to. I say that is arguing backwards. We could always get up and say: "Oh, yes, I might have discovered it in some other way." The answer to that is perfectly simple: "Why did you not?"

15876. I do not know that I rightly understood you on the subject of rabies in England. You first of all said that it was an infectious disease?—Yes.

15877. Infectious only in the sense that it is communicable, as we know, by a bite or some contact?—Yes.

15878. But not otherwise than by contact and a puncture?—There is a very interesting thing about rabies. At the Brown Institute we used to have in old days when I was there, rabid dogs brought to us with the saliva dropping out of their mouths on to our pavement and the floor of the place. That saliva, of course, was virulent; but when the saliva of rabies has once dried the virulence is gone. The organism of rabies will not survive drying.

15879. It is innocuous?—It is innocuous. In other words, the only way in which the disease is kept going is by its being absolutely introduced into the living tissues of some other animal.

15880. Then how do you say that the practical extinction of rabies in England, which we now enjoy, was brought about?—By the muzzle entirely, because you can prevent, and it is the only way you can prevent, the one animal introducing the virus into the living tissues of another by preventing its biting.

15881. How does that bear on the subject of vivisection and research through experiments?—I quoted that as an example of the immorality of the anti-vivisectors. I quoted that against the anti-vivisectors because the anti-vivisectors strongly opposed the muzzle, They strongly opposed the extirpation of rabies by the muzzle. I say that was immoral.

15882. I do not know about that, but there was a very strong feeling that the muzzle was not effective, and I may tell you a very strange thing about it. In my county the muzzling order was put in force by the county authorities for a considerable time, and all dogs were muzzled, but after a time it was removed by several boroughs, and after a time our chief constable, who had to report to us every quarter so many dogs seized, suspected or condemned for rabies and destroyed for rabies, advised us (in view both of the fact that the Order was illogical, because there were dogs in the boroughs contained in the county without it, and also expressing the opinion that muzzling had nothing to do with the suppression of it) to repeal the muzzling Order and to go back to the simple Collar Order; and from that very day almost rabies has ceased in the county?—I have no doubt.

15883. And he explained it by saying that hundreds of these dogs he believed were given a bad name, were chased, driven into a great state of terror, and then were destroyed and returned as attacked by rabies, and he thought that it had more to do with hysterical and imaginary rabies than suppressing it?—Fortunately imaginary rabies does not exist, and hysterical rabies was amply met by the collar Order, but the diagnoses must have been remarkable. The Board of Agriculture sent all carcases and heads of dogs to the Brown Institution, until they had their own laboratory, and all the cases were tested experimentally. But as regards the condition of things in Cheshire, I think you forget that Colonel Moorson, the head of the Lancashire Police, was very strongly of exactly the opposite opinion to that of your head constable—that the Lancashire records proved absolutely that though all this isolating and muzzling was done in the counties just as they chose or not, the Lancashire records were very good, and the muzzle had a very marked effect. And so it was in London here.

15884. We may have been just approaching the end of it, but it was perfectly remarkable for years and years we have had a clean sheet now?—May I also point out that in 1889, when that meeting at the Mansion House took place, we arranged with Sir Henry Roscoe that he should introduce a Bill into the House for the universal collaring of dogs, which is the very thing you referred to.

Sir V. Horsley, F.R.S., F.R.C.S.

13 Nov. 1907.

15885. That was for identification?—Yes, but that was not agreed to.

15886. You repudiate very strongly the charge, or the impression, that the witnessing of these operations on living animals brought about familiarity and, therefore, to some extent a contempt for pain on the part of students or the operator. You repudiate that idea altogether?—Absolutely, because the animals are not suffering any pain; there is no question of pain. On the contrary, it teaches the students how to prevent pain.

15887. I suppose you do not hold that in cases where, as abroad, operations are performed without anæsthetics?—All that idea of experiments abroad, if I may take up that point, dates from the barbarities performed at Alfort thirty years ago in the Veterinary School, but all that is ancient history. In the experiments that one sees abroad now the animals are anæsthetised as they are in our laboratories. Some investigators may not use anæsthetics, but as a rule they all use them abroad.

15888. You spoke of experiments in anæsthetics on animals being necessary before their administration to man?—Yes, I think that students ought to be taught to anæsthetise dogs.

15889. I do not think that even anti-vivisectors would object to that. I do not think that mere experiments in the administration of anæsthetics are looked upon as painful or cruel operations?—Some evidence has been offered to the Commission here—I see it was by Sir Thornley Stoker again—that monkeys when brought into the room exhibited fear and alarm, and so on, and that the giving of anæsthetics to a dog was a very painful proceeding, and Dr. Buxton repudiated it.

15890. I am not here to speak as to that, but that is not an operation?—No, certainly not.

15891. In most cases it is the administration of a drug?—Yes.

15892. Which is quite different from cutting operations?—Yes.

15893. Now, I must ask you a few questions about these operations of Dr. Crile's. They were performed in your laboratory in the College?—The first sixteen were.

15894. Not in your private house?—No, at the College. The rest he performed in America, at Cleveland.

15895. Sixteen healthy dogs were taken and made the subjects of what to the ordinary lay mind were terrible operations. I suppose that you would admit that to an ordinary person like myself they do convey a very terrible impression?—If there was any idea that the animal suffered at all it would be terrible, but surely the use of the word "terrible" is not justifiable in the case of an anæsthetised animal. I am only suggesting that.

15896. On the point of pain and suffering alone, quite apart from the justification of it, would you be quite happy in subjecting a favourite dog of your own to any such operation?—Most certainly. I have got a favourite dog of my own, and if an anæsthetic was given to it I would not care what was done to it—not a bit.

15897. Then you are absolutely satisfied in your mind that complete freedom from any kind of pain was enjoyed if one can use the word, by the animals under it?—Certainly, exactly as I am certain that the patients whom I operate upon in the hospital and in my practice are free from pain.

15898. (*Sir Mackenzie Chalmers.*) Have you ever had anæsthetics yourself?—Yes. I have been operated upon often.

15899. (*Mr. Tomkinson.*) Is it quite clear that human beings do not suffer. Is it not possible when there are those reflex motions that you spoke of that pain is felt, but that there is oblivion in the brain which creates forgetfulness of it afterwards. I ask the question because I have witnessed the case of a person who had a broken leg, and whose muscles round the ankle had stiffened during the process of healing.

Sir V. Horsley, F.R.S., F.R.C.S.

13 Nov. 1907.

After a time the patient determined to have those fixtures broken down. I saw the operation, and the patient not only struggled, but moaned so as to give me a very painful impression, and I could hardly believe it, although I admit that afterwards he said he felt nothing?—I once removed an infra-orbital nerve, which is an extremely sensitive nerve, from the face of a woman who had had enormous quantities of morphia and drugs for neuralgia before. During the whole of that operation that woman commented on every remark that I made to the house surgeon, and when I tore the nerve out she burst out laughing, yet we went on with the operation, because she did not make the slightest purposive movement to avoid it. She obviously was not feeling it. We finished the operation, and the next day she knew absolutely nothing of what had occurred; she never felt any pain whatever, and she would not believe our statement of what she had done. I saw another case operated on by a colleague of mine, and the patient read my colleague a homily on the future life the whole time. He knew nothing of it. It was a large plastic operation for a burn in the neck—a most sensitive thing—in fact, it was the sensitiveness probably that stimulated the brain. But neither of those patients suffered anything at all. I am quite satisfied on that point. One's own knowledge of anæsthetics is that you go off suddenly and that as a rule you come to gradually, but you have no consciousness of pain during the time the operation is going on.

15900. Is the brain rendered insensible of receiving sensation?—No, the brain can receive sensation. It is only a question of paralysing the higher centres—the highest centres of all. You must only paralyse them. That is the object of all this modern research on anæsthesia. We want to know how just to abolish consciousness, and at the same time to enable all the lower processes to go on unhindered. When we have solved that question we have solved the whole thing of safety to life.

15901. All these experiments of Dr. Crile's were for the same object—to test the amount of shock caused by different operations, and the effect of it?—Yes, the effect of it.

15902. On the circulation of the blood?—Yes.

15903. And that was done sixteen times over?—Yes.

15904. Sixteen healthy, beautiful dogs—fox terriers—were taken. To use an ordinary vulgar expression, do you think the game was worth the candle?—Yes; I am perfectly sure of it.

15905. You admit, do you not, that those operations, published as they have been in that form, have created a tremendous sensation, and probably one of the strongest sources of opposition to the system and attack upon it?—Yes, because of the gross misrepresentations of those operations.

15906. But is not the description of them by the operator?—Yes, certainly; but not the description that has been given of them to the public. On the contrary, several times they have been made the subject of pamphlets which I have been advised legally I could take no action upon, because in an ingenious way the fact of anæsthetics having been given was not introduced; but the whole effect of the pamphlet was to convey to the ordinary man in the street that those operations were done without anæsthesia.

15907. Do you think so?—But the whole strength of the anti-vivisection party is the capacity for writing a thing and giving it a false impression altogether by means of innuendo. That is very glaringly shown in all this evidence which has been laid before the Commission.

15908. I cannot say that they have ever been described to me as having been without anæsthetics, but accompanied with an expression of opinion that complete anæsthesia was hardly possible through such tremendous operations, and was not likely to have been carefully supervised when the animals were kept alive the whole time?—Exactly. And on what authority has that last statement been made, that anæsthesia cannot be kept up under such tremendous operations? Why, operations that we do on human beings are far more tremendous by way of nerve stimulation.

15909. I think there has been more than one witness here who has expressed great doubt whether a dog is easily kept just on the border line?—That is exactly the point that I referred to before. I felt sure that evidence of that kind had been given, and I say that that is simply a matter of knowledge of giving anæsthetics. It is sheer ignorance to say that a dog cannot perfectly well be kept under chloroform, or any other dangerous anæsthetic that you like to mention.

15910. Is that system of introducing chloroform, or whatever the mixture may be, from another room, pumped through a tube, and brought under the mask, I suppose, perfectly satisfactory to you?—Yes, quite.

15911. Quite as much so as in the case of a patient having the chloroform held to his mouth?—Quite; in fact, probably more so. In administering the atmosphere you must give the atmosphere to the individual loaded with a certain amount of the anæsthetic. What we have found now is that during the operation it is quite sufficient to have only 0.5 per cent. of chloroform, an incredibly small amount, which is quite indistinguishable by smell in the room. If you blew that to the patient it would probably arrive at him more regularly than if he drew it in himself.

15912. Because it is properly mixed?—Yes. The only thing is that it involves so much apparatus that you cannot do it in practical working.

15913. Have you had much experience or seen much of the administration of curare?—No. I have used it myself, but I have not used it much, because my lines of research have not been very much on blood-pressure experiments.

15914. Do you approve of it?—It is most useful in blood-pressure experiments.

15915. Do you approve of it?—Of course I do.

15916. Do you not think it may be dangerous, as paralysing all power of motion without rendering the animal insensible?—You mean if it was used alone.

15917. No, I mean used along with anæsthetics?—Oh, no.

15918. Thereby rendering it possible for sensation to be felt, and yet without power on the part of the animal to evince it?—No, I do not think so at all, because, in the first place, taking curare alone, I believe that when we have given curare up to the point of producing paralysis of all the muscles of the body, then the animal or person would be insensible to pain as well. Although all drugs have a more or less selective action upon the different functions of the body, no drug has such a selective action as to be a paralysant of motion only, and the statements about curare which have been made are exceedingly vague, because, fortunately, it has been so very rare that any patient has been poisoned by the poison to the degree of paralysis of the respiratory muscles. The only good case on record is Mr. White's, and in that case the person did not know that the wound was being cut out, and that is exactly what I should have suspected, namely, that when curare by itself is given in such enormous doses as it is in experiments, it acts as a narcotic as well as an ordinary paralysant of voluntary muscles. The evidence so far takes us that way. Of course it is never given alon it is not allowed by the Act; it is not an anæsthetic under the Act. Consequently it is always given in association with narcotics like morphia, for instance. Then, again, I have read the evidence offered to the Commission as to whether morphia is an anæthetic.

15919. (*Dr. Gaskell.*) Can you tell us where White's case is published?—In the British Medical Journal. I do not know if I have the date here.

15920. Could you quickly tell us just something about that case?—Yes. It was a girl who was dusting a trophy of Indian arrows in the hall of her employer. One of these arrows fell and stuck into her arm, and then fell on to the ground. She took no notice of it, naturally. But in about a few minutes, suddenly, she felt ill, began to lose power, and by the time they called a medical man to her she was already unconscious, passing into the stage of asphyxia after paralysis of the respiratory muscles. The medical men recognised immediately what had happened, and started artificial respiration, while they sent for Mr. White, who came and immediately cut out the wound with the brown poison that came off the arrow still adhering to the flesh. They went on with artificial respiration, and in about another hour or an hour and a-half the girl began to breathe spontaneously, and then gradually recovered, and when she recovered consciousness she knew nothing of what had been done, and could not understand why she had the dressing on her arm.

15921. (*Chairman.*) Might it have been from shock?—No.

15922. Or might it have been from some paralysing of the sensory nerves?—It must have been from some paralysing of the nervous system, certainly.

15923. (*Mr. Ram.*) Did White cut out the poison and the surrounding wound without any anæsthetics?—Yes, because the girl was unconscious.

15924. (*Dr. Gaskell.*) At the time the wound was cut out do you think there was a sufficient condition of asphyxia to cause unconsciousness?—No, because they had already been doing artificial respiration for some time, and she could not then have been in an asphyxial state.

15925. What anæsthetics have you had in your own case?—Ether, chloroform, and laughing gas.

15926. Can you tell the Commission whether you have experienced any sensation at all during an operation?—None at all. And on the question of morphia (Mr. Tomkinson, I see, has been obliged to leave), I was about to draw attention to the fact that the question whether morphia is an anæsthetic has been raised here; but, of course, it all depends upon the dose. Morphia given in the dose that is given in the laboratory is an anæsthetic of a most pronounced kind. I could establish that if it was required by an observation on a human being, because a very few years ago, at University College Hospital, a patient of mine, a boy, was given an overdose of morphia by the nurse by mistake. That boy had to be roused, artificial respiration employed, and stimulated in various ways to keep him going and painful impressions made upon him, many of which he resented, but he knew absolutely nothing about it; he was absolutely unconscious to pain, absolutely unconscious of everything for about 12 hours. And in the laboratory the dogs or animals that are given morphia are generally thrown into the same state, that is to say, a poisonous dose is given.

15927. Can you say whether urethane is an anæsthetic?—I cannot say. I have no personal experience of urethane. I have no doubt that it is; it is only a question of dose.

15928. Do you consider that there are idiosyncrasies in the action of morphia. Some people are said to be very receptive of morphia, and it produces excitement; in others you get a much more narcotic effect?—There may be slight differences, but I have never seen a person who did not succumb to morphia, or an animal either.

15929. How would you distinguish whether a man or an animal, when under an anæsthetic, is feeling pain?—That is a very practical point, of course. In the first place, the movements that patients ordinarily make when they are under an operation are simple reflex movements. We endeavour to preserve all those so far as they do not bother the operator. Then anything like a purposive movement, anything having at all a purposive character, I regard as a signal that the return to consciousness is not far off.

15930. Do you not consider that in a brainless frog, for instance, you can get reflex action and purposive movement?—Yes, undoubtedly you can. But you asked me what was my criterion in operations on man. That is my criterion; of course, it is always on the safe side. I mean that my criterion is a safe one. I know perfectly well that persons, however much they may have moved, will not have felt pain, because I have asked them afterwards again and again, especially in this more modern way of leaving off chloroform. With the Vernon-Harcourt apparatus, one simply turns the tap and they breathe air for ten minutes and so on. I have asked them again and again afterwards whether they knew anything of the operation, and they say no.

15931. For instance, would you call a cry a purposive movement?—No.

15932. Can you distinguish between a cry that is a reflex act and a cry that is a cry of pain?—I think I could perfectly well.

15933. In an animal as well as in man?—Yes, most certainly. The groans of a patient during an operation, which one may often hear outside an operating theatre, are distinctly the laryngeal movements accompanying respiration. It is most definite and quite different from anything indicating a return to consciousness.

15934. Have you read through "The Shambles of Science?—Yes.

15935. I suppose you could hardly tell from the statements made there by Miss Lind-af-Hageby, with respect to movements and cries, whether they were reflex or painful?—One could hardly tell also whether they occurred; but, assuming that they occurred, I could not say what they really were.

Sir V. Horsley, F.R.S. F.R.C.S.

13 Nov. 1907.

15936. With respect to the experiments which you suggest that students should be allowed to perform for the purpose of obtaining manual skill, there are two points, it seems to me. One is manual skill in the operation itself, and the other is seeing the success of the operation afterwards?—I quite agree.

15937. Would you think that the first alone would be of any use if this Commission considered that the animal must be put under anæsthetics and killed before it recovered from the anæsthetic? Would you still recommend that the students should be allowed to experiment on animals for the purpose of acquiring manual skill?—Yes, I think that half a loaf is better than no bread.

15938. But you would prefer the whole system as carried out at the Johns Hopkins Hospital, Baltimore?—Absolutely. May I say on this question of manual skill that one can only speak from personal experience in a matter like that, and I am quite sure that the delicacy of control of dissection, which is necessary in operating on a small animal like a cat or a rabbit, is an invaluable training for the coarser movements which you perform on man.

15939. Then, again, with respect to demonstrations to students, you suggest that demonstrations to show the activities of the cortex of the brain are essential. What animals would you employ for that?—The monkey, but you need not employ a monkey. You can show it all on a cat or a dog.

15940. A cat or dog would suffice?—Yes.

15941. But not any other animal?—No. A rabbit is a very bad animal for localisation experiments.

15942. That would be yet another reason for recommending that dogs should still be under the Act?—Yes.

15943. And in your opinion, rather a strong reason?—A very strong reason. Dogs are essential in so many ways to experimentation.

15944. Monkeys, of course, are not always to be had?—No.

15945. Then with respect to Certificate B, Mr. Stephen Coleridge's objection was to the words "initial operation." Do you think there is the slightest necessity, if this Act was to remain much as it is at present, to alter that certificate? Do you think there is any ambiguity in that term, "initial operation"?—There is not the slightest ambiguity in the certificate as it is worded at present for the purpose for which it is employed; but I should like to see all certificates abolished.

15946. I know; but, supposing that the certificate was to remain there you do not think it would raise any difficulty?—The difficulty has never arisen.

15947. The difficulty is an imaginary one?—Yes.

15948. (*Sir Mackenzie Chalmers.*) I think you have had read to you the answer to Question 10319?—Yes; and I said before that it was a travesty of Certificate B as it is in operation at the present time.

15949. It would be perfectly impossible, you would say, for any operator, after having done the initial operation, to allow the animal to recover and then stimulate by electrodes the cut nerves?—Absolutely impossible.

15950. (*Dr. Gaskell.*) Then there is one other point with respect to the Act that has not been mentioned. I understand that your suggestion is that under your suggested licence you would remove all certificates altogether. Would you be inclined to restrict in any way the animals under the Act? Would you draw any distinction between one set of animals and another?—No. Are you referring now to the whole animal kingdom?

15951. I am coming to that?—No, certainly not. The answer to your question is no.

15952. Would you be inclined to restrict them in the other direction—that is to say, exempting certain animals from the action of the Act?—Yes, up to the present time, as I have always understood by a mistake in an answer across the floor of the House of Commons, this Act has been made to apply to all invertebrate animals. That, of course, lands you in the most ridiculous position at times. Undoubtedly the Act ought

Sir V. Horsley, F.R.S., F.R.C.S. 13 Nov. 1907.

only to apply to warm-blooded animals. I think that is the proper separation of the animal kingdom.

15953. Was not that what was originally intended?—I have always understood that it was, and I have understood that in a question and answer across the floor of the House, Dr. Playfair misunderstood it, not being a physiologist; he put it down, and now it stands "vertebrate." It is perfectly ridiculous for fish and so forth to be included.

15954. Do not you think that one alteration which might be adopted in the Act would be to restrict it to warm-blooded animals?—Certainly.

15955. You said that you would have a licence to cover everything and abolish the certificates?—Yes.

15956. I do not think it was quite clear whether the form of that licence was put out by you or not?—No, it was not. What I suggested was that all the facts which were detailed on the certificate application form could be, as indeed they are now, detailed on the application form for a licence.

15957. Have you any form of licence which we could get down on our notes so as to let us know what it is you want?—No, but I have a draft form. I am quite satisfied that it would be enough. What is not enough, in my opinion, to give the Home Secretary complete information, is the final form that we have to furnish at the end of the year.

15958. The present form of licence causes the animal to be killed before it recovers from the anæsthetic?—Yes, the present application for a licence.

15959. That is what the licence is?—Yes, but in a new Act, of course, that could be altered. In a new Act that would come to revising Section 3.

15960. I only wanted to know whether for our own information we could have on the notes your idea of what that form of licence ought to be?—I shall be very glad to furnish it in writing to the Commission.*

15961. (*Chairman.*) On the printed form, amended as you would wish it?—Yes, and also with the alteration necessary in the first part of Section 3 of the Act.

15962. (*Dr. Gaskell.*) There is only one other point which I thought I might put to you with respect to Mr. Lawson Tait. You know this little book by Sir James Thornton, "The Principal Claims on behalf of Vivisection"?—Yes, I know it well, it is full of contradictions of fact.

15963. I want to draw your attention to a statement on page 3: "Lawson Tait says, 'This is just one of the cases where vivisection has led us astray. If the carbolic ligature had never been tried on animals, where it seems to answer admirably, it would never have been tried on human patients, where it fails miserably, and has cost many lives. The fact is that the diseases of animals are so different from those of men, wounds of animals act so differently from those of humanity, that the conclusions of vivisectors are absolutely worthless. They have done far more harm than good in surgery.'" Is there the slightest foundation in fact, in your opinion, for the statement that the wounds in animals act so differently from those of humanity?—No, it is absolutely contrary to fact.

15964. Is that true about the carbolic ligature?—It is not.

15965. Did it fail absolutely?—It did not. We use it at the present day.

* See Appendix.

THIRTY-SIXTH DAY.

Tuesday, 19*th November* 1907.

MEMBERS PRESENT:

The Right Hon. the Viscount Selby (*Chairman*).

Sir W. S. Church, Bart., K.C.B., M.D.
Sir W. J. Collins, M.P., M.D., F.R.C.S.
Sir J. McFadyean, M.B.
Sir M. D. Chalmers, K.C.B., C.S.I.
Mr. A. J. Ram, K.C.
Mr. W. H. Gaskell, M.D., F.R.S.
Mr. G. Wilson, M.D., LL.D.
Capt. C. Bigham, C.M.G. (*Secretary*).

Sir Victor Horsley, F.R.S., F.R.C.S., recalled; and further Examined.

Sir V. Horsley F.R.S., F.R.C.S. 19 Nov. 1907.

(*Witness.*) May I put in an account which Dr. Gaskell asked me for, namely, the description which Mr. White gave of his case of curare poisoning on a human being? The reference to it is the "British Medical Journal"—I could not remember the date—of March 16th, 1889, and I wish to draw attention to the fact that with regard to the very important matter which Dr. Gaskell raised, namely, whether the patient was under the influence of curare or whether she was under the influence of the state produced by asphyxia, as a matter of fact she was still breathing, she had slow, shallowy, jerky respiration, and feeble pulse. The whole track of the wound was covered with a brown apparently vegetable material. It was therefore freely exercised, and stimulants were freely given by the mouth. So that she not only breathed still, but she swallowed; therefore she certainly was only I should have said under a rather moderate dose of curare. But, she was in a very dangerous state from the condition of the pulse, because curare lowers the blood pressure—you see that experimentally, of course, very markedly—and causes a very feeble pulse and ultimately death. Then, as I stated, they kept up artificial respiration until she recovered. The final point that I want to draw attention is "That Mr. White believed that the arrow had been poisoned with curare and cited"—this is an abstract of his paper—"the experiments upon animals made by Claude Bernard, Waterton, and Sibson, of some of which he had been a personal witness, in support of his view." So that he recognised that it was curare poisoning from the effects of curare poisoning that he had seen in experiments on the lower animals. I had forgotten that last point, and I thought the Commission would be interested to hear it. With regard to the other documents I was asked for, I will put them in after my cross-examination to-day, because, of course, although I have got my own views of the working of the Act, it is quite possible that the Home Office have a great many departmental requirements of which I am quite ignorant, and I should like to hear those before I finally formulate my statement.

15966. (*Chairman.*) Sir Mackenzie Chalmers, who is going now to ask you some questions, may touch upon that, and give you an opportunity of saying what you wish?—Thank you very much.

15967. (*Sir Mackenzie Chalmers.*) I do not think we have it in evidence, but you are a practising surgeon?—Yes.

15968. I think you operate at two different hospitals?—Until quite recently I was surgeon to the University Hospital, as well as the Hospital for Paralysis. I have resigned my University College position, I am now Consulting Surgeon to that hospital.

15969. May I take it that for the last twenty years at any rate you have been operating almost daily?—Yes.

15970. And have been continually in contact with the practical administration of anæsthetics?—Yes.

15971. I want to ask you one or two further questions about what we call the Crile case. In the first place, I want to read to you Dr. Crile's application to do the experiments which he did, and to ask you a question upon it: "25th April, 1895.—To the Right Honourable Henry Matthews.—I beg to enclose a form of application for a licence to perform experiments upon the causation and the prevention of shock in surgical operations. I am the Lecturer on Surgery in the University of Worcester, Cleveland, Ohio. My engagements are naturally pressing, and I would be much obliged if you would grant me the licence asked for within a few days. I am also informed as a matter of fact that the experiments I am about to perform do not come within the Act, inasmuch as they do not involve any pain to the animal.—I have the honour to be, Sir, your obedient servant, George W. Crile."

Then, accompanying that letter was the formal application in which the experiments were described as "investigation of shock in operations performed under ether. The experiments proposed will be conducted under the licence, *i.e.*, the animals will be anæsthetised with ether and killed before recovery from same." What I wanted to ask you was this: The object of these experiments was to examine the effects of surgical shock, not surgical shock pure and simple, but surgical shock under anæsthetics?—Yes.

15972. Would the supposed object of the experiments have been frustrated if anæsthetics had not been part of the procedure?—Certainly, because we wished in this research to imitate, as far as possible, the operations done on a human being.

15973. Perhaps I may also, to complete the case, read a letter from the Association for the Advancement of Medicine by Research. I do not know whether it is within your knowledge or not that after a report on Dr. Crile's application to Dr. Poore the matter was referred to the Association for the Advancement of Medicine by Research?—I did not know that.

15974. Then perhaps, to complete the matter, I might read their letter. It is addressed to the Under Secretary of State, Sir Kenelm Digby: "Sir,—According to your letter of the 29th ult., I have laid before the Council of this Association Dr. Crile's application for leave to hold a licence under the Act 39 and 40 Vic., c. 77. I beg to return Dr. Crile's papers. The Council wish me to say that they hope this application may be granted. Dr. Crile is Professor of Surgery in one of the American Colleges, and is therefore fully qualified to make the proposed observations with judgment and accuracy. At the Pathological Department of University College he would enjoy every aid for the success of his work, and would have Professor Victor Horsley's constant help. The Council are further of opinion that the proposed observations are calculated to give very valuable results. The occurrence of shock after surgical operations, in spite of anæthesia and of all the precautions that can be taken to avoid it, is a danger that cannot be too carefully studied, and the Council therefore hope that leave may be granted to Dr. Crile to make these observations, which would, moreover, be wholly free from pain, as the animals would be killed while yet under the anæsthetic." After that the licence was granted?—Yes.

15975. Did you see any of the operations yourself?—Yes, I saw about the first six or seven.

15976. In your opinion, were the animals that underwent those operations suffering or not?—No, I think they were not suffering at all. I think they were completely anæsthetised, and unconscious of any pain.

15977. Who is Dr. Goodbody?—Dr. Goodbody is the Assistant Professor of Pathological Chemistry at University College, and when I was not present he was present at these operations.

15978. Have you discussed the matter with him at all?—I have not spoken to him since 1902, when he wrote to the "Times" in the correspondence that ensued upon the exposure of the catalogue of instruments and Mr. Coleridge's action.

15979. Do you know what conclusion he came to from the operations he saw as to whether the animals suffered or not?—I remember that he stated that, in his opinion, the animals were quite unconscious to pain.

15980. Is he an experienced and skilled observer?—Yes; he has been a laboratory worker now for 15 years.

15981. Your physiological experiments have been carried on mainly, if not entirely, at University College?—And at the Brown Institution. I was Director of that Institution for several years.

15982. Has the Home Office Inspector always had free access?—Yes; and he is constantly in and out.

15983. Does he pay pretty constant visits to your laboratory?—Professor Thane does. He visits my laboratory almost every week. Of course his rooms are adjoining mine, you know—his Department, I mean. It is quite convenient for him.

15984. Does he give you notice of his visits?—No, never. The visits have always been surprise visits, It is rather difficult to fix the date; Mr. Erichsen used to give me notice at the Brown Institution; that was before 1890. But I should say that for the last 17 years, about, they have been surprise visits invariably.

15985. Have you not carried on to some extent Professor Ferrier's experiments on brain surgery?—Yes.

15986. These experiments, I suppose, involve the destruction of some portion of the brain?—They are of two kinds. In one set of experiments the animal is experimented on under the licence, and it is killed before recovery from the anæsthetic. Those are stimulation experiments, excitation of the surface of the brain by electric current. And then in order to control the results of excitation you must perform further experiments under Certificates B and E E, in which you destroy, as you say, part of the surface of the brain, and examine the symptoms afterwards.

15987. And then the animal is eventually destroyed?—Yes.

15988. In those operations, on recovery from the anæsthetic, does the animal suffer much?—No, it suffers remarkably little. It is quite a common thing to see a monkey, for instance, from which you have removed a portion of the brain take a banana or grape as soon as it really recovers from the operation. I do not consider that operations on the brain are really painful operations in that sense.

15989. (*Chairman.*) Are you speaking of animals?—I am speaking now of animals.

15990. (*Sir Mackenzie Chalmers.*) You do not think that the animals which are allowed to recover endure acute suffering?—No, I do not.

15991. Is the brain not very sensitive then?—The higher brain itself it wholly insensitive, so far as I know. There are portions at the base of the brain where sensory paths are coming in, which I am sure would be sensitive.

15992. How do you account then, for instance, for the intense pain of headache?—One sees a great deal of that in cerebral tumours; that is due to pressure. The skull is a rigid box, and the fluid within it is at a certain pressure; it requires therefore an exceedingly small increase of tension, a little more fluid injected into the skull to raise that pressure, and the moment that occurs then you have a sensitive membrane, the dura mater which covers the brain, pressed.

15993. It is the compression of the dura mater, is it?—That is a very difficult thing to prove, of course, scientifically, but it certainly seems to be so. The dura mater is supplied by the fifth nerve, the most sensitive nerve of the whole nervous system, and from the fact that the headache varies in cerebral tumour directly with the tension, it seems the most reasonable explanation of headache.

15994. (*Chairman.*) But are the nerves which convey, the sensation of pain nerves of the dura mater, whatever the cause is?—Yes, the dura mater is very richly supplied with nerves.

15995. (*Sir Mackenzie Chalmers.*) But you have to penetrate the dura mater to operate?—Yes, you simply incise it, and turn it aside.

15996. But that does not create pressure and cause intense headache?—The opening of the skull opens this rigid box, and from that moment you have destroyed all the intra-cranial tension.

15997. In the case of ordinary headache you think there is interior pressure?—Yes, interior congestion and pressure.

15998. In consequence of these brain experiments on animals have you been enabled to perform any operations on human beings which you would not have dared to have performed otherwise?—Certainly, both upon the large brain, the cerebrum, and upon the cerebellum the small brain, and upon the spinal cord.

15999. And what of the results?—The results are excellent where the cases have been diagnosed sufficiently early.

16000. With correctness?—With correctness, and sufficiently early. On that point I should like to draw the attention of the Commission to a fact which seems to me always an exemplification of Professor Lankester's statement that scientific investigation does not add to our knowledge by arithmetical progression, but by geometrical progression. Of coure the first operations upon cerebral tumour, now some 20 years ago, revealed to us the fact that this opening of the skull which destroys the intra-cranial tension was

Sir V. Horsley, F.R.S., F.R.C.S.

19 Nov. 1907.

the mode *par excellence* by which the inflammation of the optic nerves which accompany so many diseases inside the skull could be arrested and the sight preserved, because there are not a few cases in which the patients can be recovered from a cerebral tumour, but remain blind all their lives, and this observation, which was simply made, you might almost say by accident, has been of the utmost benefit to humanity, because now, even in cases where the tumour can probably not be removed, what we call a decompression operation is done to save the sight.

16001. (*Chairman.*) Are you speaking of observations that you made upon a patient?—Yes.

16002. Not an experimental observation?—Not at all. I ought to amplify that, perhaps, by saying that attempts had previously been made to save the sight by opening the sheath of the optic nerve in the orbit, the operation of de Wecker, a great Parisian ophthalmologist; but his operation was not successful. We now know the reason—that the pressure ought to have been relieved inside the skull, not outside.

16003. (*Sir Mackenzie Chalmers.*) Have you discussed with any of your patients afterwards the effects as to whether there was pain consequent upon the operation?—Yes, often. Like all cutting operations, they have a certain amount of pain in the cut itself—a sore pain, which, like ordinary aseptic wounds, disappears in about 48 hours. A certain number of them suffer from headache due to the anæsthetic and to shock.

16004. The anæsthetic produces headache for some time afterwards?—Yes, very often. Not invariably, of course. Many people can have chloroform for an hour and have no headache.

16005. It is almost an irrelevant question, but one witness whom we have had before us objected to physiology on the ground that no advances had been made, and one special point that was taken by that witness was that, although we had been experimenting for a hundred years, nothing has been learned about any of the ductless glands. Is that correct?—No, it is absolutely untrue.

16006. Your own work on the thyroid gland is one example to the contrary?—Yes, it is only one example of a great many researches now on the ductless glands.

16007. Which are adding to our knowledge and to our power in dealing with disease?—Yes, it has all arisen since I was a student. It is an entirely new chapter in physiology.

16008. And a fruitful one?—Immensely, because you see it introduces us to the true chemistry of the living body, bio-chemistry. It is only, of course, by advance in research in bio-chemistry that we can really put internal medicine on a proper scientific basis. The University of Liverpool, of course, which is very advanced in medical matters, has founded a professorship of bio-chemistry.

16009. One other small point. You showed us a catalogue in which certain of the pictures, I must say, look very disagreeable. May I ask, as a matter of fact, are animals which have to be operated upon tied down for the purpose of preventing struggling, or are they tied down simply to keep them in position under the anæsthetic?—They are tied down simply to keep them in position.

16010. Not in any way to mask any purposive movement?—Not at all. In fact, you cannot mask a purposive movement. There was a statement made by Mr. Coleridge in his evidence about an experiment by Professor Starling about fastening down an animal on a board in connection with the Bayliss trial. It is at the top of the second column, page 205, at Question 11569. Mr. Coleridge is asked by Dr. Gaskell, "I want to know whether you do not consider, when a delicate registering apparatus is going on in the animal, which moves perfectly smoothly and gets real good curves, even although the operator says the animal is under slight anæsthesia, that does not show that the animal was not feeling pain?—Not necessarily. I have an answer to that, of Sir Victor Horsley, in the case against me on that very point that an animal can be held tight when it does not move." I suppose he means can be held tight so that it does not move. He is quoting from evidence which was given in Court, but the context of that evidence ought to be given.

16011. Was it your evidence he was quoting from?—It is my evidence he professes to be quoting from, but from my experience of Mr. Coleridge, and especially after what he has admitted to this Commission, I accept nothing that he produces in the way of evidence of what I have said unless I have the context. I will just read it, however, and then explain it to the Commission. "Mr. Rufus Isaacs: Would it be possible to perform the experiment or the demonstration which we know took place if the dog had been conscious? Sir Victor Horsley: No, absolutely impossible, unless the dog had been fixed up with all manner of apparatus, to absolutely fix every bone." I showed the Lord Chief Justice what I meant by fixing every bone with a rod passing through the bones. Of course, it is an absurd position, you observe. It is impossible to fix every bone in an animal. And the Lord Chief Justice asked me whether it could be fixed on the board—they had the board on the witness desk—and I said, "You can fix an animal with apparatus of *that* sort (pointing to the operating board). That is the answer to that—you can so fix an animal on that board, and he pointed to it; they had it in Court." The rest of that is true, but the inference drawn from it is wholly untrue. My point was that it was conceivably possible with an apparatus to fix every bone, but as you must fix every bone to make the animal absolutely immobile, so that it could not move at all, the thing was practically impossible. Mr. Coleridge's was quite a false rendering of my evidence in the way he presented to the Commission.

16012. On that we have been told by some witnesses that there is a sudden transition from pain to absolute anæsthesia. Is that so, or is there a gradual diminution of pain as the anæsthetic is administered?—There is a gradual diminution of sensitiveness to pain undoubtedly. The loss of consciousness is apparently sudden to the individual, but that is quite a different thing.

16013. Pain gradually diminishes as the anæsthetic is applied and pressed?—Yes, exactly like the disappearance of all other kinds of sensation.

16014. So that, assuming for a moment that an animal is incompletely anæsthetised, using it in the English sense of incomplete anæsthesia, there would be diminished pain, although there would be pain?—Yes, if you mean by incompletely anæsthetised, that it was still conscious of pain, it would have less pain in proportion to the amount of anæsthetic which it had received.

16015. I suppose, in certain cases, for instance, in midwifery cases, anæsthetics are given with the view of diminishing pain and not with a view of producing complete anæsthesia?—You want to avoid preventing the contraction of the uterus. If you give a very large, profound dose of chloroform, you would interfere with the normal contractions of the uterus and the expulsion of the fœtus.

16016. I am not quite sure whether there is any point we can discuss further as to certificates, but taking the Act as it stands, the licence and the certificates are framed, not with reference to the scientific quality of the operation, but with reference to the pain, are they not?—Yes, certainly.

16017. Is it not convenient, first of all, to have a licence under which an animal can be anæsthetised and killed without recovery; is it not convenient to have that by itself?—I cannot see that it is convenient except as a means of informing the Home Secretary what experiments are done, and the animal is killed before recovery from the anæsthetic.

16018. Is it not convenient in this way, for the purpose, of course, of assuring the Home Secretary and the public, that under licence alone a man should be only able to operate on an anæsthetised animal which is never allowed to recover, so that if anything further is wanted, a special certificate should be given?—I am sorry that I cannot see the convenience of the proposal, because my proposal embodies exactly the same facts, and it strikes me is simpler. I propose that on the application for a licence the applicant should state the different classes of experiments he is going to do. If he were only going to do experiments on animals killed before they recovered from the anæsthetic, he would simply state so, and there is an end of it. But I do not see why that application should be, in substance, different from any other application so long as he states what he is going to do. The Home Secretary must know, of course, the details of what he is going to do, and then, as I say, the Inspector would see that he was doing it.

16019. And he would report his experiments?—He would report his experiments on a form which would put these points down in detail.

16020. But you suggest that on his application for a licence he would so far indicate the precise nature of his experiments as to inform the licensing authority what amount of pain would be involved?—Certainly.

16021. That would merely come to this, would it not, that the certificate and licence would be on one document?—That is the whole point.

16022. It is merely saving paper?—No, it is saving more; it is saving office work going about and bothering people to countersign these papers.

16023. (*Mr. Ram.*) Then would you do without the signature in the case of all experiments in which the animal would die under the anæsthetic?—No, I would have every application for a licence countersigned, but at the present moment we have practically to have three documents filled up, and sent and filed.

16024. (*Sir Mackenzie Chalmers.*) By six people?—Yes, for only one thing; and that, I suggest, is unnecessary. One document ought to cover the whole thing.

16025. (*Mr. Ram.*) You would still have a countersignature?—Yes, for the assurance of the public, certainly.

16026. I have only a few points, as a great many of the matters I wanted to ask you have already been put by Sir Mackenzie Chalmers. You recollect that one of the Commissioners put to you, with regard to the suppression of rabies, that in Cheshire they had done away with the muzzling order and got a clean bill of health?—Yes.

16027. Was Mr. Long's order compulsory on the whole country?—Yes.

16028. Do you attribute to the fact that it was compulsory, and compulsory over the whole country, rabies having been practically stamped out here in England?—Yes. I would point out that the north-western district of England (Lancashire and Cheshire), was the focus of rabies, together with the Metropolis; it had been stamped out by muzzling in the Metropolis, and it was stamped out similarly in Lancashire, where the population, of course, is much greater than in Cheshire. Then, as regards Mr. Long's action, as I represent the British Medical Association, may I point out also that so far as I know, the British Medical Association was the only public body in this country that thanked Mr. Long for getting rid of hydrophobia.

16029. A good many individuals have thanked him, I think?—Yes, but I mean the only public body.

16030. Then as soon as Mr. Long's Act passed it became effective in Cheshire as well as in any other part of the country?—Yes.

16031. One or two general points first. There is a quotation of Sir Frederick Treves which you said you thought you could get for us. It is referred to in your evidence on page 719 as follows:—Sir Frederick Treves is reported to have said that he had learnt nothing, as you know, from experiments. Then you stated that he wrote a letter to the "Times" to the effect that in one particular case, one particular form of experiment, he learnt nothing from it, and you stated that you would be able to furnish the reference to the "Times." Have you been able to get it?—I will put it in now.

16032. With regard to allowing students to operate, would you, in any case in which a student was to be allowed to make an experiment for the first place, have the animal under a lethal dose of anæsthesia?—Yes, certainly, if a student was going to do the experiment.

16033. And, secondly, would you have it always under the supervision of some authorised and licensed person?—Certainly.

16034. And would you make that authorised and licensed person responsible for the fact that the anæsthetic was so administered as to be efficient at the time, and certain to be lethal?—Yes.

16035. And only under those conditions would you allow students to experiment at all?—Exactly, just in the same way as any practical class of physiology is conducted now.

16036. With regard to experiments for acquiring manual dexterity, in your opinion would it be distinctly beneficial to the human race, who have to be operated on in many cases by young surgeons, who are learning and in progress of getting perfect, that young students and young surgeons should be allowed to operate on animals under a lethal dose of anæsthesia for the purpose of acquiring manual dexterity?—Certainly. May I point out that in respect of these brain operations that have been mentioned, the appearance of the normal brain ought to be first learnt on an animal. It is extremely difficult very often, when you have exposed a diseased portion of the brain, to tell whether it is actually diseased or not, and the differential diagnosis of the condition of that brain ought, certainly, to be established by experience on animals and not on man.

Sir V. Horsley, F.R.S. F.R.C.S. 19 Nov. 1907.

16037. Is it the fact that by seeing the brain of a living animal, under an anæsthetic, of course, you can learn more than you can learn from seeing the brain of a dead animal, by vivisection?—Yes, the brain has a totally different appearance, and a totally different texture.

16038. Had you only experience of the brains of dead animals, or even dead human subjects, would it be difficult for you, in an operation on a living subject, to decide whether the brain was diseased or not?—Yes.

16039. But by examination of what I may term a living brain under anæsthesia you can differentiate between a diseased and an undiseased brain?—Yes.

16040. With regard to the knowledge of blood pressure, has that been obtained entirely, or if not entirely, largely, through experiments on animals?—Entirely by experiments on animals; the fact that arteries contain blood under pressure was proved by the experiments of Galen, who opened arteries really to see whether they contained air or "spirit" as was supposed at that time, and found that they contained blood under pressure. Next, the first definite observations were made by Hales upon animals; and then, from that time onwards, the whole of our real knowledge has been derived by observation on animals. Now, of recent years, the measurement of blood pressure is being introduced clinically, and we are now accumulating records of blood pressure in man under different diseased condition.

16041. And is the knowledge of blood pressure under certain circumstances of vital importance, both clinically and in operations?—Undoubtedly. We have never recognised its importance until recent years. Like every other advance in medicine, it comes very slowly, but we appreciate it at last when it does come

16042. With regard to inspection, you have answered to Sir Mackenzie Chalmers many of the questions that I was going to ask you; have you ever found it at all hindering to you in your work?—Oh, no.

16043. And if it was thought desirable that the number of Inspectors and the number of their visits should be increased, would it in any way, in your opinion, hinder research or hinder experiments?—Certainly not, if the Inspector was a qualified man.

16044. Do you think that inspection, such as it has been hitherto, has been useful in any way at all?—No, I do not think it has, but there is no objection to it.

16045. Why do you think it has not been useful—for what reason?—Because my experience is that there is really no violation of the Act, and that these iniquitous statements which have been made respecting the indifference of experimenters to pain, and so on, are absolutely untrue; consequently no Inspector has ever, so far as I know, come round on surprise visits and discovered a vivisector callously inflicting pain. The thing is ridiculous.

16046. If it be desirable for any reason that inspection should continue, do you think that the number of inspectors ought to be increased?—I think that the present number of experiments done could be quite well inspected by the present staff, and if the public, the House of Commons, for instance, thought that the inspector ought to be going round more frequently, all they have to do, it seems to me, is to make him a whole time officer. At the present moment he is not.

16047. And to that you, as an experimenter, would have no sort of objection?—No; no experimenter would object in the least to the visits of the inspector; of course, as I say, provided he is a qualified man.

16048. Now, with regard to some of these experiments of Dr. Crile, you are aware that he is reported to have used the words "these animals being under incomplete anæsthesia"?—Yes.

Sir V. Horsley, F.R.S., F.R.C.S.

19 Nov. 1907.

16049. You have already fully explained that, and stated that in your opinion the animals suffered no sort of pain?—Yes.

16050. It seems to me that the use of those words "incomplete anæsthesia" by him is really the whole cause of the trouble which has been raised with regard to his experiments?—Possibly.

16051. The word as he used it is apparently a misnomer, is it not?—No, we constantly use the terms "incomplete anæsthesia," "light anæsthesia," "very light anæsthesia," and so on, meaning degrees of the depth to which the body is poisoned; and, unfortunately, at the present time there is actually no technical word to describe the condition of a person who is conscious, and at the same time unconscious to pain. I have brought the question myself before anæsthetists, and asked them to draw up a terminology. The word narcosis, for instance, is used by the Germans; they talk about *tiefe narkose*, and *leichte narkose*, in the same way as we do of deep anæsthesia and light anæsthesia; but in both cases the word, narcosis or anæsthesia, we understand to mean unconsciousness to pain.

16052. But, of course, to the ordinary layman, who did not know of that distinction, the term "incomplete anæsthesia" might very well convey the idea that the animal was not wholly insensible to pain?—Yes, and an ordinary honest layman would write to Dr. Crile and ask him what the words meant before he commented on Dr. Crile's action.

16053. We are glad to have your explanation of what the words do mean and what you know them to mean?—Certainly, because those words, if they are translated in any other way, conflict with Dr. Crile's statements in the preface to his paper.

16054. One question about curare, because, although we have had other views on the point, I shall be very glad of yours. The number of cases in which curare is used is comparatively small?—Yes, very small.

16055. In curare, I suppose, one or two indications of anæsthesia are absent?—Yes.

16056. I do not know if you follow my question?—Yes, quite.

16057. Therefore, whether the anæsthesia is perfect or not, depends upon the skill of the person giving the anæsthetic, and his assurance that it is a sufficient and complete dose?—Yes, his observation of what is going on, with the changes, for instance, in the blood pressure.

16058. If it were thought desirable, in order, perhaps, to allay reasonable public feeling with regard to curare, that the inspector should be present in all cases when curare was administered, would that, in your opinion, be an impediment to research?—Not in the least if the convenience of the investigator is safeguarded.

16059. Provided that the inspector was present, he could satisfy himself about the depth of the anæsthesia?—Yes, and the correctness of its administration.

16060. (*Sir William Collins.*) I do not think you have told us how long you have held a licence under the Act?—I think my first licence was obtained in 1883.

16061. Have you held it continuously since then?—Yes, continuously.

16062. And I do not think you told us what certificates you hold now and have held in past times?—I have held, but I could not tell without actual reference, Certificates A B C and E E. I also held Certificate F at one time, when I was at the Brown Institution.

16063. That was for operations on ungulates?—Yes, special ungulates.

16064. You mentioned incidentally some of the animals that you employed for your experiments; could you name them all?—Yes. I have experimented on the rodents, on rabbits, and guinea-pigs. I have experimented on carnivora, the cat, and the dog. I have experimented on ungulates, as I have mentioned, on the horse, and on the donkey, and on sheep, and of higher animals, on the monkey.

16065. Could you give us any idea of the number of animals that you have employed in the course of your experiments?—No, I am afraid I could not do that. Experimental work varies very much. I daresay that I do, on an average, about 110 or 120 experiments a year.

16066. And that has been continuing over a period of 24 years, has it not?—Yes.

16067. The present Inspector, you have told us, is Professor Thane, who is on the staff of University College?—Yes.

16068. He was preceded by Dr. Poore?—Yes.

16069. Who also was connected with University College?—Yes.

16070. And he was preceded by Sir John Erichsen?—Yes.

16071. Who also was connected with University Collegs?—Yes.

16072. Do you think that University College has had an excessive amount of attention by way of inspection in consequence?—Oh, no, not a excessive amount, because, as I say, I think that inspection does no harm.

16073. I mean by reason of the facility afforded to the inspector by his connection with University College, do you think that there has been a greater opportunity, and that that opportunity has been used more by the Inspector?—No, I do not think so. Dr. Poore and Mr. Erichsen (as he was then) both came down pretty frequently to the Brown Institution when I was there. I should say that Dr. Poore inspected the Brown Institution as often as he did University College. I was only quoting Professor Thane's actual rooms—being next to mine.

16074. I suppose that University College does not have less attention by way of inspection than other places?—I do not think so at all.

16075. How many do you think of the 110 experiments that you perform in a year would be witnessed by the Inspector?—That is very difficult to say. Professor Thane has witnessed a great many of my experiments.

16076. Half of them, do you think?—No.

16077. Ten per cent?—Yes, certainly 10 per cent.

16078. Do you think more than that?—Yes, I should think even more.

16079. How much more?—You see he knows very accurately when I am likely to be doing an experiment. I have fixed days in the week which I give up to scientific work, and he knows those days, so that he very often comes in then, and finds me in the middle of an experiment as a rule. He has certainly witnessed quite 10 or even 15 experiments of mine in the year, personally.

16080. Do you think the Inspector witnesses as many as 15 per cent. of the experiments performed by other experimenters throughout the country?—I should think not. I was asking Professor Gotch how often they were inspected. I am sorry to say that I have forgotten at the moment how often he said that it was, but certainly not as much as that.

16081. That would rather suggest that University College does have more inspection than other places?—But then he is at Oxford you know, and Oxford is some distance from London. University College ought to be compared with some of the other medical schools in London.

16082. But the Inspector's duties extend over England, do they not?—Yes, they do, but you see he is a part time officer.

16083. I rather gathered from the replies that you gave to Mr. Ram that you looked upon inspection as superfluous, is that so?—Yes, I do, judging inspection from the popular meaning of the office of Inspector.

16084. Might it be regarded as harmless trifling?—I think it is a harmless non-necessity, certainly. I think the idea that the Inspector prevents pain to animals is trifling; it is perfectly ridiculous.

16085. The evidence which you have been so good as to give to the Commission has been largely concerned with physiology and surgery?—Yes.

16086. Physiology being the science of living things you would, *a priori*, suggest that it might be advanced by experiments upon the living?—Yes; I think it can only be advanced by experiments on living tissues.

16087. And surgery dealing largely with the making and healing of wounds you might also *a priori* suggest would be likely to be advanced by experiments on the living?—Yes, and inasmuch as the diagnosis part of surgery is quite as important as the operative technique, *a fortiori* it must be advanced by experiments on the living.

16088. I think you told us in your examination-in-chief that there is not a single function of the ner-

vous system, the principle of which we now know, that is not derived from experiments on animals?—Yes, not a single fundamental principle in the functions of the nervous system.

16089. The function of the sensory and motor nerves must, in your opinion, be determined by experiments on living animals?—Yes.

16090. You suggest that there should be no certificates required at all?—Yes, I do. I think they are unnecessary documents, and consequently give unnecessary work in the Home Office, and they give unnecessary trouble to investigators who have to obtain them.

16091. Are you opposed to the Act altogether?—Oh, no. I look upon the Act as necessary in view of public opinion. Public opinion has decided now for 30 years that experiments on animals should be conducted by certain persons under certain restrictions, and, of course, one quite accepts that. It is obviously a matter of satisfaction to the public, and there can be no objection to it.

16092. But from the point of view of physiology do you regard the Act as superfluous?—Quite, if you mean that the Act is really an Act to prevent cruelty to animals as it is entitled, I do object to it. I object to any Act appearing on the Statute Book as a "cruelty to animals" Act when it refers to scientific experiments. It is an unjustifiable use of the word cruelty, and it ought never to have been accepted by the Government of the day.

16093. You object to the title of the Act?—I object to the title of the Act *in toto*, but to the purpose of the Act, namely, that experiments should only be done in registered places, and only by persons who hold a licence from the Home Secretary there can be no objection whatever, at least, I cannot see any.

16094. But the justification which I understood you to suggest was the gratification of the public?—I did not say the "gratification" of the public. If the public is uneasy on a public question I think it has a right through the House of Commons to be satisfied, and this Act is the satisfaction to the public.

16095. Would you agree with a physiologist who was in the witness chair some days ago, who told us that the Act was entirely opposed to the advancement of physiology?—If he meant that the Act hindered the progress of physiology, I am not prepared to contest it at all, because I can give you an example at the present time. There is an American physician who has come here purposely to study the surgery of the nervous system. I advised him to apply for a licence to do some experimental work in my laboratory, and it has taken him six weeks to obtain that licence. Now here is a man whose time is limited, and all these modern processes of investigation take endless time; the anatomical investigation of the material, that you prepare in the experiments takes months, and so to cut off six weeks of that man's working time I think was unjustifiable. One, of course, does not expect a Department to go on without some official routine, it must follow a certain routine, but if that routine can be diminished by an amendment of the present Act, then most certainly it ought to be.

16096. You referred us to the Report of the previous Royal Commission of 1876. I see that in that Report it is stated: "In considering the question of legislative interference, we have found in some minds a decided prepossession against it. This appears to be connected, as in the case of Mr. Lister, with a notion that such interference implies an imputation of cruelty upon those who are engaged in those investigations—an imputation they are conscious they have not deserved." Do you agree with that?—Certainly. I have already protested against the title of the Act on that very ground.

16097. But Mr. Lister regarded any legislative interference as superfluous?—So do I. I think it is perfectly superfluous for the object for which it was designed. The object of the Act was to prevent the infliction of unnecessary pain. At the time when it was passed there was no infliction of unnecessary pain. I quite agree that such legislation then was superfluous.

16098. Then you do think that the Act of 1876 was superfluous legislation?—Certainly; but if the public demand it, I do not object to it.

16099. Now, Mr. Pembrey, in answer to Question 14090, said: "I think we ought to be given a licence to cover all experiments. I think that the Act is entirely antagonistic to the advancement of physiology. If we were given a licence for all experiments, there would be no more cruelty. There would be a great saving of time and a great limitation of work, and there would actually be in the long run a saving. Q. What do you mean by a licence for all experiments? A. I mean without any conditions. Q. With or without anæsthesia? A. Yes, without any limitation at all, and without certificates. Q. That is to say, you are to put yourselves in the condition in this country which, I understand, physiologists are in in some parts of Germany, where there is no limit? A. I think there should be no limit—that is to say, that a recognised physiologist should be given a licence to cover all experiments. Q. Without anæsthetics? A. Without anæsthetics, or with anæsthetics without certificates." Does that state your view?—Undoubtedly; in this way: I propose that an applicant for a licence should state on that application exactly what he is going to do, whether he is going to do experiments with anæsthetics or without anæsthetics, although no such application has ever been made since 1876; or whether he is simply going to do inoculation experiments. In fact, he should put upon his application the details of his proposed experiments, so that the Home Secretary should know exactly what he is going to do; but the Home Secretary, being thus informed of what is going to be done, would still, of course, under the Act, have the plenary power which he possesses at the present time, of deciding whether a licence should be granted or not.

16100. And should the Home Secretary, in arriving at his decision, be advised, in your opinion, by the Association for the Advancement of Medicine by Research?—Certainly.

16101. Are you a member of that Society?—I am. The Home Secretary cannot possibly, I think, be guided correctly in the administration of the Act except by experts on the subject, who alone know what is the probable value of the proposed experiment, and who alone know the qualifications of the investigator who is making the application.

16102. I rather gathered from the Report of the previous Royal Commission that they contemplated the Home Secretary calling to his aid persons skilled, no doubt, but not necessarily belonging to any Association?—I suppose that the paragraph relating to the countersigning of certificates includes that; that is to say, that they thought it would be quite sufficient to have the names of two individuals as guarantees. The Association for the Advancement of Medicine by Research was not in existence at that time, and consequently the Commissioners, I take it, did not think of an Association doing the work. As a matter of fact, both parties do the work now; the work is done doubly—it is done, as contemplated by the original Commissioners, by two individuals who countersign the certificates; but, in addition to that, all the papers go to the Association for the Advancement of Medicine by Research for further investigation.

16103. Is there anyone who plays the part of *advocatus diaboli*?—In the Association, do you mean?

16104. No, in the advice obtained by the Home Secretary?—Not that I know of. I take it that the Home Secretary himself is both judge and advocate in that matter. He certainly is the judge.

16105. You have laid great stress upon the importance of vivisection as necessary for the teaching of students?—I have.

16106. Does that apply to all medical students?—To every one.

16107. In physiology, first of all, you mentioned?—Yes.

16108. Then in pathology?—Yes.

16109. In both those cases would it mean practice by students as well as demonstrations?—Certainly in physiology. As regards pathology, I think it ought also to be so; but, then, I am a pathologist, and perhaps I think that pathology ought to take a larger place in the curriculum than it does.

16110. And is the same thing true in pharmacology?—Yes.

16111. And in forensic medicine?—The tendency now, you know, is for special classes of forensic medicine to be given up. There is much less time spent in forensic medicine than there was when I was a student, because pathology is taking its place; so that prac-

Sir V. Horsley, F.R.S., F.R.C.S.

19 Nov. 1907.

tically forensic medicine you might group under the head of pathology.

16112. Then you also suggested that experiments on animals should be employed in a course of anæsthetics?—That is most essential.

16113. By every student?—Yes; I had proof of that this very morning in an operation.

16114. Do you care to amplify that?—No; it might be painful. It was a question of sheer ignorance from want of having seen the condition in an animal first, and inability consequently to diagnose movements which were asphyxial in character, as contrasted with movements which were purposive in character; and, as you can see, that might be a very fatal mistake.

16115. Then, again, in surgery you advocated that all students should be instructed by vivisection experiments, with a view to obtain manual dexterity?—Yes; first with a view of obtaining a knowledge of technique, and secondly with a view of obtaining manual dexterity—the words in the Act.

16116. And you have no reason, from your own experience, to think that the effect of witnessing experiments on living animals is demoralising to students?—I know that it is not. It is a sheer invention on the part of those who offer such evidence.

16117. You quoted a portion of the Report of the Royal Commission of 1876 on that subject?—I did.

16118. There is a preceding portion of the sentence which I do not think you quoted; may I call your attention to it: "But the tendency to demoralisation is connected, as the shadow with the substance, with the rightness or the wrongness of the thing itself"; and then follow the words you quoted: "And the evidence we have quoted above seems to show conclusively that at the medical schools where such demonstrations are exhibited under anæsthetics the sense of humanity in the students is not in fact impaired"?—Quite so. I do not see how the previous words in any way alter the sense of the part that I quoted.

16119. In an earlier paragraph of the same Report they say: "It is manifest that the practice is, from its very nature, liable to great abuse; and that since it is impossible for society to entertain the idea of putting an end to it it ought to be subjected to due regulation and control." And, further: "It is not to be doubted that inhumanity may be found in persons of very high position, as physiologists. We have seen that it was so in Majendie." Apparently the Commissioners had it in their mind that there was peril in the permission of these experiments, and need for circumscribing them and watching them?—Undoubtedly they had it in their mind, although they had no absolute evidence before them that such a thing as inhumanity actually existed in the schools in England.

16120. They called attention to Majendie?—Yes; but Majendie was in 1820; that was 50 years before that Commission.

16121. (*Chairman.*) In France?—Yes, and in France; he was not in England at all. The English medical profession had always discountenanced anything like the giving of unnecessary pain in experimental work, and certainly at that time, as I have already stated in my evidence, demonstrations had been given at University College for some years, and there was no idea of demoralisation of students or anything of the kind. There had been, on the contrary, a great accession of interest and of educational value in the course of physiology.

16122. (*Sir William Collins.*) Do you think that there is such a distinction to be drawn between the practice of vivisection abroad and its practice in England?—At the present time?

16123. Either at the present time or formerly?—Formerly, no doubt, the English medical profession, as a profession, like the public, were more humane than their continental brethren, but at the present time if you read any scientific record of experimental work, you will find that the animals are all anæsthetised.

16124. Then do I rightly understand that you do not draw any distinction between vivisection, as now practised on the continent and in America, and as practised in this country?—I cannot say that I draw no distinction, because we know perfectly well that the Romance Nations, for instance, have not the same natural regard for animals that we have. They do not value animal life or regard animals in the same way that we do.

16125. (*Mr. Ram.*) An English crowd would not stand a Spanish bullfight?—Certainly not.

16126. (*Sir William Collins.*) Do not the Spanish retaliate upon the English foxhunt?—Yes, they may. It is a question of degree. That is not a question really which has ever appeared to me to have any bearing on this subject. We are concerned here with our work in the English medical schools, and it does not matter what goes on on the continent; we have nothing to do with it from a legislative point of view, and therefore it always seems to me utterly irrelevant to the subject, so far as we are concerned as a profession.

16127. You referred us to the Report of 1876, and I was anxious to know whether these paragraphs were present to your mind?—Yes, that paragraph relating to Majendie was.

16128. And his "infamous" experiment, as Sharpey call them, according to that Report?—Yes.

16129. You spoke of there having been no evidence before the last Commission of "inhumanity' in this country; they had the evidence of Dr. Klein, had they not?—Yes.

16130. You said that you were unable, or you omitted, to give us that quotation which you kindly promised about Sir Frederick Treves. It was, I understood you to say, a contradiction of something which is frequently quoted from his works?—The original quotation, I think, was in a lecture.

16131. Is this the original quotation, that we may have it clear? This is from the "British Medical Journal," of November 5th, 1898, in the report of an address by Sir Frederick Treves on "Some Rudiments of Intestinal Surgery," in which he stated: "Dr. Halsted, by the way, expresses his conviction 'that there should be a law compelling all surgeons to practise on animals the operations for circular suture of the intestines and for intestinal anastomosis.' I hope this view will not commend itself to the legislators of this country. Many years ago I carried out on the continent sundry operations on the intestines of dogs, but such are the differences between the human and the canine bowel, that when I came to operate upon man I found I was much hampered by new experience—that I had everything to unlearn, and that my experiments had done little but unfit me to deal with the human intestine"?—Yes, that is the reference. I have obtained for you Sir Frederick Treves' answer to it.*

16132. I am much obliged to you?—Of course, Sir Frederick Treves could answer for himself, if the Commission desired it, naturally, but may I point out also that he did those experiments many years ago, and that is why I should not accept his experience any more than the personal experience of a man who had done experiments which were no use to him. I may suggest, with all respect to Sir Frederick Treves, that we have, many of us, done experiments which have been failures.

---

* The witness subsequently forwarded the following letter:—

To the Editor of the Times.

Sir,—My attention has been drawn to a letter in the "Times" of April 9th, signed by Mr. Trist as Secretary of the London Anti-Vivisection Society. In this letter it is stated that I have testified as to the fallacy of vivisection.

My solitary utterance on the subject of vivisection is contained in an address delivered at Birmingham, in October, 1898 (Lancet. November 5th, 1898). Speaking of the suturing of intestine, I said that I had found out that operations upon the intestines of dogs were useless as a means of fitting the surgeon for operations upon the human bowel.

Those who are familiar with the controversial methods of the anti-vivisection party will not be surprised that certain of my remarks have been cunningly isolated from the context, and have been used (in advertisements, pamphlets, and speeches) to condemn all vivisection experiments as useless. The fallacy of vivisection can hardly be said to be established by the failure of a solitary series of operations dealing with one small branch of practical surgery.

No one is more keenly aware than I am of the great benefits conferred upon suffering humanity by certain researches carried out by means of vivisection.

I am, Sir, your obedient servant,

FREDERICK TREVES.

6, *Wimpole Street, W.*
April 14th.

16133. We have also had our attention called to a passage from Koch's work on the cure of consumption, in which he said: "Here, again, is a fresh and conclusive proof of that most important rule for all experimentalists, that an experiment on an animal gives no certain indication of the result of the same experiment upon a human being." That, I gather, you would not agree with?—I do not agree to that at all.

16134. Now, in your *précis* you refer to the morals of the question of vivisection and anti-vivisection?—Yes.

16135. You gave us the views of the British Medical Association on the morality of vivisection and the immorality of anti-vivisection?—Yes.

16136. I understand from you that, in your opinion, to experiment upon man is immoral?—Certainly. A modification in surgical procedure might be a trivial matter, in that it did not involve any risk to life, and that, if tried on a man first, would by many people be called an experiment. I should not object to that if there was really no risk to the individual on whom it was tried, and, of course, that has been the practice of all surgeons who have not first tried their methods on animals; it has been a common practice, I mean, up to the present time. But I suggest that as a general principle, it is undoubtedly immoral. If a new idea or a new method is to be tried, it certainly ought to be tried on an animal first, because, as I have pointed out in my previous evidence, it is not only that you do not know the result until you have made the experiment, but you actually do not know that your method of performing the procedure is going to be the best.

16137. Then you speak of the morality of vivisection as against the immorality of the anti-vivisectionists?—Yes.

16138. And you suggested that the anti-vivisectionists were immoral in utilising knowledge which had been obtained by means of experiments on living animals?—Yes; I suggest that they are immoral from two points of view. I suggest that they are immoral, in the first place, because they oppose means whereby suffering and disease may be prevented, and I think it is immoral to do that—to oppose means whereby we can obtain new procedures against disease and suffering; that is the first thing. Then, inasmuch as they hold that vivisection is immoral—that it is immoral to use animals for these purposes—I say that it is immoral of them to make use of knowledge gained by vivisection. And I think that is the general public view also. I repeat what I said before—that the money for a so-called anti-vivisection hospital in Battersea was collected on that very ground, and yet now, at the present time, evidence has been laid before the Commission by anti-vivisectionists—Mr. Coleridge, Dr. Stephen Smith, and others, claiming that they are justified in making use of the knowledge derived by vivisection.

16139. Mr. Tomkinson put it to you, when he said that, in your opinion, all pursuit of knowledge was moral, and any obstruction to the pursuit of knowledge was immoral?—Certainly.

16140. But human vivisection, in your opinion, would be immoral, I understand?—Yes.

16141. And if knowledge could only be obtained by experiments on man there would be a conflict between your morals and your pursuit of knowledge, would there not?—No. The moral question would then come in in the sacrifice of the man; and if a man was a scientific observer, who chose to sacrifice himself, I should say that he was not doing an immoral act, unless he caused some serious disability to himself, as some men have done.

16142. But take the case, not of experiments upon the man himself, but upon other persons—involuntary experiments?—I do not approve of them.

16143. For instance, when Lady Mary Wortley Montagu introduced inoculation into this country, the practice was started upon some criminals in Newgate, I think. Do you think that was moral or immoral?—I think it was immoral.

16144. Recently I think Dr. Garnault, in Paris, has inoculated himself with tuberculosis?—Yes.

16145. Do you think that is moral or immoral?—I think it is decidedly immoral, because practically it was one form of committing suicide, or it might be.

16146. That is to say, it would be immoral to expose a human being to peril or disease?—Yes, to disable him.

Sir V. Horsley, F.R.S., F.R.C.S.

19 Nov. 1907.

16147. The knowledge obtained from experiments on human beings in that way would, in your opinion, be immoral knowledge?—I think it would be immorally gained.

16148. And you ought not to use it?—Oh, no.

16149. I understood you to say that the knowledge obtained by an immoral procedure ought not to be used; that it was immoral to do so?—What I said was that persons who held that vivisection was immoral were not entitled to use the knowledge thus gained.

16150. But you hold that human vivisection is immoral?—Certainly.

16151. Would you not be similarly barred from using knowledge obtained by human vivisection?—Certainly.

16152. That is what I put to you?—I beg your pardon. I did not understand your question. I certainly think so.

16153. Was not some knowledge obtained by the experiments of Herophilus upon human beings?—We are told so, but it is very uncertain really whether he actually did vivisect human beings. It is said that he anatomised them.

16154. Is it not said that he dissected alive some 600 persons?—The allegation is made.

16155. He was so charged by Tertullian, was he not?—Yes, I believe so, but we do not actually know what knowledge he did gain by those alleged vivisections of human beings.

16156. Have you not called attention to the work of Herophilus in your book on "The Brain and Spinal Cord"?—Yes. I have quoted him in my historical narrative.

16157. Do you suggest that he, by his investigations, added knowledge with regard to the nervous system?—He is alleged to have done so.

16158. Was he "the first to discover the peripheral nervous system or nerves, that these latter were connected with the brain and spinal cord, and that they conveyed sensory impressions"?—He was so alleged.

16159. Do you not allege it yourself?—No, I quote it, but I should be very sorry to vouch for its accuracy, because, as a matter of fact, the most detailed experiments on conduction are those of Galen, which I also quote.

16160. Was Galen not charged with experiments on human beings?—He was accused of it.

16161. He did use a good many animals for experiments, did he not?—Yes, the animal apparently that he used was the pig, and in the mediæval period they also used the pig.

16162. I gather from your book that you set a good deal of store upon the experiments made by Galen?—Yes.

16163. Have the results which he obtained remained absolutely correct until the present day?—Yes, they are the foundation of our knowledge.

16164. There was a piece of evidence given by the late Sir James Paget before the last Royal Commission, upon which I shall be glad to have your view. He said: "There must be reason and moderation in the use of these experiments"—that is, vivisection experiments. "I can quite believe that ardent physiologists put more trust in the experiments on living animals than I should; and certainly those studying therapeutics and diseases think more of them than I should. I think more of the advantage of clinical inquiry. But I am very anxious that there should not be a general condemnation of experiments on animals, since it seems to me that there are a number of things absolutely essential for the life of man that cannot be ascertained by other means." Do you agree with that?—Certainly. What Sir James Paget is saying there is that clinical observation is very useful and that experiments are useful.

16165. (*Chairman.*) You say that you agree with that, but I rather gathered from the evidence which you have given before that you place a good deal more faith on experiments on animals than Sir James Paget wished to express in that answer?—I cannot extract that from Sir James Paget's statement. Sir James Paget is saying there what everyone must agree with.

Sir V. Horsley, F.R.S., F.R.C.S.

19 Nov. 1907.

16166. He says: "Some things," "in some instances." That was what I was referring to.

16167. (*Sir William Collins.*) It was rather a question of the relative importance of clinical inquiry and experimental inquiry?—I do not agree that there is any relative importance in any method of acquiring knowledge in our work. It has often been alleged, for instance, that anatomy is more important than physiology. It has been alleged by anti-vivisectors that experimenters, as they call them, have neglected anatomy for physiology, and in the same way it might be alleged, or it might be deduced from Sir James Paget's remarks, that persons like myself would neglect clinical observation for experiments in the laboratory. It is a monstrous suggestion altogether; gether; it is perfectly monstrous.

16168. (*Chairman.*) I do not understand Sir James Paget suggesting that; it may be true in some cases, but I do not think he is suggesting it. I think that what he suggests is that, out of the sum of human knowledge obtained, he inclined to the view that more has been gained from clinical observation and less from animal experiments than you would put it. That is all I understand him to say?—I suggest that an attempt to make a comparison of that sort is absurd from the scientific standpoint. Both avenues of knowledge, if properly pursued, give us new ideas.

16169. I think you hardly follow me. I am not suggesting that Sir James Paget says the reverse of that in the least; he says that both avenues will bring results, and they are not put in conflict at all?—No, I am sorry that I did not understand you. I know the point that has been raised again and again; it is suggested that clinical observation is better than experimenting in a laboratory. All I maintain is that such a statement as that is absurd from the scientific standpoint. There are some things that you can gain from clinical observation which you could not see in a laboratory. Of course, that goes without saying, and *vice versâ*. You must do both things; you must have all these avenues of work open.

16170. (*Sir William Collins.*) The President of the Royal College of Surgeons, when he was here, told us, I think, that he had never himself practised vivisection, and he did not advise the practice of vivisection for the purpose of acquiring manual dexterity. I gather from what you have told us that you disagree with that?—I totally disagree with that, of course.

16171. I gathered from some of his replies that he relied upon his experience in operations on the human subject?—He is obviously one of those who have learnt on man. He has gained his experience by operating on man.

16172. That you regard as immoral?—Certainly. I think the more moral proceeding is for a man to have learnt by experiments on animals first.

16173. (*Chairman.*) Do you mean by experimenting or by operating on patients?—By operating on patients.

16174. What you said was immoral was not operating on patients, but experimenting upon them?—That is what I meant.

16175. (*Sir William Collins.*) I understood you to say that knowledge obtained as the result of experiments upon human beings in the course of surgical operations was, in your opinion, immoral?—The use of the terms "moral" and "immoral" are relative; but what I say is, that I think it is, if you like to put it so, a more moral proceeding for a man to gain that knowledge of technique, and so forth, by trying first on an animal the experiment, or by being educated by operating on an animal, before he operates on a man.

16176. That introduces us into the sphere of relative morals?—Well, it is the basis of the whole of education. Are you going to gain your experience on the bodies of persons that come into your hands, or are you going to gain it in the laboratory by experiments on animals? That is what it comes to; you cannot shirk the question.

16177. I took the notion of relative morality from yourself?—Yes, certainly.

16178. We have many times had the question of reflex action and purposive movement before us, and I shall be glad to get from you, as a great authority on neurology, what you really mean by reflex action?—By a reflex action I mean an automatic, which may be, and usually is, an unconscious response to a stimulus.

16179. Is reflex action ever conscious?—That depends upon the sense in which you use the term. A perfectly conscious being may execute a reflex action. For instance, if somebody suddenly stuck a pin into my hand I should certainly draw my hand back, and of course I would be perfectly conscious; but there would be nothing purposive in that act of mine; it is purely reflex.

16180. Would it not be a purposive act?—Not at all; the time is too short. In my opinion, a purposive act is a conscious act.

16181. Is a purposive act always a conscious act?—In my opinion, a purposive act is a conscious act.

16182. (*Mr. Ram.*) What is a sneeze?—It is purely reflex.

16183. I am conscious when I sneeze?—Exactly; that is what I say. You must not introduce the connotation of consciousness in the discussion of reflex action, because the latter only means that the response in the nervous system is executed within an extremely short period as contrasted with a response which involves the higher centres, and therefore takes a longer time to execute. But if you introduce the question of consciousness or unconsciousness, then you must add a great deal of analysis of higher functions, especially in regard to this question of anæsthesia.

16184. (*Sir William Collins.*) You have called attention to that, I think, in your book on the "Brain and Spinal Cord," where you say: "A vast array of writers have discussed the question as to whether we are to regard the lower animals as possessing, as they say, consciousness, and from this have even proceeded to formulate ideas as to whether they have a soul; while owing to the remarkable discoveries of the pathologists about 40 years ago as to the functional activity exhibited by the spinal cord of the frog, when separated entirely from the brain, an animated debate was actually excited as to whether the spinal cord possessed the attributes of the mind"?—Exactly, that was so.

16185. G. H. Lewes, I think, took part in that discussion?—I had forgotten that.

16186. Is a frog deprived of its cerebral hemispheres capable of purposive acts?—It is capable of most complex reflex acts which might be regarded by an ordinary observer as purposive, but to argue from that to purposive acts such as are performed by warm-blooded animals, with an intact nervous system and fully conscious, is quite another thing.

16187. Are those acts of a brainless frog conscious acts?—No; in my opinion, there is no connotation of consciousness unless you have an activity of the highest centres present. The cortex of the human brain is undoubtedly necessary for the purpose of consciousness.

16188. In your *précis* you state that "no experiments on unanæsthetised animals of a painful character have been performed in the United Kingdom during the administration of the Act"? So far as I know, there never has been a cutting operation performed on animals without anæsthetics.

16189. I could not quite harmonise that with what Dr. Thane told us in answer to Question 457, where he is asked, "Are there any experiments that you can describe as being really painful"?—That is another thing. He means painful after an inoculation. I am not aware of any application ever having been made to the Home Office for a cutting operation to be performed without anæsthetics.

16190. Then, when you say that no "experiments of a painful character have been performed on unanæsthetised animals in the United Kingdom during the administration of the Act" you are prepared to allow that there were these painful experiments which were referred to by Dr. Thane?—Not at all. I do not know what Dr. Thane is alluding to except inoculations. I am sure, at least from my own personal knowledge, that he was not alluding to a cutting operation performed without anæsthetics. The question has been raised again and again.

16191. I was about to read his answer. I thought you knew what it referred to?—I beg your pardon.

16192. His reply was, "On the other hand, it is certain that in some cases of this group"—that is,

experiments performed under Certificate A——"—Yes, those are inoculations.

16193. "The infection or injection is followed by great pain and suffering. I may mention the injection of tetanus toxin and the infection with plague; also the insertion of certain drugs"?—Yes, none of those are what I stated. I was referring to cutting operations.

16194. Are they not performed on non-anæsthetised animals, and under the administration of the Act?—Yes, but they are not cutting operations.

16195. But I did not gather that the passage which I have read to you contained that proviso?—What I referred to in my *précis* was a statement which I have made again and again in the public Press, and which has never been challenged, that no cutting operation on an animal has ever been performed in this country without anæsthetics under the administration of the Act.

16196. I have the words of your *précis* before me, and they are: "No experiments on non-anæsthetised animals of a painful character have been performed in the United Kingdom during the administration of the Act"?—Exactly, and I have explained to you what that sentence refers to, namely, cutting operations.

16197. Without that elucidation it was not perfectly clear, to my mind at any rate?—Because you hardly realise that a *précis* does not necessarily convey everything that is in a man's mind.

16198. It shows the advantage of a little examination on the *précis*?—Quite so. But the anti-vivisection party have repeatedly alleged—in fact, it is their whole stock-in-trade—that cutting operations are done in this country on animals without anæsthetics; it is part of their business to show that; and, as I have stated, under the Act it is impossible, because no application has ever been made to the Home Secretary to perform such operations.

16199. Now, with respect to the experiments of Dr. Crile's to which you have called our attention, and which have been so often before us, they were done, I understand, under your guidance and at your suggestion?—Yes.

16200. And they were continued in America, I think, subsequently?—Yes.

16201. Did the series in America differ from those which were performed in this country?—I do not know.

16202. What was the conclusion at which Dr. Crile arrived as the result of his experiments?—That there were changes in the blood pressure of a marked character—changes which we ought to contend against in operations on man.

16203. I see that the conclusion of his paper is set out thus. Is this correct. "Surgical shock, then, is due mainly to a vasomotor impairment or breakdown. The cardiac and respiratory factors may be of considerable importance. However, the main effect is on the vasomotor mechanism. If the foregoing be true, it will be seen how much more important is prevention than treatment. Prevention of shock may best be accomplished by taking into account all the known physiologic functions of every tissue and organ of the body in a way that would suggest itself to any practical surgeon. While the cause may be local, the treatment must be general. It would seem to be desirable to direct special attention to the distinction made between collapse and shock; the result of action is reaction; of rest is restoration." That was the conclusion of the whole matter, was it?—Yes.

16204. And I understood you to say that these experiments of Dr. Crile exactly reproduced what was done on a human being?—Yes.

16205. Among those experiments was one—I think the first experiment—of cutting out both cerebral hemispheres?—Yes.

16206. Have we an analogue to that on a human being?—No, I did not say that all the experiments of Dr. Crile exactly reproduced what was done on a human being.

16207. That description would not apply to them all?—Certainly not. If you wish to analyse any physiological function you must introduce into the experiment various operative procedures to exclude the functions of different parts, which, of course, is not necessarily a part of the procedure of an operation on a human being.

16208. Tearing out the brachial plaxus was another?—Yes, that was to imitate a well-known fly-wheel accident which is not uncommon in factories.

16209. Crushing the foot extremely before the corneal reflex was abolished was another?—Yes.

16210. That, you say, tarsectomy represents?—I said that tarsectomy reproduced the crushing of the bones of the feet. I should say that a railway accident also correctly represented the experiment you are describing now.

16211. Tarsectomy had been performed long before Dr. Crile's experiment, had it not?—Yes, all the operations for divisions of bones had been performed, of course, long before anæsthetics even were given.

16212. Then crushing the testes and other parts?—Yes, that is a most important question, because the operation of castration has frequently been followed by very grave shock—fatal shock.

16213. I did not quite understand you. I thought you suggested that there was some analogous operation on the human body to the experiment of Dr. Crile of pouring boiling water on to the intestine?—Pouring boiling water into the abdominal cavity. It does not matter whether it is on the intestine or the abdominal wall.

16214. Any procedure in which boiling water was used?—Yes. I quoted the injection of scalding steam into wounds of the liver.

16215. Would the temperature at which that steam touches the liver be the same as that of boiling water applied to the intestine?—Certainly.

16216. Really?—Practically. You get the nozzle of the injector close to the liver; that is the whole object of the procedure—namely, to produce instant coagulation at a scalding temperature.

16217. How is the jet of steam produced?—By a boiler under pressure.

16218. Do you think that the temperature applied to the organ by that means would be that of 212 deg. Fahrenheit?—No, not absolutely, but practically the same thing. You must produce a scalding effect, and the question is whether it will produce special shock.

16219. Had that method not been employed before Dr. Crile's experiment?—Oh, yes.

16220. The President of the Royal College of Surgeons told us, I think, that he did not like many of these experiments of Dr. Crile. Tastes differ?—I do not know what anybody means by liking or not liking an experiment. To my mind, as I said the other day, in answer to Mr. Tomkinson, about the use of the word terrible, or disagreeable, and so forth, if an animal is anæsthetised all those expressions are absurd. If the animal were not anæsthetised, then, of course, it would be quite another question.

16221. Do you mean that if these experiments of Dr. Crile's had not been performed under anæsthetics they might be described as outrageous?—Certainly, because here we are armed with anæsthetics, and it would have been the infliction of terrible pain—well, wickedly.

16222. The introduction of anæsthetics into these experiments, in your opinion, made all the difference between their being outrageous and, shall I say unfairly, moral?—Certainly, at the present day, because the whole idea was to investigate conditions of shock as they arise in operations on the human being, and no one would dream of applying such procedures to a human being in a conscious and sensitive state.

16223. Did I understand you rightly to say that you would have no objection to your own pet dog, if it were under anæsthetics, being submitted to those same experiments?—Certainly, if my own pet dog was to be killed and it was put under anæsthetics, I should not care what was done to it as long as it did not recover consciousness to pain. Why should I?

16224. I am afraid that I am not in a position to make replies?—But you asked me a question, and I think there are deductions from questions which one is sometimes entitled to comment upon.

16225. Have you heard of some experiments which Dr. Watson performed in America, of dropping dogs from a height?—Yes. I know of those experiments.

Sir V. Horsley, F.R.S., F.R.C.S.

19 Nov. 1907.

16226. Were they, in your opinion, valuable experiments?—I cannot at the moment call to mind whether they revealed any new conditions; I should have to look them up again to see whether, in my opinion, they really did add to our knowledge. I cannot at the moment express an opinion.

16227. Were they justifiable, in your opinion?—Certainly.

16228. Were they performed under anæsthetics?—I cannot tell you that, but I should say that the mere dropping of an anæsthetised dog from a height in order to obtain concussion of the spinal cord, would be a very useful experiment, if it was followed up by an anatomical investigation of the spinal cord, and I can see no objection to it whatever, if the dog was anæsthetised.

16229. Were those experiments of Dr. Watson's severely condemned by the "British Medical Journal"?—Quite possibly, if the dogs were not anæsthetised.

16230. That journal is the organ of the Association on whose behalf you are giving evidence?—Yes.

16231. With regard to the thyroid and myxœdena we have had a great deal of evidence on that subject, Should I be right in thinking that clinical investigation had, prior to your own experiments, may I say, suggested a close relationship between the diseases and defects of the thyroid gland and the cretinoid condition of a human being?—No. Sir William Gull, in speaking of those patients as cretinoid, had no pathological investigation of the case before him. The only pathological investigation that was made at all was Dr. Ord's. The word cretinoid was used by Sir William Gull simply from the appearance of the patients, but he, of course, had no idea whatever that it had anything to do with the thyroid gland. Dr. Ord's case was the first case in which the thyroid gland was shown to be degenerated, as well as other organs in the body.

16232. In Dr. Ord's case he showed that the diminution of the thyroid gland was associated with an almost complete annihilation of the proper gland structure by the degenerative material, did he not?—Yes, but all the clinical work, as I have pointed out, was subsequent to Schiff's experiments in 1859. Mine were not the first experiments on the subject.

16233. Had not Hirsch pointed out that goitre and cretinism were a pair of diseased types closely related in their pathology and etiology?—Yes.

16234. That would be prior to 1885?—Yes, certainly.

16235. And had not Hilton-Fagge contributed some cases on sporadic cretinism occurring in England as long ago as 1871?—Yes.

16236. Had he not pointed out there that there was no thyroid gland to be detected?—I do not remember that, but, of course, the connection between sporadic cretinism and goitre had been pointed out a great many years before that.

16237. Do you remember Curling's work in 1850, in which he published two cases of absence of the thyroid body connected with defective cerebral development, where he showed that there was not the slightest trace of the thyroid body in those cretins?—No, but it is quite possible. Many cretins, on the contrary, have a very large thyroid.

16238. Had not Fagge suggested that the presence of goitre was protective against cretinism?—I dare say, but the clinical knowledge on the whole subject was in a complete fog, of course.

16239. But through the fog was there not emerging a notion that cretinism was combined with absence of the thyroid gland?—No, I do not think so at all, because many cretins have enlarged thyroids.

16240. Did not Curling himself in 1850 call attention to the fact that cretinism was combined with absence of the thyroid gland?—I do not know. I do not know the case that you refer to—the paper of Curling's.

16241. When was the first successful operation in this country of transplanting the thyroid gland of sheep into a human subject?—That I do not know. I do not know who did the first transplanting of sheep's thyroid at all.

16242. Have you never heard of a case?—Oh, yes, I have a sort of idea, but I really cannot answer that question.

16243. You were, I think, on some Commission or committee that inquired into tuberculosis in animals?—Yes, it was a Departmental Committee.

16244. It was a Committee of the Privy Council in those days?—Yes.

16245. You are not, I think, a member of the present Tuberculosis Commission?—No, I am not.

16246. Do you accept the view that the so-called tubercle bacillus is the cause of tuberculosis?—Of course.

16247. And is it capable of being transmitted hereditarily?—Do you mean by the spermotozoa to the ovum, or in the ovum itself?

16248. The reason I ask is because of your own special report upon that former Committee?—My minority report of one, you mean?

16249. May I read the words, to remind you of what you wrote: "Tuberculosis is notorious, even among the laity, as a disease which is transmitted from parent to offspring. This is a fact with which cattle breeders are specially familiar, and which finds strong expression in the evidence attached to this Report. Further, this generally received truth has been completely confirmed by the results of scientific investigation, as is also duly set forth in this Report." That is to say the result of scientific investigation, prior to the report of that Departmental Committee, led to the conclusion that tuberculosis was hereditarily transmissible?—Yes, that was because Baumgarten had found the bacillus in the ovum in a rabbit, and Johns in a new-born calf. Of course, if that occurred, clearly you could say then that that individual if the embryo developed, in spite of the bacillus, would be an instance of hereditary transmission.

16250. Is the hereditary transmission of tuberculosis accepted by pathologists to-day?—Not in man, so far as I know.

16251. In animals?—That I do not know. But the question then before the Departmental Committee was the question whether certain infected prize bulls communicated the disease, and the evidence before the Committee was to the effect that they did.

16252. And you suggested that there should be legislation to prevent breeding from those tuberculous animals?—My Minority Report went a great deal further than that. The reason why I was in a minority of one was because I proposed the extirpation of the disease by stamping out, and by the compensation of the owners; but none of my fellow Committee-men would report in favour of compensating the owners.

16253. But there was also this point of legislation with regard to preventing breeding?—Naturally, but that was only a side issue compared with the enormous question of compensation.

16254. I should like to ask you a question in regard to the evidence given by Sir William Fergusson, who was a distinguished surgeon, of course, before the last Royal Commission. In their Report the Commission say: "Sir William Fergusson thinks that experiments which involve suffering are carried to a greater extent than they need be, and that there is continued and useless repetition. His own opinion is much less favourable to these experiments than it was when he was young, because he had much less grasp of the subject at that time. The more mature judgment of his later years has led him to say to himself that he would not perform some of the operations now that he performed in his earlier years. He thinks if the public really knew what was actually going on in this country at this time they would expect an interference on the part of the Crown and Parliament"?—I am perfectly well aware of that statement of Sir William Fergusson's. I always thought that it was a most unwarrantable statement for any man to make, from my knowledge, at any rate, of what went on in a medical school. I do not in the least degree know to what he was referring in the matter of detail, and I am not sure that the Commission pressed him on that point at all.

16255. (*Chairman.*) The operations in his early days of which he speaks were performed before anæsthetics were used?—Certainly. Sir William Fergusson was a student in Edinburgh.

16256. About what time?—I suppose about 1830.

and the description of his time, and the share that he took in resurrecting bodies, and so on, is what is called a romantic story. I cannot see any romance in that kind of thing, but I see a great deal of romance in that answer of his, so far as medical school work was concerned in 1876. I do not believe for a single moment that there is an atom of truth in his innuendo, at least, of that statement, that the physiological medical schools of this kingdom were committing cruelties by unnecessary experiments on animals.

16257. (*Sir William Collins.*) 1876 was, of course, long after the introduction of anæsthetics?—Long after; but you have the evidence before you; I do not remember his particularising in his evidence an instance of such cruelties. I do not believe that there is such an instance in the evidence you hold in your hand.

16258. Chloroform was discovered by experiments on a human subject, was it not?—The actual use of chloroform as an anæsthetic agent was practically discovered by Simpson inhaling it himself, and giving it to his friends.

16259. (*Sir William Church.*) It has been put before us several times in this room that the essential feature of Listerism was the use of the spray. Is that a total misconception?—Absolutely.

16260. Do you remember in what sort of cases Lord Lister first made use of his antiseptic treatment?—I think it was in regard to compound fractures, in which his celebrated putty was used, carbolic putty, in order to exclude organisms.

16261. Was it not his principle to try and turn a compound fracture into a simple one; that is to say, where the skin was not broken?—Exactly.

16262. And to cleanse any protruding part first with carbolic acid in order to destroy any organisms which had got into it?—Precisely.

16263. And then to protect the wound and make it into practically the same condition as if the skin had not been broken?—Yes, he covered it over with this antiseptic putty.

16264. And the spray was not used?—It was not used at all in those days.

16265. In your answer to Question 15811, you are speaking of the necessity for demonstration in teaching physiology, and you are asked: "Professor Gotch here stated that for two years he had not used living dogs for teaching purposes, and Dr. Pembrey admitted before the Commission that during all this year, at least, he had not vivisected any animals at all before his class. From that you would rather criticise the efficiency of the teaching?" and you say, "Certainly, I would." I want to be quite clear. Does that answer apply to Professor Gotch and Dr. Pembrey?—No, it applies only to the second part, because Professor Gotch gives physiological demonstrations.

16266. You were not criticising Professor Gotch's teaching, because he had only used rabbits instead of dogs in illustration of his lectures?—Not in the least. I was criticising Dr. Pembrey's statement that during all this year he had not vivisected any animals at all before his class. I think he ought to have done so.

16267. Then, in answer to Question 15952, you say: "Undoubtedly the Act ought only to apply to warm-blooded animals"—would you leave cold-blooded animals entirely outside the Act?—Yes, practically it come to this, that the frog, which, of course, is a cold-blooded animal, is used enormously in teaching physiology, yet everything can be shown on a frog after its decapitation.

16268. You say in the next answer: "It is perfectly ridiculous for fish, and so forth, to be included"?—Yes, if you take fish, for instance, I think that it is unnecessary to anæsthetise fish.

16269. I suppose you think that they suffer pain?—I am not at all sure of that. Now, I come back to an answer which I gave earlier this morning there is no pain without consciousness—that consciousness in man is undoubtedly associated only with the complete function of the cerebral cortex. As you descend the animal kingdom you at last arrive at the fish, and you find that the fish has no cerebral cortex at all. I do not, therefore, regard fish as possessing either consciousness in any way analogous to what we call consciousness or sensitiveness to pain.

16270. Shall we take the snake?—The snake has a very thin semblance of a cortex, but a fish has no cortical grey substance at all.

16271. Do you really think that the invertebrate kingdom suffer no pain?—Certainly. I do not believe that the invertebrate kingdom are at all conscious of pain. If you apply a powerful stimulus to an invertebrate, it shrinks up undoubtedly by a reflex or defensive act, but I do not think that that act is accompanied by any pain—certainly nothing in the least degree approaching what we have any idea of.

16272. Then you would not even apply an Act of Parliament dealing with cruelty to animals to cold-blooded animals and invertebrate animals?—To take a case in point, you mean that if some boys were found torturing a frog they ought not to be punished?

16273. Yes?—I do not agree to that. That point has already been frequently discussed, of course, in connection with the moral right of wild animals; I mean as regards the statutes. I do not think that point really bears upon my position at all. I am referring now to legislation affecting the performance of an experiment for the sake of gaining knowledge. I do not think it is in any way analogous.

16274. You would leave, then, cold-blooded animals, that is to say the animal kingdom, from birds downwards, outside an Act dealing with experimentation on animals?—Certainly.

16275. And you would not agree with Professor Langley, who thought it was desirable that they should be under a separate clause?—What is Professor Langley's statement?

16276. He said, in answer to a statement at Question 15399: "I think it would be better to have a separate certificate for cold-blooded animals, like fish, frogs, etc."?—I cannot see the advantage of it at all, because, of course, here again we have the question of the certificates, and may I point out once more that my proposed amendment of the Act would provide the Home Secretary with absolute knowledge of whether it was going to be done on a warm-blooded animal or a cold-blooded animal, and, if belonging to either class, which animal? All those details would be furnished to the Home Secretary, and consequently there is no reason to construct a special certificate for cold-blooded animals; it would be unnecessary. And, if Professor Langley's point was that a fish, for instance, was conscious of pain, as I have said before, I have given my reasons to the contrary.

16277. I do not wish to pursue it. Professor Langley's words were: "I think they certainly must suffer very little"—that is pain—"but I think, again, as a matter of public policy, it is difficult to press for their exclusion"?—I did not know that I was here to answer on questions of public policy.

16278. But those are the words that Professor Langley used in reply to the question, whether there was any need to include cold-blooded animals in the Act?—As I have stated, I do not think that there is any need, and in connection with fish, I have given reasons for supposing that they do not suffer pain. I see that Professor Langley says here: "The organisation of the part of the brain that is connected with pain in man is so small in those animals that it cannot have any very large function"—certainly as regards teleostean fish it has no function at all; consequently, I do not believe that fish suffer pain. There is plenty of direct evidence, of course, on that point, of fish that have taken a fly a second time, and so forth, when the hook is sticking in the side of their cheek. However, I need not waste the time of the Commission on that.

16279. You would agree with Professor Langley, but you would go a little further than he does; you say that you think that they should be excluded?—Yes, you must draw the line somewhere for the purposes of a statute, of course, and therefore I think the best line would be between the warm-blooded animals and the cold-blooded animals.

16280. (*Chairman.*) Are anæsthetics sometimes administered to animals through a tracheal tube?—Yes.

16281. And for that purpose it is necessary first to perform the operation of tracheotomy?—Yes.

16282. In those cases are the animals anæsthetised when you open the throat?—Yes, of course.

16283. They are previously anæsthetised?—Yes.

Sir V. Horsley, F.R.S., F.R.C.S.

19 Nov. 1907.

Mr. F. Hobday, F.R.C.V.S., F.R.S.E., called in, and examined.

Mr. F. Hobday, F.R.C.V.S. F.R.S.E.

19 Nov. 1907.

16284. (*Chairman.*) You are a Fellow of the Royal College of Veterinary Surgeons?—Yes.

16285. And also a Fellow of the Royal Society of Edinburgh?—Yes.

16286. Have you been Professor of Therapeutics in the Royal Veterinary College, London?—Yes.

16287. And for six years, I believe, you were Examiner in Therapeutics at the Royal College of Veterinary Surgeons?—I was.

16288. Since you were qualified have you practised generally as a veterinary surgeon?—Yes.

16289. And you are now in consulting practice as well as in general practice?—Yes.

16290. And you have treated and operated on, as patients, a very large number of animals in your time?—A very large number.

16291. Have you experimented on them, too?—I have experimented on them, but not since I left the College. Practically I have done very little absolute experimentation.

16292. Your time has been taken up with practice?—Yes, absolutely.

16293. I am going to ask Sir John McFadyean, whom you know very well, to ask you questions about the matters on which you come to give us evidence?—Very good.

16294. (*Sir John McFadyean.*) You have for a number of years made rather a special study, have you not, of the administration of anæsthetics to domesticated animals?—I have.

16295. Did you investigate this by way of experiment, as well as by observation on animals that were to be subjected to surgical procedures?—I did.

16296. What was the motive for your undertaking the investigation when you were at the Royal Veterinary College?—When I was a student I was always taught, and I think it was generally understood, too, by the majority of practitioners, not only the veterinary practitioners, but also by the general public, that the dog in particular was a subject which could not be chloroformed with safety, and it was entirely with a view to attempting to do a little towards undermining that idea, or else seeing if the idea was absolutely a true one, that I undertook for many years a number of experiments for which I obtained the necessary license, and with various patterns of apparatus, to see whether the dog was, or was not, a good subject for anæsthesia, chloroform anæsthesia mainly.

16297. You had charge of the Out-Patients' Department at the Royal Veterinary College?—I had.

16298. I suppose there are some thousands of animals treated there annually?—Many thousands every year.

16299. Can you tell me what anæsthetics were in common use in connection with that and other veterinary colleges before you began your investigations?—If ever we had, on the insistence of the owner, to chloroform a dog, either my teacher, when I was a student, or myself, when I had the Professorship, always told the owner that the result might be fatal, and it frequently was.

16300. To what do you attribute those unfortunate results prior to your investigations?—Partly to a want of skill in administration, but mainly to a wrong method of administration.

16301. Your experiments were carried out on dogs and cats principally, were they not?—The horse is generally understood by the veterinary practitioner to be a good subject for chloroform, therefore I confined my attention to the dog and cat, because the horse was said to be a very good subject for anæsthesia, therefore I had no need to investigate it; in fact, I always used chloroform freely for the horse.

16302. Was there any sufficient experience to show that horses might with safety be anæsthetised?—Yes.

16303. Did you use any other farm animals for experiment—the pig, for instance?—I did use some pigs, but not any great number.

16304. Or sheep?—Yes, I have chloroformed lambs, but not any great number.

16305. And cattle?—Cattle I have practically no experience of. I have done a few odd ones. I have experimented mainly upon the dog and the cat.

16306. What may be said to be the general outcome of your experiments and your experience with regard to the safety of administering anæsthetics to dogs and cats?—I think I can claim that it has given a great impetus to the anæsthetisation of animals for surgical operations among veterinary practitioners; for I know that a very large proportion of the modern men, practically all the men of recent years, whenever they have any canine practice have continually used chloroform now for their surgical operations.

16307. Have you kept any record of the number of dogs that you have yourself anæsthetised?—I kept records of my first 1,200 consecutive cases, after once I had got my apparatus in working order. Since then I know that I have done many thousands, but I am in busy practice, and I thought the thing was proved sufficiently up to the hilt with 1,200 consecutive cases, and I am afraid that I have not kept definite records since.

16308. Can you give us any particulars with regard to the 1,200 consecutive cases with chloroform. Was it with pure chloroform?—Yes, or rather methylated chloroform.

16309. Not the A.C.E. mixture?—No, chloroform.

16310. What was the date of the 1,200 consecutive cases?—They have nearly all been published in the medical papers; 850 have been published. It was during the period of my Professorship at the College.

16311. Which terminated about five years ago?—Six years ago. It would be, I should think, between 1894 and 1896 roughly. It is about ten or twelve years ago.

16312. Do you remember in how many of these cases death occurred as the result of the anæsthetic?—Yes, I attributed the death to the use of the anæsthetic in five instances. But I want particularly to say here that these patients were taken as they came. By far the greater proportion of them were poor people's animals which came to the Out-patients' Clinique of the Royal Veterinary College, and we had not an opportunity to prepare them as one would do in ordinary practice with a patient brought to a veterinary surgeon for anæsthesia, mainly because we had not accommodation for taking in a number of animals to prepare them previously, partly because the owners themselves are usually very fond of their animals and will not allow them away from home longer than they can help, and partly because with a busy clinique such as we have at the College we have not time to do anything more than one considers to be absolutely necessary in the way of preparation.

16313. By preparing them you mean seeing that their stomachs were not overloaded?—Yes, I mean that they had not had any solid food that day, and were not anæsthetised with a full stomach. Observation proved on several occasions that if the animal was anæsthetised with a full stomach (like a puppy which had just gorged itself) it was excessively dangerous; it would often die.

16314. These 1,200 animals would be mainly diseased animals?—Most of them were diseased animals sent for some surgical procedure.

16315. Subjected to anæsthesia without any preparation?—Most of them without any preparation. Some of the 1,200 cases included patients either brought into the College for an operation, or which were operated on outside, in which case they were prepared, but by far the majority were absolutely unprepared. I mean that some of them were in a diseased condition in which from my experience now as a general practitioner I should have hesitated to give any anæsthetic; and the *post-mortems* were made by yourself.

16316. Could you say that your later experience, which I gather includes more than 1,200 cases, would be more favourable to the safe use of anæsthesia than in the first 1,200 cases— take your last 1,000 cases in general practice?—Yes, it would be much more favourable, I am perfectly satisfied, and I still use chloroform for any operation which I think necessitates chloroform, without hesitation.

16317. You performed very extensive operations on dogs, I suppose?—I did, and minor ones, too, for the same reason, because I was told particularly that in dental operations, for instance, on a human being, it was considered very dangerous to extract a tooth under chloroform, so that whenever opportunities occurred for that in a dog, whether they were loose or fixed I gave chloroform on every possible occasion.

16318. Have any of your operations extended over a period of an hour or two?—Yes, a number of them. The longest was five hours. That was not an operation; it was a case really of chorea. I wished to see whether chloroform anæsthesia would benefit chorea or not.

16319. Did the dog die?—No; the chloroform was given by students; they were men who had seen me give chloroform, but it was given by relays of students, because five hours is a long time for one man to be at it.

16320. I now want to read to you some evidence which has been given to us by previous witnesses bearing on this point. For instance, one witness told us, in answer to Question 812, that he thought it was "generally impossible to keep a dog alive for two hours under full anæsthesia, or for one hour." Do you agree with that?—Absolutely no.

16321. You think that is certainly erroneous?—I do not think, I know it is erroneous. It was the idea years ago, but it is erroneous. I will prove that to anybody.

16322. You still use chloroform and not the A.C.E. mixture?—Absolutely, except just in certain cases.

16323. Have you used the A.C.E. mixture pretty extensively, too?—Yes, I have used it extensively.

16324. Did you find that it was particularly dangerous?—No.

16325. But why have you abandoned the A.C.E. mixture?—I use the A.C.E. mixture still at times.

16326. But you also use chloroform?—Yes, I prefer chloroform, especially for abdominal or any serious operations, because it is so much easier for my assistant to keep the patient still.

16327. So that you are perfectly satisfied, as the result of your own extensive experience, that it is possible to keep a dog under the influence of chloroform to such a degree that it is quite unconscious for a period of two hours?—I am so satisfied of it, that I cannot understand any one who has had any experience at all making the opposite assertion.

16328. I am not sure that we have had any evidence to the contrary from anybody who has said that he had extensive experience, but it seemed to be a pretty widely-felt opinion, especially among laymen, that it was practically impossible to keep a dog under an anæsthetic for a long period without a very great risk of the animal being killed by the anæsthetic?—I know that it has been a common impression because I have many thousands of people to deal with in the course of a year, and a very great number of them are ladies, who have pet dogs, who have this impression, or who have had this impression.

16329. The next point I would like to ask you is, have you experienced any great difficulty, when anæsthetising animals, in satisfying yourself as to when they had become unconscious to pain?—No, I have had no difficulty.

16330. You do not think that there is any great difficulty in that?—I do not think that there is any great difficulty. I have purposely experimented in order to test that particular point by starting my operations soon, at a certain stage, and then, of course, leaving it until the animal is quite deeply anæsthetised, and in my own mind I have no hesitation in saying that I think I can tell when an animal feels pain and when it does not feel pain. I tell by the response to my stimulus.

16331. And in practice at the present time you are never in doubt?—I am never in doubt.

16332. (*Chairman.*) When you perform an operation do you administer the anæsthetic yourself?—I cannot do that. I must do the operation antiseptically. I cannot touch anything that is not surgically clean.

16333. It is administered under your supervision?—Yes, by my nurse generally. We have nurses for it, or it is done by an assistant, but mainly a nurse has done it lately; a lady especially trained to it.

16334. (*Sir John McFadyean.*) Do you think that the administration of chloroform to a dog involves any cruelty to the dog itself?—No.

16335. We have been told so here. I will read the answer to Question 808 in the evidence of Sir Thornley Stoker, and I think we have had other evidence to the same effect. The answer was: "The amount of terror that a dog feels, even in being put under chloroform, is rather painful to witness." Does your experience bear that out?—No, it does not. A dog will struggle against anything being put on its nose, but it is only struggling against a foreign body. If I put this mask which I have here on a dog's nose, or if I put it on the operating table it will struggle, naturally, because it is something foreign to it, but not from fear. It struggles to get away, as every dog will.

16336. You do not think that dogs exhibit signs of terror in anticipation of being chloroformed?—Not if they are gently handled. I purposely did something to test that question a little while ago in front of several gentlemen who had an idea that a dog would show a great deal of terror. They were gentlemen connected with a certain Society. I asked two of them to come one afternoon to see that what they had thought was not really the case. We chloroformed a couple of animals; we did one abdominal operation, and then, in front of them, we took a number of dogs purposely out of their kennels. I should think there were 12 or 15 dogs, one after another put on the table; we put them down on the table with the operating hobbles.

16337. Did you convince the persons for whose benefit it was done?—I think they were convinced; I believe so.

16338. (*Chairman.*) You mean that you merely put them in position without operating?—I may say that there were 10 or 12. I did two operations under chloroform. Those were all that I had that afternoon, and I took a number of dogs out of the hospital kennels and put them on the operating table with the hobbles. They were put there gently, as we always do put them, and when a dog is put on the operating table with the hobbles, if it is soothed and talked to gently, it does not show excessive fear.

16339. (*Mr. Ram.*) Those would be curative operations?—Those dogs were patients in the hospital.

16340. (*Sir John McFadyean.*) May I ask whether in operating upon dogs you invariably secure them to the table?—Not always, because occasionally, for perhaps some minor operation, a lady will insist on having the dog chloroformed in her arms, and that we do.

16341. But as a rule they are fastened to the table?—For our own convenience they are. I have some hobbles here.

16342. Have you ever seen an illustration of the way in which so-called vivisectors fasten dogs to a table?—I think I have seen a catalogue, but I forget what it was like. I think the position is similar to my own, but there are certain alterations which I think are safer for chloroformisation. I think that the table to which you refer is curved a little on the top. Mine is a flat table.

16343. In your case the dog is secured by the four legs?—By the fore legs and the hind legs, and it is stretched out in such a position that its chest gets free play.

16344. Is that in case it might be incompletely anæsthetised and be in a dangerous state when you begin to operate?—No, it is done because I think that is the safest position; it gives its chest the freest play. If its legs are extended it has the freest play for the lungs.

16345. You think that is the safest position for anæsthetising an animal?—I do.

16346. But I suppose it is also the most convenient position for the operator?—Certainly.

16347. Then I want next to elicit your opinion with regard to the possibility of inducing wounds inflicted on animals to heal directly, that is, by first intention. You succeed frequently, do you, in inducing even large wounds in the lower animals to heal without suppuration?—I do. I have a horse at the present

Mr. F. Hobday, F.R.C.V.S., F.R.S.E.

19 Nov. 1907

moment with a wound about 11 inches long. Nine inches of it has healed without suppuration, and in the dog I should never bandage or dream of touching the wound again for from five to ten day. I never bandage wounds. Many thousands of dogs have had operative wounds made on them and have never been bandaged, and I have never bandaged an antiseptic surgical wound on a dog but once during the last six years, and that time I regretted it. I did it at the owner's request, and I regretted it. I do not always get a healing by first intention, but in by far the majority of cases I do. That means that I have no irritation there, and the dog has not licked his sutures out. If irritation is present, or if the wound is painful, there is no animal which is so eager as the dog to get at it with its tongue and spoil all my work.

16348. We have been told here that it is scarcely possible to apply bandages to one of the lower animals in connection with a surgical wound with any chance of the bandage being kept on; that the pain in the wound will usually induce the animal to tear the bandage off. What do you say in regard to that?—In reply to that I say that if my operation is done antiseptically, then, if the dog tears the bandage off it will not be pain in the wound that makes it tear it off, but the restraint of the bandage to which it is unaccustomed, and that is one of the reasons why I prefer not to bandage. I do bandage afterwards if the wound suppurates; but I always know that the dog has to be watched to see that it does not get the bandage off, and it is a continual nuisance to me.

16349. But do you ever leave an extensive surgical wound in a dog unbandaged?—Always.

16350. That is your rule?—That is my absolute rule.

16351. (*Mr. Ram.*) You put a dressing on?—Yes; the operations are done antiseptically, and the wound afterwards is dried properly with ether and various things. Time is taken over all this, and the wound is afterwards dressed with iodoform colloid, or some such preparation (we have several preparations of that kind), in order to hermetically seal it from contamination from the exterior.

16352. (*Sir John McFadyean.*) It has also been represented to us that extensive surgical wounds inflicted in physiological experiments on the lower animals must necessarily be painful when the animal comes out of the anæsthesia. Have you any evidence bearing on that question?—I have no experience of a physiological laboratory; I never worked in one; but my own experience is that the statement is absolutely untrue. I argue in this way: the wounds are the same whether the human surgeon makes them with the scalpel or I make them; if they are done antiseptically they are the same in principle. If my wound was painful I should expect, from my knowledge of the dog, or even of the monkey (for I have also had experience of monkeys), that the animal would immediately go for those sutures and pick them out, or, at all events, lick the wound continually. That is evidence of irritation in the dog, but I do not find that as a rule. I am annoyed when I find that a wound has got contaminated and my dog has licked the sutures out. By far the greater majority of my wounds heal by primary union.

16353. And apparently without pain?—Apparently without pain. I have done this repeatedly to prove it. I have done abdominal section, removed the ovaries, and perhaps the uterus of a bitch, and sent it away from the hospital repeatedly within 10 days, and frequently on the fourth, fifth or sixth day.

16354. Do you employ any restraint to prevent the dog licking the wound?—Absolutely none. The dog is simply put into a cage and given over to the nurse until it is out of the chloroform, and when once it is out of the chloroform it is simply put into a kennel like other dogs.

16355. What do you say with regard to the popular belief that licking is good for a dog's wound?—It is not good. I want wounds left alone. If a dog licks the wound it infects it.

16356. It is an indication that it is experiencing irritation?—Yes. That, again, I have gone into, because when the wounds have been irritable the application of antiseptics has caused that irritation to cease quickly.

16357. There is just one other question that I should like to ask you, and that is, what would be your opinion as to the wisdom and advisability of making it illegal to use dogs for experiments. I want, in the first place, to ask whether you think it would be in the interest of the extension of knowledge with regard to disease of the dog itself?—Do you mean to use diseased dogs for experiments?

16358. No. I mean, would you approve of its being declared illegal to make an experiment on a dog, even for the purpose of extending knowledge with regard to diseases of the dog?—It was particularly understood that I was not to be asked questions of that kind. You will quite understand me. For certain reasons, I was particularly asked that I should come in the character of an independent witness, neither on the vivisection side nor the anti-vivisection side. I came on the anæsthetic question, and for other reasons, too. I was given to understand that I should not be asked questions of that kind.

16359. I have no desire to press the question, but I ask you what your own inclination may be?—I will tell you this much, that if I had a diseased dog, and I thought that some experiment upon it whilst it is in a state of disease would help other diseased dogs (and I knew it was a hopeless case with our present knowledge), I should not hesitate to try that experiment, whether surgical or medicinal, upon that diseased animal.

16360. That is hardly what I wanted. I suppose you admit that there is a good deal of ignorance with regard to diseases of the dog itself?—Yes.

16361. Is an extension of knowledge with regard to such a common disease as distemper desirable?—It is very desirable.

16362. Supposing that you were commissioned to try to extend that knowledge, how would you set about it now?—I would be only too glad to act on a Commission which involved the use of a certain number of dogs in order to save the majority of dogs.

16363. Then, that comes to an expression of opinion that to declare experimentation on dogs illegal would tend to keep up ignorance with regard to diseases of dogs?—It is impossible to make progress without utilising some healthy dogs. Take your own example of distemper; it would be impossible to make progress in the knowledge of the disease without utilising healthy dogs.

16364. Without experiments?—Without experiments.

16365. You do not think it would be possible to investigate the question of distemper at the present time without experiments?—I do not, and, moreover, I am quite prepared to go to this extent, that to let a few dogs comparatively have distemper, whether given artificially or whether given naturally, would be a much better thing than to let hundreds of thousands die every year from this scourge, as they do at the present time.

16366. (*Sir William Collins.*) Do I rightly understand that you were Professor of Therapeutics at the Royal Veterinary College for seven years?—Yes.

13667. Did you illustrate your lectures by experiments on living animals?—To some extent. I got a certificate to permit me to use anæsthesia to demonstrate the methods of giving chloroform anæsthesia. I had to get a certificate to do that before my students.

16368. You held a licence?—Yes.

16369. Which certificate did you hold?—I think it was C; it is some years ago.

16370. Was it limited to the question of anæsthetics?—No; I wanted to demonstrate poisons, too. When an animal was to be destroyed I wished to do it before a class of students, explaining the different symptoms as one went on. But another object that I had, which I worked at when I was at the College, was to try to find out the most humane method and quickest method of destroying a dog.

16371. Then, you demonstrated the poisoning of dogs by various poisons?—The killing of dogs by various things; and as the result of that I had a little apparatus made which, I think, is very humane.

16372. Did you administer anæsthetics as well as the poison in those cases?—Not always.

16373. So that they were experiments without anæsthetics?—Yes; the dog had to be destroyed, and it was destroyed.

16374. (*Chairman.*) What was the poison that you generally used?—Prussic acid.

16375. That has always been the drug used, has it not?—Yes; but the reason of my experiments was that when dogs have prussic acid given to them, it is very rapid in its action and it kills within 30 to 45 seconds; but with a large proportion of them, and with cats too, you get a most horrid yell or scream, which is very objectionable and sounds as if it might be painful. It may be involuntary, but it sounds as if it might be painful during those few fractions of seconds.

16376. (*Sir William Collins.*) Was prussic acid the only poison that you employed?—No, I used chloroform a great deal.

16377. (*Sir Mackenzie Chalmers.*) And morphia?—I did not use morphia then.

16378. (*Sir William Collins.*) You spoke of certain ill-results which had occurred in the administration of anæsthetics to dogs. What did you mean by that?—I was always taught that if you gave a dog chloroform it never woke up again, it was killed. Those are the ill-results. Frequently one used to be giving a dog chloroform, or a student would give it chloroform, and suddenly respiration would cease, and it would be impossible or extremely difficult to bring the dog back to life again.

16379. Why was that?—Because it got an overdose of chloroform.

16380. Then what you have learnt of recent years has been to measure and graduate the dose?—Yes.

16381. Do I rightly understand that you regard chloroform as better than the A.C.E. mixture for animals that you have to deal with?—For the majority of dogs I do.

16382. Do you always administer it by a mask?—Always.

16383. Not by a tracheotomy tube?—Never. You cannot with a patient.

16384. Have you any experience of hypnotism as a means of anæsthetising animals?—I have none. I have tried it and failed.

16385. Why do you not employ a tracheotomy tube in cases that you have to deal with?—Because naturally my clients would not like me to make a wound in their dog's throat when I can give chloroform so readily without it. They would not like them to go home with a wound in the throat, and the trachea itself would be injured.

16386. Have you ever given an anæsthetic by means of a tracheotomy tube?—I do not think I have. If I have it is only once or twice.

16387. Would it introduce any complication, in your opinion?—I have had no experience of it. I should not dream of doing it on a patient. The complications would be the unfortunate necessity of making a wound and having to heal it afterwards again.

16388. I see that before the last Royal Commission on Vivisection a memorial was put in on behalf of the veterinary surgeons of Scotland to this effect: "We, the Court of Examiners for Scotland of the Royal College of Veterinary Surgeons, desire to express our opinion that the performance of operations on living animals is altogether unnecessary and useless for the purpose of causation." That is signed by "James Syme; James Dunsmure, M.D., President of the Royal College of Surgeons of Edinburgh; J. Warburton Begbie, M.D.; John Lawson, President of the Royal College of Veterinary Surgeons; B. Cartledge, M.R.C.V.S., Member of Council of the Royal College of Veterinary Surgeons; William Cockburn, M.R.C.V.S.; Charles Secker, M.R.C.V.S.; and James Cowie, M.R.C.V.S. I fully concur in the above, John Wilkinson, principal veterinary surgeon to the Forces." That was put in in 1876, but the document was earlier than that. Do you wish to say anything with regard to it?—No, it is so long ago, and medical science in five years is completely revolutionised. I know nothing of their opinions then.

16389. Do you wish to give any opinion now as to whether experiments on living animals are useful for the purposes of veterinary science?—I should say the same to you as I said to Sir John McFadyean. Take the case that he instanced. If you mention any specific instance, take distemper.

16390. Have we discovered the cause of distemper?—We want to do so.

Mr. F. Hobday, F.R.C.V.S., F.R.S.E.

19 Nov. 1907

16391. Then that would hardly be an instance of definite value that had accrued?—No, but if you want an instance of definite value having accrued, so far as I personally am concerned, it was the knowledge that the abdomen was opened continually in a physiological laboratory which encouraged me personally to open the abdomen in a dog for removing certain things from it. I mean the knowledge that it was done with safety. When I was a student in the pre-antiseptic days, as the thing was practised when I was a student, I dare not open the abdomen of a dog without warning the owner that the patient would very probably succumb, not from the operation itself, but from peritonitis or something of that kind.

16392. The abdomen was opened, was it not, in pre-antiseptic days in veterinary surgery?—It was opened, but the veterinary surgeon never failed to warn his client that there was a prospect of grave trouble afterwards. Take, for example, the operation of spaying a mare, ovariotomy of a mare, which I think now can be claimed to have been revived again in England. It was done seventy or eighty years ago continually, and spaying a cow, too. Charlier, at the beginning of last century, proved that the abdomen of a cow could be opened with safety and the ovaries removed.

16393. That was in the pre-antiseptic days?—Yes, but Charlier, looking back over his methods, was antiseptic without knowing it. He boiled everything, and cleaned his hands and cleaned the cow's passage out before doing the operation; and that was the reason of his success.

16394. Did it answer to the antiseptic method?—He did not call it the antiseptic method, but he operated with great success certainly, because he boiled his instruments, and washed his hands clean and washed his cow. As I say, during Charllier's time, in his hands the operation was very successful. After his time it fell into disuse again, because other people tried it and they were not successful, and the same with the mare. In the present day I think that any modern veterinary surgeon will go forward and do these operations practically stating that his patient will live afterwards, but the primary ones must have been experimental.

16395. In that case the animals have benefited by improvements in surgery in the case of man?—Done by human surgeons on man.

16396. Done by surgeons rather on human patients?—Yes.

16397. (*Sir Mackenzie Chalmers.*) As regards these operations that you have told us of on dogs, taking out the uterus and the ovaries, is that done on account of disease, or is it done to prevent the animal breeding?—Sometimes for one thing, sometimes for the other.

16398. Does your practice extend to horses as well?—Yes, I have a great number of horses to treat.

16399. Can you give a horse anæsthetics?—Yes.

16400. Can you give chloroform safely to a horse?—Yes.

16401. When a horse is castrated what do you use, the knife or the ecraseur?—I do not use either. I use a special instrument generally. Sometimes, if I have a pupil who wants to see an ecraseur used, I have one, and I use it.

16402. What anæsthetic do you give to a horse?—Chloroform always, or, if it is local, cocaine perhaps, but choloroform always for castration.

16403. In the case of ordinary farmyard animals are anæsthetics ever used?—They are used.

16404. When a veterinary surgeon does it?—Yes.

16405. Not when the farmer does it, I suppose?—I should think that the farmers would hardly use it. Some farmers are very clever at it, but the majority would not dare to use it. It requires special skill.

16406. In the case of a horse, I suppose it is always done by a veterinary surgeon?—No, many horses are castrated all over the country by the castrators. Thousands of horses in England even.

16407. By an ordinary man—by a gelder?—By a castrator, whose father and grandfather probably have been castrators before him.

Mr. F. Hobday, F.R.C.V.S., F.R.S.E. 19 Nov. 1907.

16408. In that case are anæsthetics used or not?—Now and again we come across a man who perhaps himself started his career at the College—a man, I mean, of some education—who will dare to use chloroform, but it is very rare to find that. By far the majority use no anæsthetics at all. To begin with, they would have a difficulty in getting a poisonous agent like chloroform; they would have to get it through a friend who held a medical qualification.

16409. Is castration a very severe operation; is there great pain?—There is great pain for an instant, but it is very rapidly done, and the horse will go straight to its manger, in the majority of cases, afterwards. In fact, I have seen them repeatedly pick up grass off the ground before the hobbles have been removed, within a few seconds of the operation done without anæsthetics.

16410. They are cast, of course?—Some are cast, some are done standing. A very large proportion of horses are done standing up. Some men simply go in without even any method of restraint at all, or without a companion. Some men will go into a loose box and operate and come out again within four minutes, with the two testes in their hands, but in the majority of instances two men are used, one at the head and one at the hind quarters, and the operator himself will do the whole thing in a few moments. Personally I have done it in two and a half minutes, so that I know it can be done, and I am not an expert at it.

16411. (*Chairman.*) At what age is the horse operated on?—Some are done as yearlings, but it is usually done at two, three, or four years old. Some horses are done when they are very old, ten and twelve years old, but the majority are two, three, and four years old.

16412. (*Mr. Ram.*) Is the horse restrained in any way when it is done standing?—Sometimes a twitch is put on to its nose, and it is pushed into a corner. Sometimes, if the horse is troublesome, the twitch is taken off and a man just holds his head. It is a very quick operation.

16413. Does the operator get underneath the horse or between its hind legs?—No, he gets just in front of the hind legs, and takes hold of the testes; the instrument is used very quickly, and the testicles are removed in a few minutes, as I say. I think there is a man who does it between the hind legs, but the majority do not. As a rule the horse does not kick.

16414. (*Sir Mackenzie Chalmers.*) Is there more danger in giving a horse chloroform than there is in giving a dog chloroform?—I do not think so. In both cases it has to be done, of course, with a great amount of skill and care.

16415. You would not expect to have a larger percentage of deaths among horses than you would among dogs?—Not if I had the supervision of it myself.

16416. You told us that you had experimented as to the most humane method of destroying a pet animal?—Yes.

16417. Is prussic acid, in your opinion, still the most humane method?—No, it is the quickest, but it is not the most humane, in my opinion.

16418. You mean that the struggle may possibly be a painful struggle?—I can hear it now. I can hear it for so long afterwards, if the animal does scream. Some do not, some will tumble dead at once, but a few do scream, and I certainly should not care to do it in front of the owner; I should prefer to get the owner out of earshot. Whether it is a cry of pain, or whether it is purely involuntary, I am not prepared to say. I do not know.

16419. (*Chairman.*) Both with cats and dogs?—Both cats and dogs will sometimes give either a scream or a yell just when they appear to be going over the border.

16420. (*Sir Mackenzie Chalmers.*) What, in your opinion, is the most humane method of destroying an animal?—I think the lethal chamber, with one or other of the present-day gases.

16421. Carbon monoxide?—I myself use a mixture of coal gas and chloroform.

16422. That would be carbon dioxide and chloroform?—That is what I use myself, and that is what I think is very humane.

16423. Does it require long immersion?—No, as a rule the patient will become unconscious in four minutes; then you leave it for a few minutes, perhaps another five minutes, to be sure; because if you take them out into the air, then they may come round again.

16424. With the carbon monoxide there is no recovery, is there?—It depends upon the quantity given with carbon monoxide.

16425. When once you have stopped the breathing there is no chance of resuscitation?—When once you have stopped the breathing, with either of them, it would be highly improbable. I have never succeeded in resuscitating an animal when once breathing has stopped.

16426. (*Chairman.*) But suffocation that takes four minutes is rather painful, is it not?—If the anæsthetic is allowed to go in gradually into the box where the patient is I think that the animal will pass away without pain, and I say so from having watched many dogs and cats put into the lethal chamber, or, rather, into a lethal box with a glass top on it.

16427. (*Sir Mackenzie Chalmers.*) There is no struggle?—Now and again you get a struggle; but any dog will struggle against inhaling anything that is foreign to it, but I do not think that is a struggle of pain. It will try to get out of the box, of course. If it is left there in the box without anything put in, it will try to get out of it quickly—that is a necessitous thing.

16428. (*Chairman.*) You do not think that it suffers pain?—I do not think so, and I speak from a large experience now.

16429. (*Sir Mackenzie Chalmers.*) You think that is the most merciful and painless death which you can inflict on animals?—Yes.

16430. For instance, would morphia poisoning be painless?—I think poisoning with morphia would be painless, but I cannot say. I have never managed to poison more than one dog with morphia in my whole life, and I have tried with a large number.

16431. Does it require a very large dose to be fatal?—A very large dose.

16432. More so with a dog than with other animals?—I believe so. A dog is extraordinarily insusceptible to the toxic effects of morphia.

16433. Does it make any difference whether the morphia is injected or given by the mouth?—I have never tried by the mouth. I have always injected it hypodermically. It would make a difference, because everything given under the skin acts more quickly and is more drastic in its action than when it is given by the mouth; it is absorbed so much more quickly.

16434. (*Mr. Ram.*) In those cases in which you experimented yourself, and of which you took notes of consecutive cases of dogs under chloroform, did you say that there were only five deaths in 1,200 cases?—That is so.

16435. And did you in that series of experiments derive any knowledge as to the length of time for which it is possible to keep dogs under anæsthetics?—Yes.

16436. You have tried that?—Yes. Most ordinary operations can be done within half an hour quite readily, but a number of operations took me over an hour.

16437. And you had no difficulty in anæsthetising the animals?—I had no difficulty in maintaining the anæsthesia at all. I did keep several dogs under anæsthesia for over two hours, and one for five hours.

16438. You have known a case of a dog being under anæsthesia for five hours?—As a matter of fact, relays of students kept it under for me, but I was about, and knew that the animal was anæsthetised the whole time.

16439. During the whole of that time was the dog insensible to pain?—It was.

16440. We have been told by one of our earlier witnesses that the horse is not a good subject for anæsthetics, and therefore that many people are afraid to have valuable horses anæsthetised when they are castrated, or otherwise dealt with. Has that been your experience?—That has not been my experience.

16441. With regard to either a horse or a dog, do you find after ill effects in consequence of the anæsthetic—sickness or trouble of any sort?—It is most

rare to get sickness. The animals are stupid and dull for perhaps an hour, or it may be a couple of hours. A sensitive dog will be stupid for a couple of hours.

16442. Seedy?—Yes, it will be seedy because it will not feed. Supposing I operated this afternoon on a little dog, I should not think anything if my nurse told me to-morrow morning that the patient was not taking its breakfast, but at the same time I should know that it was rather against the rule. The next day I should expect it to take its food.

16443. Is a dog sick after anæsthetics?—It is most rare.

16444. Is it possible for a horse to be sick?—Only under certain diseased conditions, for instance, when it has a ruptured stomach, or when it swallows hawthorn berries. You cannot make a horse sick if you try.

16445. It is not subject to any emetic?—No, you cannot make a horse sick.

16446. Have you ever seen any animal under curare?—No.

16447. (*Dr. Gaskell.*) I should like to know, please, how you know when your animal has had sufficient anæsthetic not to feel any pain?—By its irresponsiveness to a severe stimulus.

16448. Responsiveness of what kind?—Either by a cry, by an expression of pain in that way, or by shrinking away from the stimulus.

16449. But might not movement take place?—When an animal is under anæsthesia movement is always taking place; the mere fact of the respiratory muscles working draws the legs backwards and forwards, and frequently the legs are quivering a little.

16450. You very frequently find in animals that you do get movements of the legs more or less synchronous with respiratory movements?—Yes.

16451. That is common under anæsthetics?—That is common under anæsthetics if the animals are not strapped down tightly.

16452. But that is no sign of pain?—That is no sign of pain.

16453. And if you have a dog chloroformed sufficiently to remove pain, can you tell us at all how far that dose is removed from a dose which would kill?—In figures do you mean?

16454. No, I mean in your general impression is there a large margin between the two things, or is it near?—There is a margin; when a dog has been under proper chloroform anæsthesia for some few minutes it is often very difficult with the apparatus which we use to give it a lethal dose. When once the system has become tolerant to chloroform, and it is still given in a rational manner with the proper percentage of 9 to 2 per cent., it is extremely difficult. It will often take half an hour to finish it off.

16455. The danger then is at the beginning of the administration?—The danger is at the beginning. I am quite satisfied about that, and if the anæsthetic is given in an excessive dose at the beginning, your dog goes under quickly, literally like the snuff of a candle, but when once I get the animal tolerant to it I can let my kennelman or groom come and give the chloroform, and I can attend to the operation. I know I am all right.

16456. Are you right in thinking that the danger at the beginning is due to an overdose?—I think I am. I think it is due to asphyxia.

16457. Have you read a paper by Martin and Embrey in the "Physiological Journal"?—I have not seen that paper. I would like to read it through.

16458. It is to the effect that the first administration of chloroform, especially to an animal like a dog, causes a slow stoppage of the heart through the action of the vagus nerves. That is well known, of course?—Yes.

16459. And that then if the animal is apparently dying, if you cut the two vagi nerves it will recover, and you can go on with the administration of chloroform quite happily?—That is interesting. I have not seen the paper, but I will read it. The other is only my own idea, of course. I am not a skilled physiologist.

16460. The danger is at the beginning, not necessarily because you have given too much chloroform, is it, but because of the action of the chloroform in the medulla oblongata at first?—I am only speaking as a clinician, and my experience is that the danger is only at the beginning.

Mr. F. Hobday, F.R.C.V.S., E.R.S.E.

19 Nov. 1907.

16461. That is also the physiologists' experience, I may say. When you say that it takes a large dose of morphia to kill a dog, you mean a dog as compared with other animals?—Yes.

16462. Would you consider that morphia is a narcotic to a dog?—Yes, I do consider it a narcotic.

16463. Do you use it in your practice in the same way as medical men do in their practice with human beings for allaying pain?—I use it largely for stopping pain.

16464. And you find no difficulty?—I find no difficulty in the dosage.

16465. Do you find any difficulty in stopping pain?—Sometimes a dog does not respond as I should expect it to do.

16466. Is that a question of dosage, or is it a question of idiosyncracy?—I think it is a question of idiosyncracy, but I am not prepared to give a definite opinion upon that point. I begin to think it must be an idiosyncracy.

16467. (*Chairman.*) Of all dogs, or of certain dogs?—Of certain dogs. I am speaking of dogs alone.

16468. (*Dr. Gaskell.*) I think you may take it as a rule that morphia, except in very large doses, will act in much the same way on a dog as it does on a human being; it will cause absence of painful sensation, I mean?—I presume so; I have that impresion, but I have no experience of it in human beings, except that people have told me that they feel comfortable after it, and dogs certainly give me the impression that they are comfortable after it in the majority of instances.

16469. Have you any experience of such an anæsthetic as chloral with dogs?—I cannot say that I have used it sufficiently to form an opinion.

16470. Or urethane?—I have not used it at all.

16471. Practically you administer chloroform?—Chloroform, the A.C.E. mixture, cocaine and the different local anæsthetics.

16472. (*Dr. Wilson.*) Do you ever use morphia before administering chloroform in an operation?—I have sometimes done so. It is not my general practice to do so, but I have done so at times.

16473. I think you said in answer to a question which was put to you, that you prefer to use chloroform because animals keep far more still during the operation than when you use the A.C.E. mixture?—They keep far more still for a longer period than when I use the A.C.E. mixture. When once an animal is anæsthetised by chloroform I know that my anæsthetist need not keep pressing the bellows so frequently as with the A.C.E. mixture. The animals waken up much more quickly from the stage of unconsciousness when the A.C.E. is used than they do with chloroform; that is to say, the stage of anæsthesia with the A.C.E. by some few seconds, or minutes probably.

16474. You have no experience yourself, of course, but would you conclude that if the A.C.E. mixture was used for keeping up artificial respiration, through a tracheal tube, for example, in preference to chloroform, there would be more risk of the animal becoming conscious to pain during a prolonged operation?—Not at all if the anæsthesia is kept up. It requires more pumping of the apparatus to keep the animal deeply anæsthetised with A.C.E. than it does with chloroform alone, and in the same way with ether, it requires more pumping than with chloroform alone. The stage of anæsthesia with chloroform is longer, that is to say, you can cease pumping chloroform for a longer interval than you can with either of the other two.

16475. Do you think it requires more careful supervision when using A.C.E.?—I think it requires less supervision than using A.C.E. or ether, but A.C.E. particularly. I do not use ether much because it sickens the dog so afterwards.

16476. Are your dogs so completely muzzled that they cannot cry out during the operation?—If they are under chloroform they cannot cry out. Do you mean when they are going under?

Mr. F. Hobday, F.R.C.V.S., F.R.S.E.

19 Nov. 1907.

16477. Yes, you say that you use a stimulus to test whether they are sufficiently under chloroform?—I do not say that I do now, but I have done so. They would have no muzzle on at all.

16478. The response to the stimulus would be a cry?—Probably, or the retraction of a limb.

16479. Then when you are operating on them there is nothing to prevent their crying?—Absolutely nothing. If they could not cry they could moan. They just have their heads in the mask and there is nothing to stop the jaws from opening, or they might have a piece of tape round the nose. We always put a piece of tape round the nose when we are handling dogs as a matter of precaution, because however fond a dog is of you, if you do something to it that it does not quite understand it may take hold of you, and frequently will have hold of you.

16480. But supposing you used a wire muzzle instead of tape?—You could not get a wire muzzle under the mask. Besides, I do not like a wire muzzle, it is not a safe thing to use.

16481. But you would not use morphia alone without either the A.C.E. mixture or chloroform for an operation, would you?—I should for certain minor operations. For example, the operation of removing a very small tumour or removing a small elliptical piece of skin from the eyes, which is very common in certain breed of dogs with certain diseases.

16482. I was referring to a rather serious operation?—No, not for serious operations. I should give either the two or chloroform itself.

16483. (*Sir William Collins.*) Did I rightly understand you to say that dogs are insusceptible to morphia?—They are very insusceptible to a toxic dose of morphia.

16484. Did I rightly understand you to say that you had not succeeded in poisoning a dog with morphia?—I have only succeeded in poisoning one.

16485. Have you made many trials?—I use it largely. I have injected it largely either before chloroforming or I have tried on several occasions, when the owners have thought morphia a humane method of putting a dog away. I have given large doses; I have given as much as 20 grains, and to my astonishment, because I did not know that the dog was so insusceptible as that to a toxic dose, the dog has been alive the next night, 24 hours afterwards.

16486. Is it an easy thing to give a lethal dose of morphia to a dog?—Personally I do not think it is. Some dogs will become perfectly comatose with a grain, with a small amount. The other day I had a small animal; I gave it, I think, two grains, but it acted on that animal just as much as I should have expected four or five grains to have acted on an animal of the same size. The idiosyncrasy of that particular animal was very great towards it. Frequently half a grain will produce a stupor in one animal when it will take a full grain or a grain and a half to produce it in another animal of the same size.

16487. Then morphia affects different dogs differently?—It does.

16488. Can you not regulate the necessary dose by reference to the weight of the dog?—Generally you can, but you never can be quite certain.

16489. I thought you suggested just now that the weight was not a guide?—Not to the toxicity.

16490. Or to the effect?—I say it is not a certain guide.

16491. You told us that you have given chloroform to dogs some 1,200 times?—Literally thousands of times. I kept notes of my first 1,200 cases.

16492. As an anæsthetic?—Yes, as an anæsthetic.

16493. How many times have you administered morphia to dogs as an anæsthetic?—I should say pretty nearly a hundred times.

16494. For considerable operations?—Not for major operations.

16495. Why not?—I have done so and given chloroform afterwards.

16496. But have you used morphia alone as an anæsthetic for major operations?—No.

16497. Why not?—I do not use it. I prefer chloroform. I always use chloroform.

16498. Why do you prefer chloroform?—Because, for one thing, I am in the habit of using chloroform, and have been for many years, and I like chloroform.

16499. Is it because chloroform is a better anæsthetic?—Undoubtedly, for major operations.

16500. (*Dr. Gaskell.*) In those cases where you have used morphia, do you consider that the animal has not felt pain during the operation?—I do not say that. I mean that I should not use morphia for any major operation.

16501. But in cases where you have used morphia, have you felt satisfied that the animal has not suffered pain?—No, I cannot say that. I mean just at the very instant. If you take that eye operation that I was speaking of, the snip is done instantaneously, but my animal will flinch, although it passes immediately into a state of dreaminess again, and does not appear to suffer, but just at the instant of the snip, the eye being, of course, a very tender part, it will just flinch, perhaps.

16502. (*Sir John McFadyean.*) What was the condition of that dog which survived a dose of 20 grains of morphia?—Carcinoma.

16503. But what was the condition of the dog two hours afterwards?—Absolutely dead to the world, literally.

16504. Do you think it was conscious to pain?—No; I could make it respond by perhaps lifting the foot up and dropping it down again; I forget what I actually did, but I know when the nurse went to it she patted it or did something, and it just lifted its head for a mere fraction of a second, showing that it did know her for a second, but it could not recollect.

16505. Was it susceptible to such stimuli as you have mentioned?—Yes.

16506. Have you had any other case approaching it in which a dog would stand 20 grains?—No, not when I have given as much as that. I have given 16 grains, though, once before, and nine and ten grains several times, and the animals did not succumb.

16507. So that you think it might be pushed so as to obtain its full effects as an anæsthetic without much risk of killing the dog?—That is my experience. I have been astonished at it.

16508. (*Sir William Church.*) Have you experience of laudanum in dogs?—I give it sometimes.

16509. Does it fail to act in the same way; are dogs tolerant of a large dose of laudanum?—My experience is that they are very tolerant of a large dose of laudanum.

16510. Have you any idea what would be a lethal dose for a moderate-sized dog?—No, I have not any idea whatever.

16511. Is it the same with cats?—I have no experience of its administration to cats, and I have not been able to find any experience.

16512. (*Chairman.*) You hold a licence, I suppose? I have not had a licence for seven or eight years now. I just held one whilst I was at the College. I got it for the purpose of doing this work with anæsthetics.

16513. You have held a licence?—Yes.

16514. And you know that if you hold a licence, and if you perform a cutting operation on an animal, it comes under the Act?—Yes.

16515. Are there many operations which you perform on a cat, or a dog, or a horse—I mean which would be a patient—without an anæsthetic, for which you would be obliged to use an anæsthetic in case of an experiment?—I do not quite understand the point.

16516. Are there any cases in which you operate on an animal as a patient without anæsthetics?—Yes, plenty of cases. I never give an anæsthetic for a mere lancing of an abscess. There are plenty of instances in which you cannot give an anæsthetic.

16517. I was asking you about tracheotomy. If you were going to cut an animal's throat for the purpose of putting in a tube, would you for that preliminary operation, in the case of an ordinary animal patient, use anæsthetics?—Yes, unless the patient was at the point of death. Tracheotomy is an operation that we have to do in a hurry sometimes. If I was doing tracheotomy on a hunter that is a roarer and must be made useful, I should give cocaine. I should not give chloroform, because cocaine answers the purpose,

It is a mere prick of a needle to begin with, that is the only pain that the animal feels.

16518. If it was at all a serious operation you would give chloroform?—Yes.

16519. But there are a good many cutting operations which you would require leave under the Act to perform, and would only obtain leave to perform with anæsthetics, which you would perform on a patient without anæsthetics?—Yes, I expect that I should. I do not use anæsthetics for every little thing. For one thing, there is not time, and for another thing, I do not consider that the inconvenience which the patient is put to for the time being in suffering afterwards from the anæsthetic is worth it, because the operation is done so quickly; but for any major operation I should always use anæsthetics.

Mr. F. Hobday, F.R.C.V.S., F.R.S.E.

19 Nov. 190 .

16520. (*Sir John McFadyean.*) Have you ever fired a horse in full consciousness?—Yes.

16521. Have you done it a thousand times?—Not quite that, but I have done it.

16522. Do you do it as a rule without anæsthetics?—Frequently.

16523. Have you any doubt as to its being an enormously painful thing?—It is a painful thing, but I generally use an anæsthetic, I generally use some cocaine. At the same time, I do not always do so.

THIRTY-SEVENTH DAY.

Wednesday, 20th November 1907.

PRESENT:

The Right Hon. The Viscount SELBY (*Chairman*).

Sir W. S. CHURCH, Bart., K.C.B., M.D.
Sir W. J. COLLINS, M.P., M.D., F.R.C.S.
Sir M. D. CHALMERS, K.C.B., C.S.I.
Mr. A. J. RAM, K.C.
Mr. W. H. GASKELL, M.D., F.R.S.
Mr. J. TOMKINSON, M.P.
Mr. G. WILSON, M.D., LL.D.
Capt. C. BIGHAM, C.M.G. (*Secretary*).

In the temporary absence of Viscount Selby, Sir William Church took the Chair.

Mr. W. OSLER, M.D., F.R.S., F.R.C.P., called in; and Examined.

16524. (*Sir William Church.*) You, I think, are Regius Professor of Medicine at the University of Oxford?—Yes.

16525. You are a Fellow of the Royal Society, and a Fellow of the Royal College of Physicians, London, and you have been, I think, Professor at the Johns Hopkins University, Baltimore?—Yes.

16526. You wish to make a general statement showing that medicine offers no exception to the other sciences?—I put down very briefly these statements in my *précis*, particularly with reference to one or two points that perhaps have not been dealt with by other men who have already given evidence.

16527. You have read the evidence before the Commission?—Not all of it, but that of Professor Gotch and one or two others.

16528. Have you read Professor Starling's evidence?—Yes, Professor Starling indicated to me particularly the lines on which I, as a practical physician, could perhaps best give evidence, and I put down here these one or two points which perhaps have not been, as was thought, fully dealt with by others.

16529. You agree with the general line of the medical and physiological evidence, I suppose?—Fully, particularly with that of Professor Starling, the President of the Royal College of Physicians, and the President of the Royal College of Surgeons, whose evidence I have read.

16530. You would like to add a few points?—Yes, particularly these points that I have referred to in my *précis*. I do not think it is worth while to speak in regard to the influence of experiments on animals or in regard to the way in which we have learnt the etiology of acute infections through those means. But I think that the story of yellow fever illustrates, perhaps, more satisfactorily than any other, the remarkable way in which experiments, carefully devised and carried out, may influence not only our knowledge of the etiology of a disease, but may influence extensively the commercial relations of nations, and save not only thousands of lives but millions of pounds annually. Would you like me to speak of that particularly.

16531. If you please?—Yellow fever has been the great scourge of the regions round the Carribbean Sea, more particularly Mexico, the West Indian Islands, Brazil, and every few years it has spread into the Southern States of America, and occasionally has reached Philadelphia, and even as far north as Boston. In the early part of the last century on several occasions it reached Europe, and there were extensive outbreaks in Spain, costing some thousands of lives. Many attempts had been made to find out the cause of the disease, but all had failed up to the year 1900, when a Commission was sent to Havannah by the United States Government especially to investigate the cause of yellow fever. That Commission, composed of Drs. Watten Read, Carroll, Lazlear, and Agramonte, recognised particularly the relations of the mosquito to the disease, and they went out with the specific object of determining, if possible, to discover the germs of the disease. The experiments which they devised were carried out in a United States Army Camp in Havannah, and they are among the most remarkable that have ever been made. The camp was entirely isolated, so that there could be no possibility of communication with the outside. It was composed of a certain number of immunes, that is to say, persons who were no longer susceptible to yellow fever.

Mr. W. Osler M.D., F.R.S., F.R.C.P.

20 Nov. 1907.

16532. (*Mr. Ram.*) In consequence of having had it, do you mean?—In consequence of having had it—and of non-immunes. That is a common division of the population in Brazil and Havannah—namely, into immunes and non-immunes. A man is asked whether he is immune or not.

16533. (*Sir Mackenzie Chalmers.*) Does one attack confer immunity as a rule?—One attack confers immunity. In this camp a house was constructed with two compartments, divided from each other by a wire mosquito-proof screen. There were two sets of experiments made in connection with this little house. In the first place, into one side of this hut 15 infected mosquitoes were placed. Those were mosquitoes that had bitten a yellow fever patient within the first three days of the illness. Men were selected, partly from the Army and partly from civil life, who had expressed and signed their willingness to submit themselves to experiments. I may state that one or two of the medical men also volunteered. Into the compartment with the 15 mosquitoes a non-immune went in the morning, in the afternoon, and on the following morning and submitted himself to the bite.

16534. For an hour, or something of that kind?—I do not know how long, but long enough to get a number of bites. Within five days he had the disease. At the same time in the adjacent compartment, which was simply screened from these mosquitoes by a wire

Mr. W. Osler, M.D., F.R.S., F.R.C.P.

20 Nov. 1907.

netting for 21 consecutive nights two non-immunes slept. They did not get the disease.

16535. Were any precautions taken to keep the ordinary mosquitoes from them?—Yes, of course; the compartment was double-doored and very carefully screened so that there was no possibility of that. I may say that experiments of that nature were repeated on several occasions, demonstrating quite conclusively that, so long as these infected mosquitoes were kept from biting, though there was only a screen between them, the individuals did not get yellow fever. Then experiments were made on a very extensive scale to determine whether the disease was conveyed by means of fomites, that is to say, whether, as was usually supposed, the disease was carried by infected clothing and by the excreta of the patients, and by the vomit. For that purpose the clothing and material soiled by the vomit and by the blood, and by the stools of the patients were placed in one of these rooms, and a group of non-immunes slept in contact with this clothing, in some cases between the actual sheets of the beds in which these patients had died, for 21 consecutive nights. That experiment was repeated with a second set of non-immunes sleeping, as I say, with the bed linen and with the soiled materials of patients who had died of the disease. Not one of them took yellow fever.

16536. (*Sir William Church.*) What were the numbers of the non-immunes that slept in connection with the fomites?—I think two or three, two soldiers and one surgeon, for 21 consecutive nights; and a second party for the same period. Then these men were subsequently experimented upon by placing them in the section of the house with the infected mosquitoes, and in each instance they took the disease. Altogether 22 soldiers subjected themselves to the experiments and 22 took the disease; fortunately none of those cases proved fatal. One fatal case was a former assistant, Dr. Lazear, who had been for several years in charge of my clinical laboratory. He submitted himself to the bite of an infected mosquito, and three days subsequently developed the disease and died.

16537. (*Dr. Wilson.*) May I ask what interval there was between the exposure to the fomites and individuals being put into the place with the infected mosquitoes?—Some days, possibly weeks' intervals; I cannot say exactly.

16538. (*Sir Mackenzie Chalmers.*) What is the incubation period of yellow fever?—From three to five days. The mosquito to become infective must bite a patient within the first three days of the disease.

16539. (*Mr. Ram.*) Of its having been in contact with the disease, do you mean?—I mean that the mosquito must bite the yellow fever patient within the first three days of the patient having the disease. The mosquito itself is not infective under a period of 12 days; the mosquito may bite an individual anywhere up to the twelfth day after receiving the infection without being infective; then it remains infective all through the rest of its life. Of course the interesting practical point comes out, that this series of experiments has already revolutionised life in those regions. Havannah within the next two years was cleared of yellow fever, the first time in the 300 years of its existence. The French Academy sent a Commission to Brazil to study the disease, and they have reported in harmony with the American Commission—namely, that the disease is transmitted by the mosquito, and by the mosquito alone, and only by a mosquito that had bitten yellow fever patients within the first three days, and that the mosquito did not become infective until after 10 or 12 days subsequently.

16540. (*Sir William Church.*) I think in yellow fever the transmission of any organism from the mosquito to man has not yet been followed out?—No, we do not know the organism; but it must be a protozoon, possibly a spirochoete, which undergoes a slow evolution in the body of the mosquito.

16541. But nothing has hitherto been discovered comparable with the plasmodium of malaria?—No, but it is possible that it is a very minute spirochoete, which passes through an ordinary filter. This is the kind of discovery that will revolutionise conditions of life in the tropics. The discovery of the malarial parasite and the discovery of relations of yellow fever with the mosquito will enable the Panama Canal to be built. Without those two investigations the probability is that it could not be built.

16542. (*Mr. Ram.*) Or if built, would cost a tremendous sacrifice of human life?—It would cost an enormous sacrifice of human life, just as happened with the French. Now there are 20,000 whites on the Isthmus at work; of course, nearly all of those are non-immune. There has been practically no yellow fever, and what is much more important, because it was not the yellow fever that killed the French to the same extent, there is no malaria.

16543. (*Sir William Church.*) In these experiments that you have been detailing to us, animals do not come in; the animal experimented upon was man?—That is so, only as man is an animal. I am referring to those experiments only as an illustration that it is through the experimental side of medicine, the experimental spirit in medicine, that these great revolutions have been effected, revolutions with which there is nothing else in human endeavour to compare from the standpoint of humanity. There is not anything else in the whole development of the British nation that is going to have so much importance as the discovery of the mode of transmission of malaria. It is going to make the tropics habitable. And all this has come about through the experimental method and the experimental spirit. Without these such investigations could not have been made, and these perfectly phenomenal results could not have been achieved. It was the same spirit that gave us anæsthesia, and the same spirit that has given up antiseptic surgery, and the same spirit which has given us preventive medicine—three things which stand out in the record of human achievement, with which nothing else may be compared—I mean from the standpoint of everyday, common humanity.

16544. Then your contention would be that this experimental investigation into the interaction between the mosquito and man producing yellow fever would never have been thought of if it had not been for previous experiments on animals?—Never. The men who made these investigations spent their lives in laboratories, and their whole work has been based on experimentation on animals. They could not otherwise, of course, have ventured to devise a series of experiments of this sort.

16545. (*Dr. Gaskell.*) Could you experiment with yellow fever on animals?—Yes, recently Wolferston Thomas, from the Liverpool School, working in Demerara, I think, has shown that it is capable of transmission to one of the higher anthropoid apes.

16546. Do the natives take yellow fever?—Yes, everywhere; but they often have it in such a mild form, and have it as children.

16547. Still, even in that mild form, the mosquito would transmit it?—Yes.

16548. (*Dr. Wilson.*) I understand that when the mosquito has once bitten a patient suffering from yellow fever, after the first 10 or 12 days it remains capable of transmitting the disease during its short life?—Sometimes it is a long life comparatively—many months.

16549. Has that been determined?—Yes, it will live through many months; it will live through the winter.

16550. As the fever has disappeared in Havanna may I ask whether the special stegomyia mosquito has also disappeared?—No, they have made an active warfare against it, but I think the mosquito itself has not disappeared.

16551. But if the mosquito is capable of transmitting the disease during its existence, after it has bitten a patient suffering from the disease, how can you get rid of the disease, so long as the mosquito lives?—That is only a matter, I think, of 8 or 9 months. I do not know definitely what the life of a mosquito is. I do not think it is more than over the succeeding winter. What do you say, Dr. Gaskell?

16552. (*Dr. Gaskell.*) I should think not.

16553. (*Sir William Church.*) Is there anything further you wish to add about yellow fever?—No, I think not. The work in Brazil lately has shown that even in large centres, like Rio, by the mosquito brigades thoroughly carrying out measures such as were introduced in Havannah by Gorgas, the reduction in mortality and in the number of cases has been very striking.

16554. By taking steps to prevent the breeding and multiplication of mosquitoes?—Yes, and by carefully reporting and carefully isolating the very earliest cases I look forward to the total abolition of yellow fever within five years, and that, from the commercial standpoint alone, will revolutionise the trade of those districts. Every few years that a terrible epidemic arrives and spreads New Orleans and the Southern

States, and the commerce of the whole country has been paralysed for long periods.

16555. (*Sir Mackenzie Chalmers.*) How do you account for the epidemic's rise and fall, because the mosquitoes were always there, and the yellow fever on which they feed is always there?—That is the difficult point; it is not easily explained. It depends very much upon how large the immune population is. The greater the proportion of non-immunes, the heavier will the epidemic be, because in a city like Havanna every non-immune within a year of his arrival there took the disease—he could not escape.

16556. (*Mr. Ram.*) Now that you have discovered that the mosquito is the cause, how do you ensure protection against it?—By screening the houses properly and scouring out all the pools and protecting the water tanks.

16557. By destroying the habitat of the insect?—Yes, and, particularly in Havannah, by covering up and protecting the watertanks, and by the active energetic fight against the mosquito which has been made so successfully.

16558. Then the object is the extirpation of the mosquito?—Yes.

16559. (*Sir Mackenzie Chalmers.*) The mosquito does not fly very far, I suppose?—Some of them go long distances, particularly when carried by the wind. Then, of course, they are carried by ships, and get into the holds, and get from one country to another in this way.

16560. (*Sir William Church.*) Is it not the case that in the mosquito which is connected with yellow fever the changes from the egg to the complete insect occur very rapidly?—Very rapidly.

16561. And also that its breeding places specially are not running waters or large pieces of water, but small pools, and even the water left in hollow utensils, which are not thrown away, around private houses?—Yes. I have in my pocket a recent little monograph on yellow fever by Goldberger, issued this year by the United States Yellow Fever Institute, giving a very good account of the mosquito (*handing in the same*).

16562. (*Mr. Ram.*) Might I ask has there been at present any distinct diminution in the multiplicity or numbers of mosquitoes?—Yes, in all these regions, particularly where an active crusade has been waged, as in Havannah, in cleaning out these places where they have been breeding.

16563. They have become diminished in number?—Yes.

16564. (*Mr. Tomkinson.*) I suppose they never swarm as the midge does in this country?—Oh, yes, they do, and even in the cities, in countless myriads.

16565. Is it held to be possible to exterminate them?—Yes, I do not think there is any question about it. It has already been done in many places. Ross worked at that in Ismailia; and even in the West of India under the most unfavourable conditions, the reduction in the numbers of mosquitoes has been very remarkable.

16566. Do you suppose that if it were a fact that disease of a serious nature could be communicated by the midge in England or Scotland, their numbers could be seriously attacked and diminished upon the moors and bogs, and places where they swarm?—In the immediate neighbourhood of houses it could be done. A thing which has been demonstrated, parallel with that, is the reduction in the number of cases of malaria. Take, for instance, a place called Sparrow's Point, in Chesapeke Bay; within the last five or six years, since we have known how malaria was transmitted by the mosquito, the number of cases has been diminished almost to vanishing point there, entirely by clearing up the pools and waging war against the mosquito. There has been a remarkable reduction in the cases of malaria there.

16567. (*Mr. Ram.*) The mosquitoes, of course, have been diminished too?—Yes.

16568. (*Mr. Tomkinson.*) Are those pools the breeding places?—Yes. This discovery is making Africa, of course, habitable for the white man. Many of the young men who have been out on the recent scientific expeditions have by carefully protecting themselves lived for years there without having an attack of malaria.

16569. (*Sir William Church.*) You desire also, I think, to give some of your personal experiences in the treatment of cretinism and myxœdema?—I thought it would perhaps interest the Commission (as there are diseases in which I have been specially interested, and have had an unusually large experience), if I were to speak of them, because our knowledge of the methods of cure has come so directly from experiments on animals. We have learnt through experiments upon animals that the total removal of the thyroid gland was followed by a group of symptoms resembling cretinism and myxœdema. Gull showed us and Ord showed us that a spontaneous malady occurred in man of the same character. The surgeons taught us that occasionally following the total extirpation of the gland for goitre, the same symptoms occurred. Then for very many years—centuries, indeed—this condition of cretinism has been known in certain regions in which goitre is endemic, as in Switzerland. All of these conditions, particularly the sporadic cretinism and myxœdema, may be cured completely and permanently relieved by the administration of a powder of the thyroid gland. I do not know that there is a single step in our knowledge of this method of treatment (which in some ways is the most phenomenal that has ever been introduced) which has not been the result of experimentation on animals. If you will allow me just to show you here an illustration, striking as this is, it is even more striking in a woman. Take a woman, for instance, who, with advanced myxœdema, may be reduced to a condition of imbecility, dementia, to a simply frog-like or a toad-like caricature of her former self, and in a hopeless, helpless condition. Within six months that woman may be perfectly well. And she stays well. Here, for instance, is an illustration (*producing a set of photographs*) of what may be done in eleven months. *Here* is a typical little cretin child, between two and nearly three years of age, unable to walk, unable to talk, with a pot-belly and prominent navel, with no sign whatever of intelligence about its face—in fact, showing the typical apathetic, dull condition that characterises these cases. And *here* you see the successive changes in that child in the course of eleven months. You see I have marked it *here* after two months' treatment, after three months, after five months, after seven months, and at eleven months (*handing round the photographs*). That is practically a miracle. That child was doomed to hopeless imbecility. And I have had a whole series of such cases; eighteen or twenty in all.

Mr. W. Osler, M.D., F.R.S. F.R.C.P.
20 Nov. 1907.

16570. (*Mr. Ram.*) Is it the diseased thyroid gland which produces myxœdema?—Failure of the development of the thyroid gland in a child, or disease of the thyroid gland, sometimes following measles, for instance. The evidence has, I think, already been presented about the steps by which our knowledge has been gained in that way, I suppose by Sir Victor Horsley.

16571. (*Sir William Church.*) It has been stated that this knowledge could have been arrived at by mere observation of persons who were suffering from disease of the thyroid gland. What is your opinion of that?—I do not think so. We were struggling helpless until Sir Victor Horsley's experimental work, by which was demonstrated the identity of the condition produced by experimenting upon animals with the condition which Gull and Ord had described told us of.

16572. (*Mr. Ram.*) When the thyroid gland in animals was extracted the animals became like that?—The animal became exactly like that. I do not think there is any question about it.

16573. (*Sir William Church.*) Could you have found out in man what was the function of the thyroid gland. Has a normal thyroid gland ever been excised in man?—I do not think so. I do not know of any condition in which actually the normal gland would be excised.

16574. Excising a diseased gland is not the same thing, of course, as excising a normal gland?—Not at all.

16575. Therefore, until a normal gland was excised it would have been impossible to determine what influence the thyroid gland had upon the economy?—Quite impossible. What I feel, of course, is that such a thing as that, such a transformation as that which I have shown to you, is such a tremendous gain to humanity (just think what it must be to an individual who had a child in that condition), that it is impossible to put against it lives of a certain number of dogs sacrificed. I do not think that the two can be weighed together. And when you think that that has been done in hundreds and hundreds of cases, and will be done, and that these people remain well, I think it

Mr. W. Osler, M.D., F.R.S., F.R.C.P.

20 Nov. 1907.

is one of the strongest evidences in favour of the benefits which have been derived from experiments on animals that we can possibly have.

16576. (*Mr. Ram.*) I do not think we have had explained to us exactly how the treatment is applied?—It may be applied in several different ways. Usually it is applied by simply feeding with thyroid gland, a certain amount of powdered gland of a sheep or pig. But these children must take it continuously. I have had one or two instances in which the parents have said, "We do not want to keep up this treatment. I do not want to send every three months to the chemist and get this stuff; it is expensive," and the children just begin to lapse into this same condition of stupor and imbecility.

16577. (*Sir Mackenzie Chalmers.*) After the eleven months?—Yes, in one case after five or six years.

16578. You still have to continue the treatment?—Yes, you have to continue the treatment practically for life.

16579. (*Mr. Ram.*) There is something absent in the child which has to be supplied?—Yes, it is that internal secretion of this gland.

16580. And you must permanently supply it?—Yes, by this method.

16581. (*Mr. Tomkinson.*) How was it discovered—through experimentation on animals?—Chiefly through Sir Victor Horsley's experiments.

16582. But how was it discovered?—By removing the gland, in monkeys particularly, and finding that this condition was produced. I have forgotten exactly who it was that first transplanted the gland into an animal from which the gland had been removed, and then these symptoms all disappeared, showing that the function of the gland could be substituted either by a portion of the gland put underneath the skin or if the powdered gland was fed to an animal.

16583. (*Sir William Church.*) Will you now go on to the third portion of your *précis*?—That is a very important one—namely, the question of how far animals should be used to train young men in the technique of surgery. Of course, we know nowadays that surgical operations, particularly on the abdomen, have increased in a remarkable way. If you take any one of the smaller provincial hospitals, for example, the number of abdominal operations to-day is perhaps three times as great as it was 25 years ago. It is a very difficult thing to teach young men operative surgery. The usual way is to operate on the dead body. That is all very well in certain directions; it teaches the man perhaps how to make a nice stump of a limb, but he misses a great deal. He is not taught technique. It is impossible almost to teach properly the finer operations in the abdomen; I should say that it is quite impossible to do it systematically and thoroughly. A few years ago, when I was connected with the Johns Hopkins Medical School, we instituted there a course of operative surgery on animals only for a select group of senior students who wished subsequently to practice surgery; that is to say, a man had to state that he had a special interest in it, or he was not admitted to the course. A laboratory has been built, called the Hunterian Laboratory, which is in its equipment an animal hospital—that is to say, there are special rooms, and every precaution is taken to make it just as clean and as sweet and as aseptic as a hospital ward. It was very soon found—in fact, in the second course—that the veterinary surgeons and the citizens brought their animals there to be operated upon.

16584. (*Mr. Ram.*) Their diseased animals?—Their diseased animals; and this gave the senior medical students an opportunity of performing special operations under the skilled direction of one of the junior surgeons. I have brought here a paper which shows the sort of work which is done there. Here are a series of cases in dogs with tumours and herniæ, as you will see if you turn over the pages (*handing in a book*), which have all been operated upon by the senior students, and who have reported the cases. You see a whole series. These cases of hernia particularly are most interesting. I would like just to say a few words as to how the class is conducted.

16585. (*Mr. Ram.*) Is this a curative operation?—Yes, a curative operation. Two of the men who are to operate, for instance, in a case of one of these big herniæ of the dog prepare all the dressings beforehand; they prepare everything just as if it was in a hospital, and as if they were the nurses in the hospital. They prepare the animal. The animal's belly is carefully shaved, and may perhaps undergo a preliminary day or two of treatment in a case of big hernia, just as a patient would. Then the teacher gives a brief lecture, with black board illustrations, or sometimes the young man himself who is to operate has to give to his fellow-students in the class a little clinique on the hernia, what it is, and what he is going to do. Then the men proceed under the direction of the teacher to operate on the animal themselves. Of course, that is a totally different matter in the way of teaching from operating on a dead body. They have to know how to control hæmorrhage. And every single point in the technique is all done by those men themselves; and you see in those pictures what excellent results have been obtained. These are by senior students.

16586. Is the animal always anæsthetised?—Yes.

16587. (*Dr. Wilson.*) Do they operate on healthy dogs when they cannot get diseased animals?—I was just going to speak of that. A course also consists of all the important abdominal operations—short circuiting for example the intestine, or operating for the removal of the spleen or operating for anastomosis of the bowel. Those are operations done under anæsthesia on healthy animals. Then, in this Hunterian Laboratory, all experiments for the physiological laboratory or for the pharmacological laboratory are done, so that in that way the animals are there, and the results are always satisfactory, because the things are done with the greatest caution and care, and the greatest care is taken of the animals. I would like to read to the Commission one paragraph by the man who has introduced this, Dr. Cushing, because I think we have all felt there that it would be very much better if we could get animals other than the dog to operate on. If pigs were cheaper, for instance, I think they would be much better, because the intestines of the pig are more allied to those of man. But this paragraph expresses very well the feeling which I think actuates the man in charge: "There is naturally a feeling of regret in the minds of many—of none greater than our own—that animals, particularly dogs, should thus be subjected to operations, even though the object be a most desirable one and accomplished without the infliction of pain, and did expense permit, we would gladly have used animals with which there an association of less acute sentiment on the part of all." Then he states: "This feeling in the past few months has been somewhat mitigated by the fact that, learning of our work, the owners" of diseased dogs "have begun to bring these animals to us for treatment." But I do not think anyone could visit the place and see the way in which the class is conducted there without feeling that there is just the same care taken of the animal really as of a human being, both prior and subsequent to the operation.

16588. (*Mr. Ram.*) Is there any statutory regulation of experiments in America?—I do not think there is any.

16589. (*Sir William Church.*) Can you tell the Commission at all what proportion the animals that are brought to the Hunterian Laboratory for operation bear to healthy animals which are got for demonstration?—I could not say that. There is a very large number given here for this year, but how far that has grown or not I cannot say.

16590. I should be glad if you could tell us a little more as to the courses of instruction that these men receive. Do they first of all see a number of demonstrations upon healthy animals, and then, when they have received that instruction, operate themselves upon diseased animals?—An important operation, for instance, like this of hernia, would not be given to a man unless he had already a certain measure of technique, and till he had had some training. Does that answer the question?

16591. Not quite fully. I did not know whether, for instance, in training these men, they all had to perform some operation upon a normal animal in the first instance?—I do not think necessarily. What we felt was that if possible it would be very much better to send out a group of young men who wished to practise surgery, knowing all this modern technique, and knowing it thoroughly, having learnt it upon animals, than that they should go and learn that technique in the first place on their patients.

16592. Technique can be taught on human patients in hospitals, and is now so taught, is it not?—No, not the technique, for instance, of stopping hæmorrhage. Let me read to you a statement that is made here by Dr. Cushing with reference to this point, because I think it will state quite clearly these four points: "The paramount call upon the instructors, in this Listerian era, is that he shall emphasise and drill into his students, not as mere onlookers or hearers, but as actual performers, the significance of that much-abused term, surgical 'technique,' of which to-day the all-important element is asepsis—the first and the everlasting thing to be indelibly stamped on the make-up of everyone who proposes to undertake operative work, whether as a surgeon or investigator. Surgical cleanliness, which must become a reflex matter—an operator's second nature—and which, like all other reflexes, must be learned early, is necessarily disregarded in the time-honoured methods of teaching this branch." That is the ordinary dissecting room course.

16593. I was not alluding to the dissecting room course, but rather to the practice in the wards and in the operating theatre?—If you will excuse me, I think that is met by these other points: "Next in importance to the acquirement of this reflex habit of cleanliness is the ability to dissect, and to gently manipulate living tissues without damaging them so as to interfere with perfect reactionless healing."

16594. That is what I am coming to next. That appears to me to be a point in which operation upon animals is of great assistance to a surgeon—that you are dealing with living tissues, and not with dead ones. And here——?—Yes. And, again: "A third great requisite, which cannot be learned upon the cadaver, is an acquirement of skill in the proper control of hæmorrhage, from the large as well as small vessels, for the old-fashioned rough methods of hæmostasis happily are still followed by few. Nor, finally, can facility in the particular technique of visceral surgery" (surgery of the abdomen and chest) "be properly obtained through practice on the lifeless body, a fact which almost all of those who have been pioneers in these fields of work have emphasised." I may state, too, in addition, that this laboratory has been used extensively for trying new methods of surgery. For instance, quite extensive researches have been carried on to test these new methods of surgical treatment of arterial disease, particularly aneurism, and these new methods of ligaturing arteries, and of suturing arteries, which possibly may have a very important influence upon the treatment of arterial disease.

16595. I suppose in your mind the great advantage is that the student in these courses of operative surgery on animals is handling and dealing with living tissues?—Yes.

16596. I do not see much in what you have said about the technique which I should have thought a student could learn in his clinical work, and in the operating theatre on man?—Possibly; in some places where, perhaps, he is allowed to operate; but it is a very different thing to do an operation yourself and to sit in the amphitheatre, and even to be close to the surgeon and pass sponges and pass lint to him.

16597. The circumstances would be very different, would they not, in many cases in which you operate on man and on animals—for instance, the length of the mesentery and all that sort of thing in abdominal operations would be very different?—Yes, and yet, if you take one of these animals that was operated upon—I happened myself to see one of those operations on the hernia—they are very similar in the dog and in man.

16598. Could you say from your own knowledge that what is now suggested to be a regular course of instruction for those who should become surgeons has been the practice for many years among surgeons themselves in their operations?—Nearly all great surgeons, of course, have operated on animals from John Hunter's day. I should think that nearly all the great surgical procedures have been tried on animals first, just as medicines are tried on animals before they are tried on man.

16599. Should you say that the Act which was passed in this country in 1876 had any effect in preventing surgeons acting as efficiently as they otherwise might do?—I think it has hampered a number of surgeons; I think it must hamper them. I do not know how far a surgeon would be allowed to perform operations on animals for a definite purpose.

Mr. W. Osler, M.D., F.R.S., F.R.C.P.

20 Nov. 1907

16600. He cannot without a licence?—But even with a licence, with the definite purpose of testing some surgical procedure which he desired to do. Do you say he cannot?

16601. (*Sir William Collins.*) For manual dexterity the Act forbids it?—Yes, but not simply for manual dexterity, but if, for instance, he had some new device like Hunter's device for curing aneurism, could he do so?

16602. It would be practically part of a scientific investigation, I apprehend?

16602A. (*Sir William Collins.*) For manual dexterity—Sir Mackenzie Chalmers will correct me if I am wrong—that you cannot get a licence for acquiring manual dexterity, but if the experiment is for a scientific purpose, like some new method of tying an artery, you can.

(*Sir Mackenzie Chalmers.*) Wherever there is an increase of knowledge to be gained by experiments you can get a licence.

(*Witness.*) Then that would cover it.

16603. (*Sir William Collins.*) There is no Federal law on the subject of vivisection in any of the States, is there?—I do not think there is any Federal law.

16604. In none of the States, either, is there such a law?—No.

16605. Do you think that experimental investigation prospers more under that system than it does under ours?—I do not know that it prospers more, but it is hampered less, I think; there are fewer vexatious restrictions.

16606. Having had experience of both systems, would you suggest that we should follow the method of the States?—Personally, I feel that the matter could be left safely in the hands of the men who are in charge of the physiological laboratories and the scientific men of this country. I feel, of course, rather strongly; I would not like, perhaps, to express my feelings as strongly as they exist on what I regard has been in some ways a standing insult to the humanity of these men. They have been hounded by a great section of the public in a way that I think is disgraceful to the English people. These are men who have lived lives of devotion and self-sacrifice, and belonging to a group of men whose service to humanity has been so incalculable that they ought not to be treated in the way they have been.

16607. You think that we might trust implicitly to the humanity of the physiologists?—Absolutely. I know these men; they are just as humane as any other men; and to place these vexatious restrictions upon them is an insult, I think.

16608. Referring to the special cases which you have brought under our knowledge, I understood that in the case of yellow fever the recent experiments have been on man?—Yes, definitely, with the specific consent of these individuals, who went into this camp voluntarily. They were volunteers, just like "forlorn hope" volunteers.

16609. We were told by a witness yesterday that, in his opinion, to experiment upon man with possible ill-result was immoral. Would that be your view?—It always is immoral, without a definite, specific statement from the individual himself, with a full knowledge of the circumstances. Under those circumstances any man, I think, is at liberty to submit himself to experiments.

16610. Given a voluntary consent, you think that entirely changes the question of morality or otherwise?—Entirely.

16611. There were a good many experiments upon animals in regard to yellow fever prior to these experiments that you have told us of, were there not?—Very many; there were, of course, the experiments by Sternberg and Sanarelli.

16612. Did Sanarelli claim to have discovered the cause of yellow fever?—Yes, a special organism.

16613. I see in Mr. Paget's book he states: "In 1896, at Flores, Sanarelli discovered the baccillus icteroides; and by October, 1897, he had prepared an immunising serum, which was able to give a considerable amount of protection to animals." "Furthermore, Sanarelli was able to show the preventive value of the serum" in a case, I think, at San Carlos, and Paget says: "Every

Mr. W. Osler, M.D., F.R.S., F.R.C.P.

20 Nov. 1907.

prisoner, except one who had already had the fever, was therefore given the preventive treatment. At once the outbreak stopped; no more cases occurred, though only a weak serum was used, though the state of the prison and its occupants was unhealthy, though the fever, two months later, was still raging round the prison in the town"?—I do not think anybody places much reliance on that. I think Sanarelli's work has not been substantiated.

16614. I see in the paper by Joseph Goldberger that you have just handed in to the Commission, on page 7 there is a heading: "Experiments to show that the Bacillus icteroides Sanarelli stands in no causative relation to yellow fever"?—That was the first work that the American Commission did.

16615. Then if the bacillus of Sanarelli stood in no relation to the cause of yellow fever, I apprehend that this argument of a protective serum falls to the ground?—Entirely. I think it is not used at all.

16616. Did not F —— also describe an organism as the cause?—No, Sternberg.

16617. And did not Durham and Myers also describe another bacillus as the cause?—I do not know that they described it as actually the cause. Sternberg's organism was a mere suggestion. I do not think it was definite.

16618. I see on page 236 of Mr. Paget's book he refers to the work of Myers and Durham, and states that "The Report gives evidence that the disease is due to a bacillus, which is not the bacillus icteroides"?—Yes.

16619. Is this bacillus of Myers and Durham to be dismissed as also non-causative?—I think it is probably a spirochoete like the protozoal parasite—not an ordinary bacterium.

16620. Then I see "A later Commission," according to Mr. Paget, "to New Orleans, September, 1901, to January, 1902, reported an extensive series of investigations, which seem rather to support the belief that the bacillus icteroides is the cause of the disease." Were those investigations on animals?—I do not know, but I think these more recent observations have shown that we do not know the nature of the parasite.

16621. Then all theory and practice based upon a bacillus as the cause of yellow fever we may now dismiss as erroneous?—It is, in all probability, a spirochoete, not an ordinary bacterium. That that seems most likely is shown by the similarity to the cycle of development of the mosquito in malaria taking a specific period of time. It takes 12 days in the body of the mosquito before the poison becomes active. It is very unlikely when you judge from analogy of the filaria of the mosquito parasite, that that is anything but a living organism that passes through a definite cycle, just as the malaria parasite does.

16622. But morphologically are we able to find the cause of yellow fever?—No, but that is not surprising, when you remember that only quite recently the spirochoete of syphilis has been discovered. Probably it is an exceedingly minute organism.

16623. Is the method whereby you think that yellow fever may now be abolished that of immunising the community or destroying the mosquito?—Destroying the mosquito and isolating all early cases.

16624. By isolation and by the destruction of the mosquito?—Yes.

16625. I rather gathered that you considered that the case of the use of the thyroid gland for the purpose of the cure of myxœdema and cretinism was one of the strongest examples to be cited in favour of vivisection experiments on animals?—Certainly.

16626. Those of us who have witnessed the changes resulting in cases of myxœdema and cretinism as the result of feeding, or in the early days grafting the thyroid, cannot fail to be struck with the enormous advance that has been made?—Just so; and the cases were recognised as not uncommon. There were two patients, for instance, who had become hopeless dements following total removal of the thyroid gland, and who had been in that condition for years. At once, following Sir Victor Horsley's work and the discovery of the fact that the thyroid extract was potent, these patients were given it, and after many years of almost complete imbecility they were cured.

16627. Should I be wrong in thinking that prior to Sir Victor Horsley's work there had been a good deal of clinical work?—There had been a good deal of clinical work by Gull and Ord, and the men of Clinical Society's Committee here in this country. The disease of myxœdema was well known, and cretinism was well known; but there was no suggestion that it could be treated until the results of Sir Victor Horsley's work were known.

16628. Are you familiar with a paper by Curling upon the subject, published in 1850 or thereabouts?—Familiar at long range; I have seen it.

16629. Did he suggest an association between the absence of the thyroid gland and the presence of cretinism?—I think he did. I have referred to the paper several times, but it is some years ago.

16630. Do you remember one by Hilton Fagge in the seventies, I think?—Yes; but, of course, Gull's paper and Ord's work, and particularly the demonstration here in 1881 at the Congress of that remarkable group of cases, more than anything else stirred up the profession to the recognition of myxœdema as a special disease. On the Continent, before that, it was not recognised at all.

16631. Does not Hirsch in his "Historical and Geographical Pathology" cite a good deal of literature pointing to an association between cretinism, goitre and disease of the throat?—Between cretinism and goitre, that was long recognised, and was of course obvious, as so many of the cretins had a great big goitre. But the connection between myxœdema and goitre, and the connection between myxœdema and cretinism was not recognised until after Sir Victor Horsley's investigations. It was not really until Sir Felix Simon made the suggestion that these three groups of cases—cretinism, both endemic and sporadic, the myxœdema cases that came on spontaneously, and the operative cases that succeeded extirpation of the gland by surgeons were really one and the same disease, and all that came from loss of function of this thyroid gland.

16632. I ask you whether Hilton Fagge and Curling, prior to Ord and Gull, did not associate the absence or disease or defect of the thyroid with the cretinoid condition?—Yes, but it was long before then. I think that it was known that cretinism and thyroid diseases were associated.

16633. That they were a pair of allied diseases?—Yes, the cretinism and goitre had a definite association. That was manifest, of course, in Switzerland and in Savoy. I think all of those French and Italian Commissions lay great stress upon it. Whether Hilton Fagge suggested the connection with myxœdema I do not know.

16634. The name myxœdema was first given by Ord?—Yes.

16635. Did not Fagge suggest that the presence of goitre might be protective against cretinism?—I do not know. I would not be certain.

16636. In regard to the Johns Hopkins' Hospital at Baltimore, you would advocate the introduction of that system, I gather, into this country?—Under certain conditions. I think, for instance, that if certain of our senior students who were to work at surgery could be taught it on diseased animals at the Brown Institution or at the veterinary college, it would be of great advantage.

16637. Is there any proposal on foot at Oxford to introduce the Johns Hopkins' system there?—There is no practical medical school at Oxford. The men are only taught the scientific branches.

16638. You have called attention to an article by Professor Harvey Cushing in which he expresses regret that it has been necessary to employ the dog, and even though anæsthetics were used he still apparently regrets the use of the dog?—I think we all do.

16639. On grounds of sentiment?—Yes.

16640. Not sentiment in any disparaging sense, but in a lofty sense?—Yes, I think we all do.

16641. He puts in the words "did expense permit." Apparently it is a question between the sentiment and the expense?—I do not know that it is altogether. I suppose the pig would be a more suitable animal in some ways.

16642. Then apparently he suggests that the difficulty has to some extent been got over by the fact that the public bring diseased animals to the Johns Hopkins Institution?—Yes.

16643. Do you think that it would be possible to limit the system to the use of animals that are diseased

and not employ those which are healthy?—Yes, in a large city like this, when you think of the number of animals that are diseased, and that really require operation, I do not think there would be a serious difficulty.

16644. Would it necessitate keeping the animals alive after an operation?—They would be operated on to keep them alive—animals with hernia, for instance.

16645. I am afraid I have not made myself clear. I was suggesting would the scheme be practicable if animals which are suffering from disease, and possibly a disease which would require the destruction of the animal, could be employed for the purpose of operation under anæsthetics?—No. I think such animals should be destroyed without being operated on. I think it would be much more humane to destroy those animals, especially when you consider the list that is given in that article of all sorts of diseases that are curable by operation, and with the greatest relief to the poor animals, and the greatest relief also mentally to the owners.

16646. But I understand that one of the chief reasons why you advocated this system was in order to familiarise those intended to become surgeons with such operative processes as anamostasis, short circuiting of the intestine, and so forth?—Yes.

16647. Do you think that opportunities arising for performing those operations only on diseased animals would be sufficient for your purpose?—I think not, except in cases perhaps of hernia, where very often there has to be a resection of the section of the intestine that is being tied in the hernia.

16648. Do you think that those comparatively rare operations would be adequate for your purpose?—I do not know that.

16649. So that it would necessitate the utilisation of normal animals for the purpose?—Yes, if it was carried to any great extent. With a very large number of students it would, of course, be impossible.

16650. Would you advocate it for all medical students?—I would not advocate it for all medical students, but for the special group of men who wish to become practical surgeons. I think it would be very much better for these men to learn a special technique on animals, than that they should learn that technique at the risk of their fellow creatures subsequently. Take, for instance, the case of appendicitis; there is a great deal of very delicate technique often required in the manipulation of the stump of the appendix, and if that is not attended to properly the risks are considerable; and there is all that finer manipulation of such a delicate structure as the bowel.

16651. Would you advocate it in the case of all those medical students who are going to take up residence on medical appointments?—I think it very important, particularly for the resident surgeon of a hospital.

16652. For all intending to become house surgeons?—For all definitely purposing to become practitioners of surgery.

16653. (*Sir Mackenzie Chalmers.*) I want to ask you a few questions—first as regards the Act in England. The Johns Hopkins University is in Baltimore?—Yes.

16654. At any rate in that State there is no Vivisection Act?—I do not think there is such an Act in any State.

16655. At any rate there is not in that State?—I do not know of any.

16656. From your experience in the States, do you think that the consequence of there being no such Act there is a somewhat lower standard than there is in England of care for animal suffering in experiments?—I should not think so; not that I have ever seen.

16657. If you have no Act is there not the danger that while you might perfectly well be able to trust experienced medical men and experienced physiological teachers there is nothing to prevent the youngest and wildest student undertaking painful operations?—Oh yes there is. In any well-managed laboratory no student could do it.

16658. But outside the well-managed laboratories, there is nothing to prevent it?—No, but there is nothing now in this country. No Act is going to prevent a group of boys from torturing animals; they have been able to do that at any time.

16659. Except that they are punishable?—A man is punishable in any case under the Act for the Prevention of Cruelty to Animals which deals with it. There is a very active society in Baltimore, and as a rule in the United States animals are treated with just as much humantiy as they are in this country, particularly in the cities. I think in the large cities it is surprising how little ill-treatment of animals you see. I should say animals are just as well looked after there as in this country.

16660. You do not think that there is a risk of painful experiments being done without proper care and by people who are not properly qualified to perform them?—Not in well-organised laboratories.

16661. Take Baltimore for instance; would a student performing a painful operation *bonâ-fide* for some purpose of increasing his knowledge or improving his technique, be liable to prosecution under the ordinary law of cruelty?—I do not think so. I do not see under what circumstances he would do it except in a laboratory.

16662. To give a possible instance, he might try some of the, I was going to say, feeding or rather starving experiments in his own rooms?—I do not know how far he would be liable; it is quite possible he might be liable. He probably would be.

16663. Do not you think it is better that in order to perform experiments which may be painful, there should be some formality gone through to impress upon people the need of care and the need of humanity?—Yes, if you wish to act at the dictation of a group of people who distrust the greatest benefactors humanity has had.

16664. Even apart from that?—I do not know apart from that that it would be done.

16665. Now, then, coming to the use of animals to acquire technique; I suppose that a great deal of good could be done if animals were dealt with by students only for curative purposes; they would learn a good deal?—Yes.

16666. If students before obtaining hospital appointments operated upon animals merely for curative purposes, treating the diseased animal exactly as a diseased patient, there is nothing to prevent it in the existing law of England?—No, I do not suppose there is.

16667-8. Then as regards what you were saying about yellow fever, these particular experiments that you referred to were animal experiments, but the particular animals happened to be volunteer men?—Volunteer soldiers.

16669. If other animals had been available you would have preferred, of course, that the experiments should have been performed upon them?—Naturally.

16670. But as a fact, no other animals except volunteer men were available at the time?—That is so; I do not suppose the higher anthropoid apes could be had there, and it was not known that they are susceptible.

16671. And their susceptibility probably is not so great as that of man?—No; and there has only been just this one observation that Dr. Thomas has recently made.

16672. Still, there is no essential difference between that experiment and other animal experiments you would say in principle?—Certainly, given the definite consent of the individual.

16673. But I mean, putting aside all other questions, for scientific purposes this was an animal experiment?—Of course it was.

16674. How long have you been in practice? You have been in large practice as a physician, not only as a teacher, but as a practising physician?—I have been in practice for thirty-five years.

16675. You saw the introduction of what is popularly called Listerism?—Yes.

16676. You have watched the effects of it?—Yes. I started in pre-Listerian days in the old Montreal general hospital, where amputations nearly always suppurated, and a great many cases, of course, died.

16677. A great many gangrened and died?—Yes.

16678. After a severe operation in those days did you rather expect bad symptoms?—We always expected trouble after nearly every operation. A case

Mr. W. Osler, M.D., F.R.S., F.R.C.P.

20 Nov. 1907.

that healed by first intention, we all looked at with great surprise.

16679. And now?— Now a case that does not heal by first intention we all look at with great surprise—exactly the reverse condition.

16680. Has the introduction of what is called Listerism had any effect on another troublesome thing, hospital sore throat?—It has removed all that condition which was known as hospitalism previously—a whole group of infections to which surgical cases were liable.

16681. We were told by a witness the other day who has had considerable surgical experience, that Listerism is now broken down and discredited?—Where did you produce that gentleman from—Hanwell?

16682. I will not mention his hospital, but he said that the antiseptic treatment had been absolutely discarded, and that the aseptic treatment was a reversion to the old pre-Listerian days?—It is the difference between tweedledum and tweedledee. The antiseptic surgeons practised aseptic surgery, and it is aseptic surgery.

16683. They are both applications of the same principle?—Yes.

16684. There being a slight difference in the one, due to increased knowledge?—Yes, it does not make any real difference.

16685. The witness, Dr. Bantock, also denied that the bacilli or protozoa which are found in inseparable connection with certain diseases have any causative effect, and he put his view rather strikingly. He said you might as well say that trout or salmon in a river were the cause of the river as that the bacilli or protozoa were the cause of, say, Malta fever, or malaria, or sleeping sickness. Perhaps I might read you some words of his?—I think you might spare me. I decline to listen to twaddle of that sort. I would not answer a question of that kind.

16686. I will put it in this way. In America, as well as in England, are these minute entities now universally recognised as causes and not merely concomitants?—Oh, yes, by everybody who has paid any attention to the subject.

16687. I should like to read you one or two words in which he puts his theory: "The diphtheria bacillus, again, is associated with the septic or membranous throat, the typhoid bacillus with ulcerated intestine, the cholera vibrio with the inflamed intestinal canal, and the plague bacillus with the inflamed bubo or pneumonic lung. In all these instances it is not logical to conclude that these micro-organisms, instead of being pathogenic, are playing the part of Nature's scavengers"?—He is quite entitled to his opinion.

16688. But it is not the opinion of the medical profession?—It is not the opinion of any man whose opinion is worth listening to, who has paid any attention to the subject, who has studied the subject, and who knows the conditions as they exist.

16689. Does his opinion represent anything of what might be called a school of medical thought?—Not at all.

16690. Or is it a merely individual eccentricity?—It represents the school of the back numbers.

16691. Just one casual point with regard to myxœdema and cretinism. You mentioned Switzerland. In consequence of the recent discoveries is cretinism being reduced in Savoy?—I think they have been making endeavours. There are great difficulties about it, though. They have not, I think, done as much as, perhaps, we could have expected. I cannot speak positively about it, because it is some years since I looked up the question of endemic cretinism—in fact, I know nothing at first hand of endemic cretinism.

16692. You have never seen a case of endemic cretinism treated?—No, but I think cases have been treated, and some treated successfully.

16693. Is anything known of a local cause in Savoy which predisposes to cretinism?—I do not know definitely. I think a good deal of work has been done recently.

16694. (*Mr. Ram.*) What was it that first led to the suspicion of the mosquito as the cause of propagating yellow fever?—It was recognised in the Southern States very many years ago that yellow fever was worse in the seasons when the mosquitos were abounding. A very remarkable man named Nott was one of the first to suggest that the insects acted as carriers. Then I may state also that Mr. Finlay, a Scot, who has been practising for many years in Havannah—for 25 years—has been an ardent advocate of the mosquito theory, and he deserves a great deal of credit really for having insisted that the mosquito was the carrier; and it was largely on his suggestion or based on his strong belief, that the United States Government Commission carried out this series of investigations.

16695. Are animals in the infected districts liable to attacks of yellow fever?—No.

16696. Is any animal other than the anthropoid ape, so far as you know?—We only know it of the anthropoid apes experimentally; it is known that they suffer. They do not exist in the regions where yellow fever is.

16697. I take it that this great discovery of the mosquito as the author of yellow fever, and of malaria, too, is not due directly to experiments on animals?—It is not absolutely, unless you speak of man as an animal.

16698. I meant animals other than men?—No, not the domestic animals.

16699. You told us in your evidence, and I think we quite appreciated it, that it was the research spirit to which we owe this most important discovery?—Yes, these things would not otherwise have been attempted and done. These are the descendants of men who have made modern medicine what it is to-day, and that has been altogether through the experimental spirit.

16700. So I gathered. But otherwise than that, the mosquito theory for malaria and for yellow fever is not directly due to experiments on animals?—No, not directly.

16701. With regard to malaria being carried by mosquitoes, have you been able to ascertain in that case, as in the case of yellow fever, that the mosquito must have bitten an infected patient within a certain time?—No, I do not think there is any day limit, as there is in yellow fever. The probability is that at any period in the course of malaria—that is to say, when the parasites are circulating in the blood, the mosquito may become infective.

16702. But is it your opinion that in that case also in some period, perhaps undefined as to malaria, the mosquito must have bitten an infected patient?—I think that is definite, and a special variety of mosquito; it is not any ordinary mosquito.

16703. And ultimately it is to the destruction of the mosquito that you look for immunity from these two diseases?—Yes, the destruction of the mosquito and isolation of the cases.

16704. Either destroying them or keeping them away from the human subject?—Yes, but you must have an infected patient and the mosquito to keep up the chain.

16705. I think other witnesses have told us with regard to malaria that in their opinion (and I think they said it was based on experiments), given a district in which no mosquito could get near the infected patients, given a certain time over that district, the disease might be wholly stamped out in that district even though mosquitoes subsequently existed there. Have you any evidence as to that? You follow my question?—No, I did not quite catch it.

16706. It was this: Taking a certain area at present infested by mosquitoes whose bite gives malaria, if you were to clear that district for, say six months, of all human creatures—at any rate of all human creatures that had any malarious poison in them at all—even at the end of that period, though the district might be full of mosquitoes, those mosquitoes, having lost the source of contamination, would not infect other human creatures?—No, they would not.

16707. You think that is so?—I do not think; there is not any question about it.

16708. With regard to experiments by pupils, would it be possible in the case of those experiments which you have advocated should be allowed to senior students, as to abdominal sections, and so forth (I am not speaking of curative operations, but experiments), to enact that in every case the animals shall be under a lethal dose of anæsthetic?—Yes.

16709. And that in no case need the animal for the

purpose of the experiment be allowed to live?—Exactly.

16710. Therefore would you go to the length of saying that it would not be unreasonable to enact that in every case the animal so experimented upon should be under a lethal dose?—Yes, there is no reason why that should not be so.

16711. And that would not put any fetter upon scientific experiment?—No, you do not mean animals operated upon for curative purposes.

16712. No, for experimental purposes only.

16713. (*Dr. Gaskell.*) Do you not want to keep the animal alive afterwards?—Not always. There is no reason for it except for physiological reasons.

16714. I thought for the whole purpose of your surgery it was necessary to see what happens afterwards?—It would not be absolutely necessary, to obtain the technique for instance. In doing a gastric fistula for a physiologist the animal would have to remain alive; but for securing the technique itself it would not be necessary that the animal should come out of the anæsthesia.

16715. I was thinking that it was your usual custom at the Johns Hopkins Institution to keep animals alive?—Yes, but it was not absolutely necessary.

16716. (*Mr. Ram.*) I limited my question, as you know, to experiments by students for the purpose of gaining either technical knowledge or manual dexterity?—Yes.

16717. And in neither of those cases would it, in your opinion, be a hindrance to scientific research to enact that the animals must be under a lethal dose?—No, it would be no hindrance to obtaining actual technique in the performance of the operation.

16718. You have had experience both in American laboratories, where there is absolutely no statutory enactment controlling you, and you have also had experience here in England under the statute which exists to-day Putting out of question what you were saying as to the want of trust in men of noble life, have you found that the English Act has embarrassed you at all in any of your operations?—I can only speak personally upon that. I am not a physiologist. I am a practising physician.

16719. But from your knowledge of others do you consider that the English Act, as applied to-day, is embarrassing to legitimate experiments in authorised and well-regulated laboratories?—I do not think that I know sufficiently the conditions to give an opinion about that which is worth expressing; it is only just a sort of general impression one has that a number of one's friends complain of vexatious restrictions.

16720. As to experiments by students on living animals under a lethal dose, you instance that they would be able to learn control of hæmorrhage, for example?—Yes.

16721. At present, I suppose, the control of hæmorrhage can only be practically learned by a man, whether a student or in a more advanced stage, who first operates upon a living man?—Yes.

16722. Does this control of hæmorrhage require actual technical and manual dexterity?—Yes, it very often requires a great deal of skill. But it is not so much in the control of the hæmorrhage that I should say it is necessary; but within the past 20 years you see entirely new surgical conditions have come up, particularly in operations on the stomach and intestines, and for a man who has not had a good training in technique it is a very difficult thing at first to get it. I have seen it over and over again. A man who has had technical facility and practice handles his needles and everything in a totally different way. My contention is that it would be a great deal better for the community to have a group of highly-trained young men who could have at any rate opportunities to learn that technique on animals instead of having to learn and to perfect that technique on their fellow creatures.

16723. Of course, in the absence of such technical experiments on animals, the best operator has to begin in what I may term a fumbling way?—Yes, they all begin in the same way.

16724. On the human subject?—On the human subject. It is not as if they began without seeing many men who operates. A man has seen usually scores of operations before, and has helped at them; so that if he has nimble fingers he can usually imitate the man he has seen operate before, and he gets a good deal of preliminary knowledge. He begins with opening abscesses.

Mr. W. Osler, M.D., F.R.S., F.R.C.P.

20 Nov. 1907.

16725. There must be a first time for him?—Yes.

16726. Could not this technical skill and manual skill, which you say is so desirable, be obtained by experiments on animals, the animal in each case being wholly insensible to pain under a lethal dose of anæsthetics from which it can never recover?—Yes, in the majority of instances I think that it could. These, however, are surgical questions, and my surgical brethren will smile at my evidence perhaps. I am not a surgeon, only I have been in the habit of watching a great many surgical operations.

16727. On that, may I ask you, have you ever practised vivisection yourself?—Yes, to a slight extent years ago, when I was teaching physiology for a few years.

16728. Not since then?—No.

16729. Was that in this country?—No, it was in Canada.

16730. With respect to the evidence which has been given to us by some witnesses, and some witnesses of great distinction, as to the experience gained by operating on animals for experimental purposes, is the difference between animals and man so great that such experience is useless or practically even misleading when applied to the human subject?—I should say decidedly not. For instance, an operation on the arteries in animals and all the delicate operations on the blood vessels are practically the same.

16731. You would not agree with that view then?—No, but there again that is a surgical point on which my opinion is not really worth anything.

16732. You said that in many cases you thought that pigs were much more instructive animals to operate upon than dogs, apart even from the natural and wise sentiment with regard to dogs?—Yes.

16733. Is it then merely a matter of money with regard to the pig, that it would cost more than a dog?—The pig is a very difficult animal to handle, of course. It has got stomach and intestines much more like those of man.

16734. To that extent it would be a more useful animal?—Yes, it would be better. The pig was used, of course, in old days. I suppose that Galen's experiments were largely upon pigs.

16735. So we have been told. Is there any difficulty in anæsthetising a pig?—I do not know. I have anæsthetised a great many animals, but I never tried a pig.

16736. At any rate, given a pig under an anæsthetic it would be more nearly allied to man in its viscera than any other animal?—Yes.

16737. And to that extent it would be a more useful animal to operate upon?—Yes, I should say very useful.

16738. You have told us that in your opinion it might be perfectly safe to trust to the humanity of the operators, and that no legislative enactment is necessary with regard to them; but do you not think that there is an advantage at any rate in an Act, which limits and makes criminal the performance of any scientific operation otherwise than in a licensed place, with a view to restraining students and others from operating, say, in their own rooms, and in places with no restriction?—There is no objection to having certain places licensed.

16739. And with regard to the other restrictions such as are at present in the Act you have said that you regard them as unnecessary or even injurious to the reputation of men of noble lives, who have been great public benefactors; but do you not recognise that there is such a thing as a sane and reasonable public opinion of persons less informed than yourself and those associated with you, and less informed perhaps than this Commission are, who still have to be regarded with a view to the restrictions which may be put on possible cruelty to animals?—But why should they not act as they act in other cases through the Society for the Prevention of Cruelty to Animals? I see no reason why that sentiment should not receive its expression through the ordinary channels.

16740. But apart from that, unless there were certain enactments as to the performance of operations, as to the place and as to the method and as to the sur-

Mr. W. Osler, M.D., F.R.S., F.R.C.P.

20 Nov. 1907.

rounding circumstances and limitations, it would not be possible, would it, to apply a general act of cruelty to animals?—I do not know enough really about the conditions here to speak definitely about that.

16741. At present the Act for the Prevention of Cruelty to Animals is directed to wanton infliction of pain, without any ulterior cause or any good ulterior motive, and if you relied only on that, would it not be certain that there would be a great number of vexatious prosecutions of people who, from the purest motives and in the most humane way, carried on experiments which might be thought to be painful?—I suppose there would be, unless you had certain places, as you suggest, definitely licensed.

16742. Just one question as to the difference between what has been called here antiseptic surgery and clean surgery. Is there a difference? Is aseptic surgery, that is to say the abandonment of the spray treatment during an operation, tantamount simply to a reversion to the practice of cleanly surgery before the days of Lister?—In all ages there have been a few men who have had clean hands and have appreciated clean surgery; but the difference between the ante- and the post-Listerian days is the difference between chaos and order, and between a colossal surgical mortality then and nowadays, there is a progressively diminishing mortality. There has also been a great diminution in actual human suffering by the introduction of the Listerian methods and this has perhaps been the greatest of its benefits. When one thinks that before the days of Lister every operation case was dressed every day, and the poor children particularly were howling and weeping, and now a case is operated on and there is but a single dressing as a rule.

16743. (*Sir Mackenzie Chalmers.*) May I put it in this way. Is the foundation of Listerism (which is now applied universally), that contamination of a wound is contamination from without, and not from within. Is that in popular language correct?—Yes.

16744. (*Mr. Ram.*) Do you agree with this evidence, which one witness gave to us. I will read you the questions and answers: "Now with regard to this aseptic or antiseptic treatment, you have said that you were one of the pioneers of that which is practised so much now, namely, the protective measures taken by being cleanly?—(A) Yes. (Q) By being cleanly do you mean anything more than merely the use of water? (A) And soap." Is that the way in which in any great operation, abdominal section and so forth, safety is procured? Is the Listerian system sufficiently carried out if merely soap and water are used for the instruments and hands of the operator?—Not for the instruments, but often for the hands of the operator. But it varies in different cases; it is not simply one thing. Aseptic surgery includes a whole group of things—besides that the cleansing of patients, cleansing the doctors, cleansing the nurses, and the absolute protection of instruments and gauze from any contamination.

16745. And in the treatment of the wound afterwards no dressing?—The only difference is that the wound is not treated afterwards; there is no subsequent treatment. A good clean incision does not require any treatment.

16746. A good clean incision keeps clean; it cleans itself?—Yes

16747. (*Dr. Gaskell.*) When you spoke just now about malaria and Ross, would you not say that Ross's work was largely done by experimentation on birds?—Entirely; it was entirely experimentation.

16748. It would be a little false to say that the cause of malaria was discovered without experiments on animals?—Certainly, because there were experiments on birds.

16749. It was the life history of the organisms found out by Ross by experimentation on birds which really settled the question, was it not?—Yes.

16750. Could you tell me when those surgical experiments upon animals began at the Johns Hopkins Hospital; do you remember the year?—I do not remember the year definitely. I should think about 1904—the session of 1904-5.

16751. But they were going on when I was there with the Mosley Commission in 1904; was that the first year?—Yes.

16752. I was wondering whether any of those students who had that course were now in practice?—Yes, a number of them.

16753. Could you tell us at all whether there has been any noted difference in those students, when they first began operating upon man as compared with others who have not had that training?—I could not tell you any specific instances, but there have been two or three men who have gone out from the school extremely dexterous operators; I mean men who have had sufficient operative experience to tackle almost anything in the way of an operation, experience gained altogether on animals in comparative surgery.

16754. What I was rather wanting to know was whether the older people belonging to the Johns Hopkins Medical School, like yourself and others, have come to the conclusion that there is a distinct advantage in this training?—I think so. I must say that I was very greatly impressed with what I saw when I was out there last year, and saw the course.

16755. Not theoretically at all you understand, but actually whether the men turned out have shown themselves better men?—Yes, I think so. It is a course only given to a group of men specially interested in surgery.

16756. Quite so, the best men?—Yes, the best men, and the men who wish to practise subsequently.

16757. I was wondering rather whether any comparison could be made between the men who have been sent out since that school has been started, and previously to that. It is very difficult, of course, to make any statement of that kind?—Yes.

16758. Can you tell me at all about Professor Howell's Physiological Laboratory? Are you acquainted with the work going on there?—Yes.

16759. Is there not something of the same sort there also in physiology? Do not the students do physiological experiments for themselves very largely?—Yes, but they are done now largely in the Hunterian laboratory.

16760. Was it not the habit there rather (I remember when I was there Professor Howell showing it me) that a group of students would perform an operation for physiological purposes under the supervision of the head of the laboratory?—Yes.

16761. And that still continues?—That still continues, but I think now that all the important operations are done in the Hunterian laboratory, because the animals are better looked after, as it is just like a hospital.

16762. In your opinion that is a good method of teaching?—I think it is impossible for certain aspects of physiology.

16763. It is not done, of course, in England?—I think very greatly to the detriment of the teaching of physiology.

16764. So far as I understand there is this sort of difference: that in England the teacher demonstrates an experiment before a class of, say, 20 to 30 students; in the Johns Hopkins Hospital that same experiment is demonstrated by the students to the teacher, the students being only, say, three or four?—I think only in suitable cases; I do not think all experiments are so performed.

16765. I mean in suitable cases. And you would rather think that that is a better method of education than the mere demonstration that we have?—Yes, in a certain limited number of cases; I think particularly demonstrations of blood pressure and demonstrations of the effect of anæsthesia are practical experiments which it is very difficult to get students taught properly, unless they are either shown or do these experiments themselves.

16766. Have you any knowledge at all with respect to those experiments which are done in that way in Professor Howell's laboratory of any inadequacy in the method of experimentation, in the anæsthesia or anything of that kind?—I think not. I think they have been very careful. Dr. Howell is a most humane man in every way. So far as I have ever seen things there—and I have been in the laboratory at intervals—I have never seen anything that was in the slightest degree indicative of cruelty to animals.

16767. But I mean carelessness; whether the students have in these operations evidently been extremely careful?—Yes, I should say so.

16768. That was my experience when I was there; they seemed to me extraordinarily careful?—Certainly.

16769. (*Mr. Tomkinson.*) Do I correctly understand that it is believed now that malaria and such com-

plaints are only communicated by infection carried by insects?—Yes.

16770. And that the extirpation of the insects would mean the extirpation of the disease practically?—Yes, and the isolation of the patient in the case of malaria and treatment with quinine, not allowing the mosquitoes to get to him.

16771. But it must have originated some time or other from climatic conditions?—That is the old story, whether the owl came from the egg or the egg from the owl. I do not know that we have settled that yet.

16772. Does myxœdema exist in animals?—I do not think it does. I would not be certain. I have never read of an instance.

16773. Do I correctly understand that the thyroid gland in animals has been utilised for the purpose of injecting the fluid into the gland of a person in whom the function was wanting?—No, not injected into the gland; it is just simply eaten; it is taken as a powder.

16774. If, as I understand, there is no Act in America, and yet there is still a stringent law for preventing cruelty to animals, how is the profession protected against prosecution?—I think public sentiment trusts the men who are in charge of laboratories.

16775. (*Sir Mackenzie Chalmers.*) Is there no active anti-vivisection society in Baltimore?—I think they are active in many places. I do not know that there is one in Baltimore.

16776. They do not take any action in Baltimore, at any rate?—No.

16777. (*Mr. Tomkinson.*) There have been no prosecutions for cruelty that you know of?—I do not know of any.

16778. Although there is no exemption from the provisions of that Act given to the faculty?—No.

16779. (*Dr. Wilson.*) Was it not really through the strong representation on the part of the medical profession that the Vivisection Act was passed in this country?—I could not say. I do not know about it. I should not have thought so.

16780. Are you familiar with Dr. Leffingwell's writings?—Yes.

16781. I think he points out that it was through the strong attacks that appeared in the "Lancet" and the "British Medical Journal" that the Vivisection Act was passed?—That is news to me.

16782. You do not know that?—No.

16783. The Hunterian laboratory is an endowed laboratory, is it not?—It is supported by the University.

16784. There is no special endowment?—No, I do not think so.

16785. Do you not attach the same importance in teaching surgical students to what has been called living pathology?—I am not a teacher of surgery.

16786. But you do recognise that the question of sentiment, the ethical side of the question, is a question that has to be faced. With regard to experimentation on dogs, for example, you yourself have said that it is rather regrettable?—Yes.

16787. Then with regard both to the extinction of both yellow fever and malaria, is not the final recourse had to sanitation, drainage, and so forth?—Yes, but sanitation which has been taught, remember, by these very things. What sanitation would there have been in the Isthmus to-day if it had not been for the work of Manson and Ross in malaria, and of those men who worked at yellow fever? Sanitation would not exist if it had not been for those men. Those are the essentials which precede it.

16788. But still those essential sanitary conditions were believed to contribute largely to the extermination of the disease before the mosquito theory was started?—But there was no knowledge how to carry out that sanitation effectively.

16789. Is there not very little analogy between yellow fever and malaria, as regards what you call the immunes and non-immunes?—I do not know about that, because in every malarial district a large proportion of the population, particularly children, really have malaria without having any symptoms of it.

16790. That is to say they get the plasmodium in the blood?—They get the plasmodium in the blood, so that they practically are immune and yet their danger is because they are capable of infecting mosquitoes and in that way conveying the disease to others.

16791. I am referring to Europeans suffering from the disease. Do they often have second attacks?—Yes.

16792. But with yellow fever you do not have second attacks?—No.

Mr. W. Osler, M.D., F.R.S., F.R.C.P.

20 Nov. 1907.

Lieut.-Colonel EDWARD LAWRIE, M.B., I.M.S., called in; and Examined.

16793. (*Sir William Church.*) You are a Lieutenant-Colonel in the Indian Medical Service?—Retired.

16794. You are a member of the Royal College of Surgeons?—Yes.

16795. Have you any other degree that you wish to have mentioned?—I am an M.B. of Edinburgh University.

16796. I hope you understand that this Commission is only concerned, in so far as anæsthetics go, in the giving of anæsthetics to animals which are under experimentation, and that we have nothing to do with the question as to how anæsthetics are best administered except to animals under experimentation?—Yes.

16797. I think you have certain points that you wish to bring before the Commission on that head?—Yes.

16798. The first is that anæsthesia and vivisection are, or ought to be, inseparably allied, and until the administration of chloroform is established on a uniformly sound basis the question of vivisection cannot be set at rest. Would you wish to make any remark upon that? I hardly follow it. I should like to know quite what you wish us to gather from it?—That until chloroform is given in the way that has been proved to be correct, vivisection cannot be carried on without pain; that the present position of chloroform leads to its administration in the wrong manner, and that leads to the administration of other anæsthetics which are thought to be better than chloroform.

16799. And which you consider are not anæsthetics at all?—No, I do not say that at all. I say they are not so safe as chloroform.

16800. Still, I do not see what the immediate connection between the two is?—What I mean is that vivisection ought not to be practised unless it is invariably done under anæsthesia.

16801. That is the law?—But the anæsthetic is now given through a tracheal tube, which necessitates a painful operation before anæsthesia is commenced.

16802. On the contrary, the animal is anæsthetised before the wound is made?—In experiments I saw, the operation of tracheotomy was done first.

16803. (*Sir William Collins.*) Without anæsthetics?—Yes.

16804. (*Sir William Church.*) Where was that?—In Edinburgh, in Professor Rutherford's laboratory. I have narrated them in my *précis*.

16805. What date?—1890.

16806. I suppose there was no necessity for it?—No necessity whatever that I know of.

16807. And you wish the Commission to infer that that is ordinarily what is done in physiological laboratories?—I can only speak from my own observation. I understand that that is the way that anæsthetics are usually given in physiological laboratories.

(*Dr. Wilson.*) It would be a violation of the Act.

(*Sir Mackenzie Chalmers.*) It is a violation of the Act certainly; an offence is committed if that is done.

(*Witness.*) I have seen it done.

(*Dr. Wilson.*) Then it was a violation of the Act.

16808. (*Sir William Church.*) Then you go on to say that in consequence of the erroneous principles which govern the present teaching of anæsthetics, deaths occur, and the employment of such principles in vivisection experiments involves cruelty. But as the animal has to die before it recovers from the anæsthesia I do not see that it matters to the animal?—But if the tracheotomy is done first?

16809. That you have told us; we can pass on from that. It is certainly news to the Commission and contrary to what we have heard is the practice.

Lieut.-Colonel E. Laurie, M.B., I.M.S.

Lieut.-Colonel E. Lawrie, M.B., I.M.S.

20 Nov. 1907.

16810. (*Sir Mackenzie Chalmers.*) Have you ever seen it done in any other laboratory except by Professor Rutherford in 1890?—I have seen it done without any chloroform at all. I did not see it done, but I know it is done.

16811. (*Mr. Ram.*) Where?—I would rather not say where if I am not obliged.

16812. When?—In 1894.

16813. In this country?—Yes.

16714. (*Sir Mackenzie Chalmers.*) In Scotland?—No, in England.

16815. (*Dr. Gaskell.*) What was done?—Cross circulation experiments.

16816. But what was done; was tracheotomy performed without chloroform?—The whole dissection was performed without chloroform.

16817. Do you say that it was performed without anything in the nature of an anæsthetic?—It was performed with a small dose of morphia.

16818. (*Mr. Tomkinson.*) What was the operation?—What is called a cross circulation experiment. The necks of two animals are dissected and the large blood-vessels cross-connected.

16819. (*Sir William Collins.*) What animals were they?—Dogs.

16820. (*Sir William Church.*) But it was under an anæsthetic?—I do not call morphia an anæsthetic.

16821. (*Mr. Ram.*) In no case?—Not unless it is given in a poisonous dose.

16822. (*Sir William Church.*) Then you go on to say that the chief fallacy which throttles anæsthetics at present, in the operating theatre as well as in the laboratory, is the unfounded doctrine that one of the dangers of chloroform anæsthesia is death from heart failure?—Yes.

16823. You deny, then, the fact of there being such a thing as heart failure in chloroform?—From the direct action of chloroform I do.

16824. I hardly know what the direct action of chloroform means?—Chloroform has no direct action on the heart. That is what I mean.

16825. I think you agree that chloroform lowers the blood pressure?—Most certainly it does. It is the first effect of chloroform.

16826. And how is the blood pressure lowered?—The blood pressure is lowered by narcosis of the vasomotor centre of the brain.

16827. What condition of the heart does that lead to?—It rather eases the work of the heart.

16828. Does nothing else happen to the heart at all?—Nothing else whatever until the respiration stops.

16829. But when respiration is impeded?—When respiration stops, then the heart runs down and fails.

16830. In what way?—From want of nutrition; its nutrition is cut off and it runs down and fails.

16831. Is there no other cause?—In the complicated action of the drug there is no other effect whatsoever.

16832. Its contraction is not interfered with?—Not a bit.

16833. It does not become dilated?—No.

16834. Then you go on to say that the Hyderabad Commission on Chloroform proved that the uncomplicated action of chloroform, which may be called its normal action, is to cause (1) the normal fall of the blood pressure, with (2) unconsciousness, (3) then anæsthesia, (4) then stoppage of the respiration, (5) then failure and stoppage of the heart, and (6) then death, I suppose that is agreed to by all anæsthetists, is it not, in physiology?—They do not teach it. They teach that it has a direct action on the heart.

16835. Is not that the order in which the symptoms appear?—That is the exact order in which they occur.

16836. You also on your *précis* state that, owing to the rejection by physiologists of the results of the work of the Hyderabad Commission on Chloroform, vivisection experiments have been brought into disrepute in Great Britain. I fail quite to see the bearing of that?—Because they are not done painlessly, as I take it they ought to be. Vivisection experiments are not done painlessly.

16837. (*Mr. Ram.*) Is that your opinion, or your knowledge from facts?—It is from what I have seen myself.

16838. (*Sir William Church.*) Am I to conclude from that that you think that an animal which is receiving an anæsthetic through the trachea does not become unconscious to pain?—It does, of course.

16839. Then in what way is the animal not unconscious?—In that it has had tracheotomy first, which is a painful operation. To get the tube into the trachea you must perform tracheotomy.

16840. But so far as our information goes that is not so. You have given us information which may be very valuable, that you yourself saw it done once, or heard of it; I think you said that you did not see it done?—I saw it done a great many times, as it happens, in Rutherford's laboratory in Edinburgh.

16841. In 1890?—In 1890.

16842. And you inferred from that that when an animal is kept under an anæsthetic with a tube in its trachea the initial operation is never done under anæsthesia?—I do not say it is never done, but I say that I know from my own observation that it is done without an anæsthetic.

16843. (*Dr. Wilson.*) When you say "is done" you mean that it was done when you saw it. You could not say that it is done now?—No, I cannot say that it is always done from my own observation, but I understand, of course, that it is done constantly in that way.

16844. Now?—Yes, I understand so; but I cannot say from my own observation.

16845. (*Mr. Tomkinson.*) In the case that you saw, how was the animal restrained?—It was fastened down on what was called the rabbit board.

16846. Did it cry?—No, I do not think it made any particular noise.

16847. Was it muzzled?—It was tied up.

16848. Was it muzzled?—Yes.

16849. Was it prevented from crying?—It was absolutely tied down so that it could not move.

16850. And prevented from making a cry?—I do not remember about crying at all.

16851. Did you say that it had morphia?—No, it had nothing at all before this.

16852. (*Sir Mackenzie Chalmers.*) Did you know that it had no anæsthetic of any sort or kind?—Yes, I saw it done without any anæsthetic of any sort many times.

16853. (*Dr. Wilson.*) The skin, I think you say in your *précis*, was snipped with scissors?—Yes; I took it, of course, from seeing that—I was fresh home from India—that it was the usual way of doing vivisection operations.

16854. (*Sir William Church.*) But you have had plenty of opportunities since 1890 of becoming acquainted with what is the habit in physiological and other laboratories?—No, I have been in India since then.

16855. Is that the way you do it in India?—Never.

16856. (*Dr. Gaskell.*) Who was present in Professor Rutherford's laboratory at the time?—His laboratory assistant.

16857. And himself?—Yes, and myself.

16858. Unfortunately he is dead?—Yes.

16859. Are you quite sure that nothing was given to the animal beforehand?—Yes, quite certain.

16860. (*Sir William Church.*) You go on to say that with stoppage of the respiration the intake and action of chloroform cease, and that if the animal does not then recover spontaneously the circulatory mechanism shuts down and it dies from failure of the heart?—Yes.

16861. Therefore you agree with other anæsthetists that death occurs in one of two ways: either from failure of respiration or from failure of the heart?—No, only in one way; I say from failure of respiration, and that leads to failure of the heart. The heart must fail if the respiration stops.

16862. Sir Victor Horsley (you say) has shown that death occurs in the same way by hanging when the neck is broken, and by bullet wound of the brain; and you say that in all three cases the respiration stops,

more or less rapidly in the case of chloroform, instantaneously in the other two, and the heart afterwards runs down and fails. That you think is only possible when respiration has failed first?—Yes.

16863. In all three cases you say cardiac failure is attributable to the cessation of respiration, and chloroform has no more direct effect on the heart than the bullet or the hangman's rope. Then you have been good enough to furnish some photographs; but really that is a scientific question that we have not to go into at this Commission here?—Of course; but I have seen the same effect myself in a bullet wound of the brain, and I know of its happening in hanging.

16864. (*Sir Mackenzie Chalmers.*) What happens in hanging?—I know of two cases of hanging this year, in one of which the heart did not stop for 15 minutes after the hanging, and in the other for five minutes.

16865. Although the neck was broken?—Yes.

16866. Would sensation be gone?—I think so, certainly.

16867. (*Sir William Church.*) Then pages 2 and 3 of your *précis*, unless there is something you wish to draw our attention to, have not much bearing on experiments on animals until you come to the point on page 3 where you are describing the difficulty of making an incision into the trachea because of the fur?—Yes.

16868. That we have gone into. You say that that is what you saw done once?—Yes, many times.

16869. And you also say that you saw another physiologist perform prolonged vivisection experiments on dogs under a ten-drop dose of morphin solution, this dose being equal to one-twelfth of a grain of solid morphin. Had they no other anæsthetic of any sort or kind?—I believe not until the observations began on the action of chloroform.

16870. (*Sir William Collins.*) Were those dogs insensitive to pain when they had the morphia only?—They could not have been.

16871. (*Dr. Gaskell.*) Why not?—It is quite impossible that a ten-drop dose of morphin could make a dog insensible to pain.

16872. What is the usual dose given to man?—As a sedative to lull certain kinds of pain, 30 to 60 drops.

16873. One-twelfth of a grain?—No, that is much too small a dose.

16874. That very frequently is the dose?—I have never seen it given in that dose to relieve pain.

16875. One-eighth of a grain is frequently given?—That is very insufficient.

16876. Is it not sufficient in renal colic to stop pain?—Morphin has no effect whatever on renal colic. I have had experience of it myself.

16877. (*Sir William Collins.*) Would it make a man insensitive to a cutting operation?—No, not in the least; it would have no effect on the sensibility.

16878. (*Mr. Ram.*) You mean in the dose that you have just named?—In any dose I believe, short of a poisonous dose, if you take renal colic as an example. It has no effect whatsoever on renal colic.

16879. (*Sir Mackenzie Chalmers.*) You mean that with a lethal dose pain is not stopped until death occurs?—A lethal dose is a different matter. I am talking of a medicinal dose.

16880. In the case of a lethal dose, when does insensibility to pain come in?—When the animal is narcotised.

16881. (*Dr. Gaskell.*) Is it a mistake then for the medical profession to suppose that morphia is a good thing to stop pain?—It does not have much effect if there is much pain. It does lull pain in a big dose.

16882. (*Sir William Collins.*) Does the conclusion in the question just put to you arise out of anything that you have stated to the Commission?—I do not think so, but I can tell you my own experience about renal colic and morphia. I passed a kidney stone soon after coming home from India, and I was in such fearful pain that I had to send for a medical man. I sent for a great surgeon who lives close to me, Mr. Cheatle, whose name everybody knows, who gave me morphin, but it had absolutely no effect. In about 20 minutes he proposed to give me another dose. I said I was very much afraid of morphin, as it appeared to increase the collapse, but not at all afraid of chloroform. He then gave me chloroform for five and a half hours until the stone passed. But the morphin had no effect whatsoever, and it was given in a full dose.

16883. (*Mr. Tomkinson.*) But I suppose that even if morphin can be said to lull pain it need not be an anæsthetic for cutting operations?—It is not an anæsthetic in any sense of the word.

16884. (*Mr. Ram.*) Not even in a lethal dose?—In a lethal dose it makes a man comatose. It takes an enormous dose to have any effect on a dog.

16885. (*Dr. Gaskell.*) Have you tried it on dogs?—Yes, we have. I have the notes of it here if you like to have them.

16886. (*Sir William Church.*) I think we have had a great deal of evidence that it requires a large dose of morphia to affect a dog. I think page 4 of your *précis* is chiefly what I might call matter which does not concern us; it is chiefly a scientific question. Then on page 5 you say that in the vivisection experiments which have been conducted by physiologists for the last 15 or more years, either to uphold the heart theory of chloroform or for scientific purposes, the anæsthetic has been pumped into the lungs with a motor through a tracheal tube; and that the meaning of this is:—(a) that no physiological experiments on the action of chloroform during this period possess any true scientific value, and (b) that owing to the anomalous position of anæsthetics, all vivisection experiments have been accompanied by unnecessary pain. Would you please explain a little what you mean there?—The essential point in giving chloroform is never under any circumstances to interfere with natural respiration; but if you give chloroform through a tracheal tube you must do that—you must interfere with the natural respiration, and you must vitiate the experiment so far as the action of the chloroform is concerned.

16887. I do not follow you there. It is received by all physiologists that it interferes with natural respiration when the animal is anæsthetised through the intentional opening of the trachea?—It is a matter of ordinary common sense that if you pump the chloroform in through the trachea it must interfere with the natural breathing.

16888. (*Sir Mackenzie Chalmers.*) But it produces anæsthesia?—It produces anæsthesia, and it produces other effects as well caused by interference with the natural respiration.

16889. (*Mr. Ram.*) The animal does not suffer any pain?—No.

16890. (*Dr. Gaskell.*) If it is not pumped is it not natural respiration if the animal is breathing the air mixed with chloroform through the tracheal tube?—That is a different thing. I have seen that done, but this remark does not apply to that. It applies to pumping.

16891. Do you think that pumping in the way you mention is the usual method?—It is a very usual method, I take it; I understand that it is.

16892. If artificial respiration is not required. You mean artificial respiration, I presume?—No, I mean the way of giving chloroform pumped in by a motor.

16893. I have never seen it done?—It was done in those experiments described in the trial, Bayliss *v.* Coleridge.

16894. It was passed through a Woulff's bottle?—No, it was done by a motor in the next room in those experiments.

16895. (*Sir William Church.*) Do you know of any physiologists of repute who take the same view with regard to that, that if air charged with chloroform is administered through the trachea to a dog it interferes with the correctness of their experiment?—I cannot tell you what other people think about it. I can only tell you my own view of it.

16896. Then can you tell me of anybody else's views that coincides with yours?—Everybody's view must coincide with mine. It is actual fact; it is not a matter of opinion. If you pump air into the trachea it must interfere with natural respiration.

16897. (*Sir Mackenzie Chalmers.*) You are only speaking of the effect of chloroform, not other anæsthetics?—Yes.

16898. And experiments under the action of chloroform?—Yes.

16899. (*Sir William Church.*) But it does not cause

animals to have unnecessary pain?—Not if they are tracheotomised under an anæsthetic.

16900. You would withdraw, I suppose, your statement No. 2, on page 5, that it necessitates a painful operation before the administration of the anæsthetic begins?—If the tracheotomy is not done first it does not apply to those cases, of course.

16901. (*Mr. Ram.*) Or if it is done under anæsthetics?—If the tracheotomy is done under anæsthetics. But if it is done under anæsthetics, why should they change the mode of administration? And of course nothing can be worse for students than to see chloroform given in that way.

16902. (*Sir William Church.*) I suppose you are aware that chloroform is given in that way in a considerable number of operations on man?—Through the trachea?

16903. Yes?—No, I am not. I have never seen it given in that way. It may have to be done as a very, very rare and exceptional thing.

16904. And you consider that it teaches students wrong methods of administering anæsthetics which must tend to vitiate the whole of their careers?—Yes.

16905. Do you really mean the Commission to infer that the teaching of the administration of anæsthetics is seeing the physiological experiments in the laboratory?—I do not quite understand what you mean.

16906. You say, "It teaches students wrong methods of administering anæsthetics, and this must tend to vitiate the whole of their careers"?—Yes.

16907. I asked whether you think that teaching the administration of anæsthetics consists in seeing the physiological experiments on animals in laboratories?—They ought to be taught the right way of giving chloroform in those experiments, which ought to be utilised for that purpose. It is just as important as showing them other physiological effects.

16908. You do not mean the Commission to infer that that is the way students are taught to give anæsthetics?—So far as the laboratory is concerned it is.

16909. The physiological laboratory?—Yes, the physiological laboratory.

16910. But what proportion of the experiments which are done in physiological laboratories are done in this method of having the trachea opened and a tube inserted?—That I cannot tell you.

16911. Do you wish the Commission to infer from this evidence that you have given that it is the usual method?—I understand that it is the usual one; but of course the Commission can find out quite easily whether it is or not.

16912. You would not like to express an opinion yourself as to whether it is the usual way or not?—I imagine that it is the usual way, most certainly.

16913. You have not made any inquiries before you made this statement?—It is from what I have seen myself and from the manner in which all the experiments on chloroform have been described that I say chloroform is always given in that way through the tracheal tube.

16914. In cases of prolonged demonstrations before students, you mean?—Yes.

16915. You do not think it is the usual way in ordinary experimentation in a laboratory?—I understand that it is, but I may be wrong about that, of course.

16916. (*Dr. Gaskell.*) The point is the pumping. Is that what you imagine is the usual way, pumping the air and chloroform?—Yes.

16917. That is not true?—That was described as having been done in the Bayliss trial, and it was done in Embley's experiments.

16918. (*Dr. Wilson.*) That is counteracted by artificial respiration, is it not?

16919. (*Dr. Gaskell.*) It would be necessary for artificial respiration—not natural respiration?—But it does both.

16920. It is for artificial respiration that pumping is done?—And for the giving of the chloroform.

16921. In artificial respiration. In natural respiration the animal breathes air saturated with the right amount of chloroform?—This remark does not apply to natural respiration.

16922. (*Sir William Church.*) Then you go on to state that to make sure of painless vivisection, two things appear to be necessary; first, that it should be made illegal to give chloroform to animals in any other way than by the mouth, on the principles which have been proved to be sound by the Hyderabad Commission. That is what you would recommend to this Commission?—I think that certainly ought to be done in order to put a stop to giving chloroform in this way.

16923. Has nobody else worked at the administration of chloroform except the Hyderabad Commission?—Hundreds of people have, so far as I know.

16924. Do they all agree with the conclusions of the Hyderabad Commission?—The conclusions of the Hyderabad Commission have been absolutely ignored.

16925. It appears in other words that the majority of those who have studied the subject do not agree with them?—Certainly they do not.

16926. Would it not be putting a considerable difficulty in the way of experimentation if animals could only be kept under anæsthesia by what you call the natural way?—No, I do not think it would at all.

16927. In what you call the natural way, is there any method by which you can actually measure the quantity of chloroform that the animal receives?—No, there is not.

16928. I suppose you know that great attention has been paid to the actual amount of chloroform that the patient receives now?—It has been said that the chloroform has been measured, but no one can possibly take measure of the amount that is respired—the amount that is taken in by the patient.

16929. Are you acquainted with Mr. Vernon Harcourt's method of measuring chloroform?—Yes, I am. I have not seen it done.

16930. You do not think it reliable?—It is very reliable in this way, that it dilutes the chloroform; but it cannot measure the amount that the patient takes in.

16931. Then you recommend, secondly, that the General Medical Council should have the power to treat the infliction of unnecessary pain by experimenters on animals as a disgraceful act. I do not quite understand what you mean by that?—Some such power should be given to the General Medical Council in order to put a stop to unnecessary pain in vivisection.

16932. But the General Medical Council only have power over the medical profession?—Exactly.

16933. You would leave the physiologists, who appear to be in your mind the chief offenders, untouched?—But they are part of the medical profession, I take it.

16934. (*Chairman.*) Not necessarily, unless they have a medical degree?—Of course, some such power ought to be given. Someone ought to have the power of putting a stop to unnecessary pain. And, of course, there is the important point, the teaching of anæsthetics.

16935. (*Sir William Church.*) You say that chloroform given on the principles advocated by the Hyderabad Commission is a totally different anæsthetic from chloroform given on the heart principle; and you say that the former is always safe, the latter never. That in your own opinion?—Well, it is proved by statistics, and anybody can be taught to give chloroform safely on the Hyderabad principle, while no one can on the heart theory.

16936. You think that the giving of chloroform to dogs would be a reliable method of instruction in the use of anæsthetics for medical students?—Most valuable.

16937. You consider, then, that anæsthetics now are not given as skilfully as they might be by the medical profession?—I do not say anything about the skill. It is not a question of skill; it is a question entirely of principle.

16938. Then you go on to say that it would be a great boon to our sailors and soldiers in war time if all nurses and hospital orderlies were taught to give chloroform—at any rate, up to the stage of unconsciousness?—Yes.

16939. Then you would advocate the use of chloroform by others than those who hold a medical diploma?—I would advocate the use of chloroform by nurses,

and by hospital orderlies, and by medical students under proper supervision.

16940. Then you go on to say that the specialist in anæsthesia was called into existence by the belief, originated by physiologists in 1864, that the fall of the blood pressure under chloroform is synonymous with heart failure. Surely that is rather a bold statement, is it not?—I think that is really what led to the employment of anæsthesia specialists.

16941. Were there not men specially skilled in anæsthetics before 1864?—There were, but a special class of specialist was called into being by the experiments of 1864, and those of 1879, which followed.

16942. You finish your *précis* by saying that chloroform was given by students in Edinburgh for more than twenty years in the middle of the last century in all surgical operations without a death. Is that quite the case?—It is absolutely true so far as the clinical wards were concerned.

16943-4. There have been deaths from chloroform in Edinburgh; I cannot say whether in the clinical wards or not?—At that time, I believe that in that period there may have been a death, there was a death, but it was not in Syme's wards. I am talking now of the wards of the professor of clinical surgery during that period.

16945. But there were accidents from chloroform, were there not?—There were no accidents in his ward.

16946. But Simpson had a fatal case?—Yes, he had, I believe.

16947. That is one. Are you aware of the difference in the way inquests are held in Scotland and England?—There are no inquests that I know of in Scotland.

16948. So that a death from chloroform does not get into the papers?—There is an inquiry by the Procurator Fiscal.

16949. But you feel quite sure that during twenty years—I do not know what twenty years you take—there were no deaths?—No death in Syme's wards from 1847 to 1870—until he died.

16950. But you do not say in Mr. Syme's wards?—My remarks apply to Syme's wards.

16951. But it makes a considerable difference?—It really does not make much difference, because I know of no death in the whole of the infirmary during that time except one rather doubtful one. That applies especially to Syme's wards. The chloroform in those days was invariably given by students. During the whole time that I was in India in charge of many different hospitals the chloroform was given by students also in precisely the same way, and there was one death.

16952. The whole bearing of your evidence before us to-day is that chloroform can be given with perfect safety, so long as the respiration is attended to?—So long as the regular respiration is maintained.

16953. And you would always be able to see whether respiration is embarrassed and you are getting into danger?—You have no business to allow the respiration to become embarrassed at all under chloroform. You must maintain regular respiration. If the respiration is embarrassed you must take away the chloroform.

16954. (*Sir Mackenzie Chalmers.*) And stop the operation?—No, on no account, stop the administration until the respiration is regular again. That is a matter of simple management.

16955. Is there any danger of pain supervening when you stop giving the chloroform?—No, not a bit, you only stop it for the temporary embarrassment.

16956. You can go on with the operation, the patient being perfectly free from pain?—You just stop the chloroform, you take away the cap while the embarrassment lasts, and then go on with it again. You do not allow the respiration to be embarrassed while chloroform is given.

16957. (*Sir William Collins.*) How long have you been engaged in studying anæsthetics?—I began to give them as clinical clerk in Edinburgh in 1865.

16958. How long have you made them a special study?—Ever since then.

16959. A special study?—Yes, a very special study.

16960. About how many cases have you administered chloroform to?—I published some statistics in 1901 for 10 years. That included 17,000 cases, and I have not got the record for previous years, because I was moved about in India. I cannot quite tell how many, but the number was enormous.

Lieut.-Colonel E. Lawrie, M.B., I.M.S.

20 Nov. 1907.

16961. We have been often told that chloroform was discovered by experiments on man, and not on animals?—Yes, but its present position depends on laboratory experiments.

16962. Was it discovered by experiments on man?—I believe so.

16963. I understand that you think Syme's method of administration satisfactory?—It was satisfactory in his day.

16964. Very satisfactory?—Yes, perfectly.

16965. Was it based upon clinical experience?—It was based entirely on clinical experience.

16966. Did Syme rather deprecate experiments on animals?—I cannot say anything about that. I do not know what his opinion was.

16967. I think before the last Royal Commission of 1876 it was stated that he rather opposed, at any rate, in his later years, experiments on animals?—From my recollection of him I should think he did, but I cannot say positively.

16968. You are a strong advocate for watching the respiration, and you think the suggestion that chloroform kills by action on the heart is erroneous, I understand?—We have proved it; the Hyderabad Commission have proved it.

16969. Did the Cambridge experiments to which you have alluded tend to show that it acted upon the heart?—The Cambridge experiments were a failure; they were allowed to be wrongly performed.

16970. Were they vitiated?—In the experiments that were done at Cambridge the chloroform had access to the brain when it was supposed to be having access to the heart alone.

16971. Was it thought as the result of those experiments that chloroform acted upon the heart?—Yes, it was allowed.

16972. Is that what you consider a wrong principle?—Yes, it is a wrong principle, from our point of view.

16973. Was the vitiation of those Cambridge experiments admitted?—It was admitted by Dr. Gaskell himself.

(*Dr. Gaskell.*) Oh, no.

(*Witness.*) I have your letter.

(*Dr. Gaskell.*) The vitiation of the experiments was not admitted by me.

16974. (*Sir William Collins.*) Are you referring to the letter on page 17 of your book on chloroform?—Yes.

(*Sir William Collins.*) I do not know whether Dr. Gaskell wishes it read.

(*Dr. Gaskell.*) You may read it if you like.

16975. (*Sir William Collins*) What is the clinical practice at the present time of those who administer anæsthetics; is it to watch the heart or watch the respiration?—All the teaching at present in the text-books is that chloroform affects the heart, but I have seen many of the best anæsthetists in London give chloroform, and I have never seen any of them watch the pulse.

16976. On page 20 of your work on chloroform I see you quote Sir Lauder Brunton's statement that "the fear of chloroform paralysing the heart is based on laboratory experiments rather than a clinical experience." Is that the point that you wish to bring out?—Yes, that is a point that I wish to bring out.

19677. That clinical experience rather than laboratory experiment has been the truer and safer guide in the administration of chloroform?—The point is this, that the laboratory experiments were supposed to afford scientific proof that chloroform affects the heart.

16978. I understand you to suggest that they do not?—Our experiments proved where those scientific experiments were mistaken. The Hyderabad Commission experiments traversed those experiments, and we showed where the mistake arose in the physiologists' experiments.

16979. So that the laboratory experiments I understand you give contradictory results?—Yes.

Lieut.-Colonel E. Lawrie, M.B., I.M.S. — 20 Nov. 1907.

16980. Whereas the clinical experience you regard as safe?—And there are no contradictory results in this way. All our own experiments were done by chloroform administered in the ordinary way by inhalation. All the laboratory experiments on which this theory is based, that chloroform affects the heart, were performed, so far as I know, with chloroform given through a tracheal tube.

16981. But there were results which were opposed to yours?—They are opposed to observations we made when chloroform is given by the mouth.

16982. You quote with approval the statement of Sir Lauder Brunton: "The fear of chloroform paralysing the heart is based on laboratory experiments"?—Yes.

16983. So that apparently there were laboratory experiments which suggested that chloroform paralyses the heart?—Yes, those are the experiments of the 1864 Commission.

16984. Was that conclusion in your opinion right or wrong?—That conclusion was really wrong, because it was inferred that the fall of blood pressure was synonymous with heart failure.

16985. Then should I not be right in saying that the conclusions arrived at from the laboratory experiments were contradictory?—Yes, they were in that way, but we brought them all into harmony.

16986. Was the harmony supported from the first by the clinical experience?—It was.

16986a. (*Sir Mackenzie Chalmers.*) I do not want to go into technical matters, but the Hyderabad Commission experimented with animals, did they not?—Yes.

16987. Do you agree that animal experimentation is necessary for the purpose of determining the action of chloroform and other substances?—It was necessary then to refute other experiments by laboratory experiments. There was no other way of refuting them.

16988. Do you agree that animal experimentation generally is necessary for advance in medical science?—Yes.

16989. And in physiology?—Yes.

16990. And in pharmacology?—Yes.

16991. Has medical science received great benefit from it in the past?—Yes, enormous benefit, but it would receive the greatest benefit of all if the Hyderabad experiments were not ignored.

16992. Apart from these tracheotomies that you saw in Professor Rutherford's laboratory, have you any knowledge yourself of any painful experiments being performed without anæsthetics in England?—I have seen two sets of experiments.

16993. In one of which I understand the animal had a dose of morphia?—They all had a dose of morphia.

16994. In one set of experiments nothing was done?—No.

16995. And in the other set of experiments, the cross circulation experiments, morphia was given?—Yes.

16996. Apart from that, do you know anything about the ordinary practice in laboratories in England?—No, except what I heard upon that trial, the Bayliss trial.

16997. The evidence in that trial?—Yes.

16998. It did not appear at that trial, did it, that tracheotomy was performed before the animal was anæsthetised?—I do not remember that anything was said about it.

16999. So far as we have had evidence of the Commission here, the evidence has been that an anæsthetic is administered first. Assuming that to be so, all that is done afterwards would be painless, would it not?—Quite.

17000. You have no doubt whatever that in whatever way chloroform is administered, it is an absolute anæsthetic, absolutely freeing the animal from pain?—Absolutely; from the time of unconsciousness there can be no pain.

17001. Your point is that it is improper and wrong to perform tracheotomy before the chloroform is administered?—Yes.

17002. Is tracheotomy a very painful operation?—It is a very painful operation, I should think.

17003. It is done continually on children, is it not?—It is done for croup and diphtheria.

17004. Pretty continually?—Yes.

17005. It is done on children, of course, without anæsthetics?—Not always.

17006. Could you give anæsthetics to a child with diphtheria?—Yes, you can give a small dose, but a child as a rule by the time it gets to the stage where tracheotomy is required is almost unconscious. It would practically not need an anæsthetic, or at any rate only just enough to divert its attention from the incision. You would not need more than that.

17007. In the case of a child it is not what you call a painful or severe operation?—It would be if the child was not suffocated.

17008. We have had evidence which does not always coincide on this point: That when chloroform is administered some witnesses have said that there is a sudden passage from feeling pain to insensibility, and others have said that there is a gradual diminution of pain. What is your view on that point?—Supposing that you are giving chloroform, you can keep on asking the patient questions, and suddenly the patient will stop answering, and has become unconscious.

17009. Do you think unconsciousness to pain goes before or after the general consciousness?—It goes after.

17010. For instance, if chloroform is administered not in a sufficient quantity to produce unconsciousness, is there any diminution of pain?—The patient would remember it.

17011. But do you think the pain would be equally acute?—No, not nearly so acute.

17012. You think, in fact, that as chloroform is administered, there is a progressive diminution of pain?—A progressive diminution of sensibility to pain.

17013. And that diminution of insensibility precedes unconsciousness?—Yes, and directly unconsciousness supervenes then there can be no pain; from that moment the patient will never remember anything you do afterwards.

17014. He will never remember it, and so far as you can tell will not feel it?—He will not feel it at all.

17015. You connect the feeling of pain entirely with the higher centres?—With consciousness. The patient must be conscious in order to have pain.

17016. That is to say, conscious to outward surroundings?—He must not be unconscious.

17017. But pain may be diminished before that stage is reached?—Yes.

17018. Have you performed other vivisection experiments besides those with reference to chloroform?—No, except with ether.

17019. Your whole study has been the action of anæsthetics?—Yes, and, of course, I taught students to operate by vivisection.

17020. In India?—Yes.

17021. You practised the student on an animal?—Yes.

17022. Which, of course, you anæsthetised?—Always.

17023. And then the student learnt what we may call manual dexterity?—Yes, he learnt how to become accustomed to do operations on living tissues, and also how to give chloroform at the same time.

17024. Do you attach great importance to students doing operations on living animals before they practice on living human beings?—It is of tremendous importance in India, because it is the only chance that a student ever has of doing an operation at all.

17025. But in England what opportunity has he?—In England a man goes through successive stages in hospitals of every kind. He may be house surgeon and hold all sorts of appointments, and becomes assistant surgeon and then surgeon to a hospital. But these men in India are frequently sent straight out from the schools into a district of which they have complete charge, hospital and all.

17026. They may have to do important operations which perhaps they may have only seen once in their student career?—Yes, they have to do everything from the time they get charge of a district.

17027. You are speaking of natives, of course?—Yes.

17028. Is there any difficulty with the native population in regard to teaching students on animals; is there any very strong feeling against it?—No, there is no feeling whatever as long as you do not give the animals pain.

17029. As long as the natives are satisfied that the animal is anæsthetised properly there is no feeling whatever?—No.

17030. You have no protests?—No, never.

17031. Is it since your day that what is called the Pasteur Institute has been established?—It has been established since I left India.

17032. You cannot tell us anything about it?—No.

17033. Can you tell us anything about the feeling of the natives with regard to that?—I think the natives would place the most implicit confidence in it, from what I know of them.

17034. Have you ever discussed with natives in India the question of animal experimentation?—Yes, often.

17035. Their objection is to the causing of anything like unnecessary pain?—Yes.

17036. As regards vivisection generally, do you agree to this extent, that it is not only lawful to experiment on animals, under anæsthesia of course, but that it is lawful to allow the animal to recover for the purpose of watching the effects of the operation?—Yes, I agree in that.

17037. And do you think it is necessary to inoculate animals for the purpose of watching the progress and spread of the disease?—I cannot give an opinion of any value about that, but I should think it is.

17038. You agree, I suppose, that for very slight operations more discomfort and pain would be caused by giving an anæsthetic than, say, the mere prick of a hypodermic needle?—I think it should be entirely left to the patient, however slight the operation is.

17039. Taking the case of an animal, supposing an animal is to have a hypodermic injection, it is more humane, is it not, to use the hypodermic needle without an anæsthetic than to give the animal an anæsthetic?—I do not see how it could be, although I should think it is unnecessary to give an anæsthetic. You could give an anæsthetic in the box without the animal being upset by it or terrorised.

17040. You do not think that the administration of anæsthetics to animals causes any great discomfort or apprehension?—None whatever, unless you fasten them down or hold them down.

17041. How do they do it in India?—They put them into a box with a glass cover, and directly the animal falls down on the floor of the box you take it out and put it on the table.

17042. You think that given in that way, the animal does not suffer?—It does not mind it or make any objection to it.

17043. What animals do you use in India?—Dogs, monkeys, rabbits and cats.

17044. But you would not yourself use an anæsthetic to an animal in case of an injection with a hypodermic needle or inoculation?—I should think it hardly necessary; it is so momentary.

17045. (*Mr. Ram.*) As I gather, your evidence comes merely to this, does it not? You hold a certain theory as to the action of chloroform, as to the way in which it acts?—Yes.

17046. Other people hold that chloroform acts in a way other than that which you believe?—Yes.

17047. It is admitted, is it not, on all hands that whichever theory is correct, chloroform rightly administered is a safe and sure anæsthetic, and absolutely frees the animal from pain?—Yes, but everybody does not agree that it is a safe anæsthetic at present.

17048. I leave out the word "safe." I meant by that that it is an anesthetic which absolutely frees the animal from pain?—Yes.

17049. I see in your *précis* you use this phrase, "but if it" (that is, chloroform) "is given on the theory that it may cause death by heart failure, sometimes suddenly it is the most dangerous of all anæsthetics"?—Yes, it is.

17050. Dangerous, I suppose, in that connection means likely to cause death?—Likely to cause a certain percentage of deaths.

Lieut.-Colonel E. Laurie, M.B., I.M.S.

20 Nov. 1907.

17051. So that it would not matter to the animal which is under operation, whether the chloroform caused death or whether it did not; in neither case would the animal feel?—That is so.

17052. So that whichever theory is right (yours or the other people's), so far as the animal is concerned the animal is equally safe if it is under a proper dose of chloroform?—So far as an anæsthesia is concerned.

17053. This Commission, as I daresay you know, has to report upon the practice of subjecting animals to experiment, whether by vivisection or otherwise, and then to consider whether the law wants amendment. Will you just tell me, please, how your evidence bears upon that, from the point we have to report upon?—My point is that all vivisection experiments can be performed painlessly if chloroform is given in the right way.

17054. Then it comes down to this, does it not, that your evidence is valuable to us according as it bears upon the method of administering chloroform?—Yes, in two ways, as regards the animal and as regards the student.

17055. You have seen it administered years ago *vid* the trachea?—Yes, but it is on those very experiments performed in 1894 that the present teaching of anæsthetic is based.

17056. And in the instance which you gave you said that there was no previous anæsthetisation of the animal?—That is so.

17057. If an animal to which chloroform is given through the trachea is previously properly anæsthetised, your theory may be invalidated, but the animal does not suffer any more?—No, if the tracheotomy is done under anæsthesia

17058. Then so far as regards the point that we have to inquire into here, it comes down to this, does it not, that you in 1890 and 1894 saw what according to your belief was, I will take it if you like that it was an actual fact that you saw the administration of chloroform *viâ* the trachea, the animal not having been previously anæsthetised?—Yes.

17059. That was an illegal operation?—That I do not know anything about.

17060. But perhaps you will take it from us as being really contrary to the very words of the Act?—Certainly.

17061. If that be so the Act wants no amendment in that respect?—No.

17062. Because the Act already makes it illegal?—Yes.

17063. Were you aware when you saw it that it was contrary to the Act?—I was told so afterwards.

17064. You were not aware of it at the time?—I did not know it at the time.

17065. How soon afterwards did you know?—Immediately afterwards.

17066. Did you report the case to anyone as being an illegal act?—No.

17067. (*Dr. Gaskell.*) I am just going to ask you one question. Can you give me the name of any person who has been in the habit of administering anæsthetics or has studied the action of chloroform who believes that chloroform has no effect upon the heart except yourself?—Surgeon-General Bomford.

17068. You mean in India; he was with you in India, was he not?—Yes.

17069. Is there anyone in this country?—I understand that all Syme's pupils have the same view as I have, but still I cannot speak for anybody else.

17070. I meant people who have been in the habit of giving anæsthetics. I mean professional anæsthetisers and that kind of person or people engaged in the investigation of anæsthetics in physiological laboratories?—In physiological laboratories, no, I cannot give you any name, but I can give you names of many surgeons and practitioners.

17071. They have hardly studied the question, have they?—They have been accustomed to doing operations, and have studied it, I should think, very closely.

17072. (*Mr. Tomkinson.*) You give a description, I see, in your *précis* of a case in which tracheotomy was performed without anæsthetics upon a rabbit, and in

Lieut.-Colonel E. Lawrie, M.B., I.M.S.

20 Nov. 1907.

view of the questions which you have been asked as to the painfulness of it, I want to ask you one question. I see that you describe it as having been necessary or convenient to cut away the skin—to flay the skin with scissors?—Yes.

17073. That, of course, would be exceedingly painful?—I thought so, frightfully painful.

17074. There would be no comparison between the pain caused by a mere incision in the skin of a child's flesh with that inflicted upon that rabbit?—No comparison whatever.

17075. In which the skin has to undergo the most painful operation that can be imagined almost?—Yes, a very painful operation.

17076. The skin, of course, is excessively sensitive?—Yes.

17077. The cutting away of that skin, the flaying of it back would be an exceedingly cruel thing without an anæsthetic?—Yes.

17078. And that was done in that case?—Yes, in several cases.

17079. And in no case was an anæsthetic administered before the tracheotomy?—No, in no case.

17080. What is the supposed advantage of introducing the chloroform in that manner instead of through the mouth, as I see you say? That means the mouth and nostrils, I take it? The inhalation is through the nostrils?—Through the mouth and nose.

17081. The mouth has to be covered as well?—Yes.

17082. What is the supposed advantage of administering it direct into the trachea instead of through the nostrils and mouth?—I cannot imagine any advantage whatever.

17083. You hold that there is none?—Yes.

17084. And it is a wholly unnecessary operation?—Yes, and it teaches the students a wrong way of administration; they learn nothing from it.

17085. Of course it would never be so administered to a human patient except in case of obstruction?—Except in exceptional operations round the mouth or jaws which would interfere with natural breathing.

17086. You hold strongly that morphia and morphin are not anæsthetics?—I am certain that they are not.

17087. Until the point is approached of almost stupefaction approaching death?—Until their poisonous effect is produced.

17088. I asked the question of a previous witness, whether the condition of a subject under the strong influence of morphia was not akin to that of a man stupefied with alcohol. You, I suppose, would hold that in neither of those cases are they incapable of feeling pain, although apparently stupefied?—I think you might do a great deal more to a man stupefied by alcohol without his feeling it, than to a man under the influence of a medicinal dose of morphin. We did a great many experiments with morphin in the Hyderabad Commission, and our conclusion was that dogs are very indifferent to the action of morphin, so that if you want to produce any effect upon them at all you have to give an enormous dose.

17089. Have you any experience of the action of curare?—No.

17090. Or the use of it?—No.

17091. Have you an opinion about it?—I really have not, because I have no experience of it at all.

17092. But you know, I suppose, generally, what its effect is?—Yes.

17093. Do you hold any strong view as to the necessity or the advantage or the propriety of administering curare in company with other anæsthetics?—No, I cannot see what is to be gained by it myself.

17094. It is rather a leading question, but should you have any fear that its paralysing effect would prevent the animal from showing signs of pain, although it might feel it?—I should think it might, but I really do not know.

17095. (*Dr. Wilson.*) Were these morphia experiments carried out at Hyderabad on dogs to render them, or to attempt to render them, completely insensible to pain?—We carried them out really to see whether they deepened the anæsthesia or not.

17096. With chloroform?—Yes.

17097. Have you operated on dogs with morphia alone as an anæsthetic?—No, we never used it as an anæsthetic; but it had no effect in deepening anæsthesia.

17098. Can you give me an idea of the dose that would prove fatal to an ordinary sized dog?—I should think you would have to give it at least 5 or 10 grains.

17099. But it would vary very considerably, I suppose, according to the idiosyncracy of the animal, and possibly the breed of the animal?—Yes.

17100. But you could not be guided by the bodyweight?—No.

17101. Did you experiment with any other narcotics besides morphia?—We experimented with various drugs administered in order to ascertain whether they had any effect in modifying the action of chloroform; such as atropin, morphin, nicotin, and so on.

17102. But with your knowledge of morphia or morphin, would you say that it was an unreliable anæsthetic for experiments on animals?—It is not an anæsthetic at all.

17103. I mean an abolisher of pain, then?—It would not abolish the pain of a cutting unless you poisoned the animal with it.

17104. But supposing that an animal gets what is called a lethal dose, how long would it live do you think under an operation?—That I cannot tell you. It might live some hours.

17105. But it would be completely insensible to pain all the time?—Yes, quite, if it were comatose.

17106. Have you seen much of plague out in India? You do not come here to give evidence on it?—No; but I have seen a great deal of plague. I was Plague Commissioner for Hyderabad for five years.

17107. Do you believe in Haffkine's prophylactic?—At the time when I saw it used, it was always putrid.

17108. Have you studied the literature of the subject since?—I cannot say that I have followed it very closely since.

THIRTY-EIGHTH DAY.

Tuesday, 26th November 1907.

PRESENT:

The Right Hon. The Viscount Selby (*Chairman*).
Sir W. S. Church, Bart., K.C.B., M.D.
Sir W. J. Collins, M.P., M.D., F.R.C.S.
Sir J. McFadyean, M.B.
Sir M. D. Chalmers, K.C.B., C.S.I.
Mr. A. J. Ram, K.C.
Mr. W. H. Gaskell, M.D., F.R.S.

Captain C. Bigham, C.M.G. (*Secretary*).

Mr. John Hughes, F.R.G.S., called in; and Examined.

Mr. J. Hughes F.R.G.S. 26 Nov. 1907.

17109. (*Chairman.*) You, I believe, are Secretary of the National Canine Defence League?—Yes.

17110. How long have you been so?—Three years.

17111. You have not, I understand, had any special education in surgery or physiology?—No.

17112. You speak principally to what we have been calling the ethical side of the question?—Yes. I wish to lay before the Commission the work that my society has done without entering into the scientific aspect of the question at all, that I propose to leave to the scientific witnesses whom we hope to produce.

17113. We should like shortly to hear what the number of members of your society is, and what their object is, but perhaps you will take it very shortly, because our object is not to inquire into the protection of dogs generally, but only with regard to surgical experiments?—I quite understand.

17114. Perhaps you will tell us, to begin with, what the number of the members of your society is?—Our membership at the present moment is 4,421.

17115. That is to say, I suppose, they subscribe?—They subscribe.

17116. One member of the Commission asks what is the subscription?—I am giving you a list of the members up to the present day. I can only give you a list of the subscriptions up to last year.

17117. (*Sir Mackenzie Chalmers.*) Is there any minimum subscription?—2s. 6d.; that is the minimum subscription.

17118. (*Sir John McFadyean.*) Annually?—Yes.

17119. (*Chairman.*) I suppose we may shortly take it that the object is that indicated by the title—namely, to defend dogs from anything that you think cruel or unjust, or wrong treatment in any direction?—Yes; to protect dogs from ill-treatment or ill-usage of any kind.

17120. How long has your society been in existence?—It was founded in 1891, but it was founded, not as a Canine Defence League, but as an Anti-Muzzling League. It was called into existence at the time of the rabies scare in 1891, when the Muzzling Orders were made by the Board of Agriculture.

17121. Do I rightly understand that the League was founded with the view of opposing what I may call the muzzling legislation of Mr. Long?—Yes, quite so.

17122. Have they continued always of that view?—They have retained that part of the work, of course.

17123. Of opposing muzzling?—Yes, that is a part of their work, but the work has developed in other directions since then. As the society has grown in strength they have seen other objects which they thought it advisable to take up, so that now the work of the League covers the whole of the question of the protection of dogs from ill-usage.

17124. Do I rightly gather that they always have been, and are opposed to, the principle of muzzling dogs, and of excluding dogs coming from abroad in order to prevent the disease of rabies being spread?—If you refer to the quarantine regulations of the Board of Agriculture, I cannot say that the society as such is opposed to quarantine regulations. We certainly think they are too stringent, and would like to have them altered in that respect.

17125. Does your society think they are useful in preventing the spread of rabies?—Yes, as long as they are not made too stringent.

17126. Do they object to muzzling on the ground that it is a cruel, though effective measure, or that it is a cruel and ineffective measure?—Cruel and ineffective.

17127. Quarantine they think is effective, but muzzling they think is not?—Quite so. We believe that quarantine ought to be in existence because it is a measure of prevention, to prevent the possibility of the spread of rabies. We believe, on the other hand, that muzzling really has been the means of causing rabies in dogs, rather than of preventing it.

17128. I daresay some other members of the Commission who deal with these matters will ask you some questions about that; I will not pursue it myself. As regards vivisection, that, I understand, you are altogether opposed to as regards dogs?—Quite, so far as dogs are concerned.

17129. Not merely to vivisection, but to all experiments on dogs either by way of inoculation or testing for drugs or for the causes of diseases?—Yes, we oppose every kind of experiments on dogs.

17130. And that is whether the dogs are anæsthetised or not?—Yes.

17131. Do you draw any distinction between the doing of it under anæsthetics and without anæsthetics?—No, we do not believe that any experiments either with or without anæsthetics should be permitted.

17132. You think that they are equally unjustifiable?—Yes.

17133. When I say you, of course I am speaking of the views that you represent?—Yes.

17134. Do you consider that experiments on animals generally are unjustifiable?—I can, of course, only give my own personal opinion on that question. I have every reason to believe that a large number of the members of my society are opposed to the vivisection of any animal, but I know on the other hand

Mr. J. Hughes, F.R.G.S.

26 Nov. 1907.

that there are some who, whilst they believe that the vivisection of some animals may do good, are equally strong against vivisection of dogs.

17135. That is not that they think that useful results might not be obtained from experiments on dogs, but that they think dogs ought to be exempt?—They think dogs ought to be exempt on moral grounds, and also so far as I can understand their views, because they believe that other animals could be experimented upon with greater effect for purposes of investigation.

17136. In all cases?—In all cases.

17137. However, that is a matter as to the distinction between the formation of the dog and the formation of man or a monkey, which is not a matter that you profess to speak about yourself?—No, not on my own authority. I have, of course, the testimonies of others; but I hope to bring forward a witness who will speak specially on that point.

17138. I think we had better, perhaps, keep clear of those questions in examining you, because we have had many gentlemen on both sides who speak from personal experience and physiological knowledge?—Yes.

17139. I understand that your main reason for claiming exemption for the dog is on moral grounds?—That is the first reason. I have put down the reasons as they occurred to me in my *précis* of evidence.

17140. That, I think, is a matter that does not require much elaboration, because while people may differ as to the weight of the reasons, the nature of them is quite obvious. Then you speak of their docility, faithfulness and companionship?—Yes.

17141. And evolution. What do you mean by that?—What we mean is that generations of training and being brought into contact with human beings have rendered the dog so much more highly developed than other animals that it is not a fit subject for experiment.

17142. But the word evolution is often used in another sense. Do you mean by it, that they are so far on their way to becoming men?—That they are nearer human beings. I do not say that they will ever become men.

17143. Not that they are on their way to that as an end?—They are on the road, but I do not know that they will ever reach it.

17144. Then you also say that they were never intended for experimental purposes. I do not quite understand what you mean by their never being intended. Do you mean never intended by Nature or Providence?—Never intended by Nature or Providence. What we know of dogs is of such a character that we cannot conceive of the possibility of their ever having been intended for the purpose of being put to pain, or for experimentation for the purpose of finding out cures for disease.

17145. When you come to say that they were never intended by Providence for that purpose, is not that entering into a very large subject, perhaps a little outside our scope. Would you say that man was never intended to be eaten by a tiger?—Certainly.

17146. Or that a cat was never intended to torture a mouse?—I cannot say that I can enter into that, but I certainly agree that man was never intended to be eaten by a tiger.

17147. I am not so sure about it. What is the distinction between a tiger eating a man and a cat eating a mouse, from the tiger's and cat's point of view?—I cannot conceive of the possibility of a beneficent Ruler and Creator creating man for that purpose.

17148. (*Mr. Ram.*) Or a mouse?—Or a mouse.

17149. (*Chairman.*) Perhaps that is pursuing, as I say, questions that we cannot follow out to the end; but it is rather difficult to assume that Providence intended a cat to torture a mouse, but did not intend a mouse to be tortured by a cat?—I can only say that it is tortured by the cat. Dogs, I am afraid, are tortured by men, too, but I do not think they were intended for that purpose.

17150. (*Sir Mackenzie Chalmers.*) I am afraid that cats are sometimes tortured by dogs?—Yes, and dogs by cats.

17151. (*Chairman.*) But when you say that dogs were never intended for experimental purposes, it opens a question which is rather difficult to decide, if you follow it out thoughout the animal life?—I quite agree, but I only put that down as the view of my society; they certainly believe that, on the same ground that you put just now, that a man was never intended to be eaten by a tiger.

17152. That is very much the same question?—Quite so.

17153. Then you give as another reason the futility of experiments. As to that again, you are not speaking from your own personal experience?—No; I have simply put those down as the reasons held by my society.

17154. We may take it, shortly, from you that that is one of their reasons?—Yes.

17155. And another is the difficulty of anæsthetisation?—Yes.

17156. That stands on the same ground?—Yes, it does, but I might say that we have had special evidence on that point, some of which I hope to be able to lay before the Commission to the effect that a dog cannot be anæsthetised in such a way as not to suffer pain; that if you give it an anæsthetic strong enough to do that you kill it.

17157. We have had before us some very eminent anæsthetists as well as eminent physiologists, and we have also had some gentlemen with knowledge and experience who have spoken on the other side of the question, but having stated that as the ground you act on, we need not follow it further with you?—No.

17158. And in the same way, with regard to the difference between human and canine organs, we have had physiologists speaking about the differences. There is no dispute that there is a difference; whether it absolves physiologists from the necessity of using dogs is another question?—Our point is that the differences are so great that all experiments on dogs are useless for the purpose of understanding the human organism.

17159. You have endeavoured to obtain legislation in favour of your views?—Yes, we have had a Bill before the House of Commons during the last three Sessions, but, unfortunately, we have not been able to get a good place in the ballot, with the result that the Bill has had to be put down under the 11 o'clock Rule, and as it was blocked every time, it has had no opportunity of being discussed in the House. I enclosed with my *précis* of evidence a copy of this Bill for each member of the Commission. I do not know whether you wish me to go into it.

17160. I think we have all read it—I have. It is a very short Bill?—Yes.

17161-2. You need not read it through. Practically it is to say that a dog shall not be operated upon; that whatever permission may be given by Parliament for operating on other animals, dogs shall be excepted?—Yes, that it shall be unlawful to perform any experiment of a nature causing, or likely to cause, pain or disease to any dog for any purpose whatsoever, either with or without anæsthetics. That is really the purport of the Bill.

17163. And that nobody, of course, shall be licensed for the purpose?—Yes.

17164. And then the rest is penalties?—Yes.

17165. That Bill, I think, has never been debated in the House of Commons?—No, it has never been debated in the House. I might say, in this connection—although I put it down in another connection—that we canvassed all the candidates at the last election on the question, and we have written pledges from considerably more than half the Members of the present House of Commons that if an opportunity occurs they are quite prepared—and they are pledged, in fact—to support the Bill.

17166. You issued a petition, I think, to the effect that the use of dogs in vivisection experiments is in no way necessary for the advancement of medical science or for instruction?—That is the medical petition. The general petition comes first, which is in these words: "That your Petitioners are entirely opposed to the vivisection of dogs, who, on account of the generations of training to which they have been subjected, and their domestication as household companions and pets, have been rendered exceptionally intelligent, peculiarly sensitive to suffering and to terror, and are docile and obedient even under torture. Your Petitioners are furthermore of opinion that, on account of this docility and obedience to the word of command, the dog has of late years been specially selected by vivisectors for

extensive and peculiarly revolting and painful experimentation, and also for demonstrations of a prolonged and agonising nature before classes of students. The Home Secretary stated on May 10th, 1903, that at one laboratory alone—that of University College, London—no fewer than 232 dogs were used for experimental purposes during the year 1902. Your Petitioners therefore pray that your Honourable House will be pleased at an early date to pass the Bill now before Parliament to exempt dogs of every kind and breed from being made the subject of vivisectional or other experiments of any kind whatsoever." That is the general petition.

17167. I see that you do not refer to anæsthetics. Is that because you think it is immaterial whether anæsthetics are administered or not?—Yes, we oppose experimentation of every kind on dogs, with or without anæsthetics.

17168. But it is very material, is it not, on the question whether the operations on them are of an agonising nature?—Yes, we do not allege that all the operations are of an agonising nature.

17169. But when you allege that all of them were of a prolonged and agonising nature, and do not say anything about anæsthetics, is that not a statement that no anæsthetics are used?—I do not think we say that they all are. We say "the dog has of late years been specially selected by vivisectors for extensive and peculiarly revolting and painful experimentation." It does not say every one of those experiments.

17170. It does not say "some of which are," but it says were "specially selected by vivisectors for extensive and peculiarly revolting and painful experimentation." However, you say that what you mean by that is "some of which were"?—Yes, we are simply giving that as a reason for doing away with it. The possibility of that being done in any case is a reason why it should be done away with altogether.

17171. Still the people who sign this petition are not people who have any apportunity of examining statistics, at least not people likely, most of them, to examine statistics, to check statements of this kind. I am only pointing out that what we have learnt from a great deal of the evidence before us is that these operations are in almost all cases done under anæsthetics—in all cases where they are not privileged by the Act?—Quite so, but a great number are privileged by the Act.

17172. Not a great number.

(*Mr. Ram.*) A very small number, indeed.

17173. (*Chairman.*) What do you say?—I think it is a large proportion—too large a proportion, I say.

17174. How large a proportion do you say? Perhaps you have some information which we have not got?—I am sure you have the information that I have, but I think the proportion is fairly large. I find that last year, according to the Home Secretary's Returns, there were no less than 281 certificates issued permitting experiments on dogs and cats and recovery from the anæsthesia; those must necessarily be of a painful character.

17175. (*Mr. Ram.*) What are you reading from?—The Home Secretary's Return of last year.

17176. Does that distinguish between cases allowed to recover and cases not allowed to recover?—Yes.

17177. (*Sir Mackenzie Chalmers.*) Certificate B you mean?—Certificate B plus E E.

17178. (*Mr. Ram.*) Would you kindly read it again?—"Permitting experiments on cats and dogs, and recovery from anæsthesia, 281."

17179. (*Chairman.*) But how many of those 281 were permitting operations on cats and dogs, and how many recovery from anæsthesia?—The whole 281 were recovery from anæsthesia.

17180. For all animals?—No, cats and dogs only. Under Certificate B, allowing for recovery of any animal, 917. I am only going into the question of dogs.

17181. There are gentlemen here more familiar with these statistics than I am; I will not ask you any more about it. You say that 281 is the number?—Yes. I have only the Home Secretary's word for it.

17182. (*Mr. Ram.*) What are you reading from?—This is an extract from the Return of the Home Secretary

17183. May I see it?—Certainly. (*Handing in the same.*)

17184. (*Chairman.*) How many signatures were there to your petition?—We have received up to date 754,584. Of that number we have already presented to Parliament 673,294.

17185. You mean that you have gone on receiving signatures since the House rose?—Yes, we are receiving them continually.

17186. Then you also have a medical petition?—Our medical petition is a short petition. It is as follows: "That we, the undersigned medical practitioners of the United Kingdom, are of opinion that the use of dogs for vivisectional experiment is in no way necessary for the advancement of medical science, or for the adequate instruction of medical students. We therefore most earnestly and respectfully pray that your Honourable House will be pleased at an early date to facilitate the passing of a measure prohibiting the vivisection of dogs." We have already received 1,261 signatures to this petition, and a large number of those have been sent in voluntarily. We sent a number of letters out, asking medical men to sign, but we made no attempt whatever to canvass the whole of the medical profession. I may say that fully two-thirds of the medical profession have not been approached on this matter.

17187. Of the one-third who have been approached, how many have signed?—1,261.

17188. I see that you wish to give an explanation of your reasons for withholding the names of the signatories from the public?—Yes.

17189. I did not know that they were withheld, but in point of fact you mean that you do not make the names public?—We do not make the names public, except with the express consent of the medical men who sign. We find that some of them object to it, and the reasons they give are such that we must respect them; they say that it places them at a disadvantage with the profession, and that since the heads of the profession are very much in favour of vivisection, they find they are both boycotted and persecuted if they are known to be anti-vivisectionists.

17190. What percentage of the 1,261 write in that strain?—A very small percentage. I could not tell you the exact number, but it is a small number comparatively. A large number have no objection whatever to their names being published.

17191. Do you mean that you have had 12, 20, or 30 letters of that kind?—I should say under 100. We put in our covering letter, a copy of which I enclosed for the Commission: "I may add that no signatures received will be published in any way, or made use of for any purpose other than for presentation to Parliament." I thought it was only fair that the Commission should know exactly how we get these signatures

17192. You have letters, you say, from medical men?—Yes, I have a very large number of letters from medical men, all of which were unsolicited; we have never asked for them.

17193. It is rather difficult to take the opinions in letters of medical men with regard to questions of medical knowledge. We might dispense with witnesses altogether in the Commission if we did that?—Yes; I quite understand that; only I thought the Commission would like to know on what we, as a society, base our views. We get these letters from all over the country from scientific men, and these come to us quite unsolicited. Our view, is, of course, that there is a very strong consensus of medical opinion—I mean a very large minority of medical men—who are opposed to the vivisection of dogs.

17194. I think we have given an opportunity to you, and I believe you are going to avail yourself of it, to call a couple of medical men?—Yes, only two, my Lord, out of a very large number.

17195. There is no objection to your stating that you have received a number of letters from medical men and the general effect of them; but if we were to have a number of letters read from different medical men who give their names, and stating what their views were, it seems to me that we should get into considerable difficulty because any member of the Commission might say that he desired to ask them questions and we should be led into a number of cross-examinations of witnesses?—As you wish about

Mr. J. Hughes, F.R.G.S.

26 Nov. 1907.

it, of course, my Lord. I have a selection of the letters here. I have not got them all.

17196. I think we may take it generally from you?—I should very much like the Commission to allow me to read these letters; it will not detain you a long time.

17197. I do not think the Commission object to your reading two or three for samples, but you produce a very formidable bundle there?—I do not intend reading all those, but I hope to be allowed to read about a hundred of them.

17198. I think you are a little *exigeant*?—I do not want to withhold anything from the Commission.

17199. You might give us two or three of the strongest.

(*Mr. Ram.*) And the most eminent leaders.

17200 (*Sir Mackenzie Chalmers.*) What we should like is really a man with scientific qualifications entitled to speak in the name of science?—May I point out before I begin that I have already printed some expressions of medical opinions, a copy of which I enclosed for members of the Commission; it is a leaflet that we have issued. I may say that those expressions of opinion were taken from letters which were sent to us in reply to our letters asking for signatures to our petition; but since then I have received in connection with my attempts to get witnesses before this Commission, 700 or 800 letters, quite unsolicited, from people, in a great number of which very strong expressions of opinion are given on this question of the exemption of dogs from vivisection.

17201. (*Chairman.*) Do you say 700 or 800 from people or from medical men?—From medical men. In addition to that I ought to say that I advertised offering a prize for an essay, during the summer, on the moral and scientific reasons for exemption of dogs from vivisection, and a large number of medical men, seeing this advertisement, wrote to me immediately for a copy of our petition, as they wished to sign it. Those, of course, came quite unsolicited, simply by seeing the advertisement.

17202. Your pamphlet was addressed, I understand, to the question of the exemption of dogs?—Quite so.

17203. And that is what their letters are on?—Yes.

17204. They are not letters on vivisection generally?—There are several of them that go into the question generally.

17205. But when you said about 100 of them, you were not referring to anything more than the exemption of dogs from vivisection?—Yes, that is our position. We do not profess at all that 1,260 doctors are in favour of total exemption from vivisection of all animals. I have a letter here, for instance, from Professor Woodroffe Hill, a very well known veterinary surgeon. This happens to be the first that comes to my hand now, if you will allow me to read an extract from it. I had hoped to have Professor Woodroffe Hill before you; but, unfortunately, his health is such that he cannot attend just now.

17206. (*Sir John McFadyean.*) Where is he Professor now?—I cannot say; but he is known as Professor Woodroffe Hill. He is a Fellow of the Royal College of Veterinary Surgeons. He says:—"As an earnest student of canine pathology for over 40 years, and having closely observed the various traits of canine character, I consider the vivisectors' evidence before the Commission concerning dogs is perfectly monstrous, notably with regard to anæsthetics." That is an extract from his letter.

17207. (*Dr. Gaskell.*) Does he say why he considers it monstrous?—That is all he says. Of course, I have not asked him any questions.

17208. I was wondering whether he gave any definite statement as to the meaning of the word "monstrous"?—No. Then I have a letter here from Dr. Frederick Page, of Newcastle-on-Tyne:—"Dear Sir,—My views about vivisection are that no vivisection for purposes of demonstrating to students facts should be allowed. I do not think we should interfere with injections."

17209. (*Chairman.*) He does not say of dogs there?—No; but he signed our petition for the exemption of dogs. And he goes on later:—"I would absolutely forbid dogs to be employed for vivisection purposes." This is one of the men, of course, who do not believe in total anti-vivisection for all animals; but he is very strongly in favour of the non-vivisection of dogs. Then Dr. MacCarthy says:—"I am quite prepared to give evidence in support of my position—that is, total abolition of vivisection on dogs, abolition of vivisection on all other animals, except by expert original researchers." That is Dr. MacCarthy, of Abbeyfeale, County Limerick. I have also a letter from Dr. Hogg, the coroner for Middlesex, in which he says (I cannot put my hand upon it at the moment) that he is prepared to give evidence in favour of the total exemption of dogs from vivisection, in the same way as the others do. I find it rather a difficult matter at a moment's notice to select the strongest letters, as your Lordship asked. Dr. Kellard, of Southsea, writes:—"I may further say that I have the greatest horror of vivisection. I cannot understand how anyone can tolerate it. There is enough misery in the world without going out of our way to make animals suffer in this cold-blooded, fiendish way." I would like to point out that these are the doctor's words, not mine:—"This earth is almost a hell for many poor animals. It is an excuse for a morbid curiosity in many selfish wretches."

17210. Do these letters which you have read to us give us a general idea of the views which have been expressed to your society?—Yes, I think they do. Some, of course, are stronger than others.

17211. It would be impossible to take the evidence, you know, of 100 doctors in this sort of way. I think we cannot go on reading any more. We may take your word for it that those are fair samples of a number of letters that you have received?—Very well.

17212. You have told us about the Members of the House of Commons who are pledged to support your Bill?—Yes. Of course, as public opinion is shown in elections, I should like to say a word about it. As I said before, we approached every candidate during the last General Election with a view of obtaining their views on this subject, and we received a reply of some kind or another from most of them; and from the replies that we received we found that 380 Members of the present House of Commons are pledged to support the Bill. These candidates were approached not officially from the head office in every case; in some cases they were, but in most cases they were approached by some of the members of the League who happened to live in their constituency. In one or two cases we made a special effort either to return men whom we were anxious to return, or to oppose and upset the election of a man where we considered it was necessary to do so and in two cases I may say that two men who had opposed our Bill in the House in the previous year were, mainly through our instrumentality, defeated.

17213. Can you tell us who they were?—One was Dr. Hutchinson, the Member for Rye, and the other was Sir Mark Stewart, Member for Kirkcudbright in Scotland. They both opposed our Bill; I mean they blocked it in the previous Session, and our members felt that a determined effort ought to be made in those cases. A very determined effort indeed was made in Rye, and in spite of the fact that the party to which Dr. Hutchinson belonged was in the ascendancy at the moment, he was very badly beaten. That, I think, is only one example of the public opinion that we have behind us on this question.

17214. I am afraid that most Members of the House would think that it is rather a strong thing to say that Sir Mark Stewart was thrown out on the question of exemption or dogs from vivisection?—It may be so, but I am quite sure that we exerted great influence at the election.

17215. It may have had its effect, no doubt?—Perhaps I ought not to say that we threw him out. All I know is that he was thrown out.

(*Mr. Ram.*) It may have been *post hoc*, not *propter hoc*.

17216. (*Sir Mackenzie Chalmers.*) You opposed him and he fell?—Quite. It may have been a coincidence, but it is a fact for all that.

17217. (*Chairman.*) Then you wish to refer to Professor Schäfer's experiments?—I put that down in my *précis* simply because I think he has appeared before the Commission.

17218. It is not a subject that you have personal knowledge about?—No, only so far as regards the society opposing the experiments at the time. They

got up a petition, it was before my time, to the Home Secretary, and also a petition to Her Majesty the Queen, on this subject, to which they received a reply expressing her disapprobation of the experiments. They also obtained the opinion of 109 medical men, and among them were very strong letters in opposition to these experiments. This is the petition that we sent to the Home Secretary: "We, the undersigned medical practitioners of the United Kingdom, beg respectfully and earnestly to protest against the licence which has been recently granted by the Home Office to Professor Schäfer to submit unanæsthetised dogs to the process of drowning with a view to studying various means of resuscitation therefrom for the benefit of human beings. We would point out that previous well-known experiments of a similar nature have proved futile of result, and we are of opinion that the present experiments must be equally unsatisfactory and disappointing, by reason of the difficulties and fallacies associated with the anatomical and physiological differences between the animals operated upon and the higher creatures whom these procedures are supposed to benefit. But even if some slight gain in knowledge above and beyond that with which we are already acquainted were possible by such means (which we do not admit), we should, nevertheless, emphatically protest against such inhuman cruelty, perpetrated in the name of science, upon the helpless, sentient, and sensitive creatures. We trust, Sir, that you will yet use your great power and influence to put a stop to any further experiments of this nature, which can but bring discredit upon a Government Department, which possesses the power of control in questions where the exercise of justice and humanity are concerned."

17219. You tell us that that came into the hands of Her present Majesty the Queen?—Yes.

17220. And she sent you a letter?—Yes, a letter from the Honourable Charlotte Knollys to Lady Paget, who sent the petition to the Queen. I find that it is marked "private."

17221. Then perhaps we had better not have it. I should not like to admit a letter from the Queen marked "private" without Her Majesty's permission. I will take your word for it that Her Majesty disapproved of the experiments?—If you please.

17222. (*Sir John McFadyean.*) Has the letter been made public?—No, of course not; it is marked "private"——

17223. (*Chairman.*) What is the next point you wish to mention?—There is a reference in my *précis* to the "British Medical Journal," and to a letter by Dr. Silvester, which appeared in that journal at that time. I am sorry that in my hurry to come away I forgot to bring it with me; I daresay it will be known to the Commission. If the Commission will permit me to send it on again, I shall be glad to do so.

17224. We have had Professor Schäfer here, and I think that some of the witnesses who were objecting to his experiments read from the "British Medical Journal"?—Anyhow, may I send it on again.

17225. Is Dr. Silvester alive?—I really do not know. I think so. I am not sure.

17226. You have told us about your membership?—I may say that in addition to our membership, we have now a large number of centres all over the country. We have over 200 centres, and there is an honorary secretary in each place who is responsible for carrying on the work of the League, so that the influence of the League is really very far reaching. I should like to emphasise one fact, if I might. We believe, of course, feeling that we have a majority of the House of Commons in favour of our Bill, that the Bill has been already passed by the nation, and that it only awaits an opportunity to be passed by the House of Commons.

17227. I understand that one of the objects of your League is the total suppression of the support of vivisecting institutions by public money?—Yes.

17228. You mean hospitals that have laboratories?—We mean that; but what I had particularly in view in that was the support of institutions from the rates and taxes which are licensed for vivisection. We do not believe that Government Departments, such as the Board of Agriculture, the Local Government Board, and others, should have any laboratories licensed for this purpose. We do not believe either that any local institutions supported by county councils or local authorities should be used for vivisection.

17229. Would it not be more accurate then, to say the total suppression of the support of laboratories for vivisectional purposes by public bodies?—Yes.

17230. That is what you mean to convey?—That is what I mean exactly. We very strongly feel that the using of public money for this purpose is not only unfair and injust, but immoral.

17231. And you object to the proceedings of the Local Government Board and the Colonial Office for the purpose of ascertaining the causes of disease and the remedies?—Yes, quite so. We object to vivisectional laboratories for those purposes because we do not believe that they are needed.

17232. Then you desire, what I hope we all wish to do, to raise the standard of humane feeling in the country?—Yes, that is really one of the great objects that we have in view.

17233. And the view of your League, I understand, is that vivisection does not do any good, which is a matter on which you do not profess to give expert evidence, but also that even if it did, dogs ought not to be experimented upon?—Yes.

17234. That that would not be sufficient cause?—Quite so.

17235-6. Then you have some notes about the Buisson bath propaganda. Would you explain what that means?—That arose at the very commencement of the League's operations in connection with the rabies scare. The views of the originators of the League were that the rabies scares were really got up largely in the interests of Monsieur Pasteur's Institutions, and they adopted the Buisson bath as an antidote to hydrophobia and found that in all cases where it was tried it was a very great success. I may say that this also was before my time, and I am only speaking from hearsay, not actual experience. These baths are, I understand, designed to bring about a free action of the skin.

17237. Have you not some witnesses coming who understand this from the medical point of view?—I am afraid I cannot do that, because I am only allowed to bring two witnesses, and I cannot very well bring witnesses who are experts on all points.

17238. We were obliged to select from each society a limited number. We have a very long list?—I quite understand that, but we rather feel that you have limited us rather more than other societies.

17239. I do not think so?—Well that is my view.

17240. Would you tell us without professing to argue for the medical merits of this system, what it is?—It is a vapour bath, the object of it is to take out of the system any virus that may have been injected into it by the bite of a rabid dog, and my society believes that this is really a more commonsense method of dealing with the question than by injecting a virus of the same character as that which has been already injected.

17241. Your society, I suppose, is governed by a committee?—Yes.

17242. Who express the views of the Society?—Yes.

17243. Are there any medical men upon it?—Yes, there are three.

17244. Will you tell us who they are?—Sir James Thornton, Dr. Hogg, and Dr. Bayfield. In addition to that we have a number of medical men who are vice-presidents, who also, of course, are of the same opinion as the committee. I could give you the names of those if you wish it.

17245. I daresay that some of your papers have their names on them?—Our letter paper has them.

17246. That will be quite sufficient?—Dr. Charles Bell Taylor is one of our vice-presidents, Dr. Carpenter is another, Sir Francis Cruise, Honorary Physician in Ordinary to His Majesty the King in Ireland, and Sir Robert Jackson.

17247. (*Sir John McFadyean.*) Might I ask whether the personal opinion of each of these gentlemen has been obtained on this particular point, that is to say, as to the failure of the Pasteurian method and the success of these baths in every case?—No, we have not canvassed them on those points.

17248. Are you sure that they approve of what you

are telling us?—I am sure that they do not disapprove, or else they would not associate themselves with the society.

17249. It is not in the constitution of the society is it, that it must believe that the Pasteurian treatment is inefficacious, and not in keeping with common sense?—Well, they have a copy of our Report every year, in which we refer most pointedly to this question, and the gentlemen I named last have only recently become vice-presidents, and they have not done so without knowing exactly what they were doing. Of course, they must generally agree with everything the society does or else they would not associate themselves with the Society.

17250. (*Chairman.*) I presume that all your members are in favour of the exemption of dogs from vivisection experiments?—Yes, and all the other objects that we have in view. We have a large number of objects besides those.

17251. Yes, I mean for the protection of dogs generally from cruelty?—Yes.

17252. But I was coming to the point about the Buisson bath?—That is certainly one of the objects of the society, and one of the forms of the work that we have been prosecuting.

17253. (*Mr. Ram.*) Is that stated publicly as being one of the objects of the society?—Yes.

17254. In what publication?—In the Annual Report.

17255. Can you give me one?—I have only one that is marked. I can send you one.

17256. Can you read me the words that would show to any intending vice-president that he was committing himself to the refutation of the Pasteurian theory and the adoption of the bath?—We have here in one Appendix particulars of how this thing is to be done.

17257. How what is to be done?—How we are prepared to assist people who want to use the Buisson bath.

17258. But I want to see whether a vice-president would necessarily know that on becoming a vice-president he was committing himself to disbelieving in the Pasteurian theory and adopting the Buisson bath. If you will show me that I shall be obliged?—There is a marked reference in the Report itself, both of last year and this year, in fact every year, to this work, which cannot fail to be brought to their notice.

17259. (*Chairman.*) I think that one of your medical witnesses who is coming might very well qualify himself to give us a really medical opinion upon this subject?—Yes.

17260. That would be better than taking it from one who does not profess to be a medical expert?—I will do my best to get a witness to do it. I cannot undertake definitely to do so, but I will do my best.

17261. You see there are gentlemen here who are familiar with medical questions?—Yes, I quite understand that.

17262. (*Sir William Collins.*) Do you state anywhere what are the precise objects of your association?—Yes, in our Report.

17263. Will you read what are the objects for which the association is formed?—"Organised opposition to the muzzle. This includes the repression of dog scares, opposition to Pasteurism, and a Buisson bath propaganda." That is what I was asked for just now. That is the first object that we put down.

17264. (*Chairman.*) Which Report are you reading from?—This is in every one. This is our last published Report.

17265. Is that passage that you have just read in your first Report of 1891, because you said it began with muzzling?—I cannot say; I do not know what the Report of 1891 was; but this is really an object of the society at the present moment. The second object we put down is "quarantine business of every kind"; that is to say, we assist people who want to bring their dogs over from the Continent by giving all information and assistance in the way of quarantining dogs.

17266. (*Sir William Collins.*) Is not the object defined more definitely than stating "quarantine business of every kind"?—That includes everything connected with quarantine.

17267. That might mean either that you were in favour of it or opposed to it. Is your society incorporated?—No, it is not.

17268. Is it registered?—No.

17269. Amongst the objects of the society is there anything stating a general opposition to the practice of vivisection?—No, not general opposition to the practice of vivisection, opposition to the practice of vivisection of dogs.

17270. Then so far as vivisection is concerned, is the sole object of your association to free dogs from the practice?—Yes, so far as the object of our society is concerned.

17271. Then your society, as such, would not oppose the vivisection of guinea-pigs or frogs?—I am not prepared to go into that at the present moment. We are a dog society.

17272. But if the society does not go into that, should I be wrong in concluding that it is not an object of your society to oppose vivisection of guinea-pigs or frogs?—It is not an object of the society to do that.

17273. Or higher mammals, such as the ape?—We cannot go beyond the dog. We are a dog society. I have every reason to believe that practically the whole of the members are against vivisection, as such; but, as a society, we cannot do that.

17274. Then your society, as such, does not oppose the vivisection of the ape?—Not as such. We have taken no measures to do that.

17275. Does your society oppose the vivisection of dogs, if the dogs are rendered anæsthetic throughout the operation?—Yes.

17276. Then if the dog were excluded from the operation of vivisection your society would, so far as vivisection is concerned, have exhausted its object?—Well, I suppose so. I cannot say what action they would take if they succeeded in excluding dogs from vivisection—whether they would go on to some other animal. But at present we are certainly confined to dogs.

17277. But your society, as such, *qua* vivisection, limits its operation to dogs alone?—At present.

17278. You make no claim to speak, I understand, on the scientific aspect?—No, I do not.

17279. (*Sir John McFadyean.*) Your society at present numbers 4,421 members?—Yes.

17280. Can you tell me how the sexes are distributed?—I could not.

17281. Are the majority of the male or female sex?—I should say the majority are ladies.

17282. What is the income of the society?—Last year our income was £1,698.

17283. Can you tell us how it is mainly expended?—Yes.

17284. (*Sir Mackenzie Chalmers.*) You publish a balance-sheet, I suppose?—Yes. Our printing last year cost us £664; elections, lectures, dog shows, memorials, travelling expenses, £133; advertisements, £116; office rent, £80; salaries and wages, and extra clerical assistance, £487.

17285. (*Sir John McFadyean.*) I think that is enough, thank you. Can you tell us what your clerical expenses would be at the last election?—The amount I have given, £133, covers that.

17286. It is mixed up with these items?—Yes.

17287. In what sense did you oppose Sir Mark Stewart when he was a candidate?—We sent people up there to speak, and we also issued leaflets calling special attention to what he had done on this question.

17288. You sent people who addressed public meetings?—Yes.

17289. Were these largely attended?—Yes.

17290. Can you tell me where any one was held?—I could not at the moment; I can give you the particulars later on.

17291. Do you know whether the successful candidate thought that you had lent him any assistance or not?—I really could not say. I fancy he did.

17292. Have you had any number of letters or statements from voters to say that your views had influenced them?—In that constituency, yes.

17293. How many?—I could not say off-hand.

17294. Five, twenty, one hundred?—I really could not say.

17295. You are sure that you had five letters?—Oh! yes, a good many more than that.

17296. What do you mean when you use the expression "the rabies scare"?—What we mean is that orders were given by the Board of Agriculture to muzzle dogs, on the ground of rabies being in certain districts. We deny that rabies was there.

17297. Is this a point on which you are prepared to offer direct evidence, and not hearsay evidence?—No, it is not.

17298. Then who is going to come? Who are "we," when you say: "We maintain that these were not cases of rabies"?—The society.

17299. Do you mean to say that the whole 4,421 members are entitled to hold an opinion on that point?—I think I am quite entitled to say that, since they are members of the society and connected with it.

17300. Then, on the average, they are better instructed on that point than you are? They are better entitled to form an opinion on that question that you are? I put it to you. It may appear an affirmation, but it is a question?—No, I do not for a moment profess that every one of the 4,421 members would be prepared to come here and give evidence on the subject; but they have their opinions on the subject. So have I. You asked me was I prepared to give expert evidence.

17301-2. I did not use the word "expert"?—I beg your pardon; I understood you to say so.

17303. No; I said "direct"—direct evidence as opposed to mere opinion?—Yes.

17304. You say that you do not desire to offer evidence on that, but that it is the opinion of your society?—Yes; I am quite prepared to bring you cases.

17305. Cases which were not cases of rabies?—Yes.

17306. You are prepared to give evidence on that?—Yes, I am quite prepared to bring forward cases which were not cases of rabies, but were returned as cases of rabies at that time.

17307. Do you know anybody who ever held that the statistics with regard to rabies were accurate in every case?—No; everybody, I think, held that they were absolutely inaccurate.

17308. Everybody did?—Everybody who knew anything about it, because the data from which the statistics were obtained were inaccurate.

17309. Just a moment, please. Everybody, you say, who knew anything about it. Then the expert officers who were employed by the Board of Agriculture were among those who knew nothing about it?—No, I do not think that they believed in the Rabies Returns.

17310. Will you give us some evidence to show that they disbelieved them?—It is very evident, from the fact that they changed the data upon which this evidence was taken so frequently, that they had no confidence whatever in the statistics given.

17311. Please give us particulars as to the way in which they changed the data?—They first of all based it on autopsy. In the next year they decided on another form—I can give it to you in a moment—the inoculation tests were brought forward. I have reasons for believing that in the first year, when the test method was adopted, the number of rabies cases returned was very much greater, simply because it was an improper way of doing it.

17312 What was there improper about it?—In this way, every man, almost, even the policeman, in many cases, I understand, was allowed to declare a dog rabid, without any evidence at all, except his own opinion.

17313. Where do you find it laid down that the policeman might make the diagnosis?—I am told so.

17314. Who told you?—I have been told so several times. I could not quote any authority, but that is the impression on my mind.

17315-6. That is not evidence before this Commission. But did you approve or did you disapprove of the attempt of the Board of Agriculture to make the statistics more accurate by introducing the inoculation test?—We approve, of course, not of the inoculation test as such, but of every effort that is made by the Board to be accurate.

17317. Then I will put it the other way: Did your society disapprove of the attempt of the Board to make the statistics more accurate by resorting to the inoculation test?—I do not quite understand your question.

17318. I will spend a little time in making it plainer, if I can. You complain that the statistics were very inaccurate and misleading when the diagnosis was based on something else than the inoculation test?—Yes.

17319. The inoculation test was introduced in order to make the statistics more accurate, and I understood from you just now that you are prepared to admit that they were more accurate afterwards?—They were more accurate afterwards, but I do not admit that they were accurate.

17320. Did your society approve of this procedure in order to make the statistics more accurate?—They certainly approve of every method being adopted, if it is a proper method.

17321. Then they approved of this method?—I cannot say whether they did, or did not, approve of the inoculation test as such. They certainly are very desirous that the figures should be accurate, but whether the mode adopted for that purpose received the approval of my society, I am not in a position to say.

17322. This is not a scientific question; it is a moral question and an ethical question, and I will put it direct to yourself. Do you approve of that method of endeavouring to obtain accurate information regarding the occurrence of rabies in this country?—You say that it is not a scientific question. I must reserve to myself the right to an opinion on that question; inoculation is certainly a scientific question, but I say that I approve of every proper method which may be used for the purpose of accuracy.

17323. That, of course, is not answering my question, because you introduced the word "proper"?—But you say that it is not a scientific question; I say that inoculation certainly is a scientific question, and if you ask me whether I approve of inoculation you enter on a province of science.

17324. I am afraid that you have misunderstood me. I did not say that this was a scientific question?—I understood you to say that it is not a scientific question.

17325. The question I put to you was not a scientific question, it was a moral question. You admit that these scientific questions have a moral and ethical side, because you have come here specially to speak upon it?—Quite so.

17326. Very well, then; has this method of inoculation, which is a scientific method, got an ethical side?—I disbelieve in inoculations entirely.

17327. Then you disapprove of this particular method of endeavouring to make the statistics accurate?—That is a scientific question on which I am not prepared to give an opinion.

17328. Do you mean that the question, whether you disapprove or not, is a scientific question?—The question whether inoculation is the right way of finding out the correct figures is, I say, a scientific question.

17329. But I have not put that question. I will ask you, please, to assume that it is a good method, and that it actually does enable you to obtain accurate information?—If that is so on those grounds, I have already said that I approve of every proper method of finding out correct figures.

17330. But do you approve of this method?—I cannot say whether it is a proper method.

17330A. But I ask you to assume that it is what it professes to be, an accurate method. Do you approve of it?—If it is what it professes to be (I cannot have an opinion upon that), I certainly approve of any proper method for the purpose of finding out correct figures.

17331. That may be held to mean that you approve of this particular method if it is accurate?—If it is accurate and proper.

17332. What do you mean by the word "proper"?—Right, morally right.

17333. And what I am asking you is whether you

Mr J. Hughes, F.R.G.S.

26 Nov. 1907.

think it is morally right?—I did not understand you to ask me that. You asked me whether I approved of it.

17334. But, of course, I tried to make it plain that that was whether you approved of it from the moral or ethical standpoint?—I have already said that I totally disapprove of every process of inoculation, because I do not think it is a proper one.

17335. May I take that as meaning that you disapprove of this particular method?—From that point of view I do.

17336. So that from the point of view of your society they would rather have had the statistics inaccurate than have had them made accurate in this way?—We do not for one moment say that this is the most accurate way of finding out statistics. What we do say is that they certainly were more accurate when they took this method of finding them out, but we say that even then they were inaccurate, because we have cases of dogs having been put to death for rabies during that period which on *post-mortem* examination were proved not to be suffering from rabies at all.

17337. (*Chairman.*) Put to death by whom?—By the authorities.

17338. (*Sir John McFadyean.*) Did these animals which were killed, as being the subject of rabies, and which were afterwards found to be not suffering from rabies, figure in the statistics as rabies?—So I understand. For example, the chairman of my society, Mr. Pirkis, had a dog which was condemned as being a rabid dog, and was put to death. They insisted on a *post mortem* examination, and when the *post-mortem* took place it was found to be that what the dog was suffering from was that it had swallowed a piece of leather, which stuck in its throat, and, of course, made it very ill, and caused the people to think it had rabies.

17339. Then it was proved that it was not rabid simply by the *post-mortem* examination?—Yes.

17340. Do you think that a reliable method of telling whether a dog is rabid or not?—I am told so. I am not in a position to give an opinion myself.

17341. But I thought that a minute ago you endeavoured to discredit the statistics of the Board, by pointing out that they were based on *post-mortem* examinations?—No, I did not; inoculations, I think I said.

17342. You think that *post-mortem* examination is more valuable than inoculation?—I should think so. Of course, as I said before, I am not giving a scientific opinion; I cannot do that, but I should imagine so.

17343. You are aware of the extraordinary reduction in the cases of rabies in this country which followed the introduction of the muzzling order?—I am aware of the reduction in the figures, but, as I said before, my society did not believe in the existence of rabies to the extent that they were returned by the Board of Agriculture.

17344. Does your society believe that there is such a thing as rabies at all?—Yes, but they believe that it is a very rare thing.

17345. How many of these cases, say in the year 1895, when there were 672 cases, do you think were cases of rabies?—Very few.

17346. How many is very few?—I really could not say.

17347. One, two, or three?—It is quite impossible to say.

17348. Do you think it is possible that there might be none of them cases of rabies?—Quite possible.

17349. So that all those who have given special attention to the subject, including veterinary surgeons and medical men, are entirely mistaken?—Probably.

17350. Why probably? Does it not seem probable that they would be right rather than wrong?—Perhaps I ought to have said possibly instead of probably.

17351. So that you do not attach even any importance to the fact that no cases of rabies have been returned during the last few years at all?—We do not attach the same importance as the Board of Agriculture do; because we do not believe that rabies existed to the extent that they said it did in previous years.

17352. Do you think it exists at all now?—Not in this country.

17353. Do you think it existed at all before the Muzzling Order was introduced?—I am not in a position to say that.

17354. So that it is actually debatable whether there has been any rabies in this country?—Yes.

17355. Do you wish to give evidence before the Commission based on your own reading and observation to bear out that view?—I am not in a position to do so.

17356. Whose opinions are you quoting?—I am quoting the opinions of my society, so far as I can gather them, previously to my coming into connection with it. Personally, I have no experience of that during the last three years; fortunately, there has been no occasion for it.

17357. But do you think that these 4,421 members are entitled to a first-hand opinion on that subject?—I think they are entitled to an opinion on anything they like. We are all entitled to an opinion on anything we like.

17358. I am afraid we use the word "entitled" in a different sense. I meant were they in a position to form an opinion that this Commission ought to attach any weight to, on a question like that?—No, I do not say they are. They are not experts, of course.

17359. Then you said in your evidence that the difference between the canine and the human organs was so great as to make investigations conducted on dogs useless as a means of extending knowledge with regard to human diseases?—So I am given to understand.

17360. But, again, you do not wish to give scientific evidence as to that?—No, I have already said that I intend to bring a witness forward to speak specially on that subject.

17361. How does the question stand with regard to experimentation on dogs for the purpose of extending knowledge with regard to dog diseases. That argument would not apply, would it?—This particular argument would not apply.

17362. Do you think that knowledge with regard to dog diseases might be extended by experiment?—It might be, but it is very questionable whether it would be right to use that method.

17363. Supposing that it were a question of investigating the skin parasites of the dog, the flea and the louse, for instance—would it, in your opinion, be a moral proceeding to transfer those parasites from a dog in which you found them occurring naturally to another one, that they might breed upon it, and afford you an opportunity to investigate their life history?—No, we certainly think it would be quite wrong to do that. We see no reason in the world why that could not be studied on the animal which suffers naturally from it.

17364. But, assuming that it would be convenient to the investigator, and provide him with a larger quantity of material, you think it would be morally wrong?—Yes, I do, certainly.

17365. Then do you take up the view that it is morally wrong to cause pain in any circumstances to a dog?—Yes, quite.

17366. Is it wrong to chastise a dog with a whip?—Chastisement comes, of course, under a different category. I do not believe myself, personally, in it.

17367. It comes under the same category?—I do not believe it is at all necessary to chastise a dog. I never chastise my dog. I find that it does all I want without it, and does it better by kindness. I do not think it is necessary ever to do that.

17368. That was not my question. My question was: Do you think it is morally right or wrong to chastise a dog?—I think it is morally wrong to do it unnecessarily.

17369. Does your statement that it is morally wrong to cause pain to any animal in any circumstances apply to other animals than the dog?—You are asking for my personal opinion, I presume; my society does not go beyond the dog.

17370. You could not possibly give me the opinion of your society on that question?—I certainly think it is wrong to give unnecessary pain to any animal.

17371. But you have introduced a most important

qualifying word, "unnecessary." That we would all assent to. But what you said before was that it was morally wrong to cause pain to an animal under any circumstances?—To a dog, I said. I see no necessity for it. That is why I say it is morally wrong.

17372. But that is not the question, because you introduce the word unnecessary, which begs the question?—I think I explained to you why I did not chastise my dog—because it is not necessary. I find I can do better without it.

17373. I did not ask you whether you chastise your dog or not. But you admitted that in your opinion, to inflict pain on a dog in any circumstances is morally wrong. Have you answered the question as to whether it is ever morally defensible in the case of other domesticated animals?—I still say that it is absolutely wrong to give unnecessary pain to any animal.

17374. But my question, please observe, was not whether it was right to cause unnecessary pain, but whether it was ever justifiable to cause pain?—I cannot say that there might not be cases in which it is justifiable. I cannot at the moment think of any, but I would not like to at once make a sweeping assertion that every possible case of that kind is wrong. But I certainly again say that every unnecessary pain inflicted on an animal is an evil, and morally wrong.

17375. I have not asked that question. But you say you feel unable to think of any circumstances in which the infliction of pain on an animal would be justified?—I cannot think of any at the moment.

17376. Then it was hardly necessary to introduce the word "unnecessary." Is it justifiable? Have you read the evidence given by previous witnesses on that subject?—I have read some of it; I have not read it all.

17377. Do you think it is morally wrong to kill an animal for food purposes?—No, I do not.

17378. Do you think that the pain inflicted in that case is necessary?—I certainly think they ought to be killed by the most humane methods possible.

17379. But supposing it were not possible to kill them without pain, is it still morally defensible to kill them?—But I think it is possible, from what I understand of the question; so that I do not see why we need discuss it.

(*Chairman.*) Shooting pheasants, for example?

17380. (*Sir John McFadyean.*) Is that painless?—I cannot say really. I do not know whether it is or not, but I say that if a pheasant is shot it ought to be shot in the most painless way possible, and no man has a right to shoot it unles he learns how to do that unerringly.

17381. (*Chairman.*) Supposing it gets shot in its body and not in its head, it suffers a good deal of pain?—I do not think that any man has a right to kill it unless he does it in the most humane manner possible.

17382. (*Sir John McFadyean.*) The most humane consistent with what—the pleasure of the man shooting?—I think the man's pleasure ought to be secondary altogether. The first thing ought to be the feelings of the animal that is being shot.

17383. I suppose you must be aware that shooting pheasants and other game, as it is ordinarily conducted, causes pain to the majority of the animals that are killed?—I suppose it is so.

17384. Is that morally right?—Well, of course, that raises the whole question of sport. I do not think it is.

17385. Is it morally more justifiable than the painless experimentation on animals with a view to extending human knowledge?—An animal that is killed for the purpose of providing food is, in my estimation, in quite a different category from animals killed for purposes of sport, although they may be used for food afterwards.

17386. Does that apply to pheasants bred on purpose that they may furnish sport?—Yes, I do not believe in that.

17387. Do you mean that you do not believe there is such a thing?—I do not believe it is right to breed pheasants or any other animal for the purpose of sport, though they may be used for food afterwards. They are not killed for the purpose of food; they are killed for the purpose of sport, and I disapprove of that.

17388. Is it morally less defensible than painless experimentation on animals?—I consider that they are both indefensible.

17389. Would you have the preservation of game for purposes of sport put down by law?—I would. I would like to say that I am not speaking for my society now; I am giving my own personal opinion.

17390. But supposing that your society is successful in its immediate objects, you would be in favour of their perhaps trying to influence public opinion so as to have sport put down?—There are societies for that purpose, and they have my warmest support personally, but I do not think my own society would enter into that at all, as it would be outside its province.

17391. Would it be justifiable to ride a horse to death in order to save the life of a human being?—That is a very difficult question. I do not think it would.

17392. It ought not to be a difficult question; I should not find the question at all difficult, and I expected you would not either; but it seemed to me to be a good case to define what is the attitude of your society with regard to these things?—I do not think it would be justifiable.

17393. Did you draft this petition to Parliament?—No, I did not.

17394. Do you approve of it?—Yes, I do.

17395. The second paragraph reads: "Your Petitioners are furthermore of opinion that, on account of this docility and obedience to the word of command, the dog has of late years been specially selected by vivisectors for extensive and peculiarly revolting and painful experimentation." Can you tell me what is the evidence that the dog was selected for experiments on account of its docility and obedience?—It is a well-known fact that the dog is very much more easily managed than any other animal.

17396. Than a sheep?—Than a sheep.

17397. Is it much more docile than a sheep?—I would not say more docile.

17398. As docile as a sheep?—Yes, quite as docile. It is more intelligent than the sheep, of course.

17399. But it was its docility that was specially mentioned?—That comes in "Docility and obedience to the word of command"—come in together. It is more intelligent than a sheep, and therefore more easily managed.

17400. Do you suggest that in experimentation a dog is managed by merely ordering it to do this and that—that the question of obedience is of real importance when an animal is to be operated upon by a physiologist?—I think so; it gives him less trouble, I should think, judging from what I gather.

17401. At what stage of the operation does it give less trouble?—At all stages.

17402. Do you mean that it is easier to catch a dog and secure it to a table than to catch a sheep?—Yes.

17403. You mean that the experimenter is in more danger of being bitten by a sheep, perhaps?—I do not mean that.

17404. In what respect is it more convenient to use a dog?—Because a dog can be persuaded to do almost anything.

17405. Do you suggest that when a physiologist proceeds to prepare an animal for experiment, he uses his power of persuasion, in the ordinary sense of the word?—I might refer to what Professor Starling said before your Commission. He said that he had known a dog which had undergone an operation and had been brought in after it had been kept for observation a certain time, and when it was brought in it licked the hands of the experimenter, and wagged its tail, and showed every sign of joy at seeing him again. I certainly repudiate most strongly the conclusion that Professor Starling came to from that. He wanted to make out that the dog was glad to see the experimenter, because he wanted to be experimented on again.

17406. (*Chairman.*) Do you say that Professor Starling said that?—That is the conclusion that he came to.

17407. I suppose from what he said?—I take it so, from what he said.

17408. Did he say that he believed the dog licked

Mr. J. Hughes, F.R.C.S.

26 Nov. 1906.

his hands because it wanted to be experimented on again?—I believe he brought it forward to prove that dogs are not averse to being experimented upon.

17409. You say that he meant the Commission to understand that?—Yes, I thought so.

17410. (*Sir John McFadyean.*) But that is really quite beside the point that I wished to receive information about?—I think that illustrates the question. You asked me why I think that a dog is more easily managed than a sheep. I say that Professor Starling himself has proved it. At least, he believes that, I should imagine from his evidence.

17411. Are you aware that, with the rarest possible exceptions, dogs when they are subjected to vivisection operations, are secured to a table?—Yes, I suppose they are—that is, for physiological experiments.

17412. That is for vivisectional experiments in the literal sense of the word?—Yes, quite.

17413. The dog has to be forcibly tied to the table?—Yes.

17414. In what sense are its docility and its obedience of advantage there, as compared with a sheep?—It is very much easier to persuade a dog. A sheep is stupid.

17415. But you do not persuade. You take the animal forcibly and lay it on the table, and tie its legs down. In what respect is it of advantage to the experimenter to select a dog for this purpose, and as a rule a strange dog?—I think that if I were going to experiment upon animals I would very much prefer to select a dog, because I know that I could manage it better than any other animal.

17416. Have you any knowledge of sheep?—No, I have not.

17417. So that it is possible that your opinion as to the advantage of a dog as compared with a sheep is entirely mistaken?—It might be, of course.

17418. Have you any knowledge of the pig?—I have no expert knowledge. I have seen one. I cannot say very much about it.

17419. Do you think it would be easier to secure an ordinary strange dog than an ordinary small pig?—I should think so.

17420 Why?—Pigs are so stupid, for one thing.

17421. But I have already pointed out that you do not ask for any assistance from their intelligence. You lift the animal forcibly off the ground, and tie it to the table?—That is where we must disagree, I think. It appears to me quite unnatural to think that an experimenter would not take advantage of the natural characteristics of a dog as compared with a sheep or a pig for the purpose of helping him in his experiment.

17422. Do you think that the experimenter relies on assistance from the dog?—I should think so. I should think it would be to his advantage to do so.

17423. (*Chairman.*) Are you not assuming that this dog is a dog that has known the owner for many years?—No, I am not afraid of any dog.

17424. You think that a strange dog would do all it could to assist the man in his experiment?—Yes.

17425. (*Sir John McFadyean.*) Supposing that the operation is to open the dog's abdomen to study some point of physiology in connection with the liver, would you please tell us the assistance that you would expect a strange dog to give you?—I cannot; that goes beyond my province. I cannot give you any view at all as to anything of that kind, upon the scientific side of the question. I do not know the nature of the experiment.

17426. You are aware that in most cases the first step, or a step at any rate before any cutting takes place, is the administration of anæsthetics?—I suppose so.

17427. Tell us what assistance you expect a dog to give you in that stage of the operation?—After the anæsthetic?

17428. Before; the assistance that you would not get from a pig or a sheep?—But it would not resist to the same extent.

17429. (*Sir Mackenzie Chalmers.*) But when it is under the anæsthesia what is the difference?

17430. (*Sir John McFadyean.*) Is the advantage lost as soon as the animal becomes unconscious?—I cannot say. I am told that it cannot be anæsthetised, of course.

17431. But you do not wish to give evidence on that point, do you?—No, I do not wish to give evidence on the question, because, as I said before, it goes beyond my province entirely.

17432. But still you approve of that statement in this paragraph?—So far as I know dogs, I think it is quite true, and I know them fairly well now. I have found dogs both docile and obedient to the word of command, and it stands to reason that it is easier to experiment on an animal of that kind than upon one devoid of those characteristics.

17433. (*Mr. Ram.*) Under anæsthetics?—No, before that.

17434. If it is under anæsthetics, where is the difference?—I am told that it is not anæsthetised. That you cannnot anæsthetise a dog.

17435. That is what you base yourself upon?—Yes.

17436. (*Sir John McFadyean.*) I did not doubt that you believed that; but I have spent about ten minutes in trying to get you to give reasons, which would satisfy the Commission as to the soundness of your conclusions; and you have not been able to give any that satisfied me?—I can give no better reason than my knowledge of dogs.

17437. But you admitted that you had no knowledge of sheep?—I have the same knowledge of sheep.

17438. Then why institute a comparison between a dog and other domestic animals?—I do not think it is necessary to have an intimate knowledge of any animal to institute a comparison.

17439. Do you know the statistics regarding the operations performed under a licence and certificates?—I cannot say. I have seen them.

17440. Can you tell me what particular operations are referred to in this petition as "peculiarly revolting and painful"?—I imagine the reference was, I do not know, to Professor Crile's experiments.

17441. What makes you think so?—Because I think this petition was drafted about that time, or shortly after that. I think they had that in view.

17442. So that if Dr. Crile's experiments were of a painless character, you would be hard put to it perhaps to justify that expression?—I do not think so. I think they would be able to find others.

17443. Will you tell me some others?—We consider that Professor Schäfer's experiments come under that description.

17444. They were "peculiarly revolting and painful," were they?—I think so. We considered them so.

17445. And others?—I do not know that I could tell you off-hand now. No doubt I could find a large number upon which you could base this. I have not the slightest doubt I could.

17446. You think you could find a large number that would be correctly described as revolting and painful?—I think so. But even if we could not I think the two cases that I have already cited are quite sufficient to justify this expression.

17447. But still you say you would have no trouble in getting a large number?—I think not.

17448. Will you undertake to look up a large number and add them to your evidence?—Yes, I will.

17449. Giving particulars as to time and place and so on?—Yes, I shall be delighted.*

17450. Then you do not think it was too strong language to use when they spoke of "Demonstrations of a prolonged and agonising nature before classes of students"?—No, I do not think it is too strong.

17451. Can you tell me any particular experimenter who has within recent years in demonstrating to a class of students caused prolonged and agonising suffering to an animal?—I cannot at the moment.

17452. Do you think you can find examples if you have time?—Yes, I think so.

17453. You think you could find a large number of cases?—A number of cases; I cannot say a large number of cases. I do not know how many, but I will find as many as I can for you.

17454. You will find as many as you can?—Yes.*

Further particulars were not supplied by the witness.

17455. Thank you very much. You quoted Mr. Woodroffe Hill's opinion. Do you know whether he is entitled to be considered an expert on the anæsthetising of dogs?—I think so. He is a dog specialist. He has published several books on dogs, and has made a very careful study of dogs in every sense of the word.

17456. Is it within your knowledge that he has anæsthetised twenty dogs in his life?—I have only his word for it. He has told me that he has done so—at least tried to do so.

17457. He has tried to do twenty?—I do not know about twenty. I cannot say how many. He has told me he has tried to anæsthetise dogs.

17458. (*Sir Mackenzie Chalmers.*) And failed?—Yes.

17459. (*Sir John McFadyean.*) Would you admit that one might measure the value of his opinion by getting to know how many dogs he had tried it on?—I should say so.

17460. You would personally yourself attach most weight to the opinion of those who had most experience, other things being equal?—Naturally.

17461. At the present time your own experience and observation do not entitle you to form an opinion on this question?—Not at all.

17462. You are adopting the opinion of Mr. Woodroffe Hill, I think?—Yes, and others who have had experience in the matter.

17463. You would be prepared to abandon that opinion if you had laid before you the views of others of a contrary character based on a very much larger experience?—Quite so, if they convinced me that their experience was of such a character as to be reliable.

17464. I want to tell you that last week we had evidence given here from a gentleman, who had administered anæsthetics successfully to many thousands of dogs, who had actually administered it, and who had tabulated the results of the administration of anæsthetics to 1,200 consecutive cases, with only, I think, five deaths; and that many of these animals were under the influence of anæsthetics for a long period, up to five hours. Would you advise the Commission to attach greater weight to that evidence or to Mr. Woodroffe Hill's?—Of course the Commission is in a better position to judge than I am. I have not heard this gentleman's evidence. I take your word that it is so. The Commission are in a much better position to judge which of the two opinions to take. I would not presume to advise the Commission as to anything.

17465. Has the fact, which I have just told you, that we had this evidence given to us raised any doubt in your mind as to the soundness of the conclusions you had previously arrived at?—I am always prepared to accept the evidence of people who know more about a subject than I do myself. And I shall very carefully read the evidence to which you have referred, in order to be able either to revise or to justify my opinion.

17466. The witness is Mr. Hobday?—Thank you.

17467. (*Sir Mackenzie Chalmers.*) May I take it generally that your society hold the opinion that dogs cannot be anæsthetised?—Yes, that is the opinion of my committee.

17468. And even if they could be anæsthetised, that would not remove their objection?—Oh, dear me, no.

17469. In your petition you mention that dogs are used for "demonstrations of a prolonged and agonising nature before classes of students"?—Yes.

17470. You are not prepared with any evidence on that subject to-day?—No.

17471. Are you aware that under the law as it stands a dog in a demonstration must be absolutely under anæsthetics, and must be killed before it comes out?—So I understand.

17472. Do you know at all on what evidence that assertion was based?—No, I do not.

17473. It was before your time?—This petition was drafted before I became connected with the League.

17474. How long have you been secretary?—Just under three years.

17475. Do you devote the whole of your time to it?—Yes, practically.

17476. Then there is a paid secretary in London and honorary secretaries in the country?—Yes.

17477. The present committee are responsible for this statement, of course?—Yes.

17478. This petition is still being used?—Yes.

17479. But you do not know on what evidence it was founded?—No, I can ascertain for the Commission.

17480. I suppose you will agree, at any rate, that if the statements are correct, the operations were illegal?—Yes.

17481. You do not know whether the attention of the Home Secretary was called to any of these illegal operations?—No, I am not aware that it was.

17482. I am afraid you cannot help us on that. I should have liked some information with regard to it. You know dogs suffer from distemper a good deal?—Yes.

17483. It is a painful disease, is it not?—Yes.

17484. Would your society hold that any experiments performed on healthy dogs for the purpose of finding out the cure or better treatment of distemper are justifiable?—They would, of course, highly approve the study of distemper in dogs which were already suffering from it; but they would totally disapprove of any inoculations or any experiments performed on healthy dogs for the purpose of giving them distemper, even with the view of finding out a cure or better treatment of the disease.

17485. Even for the purpose of saving future generations of dogs from distemper?—Yes.

17486. And that would apply to all canine diseases, of course?—Yes.

17487. Are you aware that veterinary surgeons perform very severe operations on dogs for curative purposes?—Yes, exactly the same as medical men do on human beings.

17488. Does your society hold that those operations are justifiable, if a dog cannot be properly anæsthetised?—Yes, I think so, if it is for the good of the dog itself.

17489. Whether it can be anæsthetised or not?—Yes, for that particular dog.

17490. If the operation is severe would it not be much more merciful to kill the poor beast?—It depends. If there were any hope of its recovery I should not say it would be more merciful to kill. If there is no hope of recovery, certainly it would be more merciful to kill it.

17491. Does your society agree that superfluous dogs ought to be destroyed—No, we do not believe in destroying dogs.

17492. For instance, take the Dogs' Home, where about 30,000 dogs are killed every year?—We do not approve of that.

17493. What do you suggest as an alternative?—We take measures to protect all stray dogs that come into our hands. We send them to our own home and find homes for them. We find people who take charge of them.

17494. But you are not prepared to provide for 30,000 canine orphans every year, are you?—I do not think we should find much difficulty in finding homes for them. We have no difficulty now in finding homes for hundreds which pass through our hands annually.

17495. Am I right that about 30,000 are now destroyed in the Dogs' Home in London alone?—I do not know the figures, but I know there are a large number.

17495A. However, your society disapproves of that?—We do not believe in it. If a dog is suffering from an incurable disease, then it is a greater piece of mercy to put it to death, and that we do not disapprove of; but we do not believe in the wanton destruction of dogs.

17496. I imagine that your society disapprove of the practice, for instance, of spaying bitches to prevent their breeding, which is very common?—As a society I do not know that they have any opinion as to that. I have not heard it expressed. I have heard individual opinions, of course.

17497. I was asking the views of your society?—I do not think they have any.

17498. I want just to ask you one question about Professor Schäfer's experiments. You know that most

Mr. J Hughes, F.G.R.S.

26 Nov. 1907.

of his experiments were on dogs, which he had previously chloroformed and anæsthetised?—Some of them were, I understand; I do not know the proportion.

17499. Do you know that only three were performed on dogs that were not anæsthetised?—I know that some were.

17500. According to his evidence before us, three dogs were experimented on without anæsthetics. You know that in each of those cases the dog was not allowed to recover, the dog was drowned?—I do not know the particulars.

17501. It was killed by drowning, but at any rate that was an experiment that your society strongly objected to?—Yes.

17502. Are you aware that superfluous dogs in Edinburgh, where these experiments were performed, were destroyed by drowning?—We do not approve of that method of destruction. If they have to be destroyed we believe they ought to be destroyed mercifully in a properly constituted lethal chamber.

17503. I suppose everybody would agree that that is the best way, but would your society draw any distinction between drowning a dog as a superfluous dog, and drowning a dog in the hope of discovering a means of saving human life?—I do not think we draw any distinction whatever, because we do not believe in superfluous dogs.

17504. At any rate your society protested against Professor Schäfer's experiments, but did not protest against the destruction of superfluous dogs in Edinburgh?—We protest against the destruction of dogs by drowning everywhere, where it has come to our knowledge. We have discussed the matter with the Leeds Town Council recently, and persuaded them to discontinue it.

17505. (*Chairman.*) Does that include puppies; do you extend your care down to new-born puppies?—Yes.

17506. (*Sir Mackenzie Chalmers.*) Would you not allow a puppy, before it has opened its eyes, to be drowned?—That is a matter of individual opinion, I suppose. I cannot commit my society to an opinion upon that point.

17507. There are only two other points I want to ask you about. You mentioned certain Government laboratories; what laboratories do you refer to. I am not aware of any Government laboratories?—The Board of Agriculture have licensed laboratories for the purpose of vivisection, so I understand, and also the Local Government Board and, I believe, the India Office and the Home Office.

17508. I am not aware at any rate of the Home Office having any. I should have heard of it, I think?—I may be wrong about the Home Office.

17509. (*Chairman.*) You probably mean the Colonial Office?—Yes.

17510. (*Sir Mackenzie Chalmers.*) You may perhaps speak of the Lister Institute and the School of Tropical Medicine?—Yes.

17511. That is to say, the Government ask for experiments to be performed with reference to work in subjects dealt with in the departments?—Yes; the Return of the Home Secretary for last year makes special reference to these Government laboratories and laboratories which are supported by public money under the auspices of local authorities in different parts of the country. Those are what we mean.

17512. The only other point is this. You mentioned that some of the medical men who side with you found a difficulty in expressing their opinions, because of the strong opinion held by the heads of the medical profession. How do you account for it that men of the greatest eminence in the medical profession are all on one side, that the heads of the profession are so strong?—I cannot account for it. I do not profess to be able to account for it. I am very sorry that it is so.

17513. You admit the fact?—I am afraid that I must. Of course on the other side I say there are many eminent men who do not believe in vivisection.

17514. Many eminent medical men?—Yes, I believe so.

17515. (*Mr. Ram.*) Can you tell me their names?—Yes.

17516. (*Sir Mackenzie Chalmers.*) You have given some names. We should like to know the names of any existing men of acknowledged scientific attainments in the medical profession who are on your side?—We have often heard Sir Frederick Treves quoted; I am not at all prepared to say what his views are on the general subject, but he certainly expressed himself very strongly.

17517. On one particular point?—Yes.

17518. But speaking generally it is not from the heads of the profession, but from the other end that you have to draw your witnesses?—I do not know. I think you have had some fairly eminent men from our side before your Commission.

17519. (*Mr. Ram.*) Just a few questions as to facts, please. You have given us on several occasions the views of your society. How are they arrived at?—I do not quite understand. How do you expect me to answer?

17520. I leave you to find an answer. I put the question: How do your society arrive at the views which you have represented as being theirs?—As I told you, the society was started as an anti-muzzling society, and it has developed little by little until it became a General National Canine Defence Society. They have not arrived at these views suddenly, but it has been really a development, as with most societies.

17521. To take one example, for instance, which has been already referred to. You say that your society object to all experiments, because of the difficulty of anæsthetisation?—Yes.

17522. On what do they base themselves in saying that it is difficult to anæsthetise animals?—I think I explained before that we have received letters from medical men and veterinary surgeons, who give it as their opinion, and give it strongly as their opinion, that dogs cannot be anæsthetised.

17523. You gave us the name of one gentleman who said so, and who said that he had tried and failed on a few dogs. Can you give us the name of any other gentleman besides him?—I read to you an extract from Professor Woodroffe Hill's letter.

17524. That is the one to whom I am alluding. Can you give us any other names?—Dr. Lucas Hughes, of Liverpool, wrote us a very strong letter on the subject. We issued that letter from Dr. Hughes as a leaflet, and we also published it in our report.

17525. That is what made me anxious to get at it?—I am afraid that I cannot put my hand upon it at the moment, but it was a very strong letter.

17526. What was the date of it; do you know?—I should think it was about two years ago.

17527. Did he state how many animals he had attempted to anæsthetise?—No, he does not.

17528. You will get that information for me and send it to the Commission?—I will, with pleasure.*

17529. You have already been referred to the evidence of Professor Hobday as to anæsthetising animals. I want to read to you two sentences from the evidence of Dr. Dudley Wilmot Buxton, a Doctor of Medicine and past President of the Society of Anæsthetists, Consulting Anæsthetist to the National Hospital for Paralysis and Epilepsy, Anæsthetist and Lecturer on Anæsthetics in University College Hospital, who has had a very large experience in the study and administration of anæsthetics. He was asked this at Question 12439:—"Is there any difference, and if so will you explain it to us, in the method of operation of anæsthetics upon man and upon the lower animals?" And his answer is "None." Then he was asked, "Do you note their condition of insensibility, and the degree of it, in the same way with animals as you would with men?" And he said, "Always"?—That refers to all animals.

17530. That refers to all animals. Your society, as I understand, have been informed that it is specially difficult to anæsthetise dogs?—Yes.

17530*a*. Dr. Buxton was asked that question at Question 12489:—"We have been told by several witnesses that dogs are particularly difficult to keep under anæsthetics. Is that your experience?—(A) Certainly not. (Q) There is no difficulty in keeping a dog for several hours under anæsthetics?—(A) Not if you understand your business. (Q) We have also been told that it requires a very skilled anæsthetist to anæsthetise a

Further particulars were not supplied by the witness.

dog. Is that so?—(A) That would depend entirely upon the apparatus employed." Then, at Question 12496:—"And, in your opinion, is any special skill or knowledge required for anæsthetising a dog in order to produce anæsthesia?—(A.) No, I think not. Of course, an inexpert person may produce an overdose by giving too much. I do not think he is likely to err on the other side." And again:—"If the dose of anæsthetic was insufficient, the dose of air would be insufficient, and the animal would die?—(A.) That is so. (Q.) That is your opinion?—(A.) That is my opinion." That is the evidence of a very distinguished man who has made it the study of his life to ascertain the effects of anæsthetics upon human creatures and upon animals. What is the evidence that you propose to offer to us on which you would ask us to set aside that evidence?—I am only prepared to give you the evidence that we have received, to some of which I have already referred, of such men as Professor Woodroffe Hill and Dr. Lucas Hughes of Liverpool.

17531. Those are two?—Those are two that I can remember at the moment.

17532. Our object is to see what evidence there is on either side?—I have also had conversations with several medical men, who have all said the same thing.

17533. In those conversations did you ever ask those medical men how many animals they had operated upon?—No.

17534. That is rather material, is it not?—Yes, it may be. I have simply asked them what their views were, and did they believe that this was correct, and they have said yes—that they thought the views expressed by those two gentlemen were correct.

17535. The views of your society, of course, are valuable entirely according as to whether they are or are not founded upon accurate knowledge?—Quite so.

17536. Can you tell me who drafted the petition which you presented to Parliament?—I really cannot tell you exactly who drafted it. It was drafted with the approval of the committee, but who the actual person was who drafted it I do not know. I daresay I could ascertain it.

17537. You have been good enough to hand to me a pamphlet just now, and I want to ask you about one or two expressions in it?—We do not issue that pamphlet, of course; it is a pamphlet which is issued by another society, which I simply put in my bag for the purpose of reference to the figures. I take no responsibility whatever for the pamphlet.

17538. Do your society adopt the statements that are made in it?—We simply adopt the facts as they are taken out of the Home Secretary's Returns. I could not put my hand on the Home Secretary's Official Reutrns, and therefore I put this in my bag instead.

17539. Do I take it that you have read this pamphlet yourself?—Yes.

17540. Do the statements herein made represent the views of your society also?—I do not know that they do exactly. I would not like to take the responsibility for them without going more deeply into them.

17541. Does your society think that the Act is "useless as a protection for animals, while protecting their torturers"?—That sounds rather strong, does it not?

17542. That is for you to say. Does that represent the views of your society?—I cannot say that we would put it quite in that form.

17543. I will just read you one other passage. Does your society think that "an actual painless vivisection is an impossibility"?—We do not take any responsibility for that statement.

17544. Then I will pass from that as it is not issued by your society. In the covering letter which you issued with the petition you say there has been a "terrible increase of experiments on dogs during the past three years"?—Yes.

17545. That is written in the year 1906?—Yes.

17546. "An increase proved beyond controversy"?—This letter is dated 1906; I believe it was drafted before that, only it was reissued in 1906.

17547. Will you tell me to which three years you refer in this letter when you say that there has been "a terrible increase of experiments on dogs during the past three years"?—I should think it refers to the years 1902-3-4.

17548. How can that be when it goes on to say that it is proved by a statement made by the Home Secretary in 1903. That cannot prove anything about 1904?—No.

17549. Nor can it prove anything about 1903, can it?—But this is only a statement made with regard to the year 1902, which I take to be the first of the three years referred to in the letter.

17550. (*Chairman.*) What is the date of the petition or letter?—The date of the issue of this particular letter which I have before me is April, 1906, but it was drafted, I am sure, before then, and was issued in the first instance earlier than that. This is a reissue sent out later.

17551. (*Mr. Ram.*) But it is on the faith of this letter that you are asking persons to subscribe and to take up the petition to Parliament?—Yes.

17552. Therefore, I want to test the accuracy of the statements in this letter. The letter is signed by your chairman and issued in April, 1906?—Yes.

17553. It says that in the past three years there has been a terrible increase in the number of experiments on dogs, as proved by the statement made in Parliament by the Home Secretary on May 11th, 1903?—Yes.

17554. I ask you, in this letter which is sent to me and many other people, which are the three years to which you refer?—I cannot tell you the exact three years; 1902 may have been the last of the three years for anything that I know. At all events, I do not think that the facts stated in the letter can be impugned at all, because there is a very great increase in experiments performed on dogs and other animals for all the years since 1897.

17555. (*Chairman.*) But this is all about dogs; there is nothing about other animals?—This is including dogs.

17556. (*Mr. Ram.*) Since 1897?—Yes.

17557. And other animals?—Yes.

17558. Please narrow yourself to dogs. How can you prove that there was a terrible increase in experiments on dogs during the three years preceding the issue of this letter?—I have not the figures with me with reference to dogs alone, but I feel pretty certain that it is so.

17559. Do you know how many dogs were employed by Professor Starling at his laboratory?—He says 155.

17560. Well, do you doubt that?—I do not remember exactly what year he refers to. If he refers to 1902 I cerainly do not doubt it.

17561. I will give you the reference. You will find it in Professor Starling's evidence on page 116 of the first volume, in an answer to Colonel Lockwood, at Question 3470: "I will take the year 1902, since at the request of the Inspector I separated the experiments made in that year on dogs from those made on other animals. In this year 155 experiments were performed on dogs in the physiological laboratory at University College. Of these, 151 were performed under licence alone. What does this mean? In experiments performed under licence alone the animal must, during the whole of the experiment"—(then quoting the Act)—"'be under the influence of some anæsthetic of sufficient power to prevent the animal feeling pain, and the animal must, if the pain is likely to continue after the effect of the anæsthetic has ceased, or if any serious injury has been inflicted on the animal, be killed before it recovers from the influence of the anæsthetic which has been administered.' That is a quotation from the Act. In all these experiments, therefore, the dog was first chloroformed. The experiment was then performed while it was fully anæsthetised, and at the conclusion of the experiment the animal was killed without ever recovering consciousness." That was true of 151 experiments out of 155?—Yes.

17562. You accept that statement of his?—I have no reason to disbelieve it. You see that we are saying that the numbers in 1902 were 232, and I find that that is quite consistent with what Professor Starling says.

17563. I am not disputing now whether the number is 232 or 155?—But I should like to explain that, because there seems to be a discrepancy.

Mr. J. Hughes, F.R.G.S.

26 Nov. 1907

17564. If you please?—Professor Starling said that he used 155 dogs, which I find is absolutely correct. We say that there were 232, which is also absolutely correct, the difference being that in the Physiological Department of University College 155 dogs were used, and 77 were used in the Department of Pathological Chemistry; that is the answer of the Home Secretary to which we refer in our petition, and also in the covering letter, 155 in the Physiological Department and 77 in the other, so that Professor Starling is absolutely correct and we are correct, too.

17565. I am willing to accept the numbers. What I want to point out to you is that out of those numbers it is only possible that four dogs can have suffered anything at all?—I do not say that.

17566. That is what Professor Starling states?—Yes, exactly, he says so, but I am afraid that we cannot accept that statement that only four out of 155 could have suffered any pain.

17567. Then will you tell me why you ask this Commission not to accept that statement?—Because neither Professor Starling nor anyone else can prove that the animals do not suffer. We have only to use our own common sense in the matter.

17568. But using common sense, if an animal is put under anæsthetics by which it is rendered wholly unconscious, and dies before it come from under the influence of the anæsthetic, how can that animal suffer?—I am not convinced that a dog can be anæsthetised.

17569. If you choose not to accept Mr. Buxton's and Professor Hobday's evidence, that is another matter; but hypothetically, if an animal is anæsthetised so as to be beyond all possible sensation, will you agree that it cannot suffer?—I suppose I must if it is beyond all possible sensation.

17570. And if the animal dies before recovery of consciousness, do you agree that there can be no kind of suffering in that animal?—I suppose I must. I should like, at the same time, to guard myself by saying that, even granting all that, we do not believe that vivisection of dogs is justifiable, on other grounds, of course.

17571. Following up that last remark of yours, granted that a dog is wholly anæsthetised and can never recover consciousness at all, on what grounds do you object to its being experimented upon?—We do not consider that man has a moral right to experiment upon any live animal for his own purposes. We think it is absolutely wrong to do so.

17572. That goes against any vivisection at all?—Yes.

17573. Do you draw no distinction then between dogs and other animals?—If you ask my own opinion, I do not personally.

17574. Does your society?—I have already said that my society does not go into the question of other animals. I believe that the great majority, if not the whole of the members, of my society do not believe in any vivisection at all, but *qua* the society we only advocate the non-vivisection of dogs.

17575. I will read you one other passage from Professor Starling's evidence, which you will find at page 115, in answer to Question 3451: "Though I have been engaged in the experimental pursuit of physiology for the last seventeen years, on no occasion have I ever seen pain inflicted in any experiment on a dog or cat, or, I might add, a rabbit, in a physiological laboratory in this country, and my testimony would be borne out by that of anyone engaged in experimental work in this country." Can you show the Commission any reason why they should not accept that statement?—All I can say is that I would not accept it.

17576. Why not?—Simply because it seems to me absolutely unreasonable to think that a man like Professor Starling, who has been engaged in this work for 17 years, never, as he says, saw pain inflicted on an animal. I am sorry to say that I cannot accept it. Professor Starling may think so, but my common sense will not allow me to accept it, and revolts against its unreasonableness.

17577. That is a direct statement of fact by Professor Starling?—No, of opinion, I take it.

17578. No, of fact?—So far as his opinion goes he has not seen any pain inflicted. I cannot accept that. That is all.

17579. You say that your common sense is the ground on which we ought to decline to accept that statement?—I am not dictating to the Commission; I should be very sorry to do that. I am simply giving my own views. The Commission are in a better position to judge as to what they should accept than I am.

17580. You quoted Professor Starling just now as to a dog being glad to be introduced into a laboratory. Let me read his exact words, and you will see what he said?—Thank you very much. I shall be glad.

17581. I thought you took it as implying that a dog shows pleasure at being about to be experimented upon again?—That is the impression that I had.

17582. Let me see if I can remove it. Will you turn to page 139, Question 4024—it is a question put by myself: "Such an animal, I presume, if it was an intelligent animal—a monkey or a dog—say, might have more apprehension than an animal which had never been so treated before, might it not?—(A.) I do not think so. I cannot, of course, judge of these inoculation experiments, but the experiments which I have in my experience are experiments in which the animal—the dog—has had an intestinal fistula established—that is to say, a little opening into a loop of its intestines. These animals are quite happy. When we want to observe the flow of juice from these fistulous openings, the dogs are brought into the room, placed in front of a fire in a little stand, and slung up in a duster to take the weight off their legs. Either I myself, or the laboratory boy, stays with them and talks to them, and meanwhile they are given some meat, and the juice drops from the opening into a flask placed below. These animals are happy to be brought in. They are taken notice of, and talked to, and given a good meal of meat. They are very happy to be brought into the laboratory, to be subject to observation under those circumstances, and they do not seem to be incommoded in any way by the fact that they have an opening into a loop of their intestines. (Q.) And during such time as they are not under observation in their cages, are they then in a state of suffering?—(A.) No, none whatever. (Q.) Even a well-established fistulous opening does not produce suffering while it is going on?—(A.) But what I wanted specially to insist on was that they were not even in a state of apprehension. They were perfectly happy. They liked to be talked to, and they behaved like a normal dog, in fact." That is the passage, I think, to which you alluded?—Yes.

17583. You observe there that the dogs were not brought in to be experimented upon again at all?—Yes, for the purpose of observation, I take it.

17584. They were not to be subjected to anything which was to cause them any pain?—That is the only respect in which I can modify my opinion. I am sorry that I said the other. I understood that it was for the purpose of experiment. At the same time that does not alter my views of Professor Starling's evidence, and it does not affect the point made when I adduced Professor Starling's evidence as a proof of the docility of the dog as compared with that of other animals.

17585. There is only one more question that I think I need trouble you with, and that is as to rabies. Your society, you say, doubted the existence of rabies to anything like a considerable extent?—To the extent to which it was returned.

17586. Did they doubt the existence of rabies at all?—No, I do not think that they doubted its existence at all. I think they believed that it did exist to some extent.

17587. Do they believe that it is now extinct in this country?—Yes.

17588. If rabies was not widespread, how do you account for the large number of deaths of persons who died of rabies—not of dogs, but of human creatures?—I do not think there were a large number.

17589. Do you know what the numbers were?—Not at the moment.

17590. Have you never had the numbers given you?—Yes, I have, but I cannot at the moment go through them, and my impression is that there was not such a large number.

17591. Your society, I understand, object to muzzling?—Yes.

17592. Have you ever put a muzzle on a dog?—Yes, I have.

17593. Have you ever had a dog which had a muzzle on for three or four days?—Yes.

17594. Did the dog mind it?—Yes, it objected very much.

17595. After it had worn it three days?—Yes.

17596. What sort of dog was it?—A Yorkshire terrier.

17597. Did it never get reconciled to its muzzle?—No, I do not think it ever did.

17598. I think it must have had rabies to start with; it is very different from my experience.

17599. (*Chairman.*) The muzzling was objected to on the ground of cruelty, I understood you to say?—Yes.

17600. (*Dr. Gaskell.*) There is just one question I want to be clear about. I understood you to say that in your opinion, and as representing your society, an actual painless vivisection in dogs was not an impossibility?—Oh, no.

17601. You said that just now; those were your words?—No, what I said was this. I was asked, assuming that a dog could be anæsthetised, assuming that what Professor Starling said was true, if a dog could be anæsthetised, then the experiment must have been painless, but I say that we deny, so far as we know, that a dog can be anæsthetised, and that if a dog cannot be anæsthetised, then it cannot be painlessly experimented upon.

17602. Then you want to withdraw that remark that you made just now?—I am not aware that I made it. I had no intention of making it.

17603. (*Sir John McFadyean.*) It may have been a misapprehension on your part?—Absolutely, because I have all along said that we believe that a dog cannot be anæsthetised, and therefore it cannot be painlessly vivisected. I understood the question to be whether if a dog could be anæsthetised and destroyed before it recovered consciousness, I believed that it suffered pain. I certainly say that if it could be anæsthetised it could not suffer pain.

17604. (*Dr. Gaskell.*) Did you not also just now say that in your opinion, and in that of your Society, a properly constituted lethal chamber was the best means of destroying dogs?—Yes.

17605. What do you mean by a lethal chamber?—A box designed for the purpose of putting the dog painlessly to death.

17606. In what way; how would it be put to death; what is the ordinary method in the lethal chamber; what is used?—Principally chloroform and carbonic acid gas, I think.

17607. But as dogs cannot be anæsthetised that is a painful method of putting a dog to death?—I do not say that a dog cannot be killed, I say that it cannot be anæsthetised. I said at the outset that in our opinion what we had been given to understand was that a sufficient dose cannot be given to a dog for the purpose of anæsthetisation without killing it, and that it cannot be made unconscious with a dose of chloroform or anything else without ending in death. We believe that dogs can be killed, of course.

Mr. J. Hughes, F.R.G.S.

26 Nov. 1907.

17608. Then that must necessarily be a painful death?—Not at all.

17609. Because they cannot be anæsthetised?—I do not see that, if the chloroform or other anæsthetic kills them.

17610. If the action of chloroform is first to anæsthetise an animal, and, in a lethal dose, to cause death, the period between when it is first given and the time of the animal's death, must either be a painful period or a non-painful period must it not?—I am not an expert on poisons, but I have seen a dog destroyed in the lethal chamber, and the whole process does not take a minute and a half.

17611. But during that minute and a half it is painful?—But it does not seem to have any pain at all.

17612. Of course it does not?—But, then, that is a very different thing from giving a dog a dose of chloroform when it is intended to be experimented upon by, say, a cutting process, when that dose is not sufficient to enable it not to suffer pain. I think there is a very marked distinction between the two.

17613. I was only on the question of the morality of putting it to death in the lethal chamber by means of a drug which does not anæsthetise, which seemed to me to involve a painful proceeding, and I wanted to know your opinion?—I do not think it is.

17614. (*Sir John McFadyean.*) Are you quite certain that none of these unconscious dogs in the lethal chamber could be revived?—No, they cannot.

17615. On what ground do you base that statement?—I have never known any to be revived.

17616. Is that clear evidence that they cannot be revived?—I do not think that they could always; and we have had veterinary surgeons present when they were lethalised.

17617. Have you had veterinary surgeons trying to revive them?—Oh, dear me, no; we do not experiment upon dogs.

17618. So that really you have no evidence of it?—Our object is to put them to death, when we find it absolutely necessary. We never try to revive them.

17619. Am I right, therefore, in saying that you have no evidence to show that they cannot be revived?—Because we have not experimented.

17620. So that you have no ground for asserting that they cannot be revived?—We have only the ground that they never have been revived.

Mr. JOHN ROSE BRADFORD, M.D., D.SC., F.R.C.P., F.R.S., called in; and Examined.

17621. (*Chairman.*) You are a doctor of Medicine, and a Doctor of Science, and Fellow of the Royal College of Physicians, and a Fellow of the Royal Society?—Yes.

17622. And you are Professor of Medicine at University College Hospital Medical School, Physician to University College Hospital and to the Seamen's Hospital?—I am.

17623. You are a member of the Advisory Board of the Army Medical Service, and a member of the Advisory Committee for the Tropical Diseases Research Fund of the Colonial Office, and a member of the Tropical Diseases Committee of the Royal Society?—I am.

17624. And you are Chairman of a Sub-Committee of the Royal Society for the Investigation and the Treatment of Sleeping Sickness and other Diseases?—That is so.

17625. I believe you desire to give evidence as to the value of experiments on animals principally in assisting the physician in actual practice?—Yes.

17626. We have had a great body of evidence as to the value of experiments on animals, and I will not take you into the whole history of the reasons why they are important; but perhaps you will just give us your views about the importance of it as a physician?—I have sent in a short statement already, and I am prepared to answer any questions to the best of my ability that any Commissioner may wish to ask me. I do not know that I have any reasoned detailed statement to make. If there are any points in this short summary on which any Commissioner would like to ask further questions to bring out the points I shall be very pleased to answer them, but, as I say, I have not got any reasoned detailed statement to put before you.

Mr. J. R. Bradford, M.D., D.SC., F.R.C.P., F.R.S.

17627. So far as I have looked through your statement, you go through the principal services which have been done, in your view, by experiments on animals, by discovering causes of disease or remedies, very much on the lines that a great number of witnesses have gone through them?—Yes.

17628. I do not want to take anything in unnecessary detail?—I have divided this summary, roughly speaking, into two groups—two paragraphs—the one dealing, I may say, with the results which have been obtained in the various committees on which I happened to serve, especially those in connection with the Royal Society; but I believe you have had a very considerable amount of evidence bearing on that already brought before you, so that my position as regards that is that I am here to answer any questions that I am able to answer which anybody may wish to ask me with reference to that point. Then, with reference to the use of experiments on animals in the practical work of the physician, I have divided

Mr. J. R. Bradford, M.D., D.Sc., F.R.C.P., F.R.S.

26 Nov. 1907.

that into two short headings. One is as regards the necessity of every fully-trained physician having a sound knowledge of the healthy functions of the body, which you may certainly say could not have been obtained without the results of experimental science; and then I have mentioned two or three instances in which I thought that the physician in his every-day practice was directly dependent upon the methods he had to employ, involving experiments on animals to obtain the knowledge that was necessary for the treatment of the sick.

17629. Would you tell us what those are?—The instances I quoted bear, for example, on the necessity for accurate diagnosis in the early stages of disease. There are a great number of diseases which in the early stages do not give rise to what physicians talk of as marked signs; they cannot be detected by the handling and looking at the patient, but they can be detected by methods of investigation necessitating animal experimentation. I do not know whether you want me to give specific instances?

17630. Perhaps you would give us one or two?—A specific instance which would occur to one would be, for example, the case of a patient who had suspicions of tuberculous disease of the lung, at the top of the lung. What we talk of as the physical signs of that disease may be produced by other maladies than tuberculous maladies, and there are classes of cases in which the only satisfactory method of determining whether the patient is or is not suffering from tuberculosis is the inoculation of a guinea-pig with the material expectorated by the patient. That is an illustration of what I mean. If you wait until there are unequivocal signs of the presence of one or more of these two diseases, very much valuable time is lost.

17631. Are you speaking there of a disease that is of comparatively slow progress?—Yes.

17632. You could not use that sort of experiment to discover whether it was scarlet fever?—No.

17633. That would discover itself before the experiment was worked out?—Yes.

17634. But if it is like tuberculosis or suspected tuberculosis, is that experiment practically done now by physicians?—Yes, I have done it—or, rather, have had it done on several occasions on which there has been some doubt as to whether the patient was suffering from tuberculosis or from a malady that is known to physicians as bronchi-ectasis.

17635. (*Mr. Ram.*) Is the result on the guinea-pigs certain and final?—If it is positive, of course.

17635A. (*Sir William Church.*) But the same method is also of use in what you may call acute diseases, is it not?—Yes, certainly; but I thought the Chairman asked with regard to that simple experiment.

17636. But it is also of use for diagnosing purposes in acute diseases?—Yes, and that I have alluded to in the second paragraph, where I quote the instance of diphtheria and typhoid as illustrations of acute diseases.

17637. (*Chairman.*) How would it help you in a case of suspected diphtheria?—In a case of suspected diphtheria, the modern diagnosis is made by recognising the organism as such, the cultural peculiarities of the organism. But the foundations of our knowledge as regards the organisms are derived from experiments which in the past involved experiments on animals, as, for example, to determine whether an organism is virulent or not. That is no longer necessary now in the practical question of an individual patient at the present day; but our knowledge of the virulence of the diphtheria bacillus has been obtained by experiments on animals.

17638. I quite understood that distinction. I only put the question that I did in order to distinguish the two cases—the one in which you can actually test, by an experiment on an animal, whether your particular patient in a particular case has got a particular disease, and the other the general knowledge that you have derived from discovery?—Yes.

17639. I was not aware that it was ever done in practice—that physicians in a case like tuberculosis had a special experiment made on an animal by which to ascertain whether that particular patient had that particular disease?—Yes, that is done.

17640. I think you are the first witness who has referred to that?—Yes.

17641. (*Sir William Church.*) It is also frequently done, more frequently for tuberculosis in other organs of the body, is it not?—Yes.

17642. For instance, in the bladder?—Yes; I mention that in my summary. But I took the first illustration when the Chairman asked me.

17643. What is the next head upon which you desire to give evidence?—The next head is the one Sir William Church has alluded to with reference to the same method being applied in diseases of the urinary organs. They are facts of the same order, of course.

17644. Is the use of special experiments in particular cases common now amongst physicians, or is it only some very advanced ones who take it up?—I do not think it is a question of their being advanced. I think the number of cases where that is required is a very limited number, but they do occur. I have not been quoting hypothetical cases, I mean; I have been quoting actual cases that have occurred. Certainly, in cases of diseases of the bladder and diseases of the kidney it is often extremely difficult to be absolutely certain that tuberculosis is present without an inoculation experiment.

17645. (*Sir William Collins.*) Would the finding of bacillus of tuberculosis alone be insufficient?—You mean by other than inoculation methods?

17646. Yes?—I am not a practical bacteriologist, you must clearly understand that. I do not give evidence as an expert in bacteriology. I give evidence simply as a physician from this point of view. But I have always understood that there are difficulties in the recognition of the bacillus of tuberculosis in certain fluids—as, for example, the urine. And certainly putting that on one side, an inoculation experiment is a very much more satisfactory method, because you learn not only with certainty that the bacillus of tuberculosis is present, but you also learn the degree of virulence of the organism which (here I am only perhaps expressing my own personal opinion) I think sometimes is a fact of considerable importance.

17647. Is that true also of the sputum in the case of tuberculosis? Would the finding of the bacillus be insufficient without inoculation of an animal to verify the diagnosis?—I think that the recognition of the organisms in the sputum is more easy by other methods. There are not the same sources of fallacy as there are in the case of the urine.

17648. Then would it be sufficient without inoculation?—It might be. I do not know whether the Commission wish me to quote individual cases—whether it is worth while.

17649. (*Chairman.*) Certainly, where it illustrates your views?—In a case that I have very much in my mind of a man with what is spoken of as apical bronchiecktasis, the illness was extraordinarily suggestive of tuberculosis. The examination of the sputum was negative, but yet the clinical picture was such that one had grave doubts about the accuracy of repeated examination of the sputum; and the inoculation experiment was also negative. And the subsequent history of that case proved the correctness of absence of tuberculosis, to the best of my judgment.

17650. (*Sir William Collins.*) In that case did not the bacteriological test and the inoculation test point to the same conclusion?—Yes, in that case, certainly.

17651. Can you give us an example in which the bacteriological test and the inoculation test pointed in opposite directions?—I could not recall a case actually at the moment; but I think I am correct in saying that in cases of pleural effusion one has often failed to find the organism in the fluid when the inoculation of the fluid has led to the development of the lesion in animals. I have not got an actual concrete case before my mind.

17652. (*Sir John McFadyean.*) It is a matter of common knowledge, is it not, among pathologists and bacteriologists that the inoculation test is a much more delicate one than the microscopic test?—That is so; that is my point, of course.

17653. You can use for one inoculation operation an amount of fluid that ten men could not examine in the course of several days?—That is so.

17654. (*Chairman.*) Do you attach importance to the freedom of the physiologist to experiment upon different kinds of animals?—Yes, I attach great importance to that.

17655. Will you tell us why?—First and foremost because I think that, in order to obtain a really sound knowledge of physiological processes, one wants to have the opportunity of investigating them under different conditions. Similar functions are performed

in different animals by different agencies, and with slight differences in their physiology; and one in that way, by the use of different animals, gets a wider perception of the physiological processes in any given organ. I think that is one reason.

17656. We have been told that different animals resemble man in different parts of their bodies?—Yes; some animals resemble man more closely in certain parts of their structure and functions than other animals do.

17657. The monkey, with regard to the brain, I understand?—Yes.

17658. And I think we have been told by several witnesses that there are some parts of a dog—the digestive organs and the bowels—that closely resemble those of a man?—Yes; the general nutritive processes in the dog have a closer analogy to those in man than in the case of many other animals.

17659. I suppose there are other instances in which certain parts of an animal would not afford much assistance with relation to the knowledge of man?—Yes.

17660. The last witness that we had was one who belonged to those who protest very strongly against dogs being used for these purposes. Are there any purposes for which you consider the dog is essential?—I think that it is very difficult to carry out experiments on the circulation in other animals than the dog. When I say that it is very difficult, that is perhaps not quite the correct word to use. But the dog is the animal in which the circulatory apparatus has much more resemblance to that of man than in the case of many other animals. That is one instance, I think. Then, of course, the digestive processes and the nutritive processes generally, to which you have already alluded, is another illustration.

17661. (*Dr. Gaskell.*) Would you include in the circulation the lymph system, the lymphatics?—Yes, I think so. I have not yet myself worked at the lymph system, but I certainly think I would include it.

17662. (*Chairman.*) If dogs were excluded from experimentation, what would be the result to physiology. Many people think that they should be excluded, and I wish to know what, in your opinion, the effect would be?—I do not wish to use exaggerated language, but I am bound to say that I think it would cripple physiology in this country.

17663. (*Sir Mackenzie Chalmers.*) To a great extent or to a small extent?—To a great extent.

17664. (*Chairman.*) By not giving the same opportunities to physiologists of comparing results, in the dog and in man, in particular parts of the body, do you mean?—Yes, and in preventing physiologists making useful additions to knowledge in physiology.

17665. As a matter of research?—As a matter of research, and amongst other things, as a matter of direct practical value to man. The two things go together, I mean; they cannot be separated.

17666. I understand that there are a good many experiments that could not be satisfactorily performed and with satisfactory results if physiologists were confined to such small animals as guinea-pigs, rabbits and rats?—I think that is unquestionable.

17667. As to demonstration by experiments before students, what have you to say to that?—I think that it is essential for the proper education of students that there should be demonstrations. I understand by demonstrations, of course, demonstrations on anæsthetised animals.

17668. (*Mr. Ram.*) And animals that cannot recover from the anæsthesia?—An animal that is killed before it recovers from the anæsthesia.

17669. (*Chairman.*) Have you ever known, I ask you this because suggestions have been made before us to the contrary, of animals being vivisected for purposes of demonstration (I mean cut into with the knife for purposes of demonstration before students) without anæsthetics?—No.

17670. Never?—Never.

17671. You have had long experience?—Yes, I began working in a physiological laboratory in the year 1883. I cannot trust my memory as to exactly when I gave up my licence; it was three or four years ago. Since that I have not held a licence. Roughly speaking, I have been acquainted with physiological laboratories for twenty years.

17672. What is your view as to the value of demonstrations?—My view about that is, that it is quite impossible for a student to get really a correct knowledge of any fundamental phenomenon in physiology, such, for example, as the beat of the heart, without really having seen the heart beating. I do not think that that kind of real knowledge can be acquired from reading. If you take two students, one of whom has been told the stimulation of a nerve in the neck stops the heart, and the other has seen the heart stop with the nerve being stimulated, I do not believe that those two students have got an equal knowledge. I know that I never had what one might call a true knowledge of the thing until I had seen it.

Mr. J. R. Bradford, M.D., D.Sc., F.R.C.P., F.R.S.

26 Nov. 1907.

17673. (*Sir Mackenzie Chalmers.*) That, of course, is done under anæsthetics?—Yes.

17674. (*Chairman.*) Were demonstrations of that kind common when you were learning your profession?—No, when I learnt my profession, I think I am correct in saying that there were no demonstrations to the general class, and that the only demonstrations that took place were to students who were taking the higher course of instruction, the so-called advanced course. That is my recollection. I have no recollection of having seen demonstrations in the ordinary large lecture class. I am talking of 25 years ago, of course, and more than 25 years ago.

17675. Do all students now have an opportunity of seeing demonstrations?—I believe so. I cannot speak of that of my own knowledge, because, of course, I am out of touch with the teaching of physiology now, even at my own medical school, and I do not know for certain whether all the students see demonstrations or whether it is only those who are taking advanced courses. But you have had many witnesses before you who could answer that of their own knowledge. I am not prepared to say from my own knowledge.

17676. You think it is advantageous, at any rate, that they should have the opportunity?—I think it is more than advantageous; I think it is necessary.

17677. (*Sir William Church.*) You have seen the printed evidence before this Commission?—Yes. I cannot say I have read it all.

17678. I want to ask you a question about it. You will find on page 66, first of all, Question 5843, at the bottom of the first column, that a witness, Mr. Graham, alluded to some experiments of yours in the following words: "I only propose to give just one or two cases so that my argument may not be in the air. Dr. Rose Bradford cut into the ears of dogs, destroyed the tympanic plexus, scraped out the middle ear and poured in pure carbolic." Mr. Graham, of course, had no idea what was the object of that experiment there narrated. Is he quite wrong in his description of it? I should like you to explain to the Commission what was done, and what was your object in doing it?—I daresay it is within your knowledge that I was written to by the Secretary of the Commission with reference to this matter, and I have sent in a statement already with reference to it. These experiments were experiments on the physiology of secretion from the salivary glands—experiments on nervous regulation of secretion which involved the cutting of nerves supplying certain glands, the submaxillary gland and the parotid gland. The nerve going to the sub-maxillary gland is, of course, easily divided, the nerve going to the parotid gland cannot be readily divided, and so, in order to destroy that nerve, the ear was opened, under anæsthetics, of course, in the usual way in which a surgical operation on the ear is performed, and the interior of a certain portion of the ear was rubbed with a spoon and then one drop, one minim, of pure carbolic acid was allowed to run in, and was then wiped up with a piece of cotton wool and the wound was closed. That is a description of the operation. The object of the operation was to divide the nerves, or to destroy them, it comes to the same thing, supplying this particular gland.

17679. These particular experiments were done, I suppose, under Certificate B?—Yes.

17680. Then the witness went on to say that the operation was done under chloroform, but the dog lived for weeks afterwards in what must have been a condition of great suffering. I want you to tell the Commission whether, in your opinion, those dogs did suffer greatly?—It is quite untrue, of course, to say that they lived in a state of acute suffering. There was no evidence of suffering at all, and I may say that, of course, it is a common surgical procedure to scrub wounds with pure carbolic. It is, if anything, rather painless than painful.

Mr. J. R. Bradford, M.D., D.Sc., F.R.C.P., F.R.S.

26 Nov. 1907.

17681. It was done, first of all, whilst the dog was still under anæsthetics?—Yes.

17682. What is the action of pure carbolic acid when used in that way on the immediate parts?—It has a very successful but very complete destructive action; it just destroys what it is in contact with and does not, therefore, lead to any subsequent sloughing or inflammation when it is used in a small quantity like that, and is applied just in the form of one drop locally.

17683. And it also benumbs the part?—Yes.

17684. (*Sir Mackenzie Chalmers.*) How far is it a local anæsthetic?—It is a very powerful local anæsthetic.

17685. For instance, when applied to the painful nerve of a tooth?—It is only used for that purpose.

17686. As an anæsthetic?—It is applied, of course, to destroy the nerve as an anæsthetic, but to destroy the nerve as well.

17687. (*Sir William Church.*) Therefore what I want to get at is, that in your opinion, these particular experiments did not entail much after suffering in a dog?—I should have said they entailed no more than obtains in the healing of any healthy wound.

17688. In the first volume of evidence that was published, I do not know whether you have seen certain statements made about you. You will find on page 65, at the bottom of the first column, Question 1798, a statement made by Mrs. Cook that you performed various operations upon the kidneys of dogs at the Brown Institute?—Yes.

17689. She goes on to say: "Chloroform and morphia were used for the actual operation, and the animals were then placed in a glass case, with a glazed floor, for observation. Pieces were cut out of the kidneys, and they were mutilated in different ways. In the case of one dog, the operator cut a piece out of a kidney, and then tried to graft the piece and make it grow on another part of the inside of the animal. The animal died in four days." She, of course, had no idea of the object with which these experiments were done. I did not know whether you would like to mention that to the Commission?—First of all, these experiments were not done at the Brown Institution; I do not know that that is very material; they were done before I was at the Brown Institution. There was no operation of that kind done at the Brown Institution.

At this point Sir William Church took the chair.

17690. (*Sir Mackenzie Chalmers.*) How many years ago is it?—These experiments were begun in 1889, but they went on for many years. If you want the facts, I should have to look them up. I cannot pin myself exactly to a date, but they went on for six or seven years. But these particular experiments were not done at the Brown Institution. The object of these experiments was to see whether it was possible to produce in animals, by diminishing the amount of kidney substance, a condition at all analogous to what is found in human Bright's disease—that is to say, whether it was possible to produce a slow poisoning at all akin to that seen in Bright's disease—for the purpose, I need not say, of investigating Bright's disease. A number of facts were observed in the course of these experiments, perhaps the most important being that nothing at all akin to Bright's disease was produced by the diminution of the kidney substance. I mean that no proceeding like ordinary uremia was seen as the result of these experiments. A considerable amount of information was obtained, which was of value in these observation.

17691. Could you kindly tell us in what way it was valuable, because that is important?—One of the things which I think was of value is that one got accurate information as to how much kidney was necessary for life to be maintained.

17692. That affects prognosis?—Yes, prognosis. It might also conceivably affect operative interference. Then another thing that I think of some value, only this is rather a complex subject, is that it gave one a different idea of the significance of the quantity of urine that was passed. There were certain conclusions in human medicine that were drawn from a person passing much or little urine, and I think that those experiments showed that at any rate other factors had to be taken into consideration. That is an illustration of the kind of value of the experiments. But the most important thing of all was, I think, that no such condition as that known as human uremia was produced.

17693. (*Sir William Church.*) Would you tell the Commission, if you remember at this length of time, exactly what did become of these dogs. You see, in that paragraph, Mrs. Cook accounts for nine out of the forty-nine; she does not tell us what became of the other forty?—I should be very pleased to put the facts before you. You have had a copy of the published paper, giving the facts as regards each one, of course. To summarise the thing shortly, I would say that a great number of these dogs lived, of course, for very prolonged periods, in perfect health.

17694. Without apparently suffering?—Yes.

17695. They were in the condition of a man who has had an operation on his kidney?—Yes, they were perfectly well. Some lived, for example, for two years, and they were killed, not because they were ill, but because they served no useful purpose to keep any longer. Others wasted; they passed large quantities of urine, and got thin, but they suffered no more than that. They did not suffer at all, of course, except that they were thin. Others, where the quantity removed was greater, got so thin that they became extremely weak, and no doubt ill; they vomited occasionally; and those animals were killed immediately—there was no object in keeping them, of course. Then some of them, as stated by the witness, died within a few days of the operation. I remember this one alluded to here as having lingered thirty-six days, because it was a very remarkable one. That animal lived for thirty-six days, and died suddenly. I do not know from what cause, but it is quite easy to give you the full facts as regards each individual one if they are wanted. They are fully published.

17696. So that only two died from blood poisoning as the result of wounds, and one in four days. That is what she says?—Yes, I have no doubt that is true, but I should have to look it up to verify it.

17697. And the others were much in the condition of a man who has had a successful operation performed upon his kidney after he recovers?—Yes.

17698. That is to say, it is not likely that they were suffering tortures or pain?—There is no truth in the statement that they were suffering tortures or pain. And the only ones where there was evidence of the wound going wrong in the first few days after the operation were killed, of course.

17699. I should just like to ask you one question with regard to the use of animals in diagnosis beyond what Lord Selby asked you. Is not experimentation by means of animals of the greatest use in diagnosing diseases in the interest of public health. Is it not the case that an officer of health at a port would use animals, for instance, for the diagnosis of plague or cholera?—Yes, that is so.

17700. Those, of course, are acute diseases?—Yes, and, of course, at a time in the evolution of the disease when it might be impossible to diagnose it by other means.

17701. (*Sir John McFadyean.*) Do I correctly understand that you justify and advocate experiments on animals for teaching purposes, first on the ground that such experiments can be made absolutely painless, and, secondly, that they are of great value for fixing facts on the minds of students, and giving them a better understanding of physiological processes?—Yes, only I go a little further. I say that without such demonstrations it is impossible for them to get an adequate knowledge of physiological processes.

17702. But you would not seek to justify, and you would not advocate, such experiments were you not satisfied that they can be made painless?—No.

17703. Then, with regard to the question of declaring it illegal to use dogs for experiments, I suppose that for certain experiments an animal of about the size of a dog is necessary?—Yes.

17704. That is to say, there are certain experiments which are frequently done, and you hold that it is advantageous to do, which could not be done on a guinea-pig or a rabbit?—That is so.

17705. Other animals of about the same size might be the pig, or the sheep, or the goat, but do you think that a sheep or goat, or even a pig, could well be substituted for a dog in all the experiments for which a dog is now generally employed?—I think that is quite impracticable.

17706. For example, would it be possible to throw much light on the physiological processes of digestion and assimilation in men by experimenting on ruminants?—No.

17707. At any rate, you do not think that information of value would be as likely to be obtained in that way as by using dogs?—Certainly not.

17708. And the same would apply also to the pig?—Certainly.

17709. (*Sir Mackenzie Chalmers.*) I only want to ask one or two questions from a purely lay point of view. You told us that it was necessary sometimes to have a diagnostic experiment in case of suspected tuberculous disease of the kidney?—Yes, and the urinary tract, yes.

17710. That is important for this reason, that according to the result the treatment would differ?—Yes.

17711. That is to say that if your diagnosis was wrong you would pursue a different treatment?—The treatment would be perfectly different, because the classes of affection that are likely to be confounded with tuberculosis of the renal tract are diseases associated with gravel, a totally different class of affection.

17712. Therefore the consequences to the patient of a wrong diagnosis might be very serious?—Yes.

17713. Would the same apply to what you told us about the tuberculous disease of the apex of the lung?—You would adopt a different form of treatment in the two conditions.

17714. Now as regards diphtheria, is it ever essential there to perform experiments on animals for diagnostic purposes?—No, I do not think it is, because the organism can be recognised by other methods, by cultural methods.

17715. But you have to diagnose the organism in diphtheria?—Certainly.

17716. You get the false membrane equally in laryngitis as in diphtheria?—Yes, there are other causes of false membrane besides diphtheria.

17717. Would the treatment differ according to whether you find the specific bacillus?—Yes. It is well known, of course, that in diphtheria it is of the utmost urgency to recognise it at the earliest possible moment; the life of the patient may depend upon it.

17718. As a practical physician I suppose you have seen much diphtheria?—Yes.

17719. Do you use the antitoxin?—Invariably.

17720. Have you read the evidence we have had about antitoxin here, that its efficacy mainly depends upon its early administration?—Yes, that is so, it very largely depends upon that.

17721. Have you any doubt yourself as a practical physician, that the antitoxin does save life?—I have not the smallest doubt.

17722. And not only saves life, but does it also cut short the disease?—I have no doubt of it whatever, having seen diphtheria before the antitoxin treatment, of course.

17723. Taking your opinion generally, you think that medicine owes a great deal in the past to animal experimentation, and that it must in the future, if it is to continue to make progress, depend on animal experimentation?—I have no doubt about it.

17724. As regards those experiments of yours on the ear, the whole experiment was performed under anæsthetics?—Yes

17725. Would the wound be closed in any way before the anæsthesia disappeared?—The wound would be completely closed and the dressing put on.

17726. (*Mr. Ram.*) An aseptic dressing?—Yes.

17727. (*Sir Mackenzie Chalmers.*) The ear is very sensitive, is it not?—Yes.

17728. Would there not be a danger of subsequent pain from this operation?—If the wound went wrong, if it became infected, but not otherwise.

17729. Not as long as it was aseptic?—No.

17730. Were not very sensitive nerves involved in the operation, and would not the ends of those nerves give rise to pain?—I do not think so. The nerves in the first place were destroyed by the carbolic acid, and the operation, I should like to point out, is not precisely similar, because the structure of a dog's ear is a little different from that of the human ear; but putting that aside the operation is practically identical with the very common operation in human surgery of opening that portion at the back of the ear.

17731. For the purpose of getting at an abscess in the ear?—Yes.

17732. (*Mr. Ram.*) Is that followed by pain in the human subject?—Not so far as I know. There may be pain where the thing is due to inflammation, for which the operation is done.

17733. (*Sir Mackenzie Chalmers.*) The actual operation does not give rise to great after pain?—Certainly not

17734. In the human subject at any rate?—No.

17735. Therefore there is no reason to suppose that it does in the dog?—I have no hesitation in answering that question, because I know that these dogs ran about just like normal healthy dogs, and they showed no signs of pain. Every physiologist would tell you that if he performs an operation, and the wound becomes infected the thing is to a great extent spoilt for his purpose.

17736. Then the dog is destroyed?—Then the dog is destroyed.

17737. I just want to clear up this further point. In the case of kidney operations you extirpated a portion of the kidney in certain dogs?—Yes.

17738. That was done, of course, under anæsthetics?—Yes.

17739. The wound was healed up and dressed under anæsthetics?—Yes.

17740. Was it ever necessary again to open that wound, or not?—I rather fancy that I sometimes had to take out a stitch; there may have been a stitch abscess. I never had to open the deeper parts.

17741. In fact your object was that the wound should heal?—Certainly, but some of these wounds become infected, as was stated.

17742. Then you killed the dog?—Yes.

17743. After a time?—I am speaking from memory; I have not looked up these paricular series of experiments, but my impression is that they were killed at once.

17744. What I wanted rather to get with reference to some other evidence that we have had was this: The wound was not reopened for the purpose of inspecting it, or anything of the kind?—No. When you asked me the question whether I ever reopened a wound my impression is that I did sometimes take out a stitch.

17745. It has been suggested to us that under Certificate B the operation is performed under anæsthetics, but that subsequently exploratory operations are performed without any anæsthetics—is that so?—That is not so.

17746. You never heard of such a case in your long experience?—No.

17747. You have read the evidence given to us as to various tropical investigations?—Yes.

17748. We have had evidence as to sleeping sickness, yellow fever, Malta fever, and plague?—Yes.

17749. Have you anything to add to the evidence that we have already had?—I do not think so. Sleeping sickness and plague are the only diseases of the kind that I have been directly concerned with, because I have been on the Advisory Committee controlling both.

17750. You were a member of the same Committee as Dr. Charles Martin, who gave us evidence?—Yes, the Committee at the India Office.

17751. And you agree with his evidence?—Yes.

17752. (*Mr. Ram.*) With regard to these experiments on dogs, when you extracted part of a dog's kidneys, as I understand, it was, of course, necessary that the dogs should survive after the anæsthesia passed away in order that you might see the effect?—Yes.

17753. In the majority of cases I understand that the dogs throve and showed no signs of illness?—In a large number of cases.

17754. In other cases the dogs, I suppose, were ill in consequence of the effect of the abstraction of more or less of the kidneys?—Yes, they wasted. Wasting was the prominent symptom of illness.

17755. In respect of some of those dogs, I suppose, there was pain, or at all events discomfort, in consequence of the illness?—I should say that there was discomfort. I should not say that there was pain; but there was in those animals in which there was the smallest amount of kidney left a very considerable physical weakness and inability to take food, and therefore I have no doubt that there was discomfort. There was never any evidence of local pain, and there was no reason for supposing that there should be.

Mr. J. R. Bradford M.D., D.Sc F.R.C.P., F.R.S.

26 Nov. 1907.

Mr. J. R. Bradford, M.D., D.Sc., F.R.C.P., F.R.S.

26 Nov. 1907.

17756. Were the dogs in a condition in which they were lying about in discomfort moaning?—No.

17757. It did not amount to that?—No, I never heard one of these dogs moan.

17758. Or give any actual signs of acute suffering?—No.

17759. There was an expression used by Mrs. Cook, I think, which was put to you just now—I do not know whether you adopted it—that one dog lingered for thirty-six days, and died suddenly?—Yes, my impression is that it died suddenly, but I will look that point up if you wish it.

17760. Only to this extent, the phrase she used, I do not know whether it was adopted from you or invented, that it lingered for thirty-six days, gives an idea of great discomfort?—I do not adhere to the word lingering. I do not think I used it. I should prefer to look it up, and send you an account of it.

17761. It was put to us as a case in which it was proved that the dog suffered pain for a considerable time—thirty-six days. Anything that you could give us as to that particular case I should be glad of?—I have no hesitation in answering at once that the dog did not suffer pain. I do not know in what particular form of words I described its life for thirty-six days.

17762. One other matter, please. In your statement you speak about the advantages obtained by inoculation to enable you to form a right diagnosis with regard to, for instance, tuberculosis. Does it come to this, that the instances so far as you have found them yourself tend to correct the diagnosis, to prove whether the diagnosis is right or wrong?—Yes.

17763. It tends, therefore, I suppose to indicate the proper treatment?—Yes.

17764. And may be the means of saving life if the wrong treatment were negatived, and the right treatment indicated?—Yes, that is so.

17765. Is the good which has been obtained by the discovery of these antitoxins, and so forth, confined, do you think, to correct diagnosis, or is it in any cases used in a curative way for the patients themselves?—It is certainly so used in a curative way in the case of diphtheria, for example.

17766. We have heard a great deal of Sir Almroth Wright's experiments lately, and you have been speaking of such instances as acute forms of pleurisy, lung diseases, and tuberculosis of the urinary tract. Tuberculosis of the urinary tract, on which some witnesses have given us evidence, is a matter, I suppose, that can only be treated through the system?—It can be treated surgically, of course.

17767. But apart from surgically, it must be treated through the system?—Yes.

17768. So far as you know, is the serum used by Sir Almroth Wright used curatively?—On his patients, I believe so.

17769. Have you known any cases in which, for instance, in tuberculosis of the urinary tract, this serum has been used?—I have no personal knowledge.

17770. Do the books disclose any cases?—There have been cases recorded in literature where it has been successfully employed.

17771. But you have seen cases in books?—Not in text books.

17772. I use the legal phrase, in books?—I thought you meant text books.

17773. No, I mean in literature. You have seen instances there recorded, in which it has been useful as effecting a complete and permanent cure of such a matter as tuberculosis of the urinary tract?—Yes.

17774. (*Dr. Gaskell.*) You have had experience of experimentation upon various animals, have you not—dogs and others?—Yes.

17775. Have you ever found the slightest difficulty in anæsthetising dogs?—No, none.

17776. You would not put them in a different category from other animals in that respect?—No, I should not put them in a different category. I should have said that I have had personally more facilities in anæsthetising dogs, and that I have found them very susceptible to certain anæsthetics, chloroform particularly.

17777. (*Mr. Ram.*) Meaning, that they are more liable to die under the anæsthetics?—Yes.

17778. (*Dr. Gaskell.*) But when you have succeeded in keeping them alive, you can keep them well under anæsthetics?—Yes, you can get the most perfect anæsthesia in dogs.

17779. You have had a licence and various certificates for some time?—Yes, I have held, I think, all the certificates. I never held a demonstration certificate. I think I have held all the others.

17780. Do you consider that the present Act puts trouble in the way?—I think there is a little trouble. Personally, I cannot say that I have had any serious amount of trouble. I have never been delayed in the course of any experimental inquiry that I have been engaged in, but I think I have known of instances where delay has occurred.

17781. Do you think it would be better if the present Act were abolished altogether?—No, I do not think that. I think that experiments on animals should be regulated by an Act.

17782. Have you any suggestions to make to this Commission as to any alterations in the Act that would be beneficial, or have you not thought about that?—I have not thought about it of recent years, I must confess; but I think I can answer that question, at any rate, to a certain extent. I think that certain individuals, at any rate, should perhaps have more general powers given them; that instead of having to apply for certificates for different categories of animals, they might be all covered by one certificate. Some years ago, when I was conducting some observations on a disease allied to sleeping sickness (nagana) in animals, I had to do those experiments on a very large number of different kinds of animals—horses, cattle, and a number of different animals—and I had some little inconvenience in getting those certificates; but it never amounted to anything very serious.

17783. (*Sir Mackenzie Chalmers.*) Were those experiments in nagana done in England?—Yes, they were done at the Brown Institution.

17784. (*Dr. Gaskell.*) That inconvenience, I presume, also affected the people who had to sign the certificates?—Yes.

17785. It was a bit of a worry for them, was it not?—Yes. I think there is a grave misconception in the mind of the public with reference to the wording of some of these certificates—Certificate B especially. There is one certificate which on the face of it rather implies that you are doing the experiment without anæsthetics—it is Certificate A—and in many cases you are really using an anæsthetic.

17786. (*Sir Mackenzie Chalmers.*) Certificate A only authorises feeding experiments or experiments which do not involve more operative procedure than the prick of a hypodermic needle?—I think I am under a misapprehension; I think the certificate was altered a few years ago; but there was a time when I held the certificate, and the particular certificate was the certificate dispensing with anæsthetics.

17787. That refers to the old E before EE?—Yes; there was one certificate which you had to apply for, which dispensed with anæsthetics, and you had to apply for that certificate when you were going to do an experiment on a particular animal under anæsthetics, and therefore the public who could see an intimation that So-and-so held a particular certificate, acquired the idea that they were doing experiments without anæsthetics, when really they were not.

17788. We had that in the evidence of Sir Victor Horsley. It was the old Certificate E, afterwards abolished by Mr. Asquith, and EE substituted for it?—Yes. I think there might be some modification with regard to the certificates.

17789. (*Dr. Gaskell.*) I may take it then that you would like to have some modification with regard to certificates?—Yes.

17790. And larger powers given to certain individuals?—Yes.

17791. Would you specify those individuals?—No, I would not specify them. I think that ought to be determined by the people who sign the certificates; they might act as referees with reference to that. They might be defined perhaps as teachers and professors of physiology in universities and teachers in medical schools.

17792. It has been suggested to us that they might be defined as heads of laboratories?—I think that would be quite a suitable thing.

17793. (*Sir William Church*). Would you be in favour of doing away with all certificates?—No, I do

not think I should. I think there might still be certificates for certain animals.

17794. But you would be in favour of doing away with all certificates for persons who were in the position of head of a laboratory?—Yes, I think so.

17795. But for men who held less responsible and less well-known positions, you would still require Certificates A, B, C, and EE?—I think the certificates might be simplified.

17796. (*Dr. Gaskell.*) Have you read Sir Victor Horsley's evidence on that point?—No. It is not a thing that I have given much thought to, but I certainly quite agree that heads of laboratories ought to have further facilities.

17797. (*Sir Mackenzie Chalmers.*) You told us that you thought the Act ought to be kept up?—An Act.

17798. Is that for the reason that having an Act tends to keep up a high standard of humanity, or for the reason that it tends to allay public apprehension?—That it tends to allay public apprehension. I do not think there is any necessity to set up a standard of humanity for the gentlemen engaged in work of this kind, because their object is to relieve humanity. *Mr. J. R. Bradford, M.D., D.Sc., F.R.C.P., F.R.S.* 26 Nov. 1907

17799. Would there not be danger without the Act, of experiments being performed by quite a different class of people, who might not have the same qualifications or the same standard of conduct?—I imagine that those individuals come under the Prevention of Cruelty to Animals Act—Martin's Act.

17800. They would now; but if you abolished this Act, would there not be a danger of unscientific people in the name of science performing reckless experiments?—I am not in favour of doing away with an Act.

THIRTY-NINTH DAY.

Wednesday, 27th November, 1907.

PRESENT:

The Right Hon. The Viscount Selby (*Chairman*).
Sir W. S. Church, Bart., K.C.B., M.D.
Sir W. J. Collins, M.P., M.D., F.R.C.S.
Sir M. D. Chalmers, K.C.B., C.S.I.
Mr. A. J. Ram, K.C.
Mr. W. H. Gaskell, M.D., F.R.S.
Mr. J. Tomkinson, M.P.

Captain C. Bigham, C.M.G. (*Secretary*).

Mr. Henry Head, M.A., M.D., F.R.S., F.R.C.P., called in; and Examined.

17801. (*Chairman.*) You are a Doctor of Medicine, a Fellow of the Royal Society, and a Fellow of the Royal College of Physicians, I believe?—Yes.

17802 And Physician to the London Hospital?—Yes.

17803. You desire to offer some evidence to us, I believe, with reference more particularly to the relation of diseases of the nervous system to experiments on animals?—Yes.

17804. First, I think, you desire to point out how far experiments on animals have led to the elucidation of difficulties in the structure and functions of the nervous system?—If I may, I want to point out that all rational diagnosis and treatment must be based upon knowledge of the structure and functions of the nervous system. Sixty years ago little was known of its structure, and still less of its functions. Charles Bell and Majendie had proved that the anterior roots were motor and the posterior roots sensory in function. Marshall Hall was describing reflex action in the spinal cord. It was then an entirely new idea. A few diseased states were known to be accompanied by gross changes, but none of the paths by which impulses pass to and from the brain were then known. I thought it might interest you to hear what Sir Thomas Watson, in his text book (Lectures), said in 1845. He explains the peculiar difficulties to which the physician was exposed when dealing with nervous disease by saying, "One source of difficulty lies in the circumstance that the structure of the nervous system has no perceptible or understood subservience to its functions. We do not discover in the mechanism of this system that adaptation of means to an end which is so conspicuous in many other parts of the body; and consequently, though such adaptation doubtless exists, we are not able to trace the reason or the manner of its interruption"; and again, "It is a further source of difficulty that physiologists have not yet been able to determine with anything like precision or certainty what share the several parts of the brain and spinal cord have in regulating, respectively, the functions which all physiologists acknowledge to belong to the nervous system in the aggregate. There are many and convincing reasons for believing that the brain is a complex organ; but we can seldom put our finger upon this or that portion of the nervous matter which composes it, and say here resides the influence that governs this or that particular function." That was 60 years ago.

17805. Sir Thomas Watson was then, I suppose, a gentleman who might be relied on to give the up-to-date knowledge of his time?—I think so. Sir Thomas Watson was particularly interested, I believe, in matters of this kind. When the part of the book on the nervous system is read, it is very difficult to say how it reads, the ignorance is so profound. When you read the rest of the book on the other systems much of the knowledge given could be transferred to an ordinary text-book. *Mr. H. Head, M.A., M.D., F.R.S., F.R.C.P.* 27 Nov. 1907

17806. We may take that as showing the high-water-mark at that time, then, of the specialist's knowledge on this subject?—Yes, I think so; because he even alludes to the very recent knowledge of reflex action; he mentions Marshall Hall, and he puts in the recent knowledge that was only published shortly before; so that I think we may take Sir Thomas Watson as fairly representative of the professors of medicine of that day, and of the knowledge that was given to students at that time. The whole of the knowledge which we now possess of the structure and functions of the nervous system is due to the close co-ordination of the results of animal experiment and the consequences of localised disease. The anatomist (this is the point I want to make first about anatomy) of the dissecting-room can help us very little. He cannot even say whether the biggest tracts visible to the naked eye conduct upwards or downwards. The beginning of our present knowledge came with Waller's discovery that a nerve degenerated when separated from its nutritive centre. This law was the direct outcome of experiments on animals, and its application to the brain and spinal cord has been responsible for the greater part of that knowledge we now possess of the structure of the nervous system.

17807. When you speak of a nerve degenerating do you mean losing all its functions?—Not only losing all its functions, but undergoing retrograde destruction. When a nerve is separated from its nutritive centre it becomes gradually functionless, but also it becomes gradually destroyed entirely, so that no nervous matter is left behind. Let me explain by a simile how the anatomy of the nervous system depends upon experiment. I am not talking of the functions at all; I am talking simply of the anatomical structure. Let me just take a simile. Imagine a wall covered with creepers arising from several stems. If we wished to know from which of these any one branch takes its origin, we could cut one stem and every leaf arising from it would die, marking out among the healthy foliage the offshoots of the divided stem. This is the principle that has been used in tracing the paths in the nervous system. Gowers, by applying this method, discovered the ascending tracts in the lateral column of the spinal cord.

17808. When you say, by this method, do you mean by experimenting in that way upon living animals?—By applying this method to localised lesions in the spinal cord.

Mr. H. Head, M.A., M.D., F.R.S., F.R.C.P.

27 Nov. 1907.

17809. (*Sir Mackenzie Chalmers.*) Accidental lesions or lesions caused by disease?—Yes.

17810. (*Sir William Collins.*) Did Gowers himself employ both methods?—No, I am just taking Gowers' as an application of this method to an accidental one first.

17811. But did Gowers employ both methods?—Gowers, by this method, discovered the ascending tracks in the lateral column of the spinal cord which had degenerated in consequence of injury. This is an instance of the fruitful application of a law discovered by experimentation on animals to a case of an accidental lesion in man, because, but for Waller's law Gowers could never have used the injury in man to discover ascending tracts in the lateral column. But there was a great deal of dispute about them until Mott and others settled their anatomical connections once for all by animal experiment. Gowers' own observation was not able to give us the complete distribution of these tracts; that only arose where the experiment could be repeated several times under set conditions in animals. From that time the preliminary observations made by Gowers have been verified by several others, and made perfectly certain now by animal experimentation, and we now know the greater part of the distribution of this path. The lesions of disease are usually too diffuse, and the opportunities for *post-mortem* examinations too uncertain, to give clear answers to a direct question. By experiments on animals a tract or set of tracts can be divided precisely; the animal is kept alive until degeneration has taken place, and is then killed. By suitable means the dead parts can be coloured so as to stand out clearly in the microscopical picture. The method by which these dead structures are made to show up clearly against the healthy parts was discovered by Marchi from experiments on animals. Waller's law and Marchi's method applied to material obtained from experiments on animals and from disease or injury in man, are responsible for almost all our knowledge of the anatomical paths in the nervous system. But for experiments on animals we should not have had, so far as we can tell, Waller's law; and the method of colouring the diseased parts (which had been the greatest difficulty in applying Waller's law to the nervous system) was discovered entirely by experiments on animals by Marchi.

17812. (*Mr. Ram.*) The knowledge of one was made available by the method of the other?—Yes. If I may just be allowed to say so, our present knowledge of the anatomy of the nervous system depends to an enormous extent on methods discovered from experiments on animals, and in the utilisation of these methods upon material derived from the results of disease or accident. When we turn to the knowledge of the functions of the nervous system still more do we require controlled experiments to correct and amplify the uncontrolled results of disease. For a knowledge of ingoing sensory paths we are obliged to fall back mainly upon disease, because man alone can tell us of his sensations, but disease produces irregular and diffuse destruction, and the most instructive conditions rarely come to post-mortem examination. Even here, when observation of disease on man starts with a preponderating advantage, in that man can tell us of sensations, experiments on animals are necessary to supplement the rare opportunities offered by disease. On the motor side experiments on animals have the overwhelming advantage that the destructive lesion or the stimulus can be localised accurately, and observations can be made, under the direct conditions of experiment, time and place being convenient. Hughlings Jackson discovered by long and laborious observation that when certain parts of the surface of the brain were the subject of disease, certain movements were produced in the limbs. But these results remained a brilliant hypothesis until Hitzig in Germany, and Ferrier in England, showed by simple direct experiment that stimulation of the surface of the brain in animals produced movements of the limbs such as Jackson had described. In spite of a generation of clinical observation since that time, many important details of cortical localisation still remained undecided until Sherrington and Grünbaum's experiments on the anthropoid apes; that is to say, that although Dr. Jackson, by the most brilliant intuition and most laborious observation, said that stimulation of certain parts of the brain marked by disease were associated with these convulsive movements, few, if anybody, believed him, because everybody said that it is impossible to stimulate the brain. They held exactly the idea that is given in Watson—that the brain was a sort of independent structure, in which no function was placed in one part or in another—that the brain was the seat of a sort of generalised function. But it might be asked: Why not experiment on men who offer themselves voluntarily? I hold very strongly that no man has the right to be the subject of an experiment unless the whole conditions surrounding that experiment are previously known as well as they can possibly be at the time. In my own case the most careful observations were made upon patients suffering from accidental injuries to nerves. Then the experiment was designed so that the question which could not be answered by these accidental lesions was put directly, and the answer given clearly.

17813. (*Sir Mackenzie Chalmers.*) In the case of an animal?—In the case of myself. No man has the right—I want to insist upon that—to experiment upon himself unless the whole of the conditions of the experiment are known beforehand, so far as it is possible. That is to say, that vicarious experiments are useless, and that an experiment on man, if it occurs—self-experimentation—must be the culminating point in a complete series of thoroughly thought out data, which can only be obtained by a long course of observations of disease, together with animal experiment. Every now and then, for the relief of pain, man is operated upon under conditions that closely represent those of animal experiment. I refer particularly to such operations as the division of the posterior roots for pain and the operation of the removal of the Gasserian Ganglion at the base of the skull for persistent neuralgia. From such instances, when they occur, we can obtain the most valuable information, but such cases can only occur with excessive rarity, and, as in the case of the Gasserian Ganglion, it is always the same structure which is removed.

17814. (*Chairman.*) When you say such cases, do you mean cases in which a surgeon would venture on such an operation?—Yes; I obtained most valuable information from two of Sir Victor Horsley's patients, in whom he had divided the posterior roots in the back for persistent neuralgic pain; but such cases occur with excessive rarity.

17815. When you say information, do you mean that you questioned the patients about their sensation?—I examined them as if they were animals only, with a human consciousness. People may say that there occur in human beings opportunities in consequence of surgical operations which are equally good with those of animals, and give you the advantage of having a man to deal with. But those are excessively rare, and not only that, but when they are not excessively rare, as in this modern operation of removing the ganglion at the base of the brain for this persistent neuralgia, it is always the same structure that is removed. I do not want at the present stage to see any more patients in whom the Gasserian Ganglion has been removed.

17815A. Will you explain?—At the base of the brain the whole sensory nerves of the face and head come together, and form a sort of knot. This knot or junction point is the part from which all the ingoing lines pass into the brain, so that they carry the whole of the sensations from that half of the head into the brain. Now, for extremely severe neuralgia this knot is cut, and the junction is removed, so that the pain impulses no longer pass into the brain.

17816. Do you mean pain impulses coming from the rest of the body?—No, from the face and head; it is facial neuralgia. They no longer pass inwards, and the whole of that part of the face is made entirely devoid of sensation.

17817. Is that an operation that is successfully performed now?—It is a brilliant operation; it is brilliantly successful.

17818. Is it successful in its after results?—Yes, brilliantly successful, if it is done with care by the people who can do it.

17819. (*Sir Mackenzie Chalmers.*) Is it a dangerous operation?—Yes, but the mortality is going down enormously; now that people are getting skilled the mortality goes down every year.

17820. Does the destroying those sensory nerves produce any other ill-effects afterwards? Have you

watched cases for a number of years?—Yes. One particular case that I have under observation now was done about 1897—ten years ago.

17821. (*Chairman.*) Does it affect the vitality of the patients at all generally?—No, not generally. It enormously improves it, because they have been the subject of this terrible pain over long years, and the relief of that pain often turns them into entirely different beings from the patients you have seen before.

17822. Does it alter the appearance of the person's face?—Yes, because you must divide the motor nerve for certain parts of the face, too; you cannot get the one away without the other.

17823. Does it take away the power of movement?—Part of it, not altogether.

17824. (*Mr. Ram.*) Is the whole of that side of the face affected permanently?—Yes, permanently.

17825. Is it dead to all sensation?—Very nearly.

17826. Does it feel a touch or a prick?—To a varying extent. There are parts which are entirely insensitive to everything; and pain, of course, disappears with it.

17827. (*Sir William Collins.*) Is the nutrition of the parts supplied by the divided nerve affected?—Somewhat.

17828. Detrimentally?—Not with care; it does not heal so easily quite on that side if there is an injury, but not otherwise.

17829. Is the eye affected?—That depends entirely upon whether you have taken care or not. If you have taken care, in the present day, the eye is not affected, for you can be careful to shield it.

17830. No ulceration of the cornea follows?—Not necessarily. In the modern operations the eye escapes altogether. In the old cases the eye used to suffer a good deal.

17831. (*Sir Mackenzie Chalmers.*) Was that from accidental division of nerves affecting the eye?—The eye loses its sensation.

17832. (*Sir William Collins.*) You spoke of the mortality having fallen enormously. Was the mortality originally enormous?—Yes, it was high at first.

17833. About what was it?—I would not like to say exactly what the first mortality was. I should have to look it up, but it is going down rapidly.

17834. (*Chairman.*) You only performed this operation in cases where the pain was so severe that it made life intolerable?—Absolutely. That is the question you always ask; Is life intolerable?—That was not quite the point that I wanted to make. The point I wanted to make was that these occasions arise very rarely, and although you might say—Ah, yes, but you have got, let us say, statistics of hundreds of Gasserian Ganglion operations to deal with, yet it is always the Gasserian Ganglion.

17835. (*Mr. Ram.*) You want to learn about other nerves?—We want to learn about others; you cannot go on for ever learning one particular thing. I have not the slightest doubt that years hence, when our knowledge advances, we may go back to this and learn more. What I wanted to prove was that animal experiment has been necessary, not only for the study of the function, which is more easily, perhaps, understood, but also has been absolutely essential in the progress that we have made towards our knowledge of the anatomy of the nervous system. And, then, it is not animal experiment only, but it is animal experiment, closely interwoven with other forms of experiment; that is to say, I want to show how closely related animal experiment and the utilisation of material obtained from disease or injury are to one another; that but for animal experiment we could not have utilised in the way we have done material obtained from disease. And I may perhaps be allowed to pass on to tell the story of a small research, which happens to illustrate this close inter-relation. The problem of this particular research was given by disease, and it was—Why does pain caused by irritation of some internal organ radiate on to the surface of the body or into the limbs, and why do these parts become tender? It had long been known that when an internal organ (let us take the heart) was affected, the pains were not always situated over the heart; they seem to go into other parts of the body. Now, in consequence of the work of Dr. Gaskell, some of us suspected that this was a definite phenomenon, and was the way in which the internal organs expressed themselves when they were diseased. First of all, Dr. James Mackenzie and myself independently attacked this problem, and we examined for a number of years the actual facts as they occurred.

Mr. H. Head, M.A., M.D., F.R.S., F.R.C.P.

27 Nov. 1907.

17836. (*Chairman.*) In patients?—In patients in the hospital. We selected instances in which one organ, if possible, was affected. Take, for instance, such a disease as stone in the kidney, where we watched the pain produced by the stone, and then we saw the stone removed, and saw the pain disappear, and by a long and laborious series of observations, extending over a number of years, we determined that when an internal organ was affected in this sort of way it expressed itself by pain radiating round the body, associated with areas of tenderness on the skin. That is a good instance of the phenomena of referred pain. But, of course, I need scarcely say that if you attempted to describe phenomena like that people might say—Oh, yes, we know that it happens, but it is all hung in the air; it has no relation to anything whatever that we know. So little had it any relation to anything that was known that most people doubted that these areas occurred at all. But throughout the whole research we were much comforted and supported by Sherrington's experiments on the distribution of the posterior roots. Sherrington found by a most ingenious method of experimenting, which I do not think I need explain, that supposing you worked out the parts supplied by one posterior root you found that they spread over the body and limbs, and were distributed in a sort of zone, like a belt round the body; they went round like a half-belt; and it was the fact that I was in touch throughout the whole of my observations with Sherrington, who was at that time working out these zones which were previously entirely unknown in animals, that made me perfectly certain that my observations on referred pain were correct, and enabled me to propound a set of figures, what you may call a map of the body. This I should never have dared to put forward had I not known that in the nervous system there lay the possibility of a series of zones of this kind; that is to say, it was knowing by experiments on animals that the posterior roots followed a course somewhat of this kind, that made me much more confident that what I found in disease was really the fact.

17837. Were the experiments on animals for the purpose of verifying an idea which had presented itself, apart from experiment?—No, Sherrington was working entirely independently. He went purely for knowledge. What is the distribution of the posterior roots is what he asked himself; that is, how are they distributed, and he worked that out by animal experiment. That was undertaken entirely apart from any thought of disease or anything to do with it, only it so happened that we were both influenced by Dr. Gaskell's ideas, and so he took the experimental side of the work, quite independently, and I wanted to see how far this idea could be borne out by the examination of cases of disease of patients.

17838. By observation?—By observation. But what I wanted to impress upon the Commission was that taking this small piece of work I would never have dared to put forward a map of the body worked out in this way from observation only, had I not known that the structure and functions of the nervous system contained something which was similar.

17839. For that purpose how long did you carry on experiments on animals?—I did not do any then at all. I was observing human beings.

17840. How long did Sherrington carry on experiments on animals?—I think some four or five years.

17841. And in that time he operated on a great number, I suppose?—A considerable number.

17842. 200 or 300?—I could not tell you without looking it up.

17843. What kind of animals did he use?—Monkeys and cats.

17844. Those were the most suitable for that purpose?—The monkeys particularly.

17845. Then he would use a good many, I suppose?—I do not know exactly how many.

17846. Would it be necessary in that case to get a certificate for letting the animal come to?—Yes, because he divided the roots; he cut the lines below and cut the lines above, leaving the one in between untouched; then the animal had to come to, and the sensory ideas were marked out later on when the animal was quiet.

Mr. H. Head, M.A., M.D., F.R.S., F.R.C.P.

27 Nov. 1907.

17847. When the animal was under anæsthetics the only operation was a cutting one?—Yes.

17848. Was the wound then allowed to heal?—Yes, the wound was allowed to heal in many cases.

17849. Then after the operation had been performed there would not be artificial irritation of the nerves of the body?—No, there was none. The only way in which it was done was by stroking or pricking the skin.

17850. To see whether there was sensation—not pain?—No, not pain at all. Sherrington would take a pencil, for instance, and rub it along, and then when the animal moved he knew that the movements must have been supplied by the other root that he had left there which was sensitive.

17851. (*Mr. Ram.*) Would the animal be in any state of suffering on account of the operation?—Not the least, except for possible post-operation discomfort.

17852. The healing of the wound?—Yes. The whole point in the operation was that the animal should be as normal as possible, otherwise it was no good.

17853. (*Mr. Tomkinson.*) Then after the wound was healed, would that monkey be operated on again for further experiment, as a rule?—Not necessarily; there was no necessity.

17854. But it might be; it had not to be destroyed?—That depended upon what the nature of the experiment was.

17855. In certain experiments was the whole object to see how the healing took place?—No.

17856. How the animal recovered from it?—No, it was allowed to recover that its sensations might be tested.

17857. Tested for what?—Tested for touch. You see, Sherrington had taken away sensation above and taken away sensation below, and left a little oasis of sensation in between in a desert of loss of sensation. You passed through the desert of loss of sensation, and the animal made no response; you came into the little oasis of sensation, and it responded at once; put its hand out, or whatever it was, and then you knew that it must be supplied by the only root he had left uncut.

17858. (*Sir Mackenzie Chalmers.*) That, of course, was a painless proceeding?—Yes.

17859. Merely tactile?—Yes, or no more than the prick of a pin.

17860. (*Chairman.*) As regards further operations, I suppose that for physiological purposes the animal might be fit for other operations on different parts of the body?—Yes, just as a man who has had his Gasserian Ganglion cut out of his face.

17861. But whether that can be done is rather a question of law than for you?—Yes, that is what I meant.

17862. (*Mr. Tomkinson.*) Would it be a perfectly healthy animal after the operation?—It would be as healthy as a man who had had the nerves of his face divided.

17863. Nature would not restore the lost part, would it?—No; arrangements were made that it should not.

17864. Do I correctly understand that there was a certain severing and taking away of the nerves above and below?—Yes.

17865. Those nerves would not come together again?—Arrangements were made that they should not, just as in human neurectomy.

17866. That leads up to a question I wanted to ask. You know, no doubt, that there is sometimes performed what, I think, is a very cruel operation on a horse, unnerving a horse to make a horse which is lame in the feet insensible in the feet altogether, to practically give it dead feet?—Yes.

17867. I understand that a piece of nerve is taken out?—Yes.

17868. And for a time the horse's feet are absolutely insensible; it will go on hard ground that it could not go on before?—Yes.

17869. But in course of time that nerve grows together again?—Yes, because it is not done in such a way as to prevent the nerve coming together again. But it can easily be done in such a way as to prevent the nerve coming together.

17870. (*Chairman.*) Whether or not that is a cruel operation, so far as regards the operation itself on the horse, could it be done under anæsthetics if the veterinary surgeon performing it thought right?—Yes, perfectly well. And not only that, but if it was done so that the nerve did not come together, it would not be cruel in any sense of the word.

17871. It would be a painful operation, I suppose, if the horse was not under anæsthetics?—It is difficult to say how painful. I should not think it would be excessively painful.

17872. And not lasting?—If you did it extremely quickly it would be a momentary violent stab of pain and then the thing would be over; but the only pain that can come in is when the nerve regenerates, not when the nerve is divided. If the nerve remains divided, no pain can come in. It is when the nerve regenerates that the pain comes in.

17873. I introduced that in the course of what you were saying, because I was anxious to bring what you said to bear on the subject of our inquiry, namely, the law relating to operations on animals. Will you now proceed?—I wanted, in this account of the small research in which I was personally concerned, to bring forward how closely all these methods are united together, how they are all woven up together. The next stage was to find out what happened if these parts that Sherrington had been working upon were irritated in man. That, of course, could not be done by an ordinary experiment obviously; but it so happens that there is a disease which is known to everybody, shingles, which produces the most violent irritation of this particular part. That is well known now ever since 1860.

17874. Which particular part?—This posterior root, the ganglion. But by working on the shingles, by working on the material, the dead-house material, microscopically, and using the method for colouring that had been discovered on animals, we were able to show that the irritation of the ganglion was able to produce these zones on the body closely resembling, but differing on the other hand to a certain extent from, those obtained by Sherrington. That last step in the research was given by the working up of dead-house material, of the material on dead human beings, by means of a method which was discovered by experiments on animals. At the end of this stage we at once saw how little we knew about the distribution of the nerves on to the surface of the body. Generations of anatomists had dissected the nerves of the human body, and it was thought that we knew all that was to be known about their distribution. Yet if a workman cut his wrist and came to the hospital with one nerve divided, the actual anatomical facts could not explain what we saw in any single case. Anyone who was honest when a workman came to the hospital, any physician or surgeon who saw him and was honest with himself, had to say, our knowledge gained from dissection tells us nothing with regard to the sensory condition of that man's hand. But there did not seem to be any way of working it out at first, and we were so impressed with the absence of knowledge on these points, that we set to work first of all to observe what actually happened when by accident various nerves were divided. We began to suspect that there were certain laws underlying the whole thing which had never been formulated. But good as hospital patients are (and they are extraordinarily good from the point of view of many observations) it was obvious that no working man could give the time required or the attention for a long and elaborate series of observations. Therefore after everything had been thought out in the most careful manner, and after we had made several hundreds of observations on ordinary hospital patients, I determined to have three nerves divided in my own arm. This was done with the most successful results; the question that we put by our operation was answered immediately with a clearness that we could not obtain by any other means, and for five years we have been working out the results of that experiment.

17875. Do you mean that you ascertained exactly what parts of the hand lost their use or their sensation in consequence of the severing of those nerves?—We knew before from our observations what parts would do that; from previous observations we knew what parts would probably lose their sensation. But Nature, or rather accident, cuts the wrist or the arm, say, with a circular saw, and you cannot tell a circular saw that you only want sensory nerves cut—it

cuts everything it comes across. Therefore the man loses not only sensation but motion. The problem that we wanted settled was, if only the skin is made anæsthetic what is the result? That was the point.

17876. Only the skin?—Not the parts supplied by the nerves which go to muscles. The problem we wanted to solve was this: There go to the hand, nerves which go to the muscles, and nerves which go to the skin. Ordinary accidents divide both. We wanted to know what happens if you divide only the nerves that go to the skin and leave all the nerves which go to the muscles untouched. The day after the operation that question was solved, and we thereby obtained a knowledge of an entirely new form of sensibility; a form of sensibility which had never been described before. A direct answer was given to a direct question.

17877. Could you take your three nerves, for example, and could you say what was the result of the severance upon the sensation in your hand or in what part of your body?—We desensitized the skin over the whole of the part. (*Describing the same.*)

17878. Did you find that it destroyed sensation in the skin in that part only?—Yes, we took only the skin nerves and left all the nerves which go to muscles, that was part of the operation; and the result was that we discovered that under this sensation, which is what we all have when we touch ourselves like this (*describing*), there lay an entirely unappreciated sensory mechanism, which is responsible for an enormous amount of our sensation, but that it runs with muscular nerves, which was an entirely new fact, and a thing which has revolutionised the conception of sensation altogether. Because in old days we would have been told, if you cut all the sensory nerves going to the skin you desensitize the part. It is nothing of the kind. You must cut the sensory fibres in the muscular nerves before you do that.

17879. You did satisfy yourself by an experiment on yourself; but could you have satisfied yourself by experiments on animals?—No. I was going to point that out to you, because we could not test the sensation of animals. But the whole point is, that running alongside came a series of experiments on the way in which nerves united in animals, which were necessary to show how these reunited nerves conducted. That has been going on upon animals, and can only be done on animals. Therefore the points that I want to make so strongly are, that in every inquiry into the structure and functions of the nervous system, observation of disease and experiments on animals are intimately interwoven; the one amplifies the other, and neither can be fruitful alone, because, as I have shown before, the very methods by which we examine disease are discovered from experiments on animals. Experiments on animals cannot tell us about what a human being feels; for that we require disease; but on the other hand in many of the cases where we have to depend upon human beings, we only know what is the matter with them because we have made that lesion in animals. So that the whole thing is all woven together like a fabric, and you cannot pull out one coloured thread without altering the pattern. Lastly I did not know whether it would be of any value simply to put one's self forward to answer any questions; as for practical purposes I am an animal that has been operated upon under Certificate B.

(*Chairman.*) I will leave that to some of the gentlemen who understand the matter more than I do.

17880. (*Sir William Church.*) You have given us a very interesting account of experimentation on animals and on yourself with regard to the nervous system, but I suppose you would say that, *mutatis mutandis*, all that you have said applies in a very large measure to researches into other organs in man?—Yes. I have been particularly interested in the nervous system, and also the nervous system was within so comparatively short a time a *terra incognita*. Our knowledge of the nervous system as exhibited by Watson is like the old maps of Africa, undiscovered country. Now we know its paths, because within a comparatively recent time we have learnt such an enormous amount about them; that is why I chose it particularly. But, *mutatis mutandis*, it is absolutely as you say.

17881. But you would, I suppose, agree that the same methods of observation and experiment are required for researches into our knowledge of other groups of organs in man?—Absolutely. I think it is only a small example, taken from the nervous system, of great general methods.

Mr. H. Head, M.A., M.D., F.R.S., F.R.C.P.

27 Nov. 1907.

17882. You personally, of course, do not maintain that experimentation upon animals should take the place of observation upon man in what we call clinical observation?—Most certainly not; the one can only be fruitful with the other.

17883. The two should be worked together?—Yes. It is absolutely necessary that the two should be worked together. The great progress in our knowledge of the paths of the nervous system came from Waller's discovery, which was made on animals.

17884. So that the great value of experimentation on animals is that by that means you can put a definite question as it were to Nature, and get a definite answer?—That is it exactly.

17885. Therefore, as your research into any group of organs goes on, so it is necessary for you to put definite questions and obtain, if possible, absolutely certain answers?—Yes.

17886. So that in your view the great value of experimentation on animals is in addition to our knowledge either for scientific purposes or for curative purposes?—Yes. I should like also, just as a corollary to that, to point out the uselessness of experimenting for a practical end. Men have been experimenting for practical ends and observing for practical ends with regard to pain and disease with comparatively little progress.

17887. Because they have not sought for knowledge but for practical results.—Yes. It was only when we determined to see whether we could not apply the theoretical results obtained by Dr. Gaskell to the structure and the functions of the nervous system that we discovered these other laws, which are of daily practical importance.

17888. Consequently those who object to experimentation on animals upon the ground that immediate practical results are not obtained simply do so because they do not understand the way in which practical results can be obtained?—Yes; certainly. Practical results are the bye-products of a manufacture of which knowledge is the aim.

17889. (*Sir William Collins.*) May I ask you one or two questions with regard to the very interesting experiment that you carried out upon yourself? It would not have required a licence under the Vivisection Act, of course?—I am not a domestic animal.

17890. It would not, therefore, have required a licence under the Vivisection Act?—No.

17891. I understood you to say that that experiment which you made entirely revolutionised our conception of sensation?—If the results that we have recorded are right, it has done so because it has discovered for us something that we did not conceive before. It has discovered for us the fact that nerves which run with the muscular nerves which were supposed to have certain comparatively inferior functions, have very much higher functions and are of very much more importance in the field of sensation that was ever supposed.

17892. You say, if the results that you derive from your experiments are correct. Have you any doubt as to the results?—I have not, but other people may have. That I leave to time; only time can tell that.

17893. The difficulty that you apprehend is in convincing others?—No, I think it is like all new things. They have to undergo the test of time.

17894. (*Sir Mackenzie Chalmers.*) One experiment is not conclusive?—It is one in a series of advances.

17895. (*Sir William Collins.*) I am anxious to know why you qualified that previous answer by saying if the results you obtained were to be regarded as correct?—I think that is the attitude of every one who is a scientific worker. Personally I do not doubt it.

17896. You have no doubt that this experiment has revolutionised our conception of sensation?—Certainly it has revolutionised my conception.

17897. And that you discovered a form of sensation which was never described before, I think you said?—Not in full.

17898. Would you tell me what are the three nerves that you divided?—They are the radial, and the two branches are what is called the external cutaneous, one of which runs down the front of the forearm, and the other down the back of the forearm.

Mr. H. Head M.A., M.D., F.R.S., F.R.C.P.

27 Nov. 1907.

17899. Was it not surmised previously to your experiment that the radial nerve was concerned in cutaneous sensation of the extensor surface of the forearm and hand?—It was supposed to be proved that it was not. If you look up Bowlby's book, you will find that he showed that when it is divided, there is no change of sensation.

17900. Do you mean that I shall not find in any physiological or anatomical work prior to your work any such suggestion?—I do not for a moment mean that. That was not the experiment.

17901. That is my question?—No. The anatomist has always said that the radial played a considerable part, but when the radial was divided in man we could not find out that anything of the kind happened. That was one of the most characteristic instances where anatomy and fact did not go together. The anatomist always described (as you know from your books) a large area supplied by the radial. He put it down with very marked local borders like the borders between Switzerland and France and other countries. But when the radial was divided, nothing apparently happened.

17902. You stated that anatomical knowledge told us absolutely nothing as to sensation of the hand?—Quite so.

17903. Do you think that anatomical knowledge has not told us anything as to the radial nerve being associated with sensation of the extensor surface of the forearm and hand?—But it did not explain why, when you divided the radial nerve, you could not get the result that anatomists said that you should get. That was the trouble.

17904. Will you tell us what was the result of dividing the radial nerve in your own case?—I did not divide the radial nerve only; I divided it together with two other branches.

17905. Will you tell me what the result of the division of the radial nerve in your own case was?—I did not divide the radial nerve only. I divided it together with two others, so as to make quite certain that I got a loss of sensation which I found that I could not get by dividing the radial nerve only.

17906. Have we any knowledge of the part played by the ulnar nerve in respect of sensation motor power?—The motor power was accurately known; the sensation was very imperfectly known.

17907. Was nothing known of sensation of the hand in reference to the ulnar nerve prior to your experiment?—I am afraid I do not quite understand you. My experiment had nothing to do with the division of the ulnar nerve.

17908. But I understood you to say that anatomical knowledge had told us absolutely nothing as to sensation of the hand, and you said that the distribution of the ulnar nerve suggested nothing as to sensation of the part of the hand that it supplies?—That has nothing to do with my experiment. That has to do with my observations on man.

17909. It has to do with your statement that anatomical knowledge has taught us nothing as to the sensation of the hand?—That is perfectly true, but that has nothing to do with my experiment; it has to do with the observations made by Sherrington on animals and myself upon human beings, where the ulnar nerve had been divided. It was found in those cases that if you gave the anatomist a patient in whom the ulnar nerve had been divided, he could not tell you whether it had been divided and partly re-united, or whether it had not been divided, except by looking at the motor supply. If by any chance the motor supply was uninjured, he could not tell you in what condition that nerve was; he could not tell you whether to cut down and suture that nerve, nor could he tell you if you did cut down upon it what you would find.

17910. Had it been observed by surgeons that when the ulnar nerve has been divided at the elbow joint, there has been loss of sensation in the little finger and in the adjacent portion of the next finger?—But that is not sufficient to tell you whether it has been divided.

17911. Did we know absolutely nothing of sensation in the hand from such observations as that?—Nothing that would be of practical importance to you; so much so that it was the habit to neglect sensation and to depend entirely on the motor condition.

17912. Will you be surprised to hear that a surgeon seeing a case of division of the ulnar nerve at the elbow joint, and finding loss of sensation in the little finger and the adjacent portion of the next finger, had cut down upon that ulnar nerve and re-sutured it and found sensation restored?—Not in the least, because he cut down without knowing, except on the motor side, what he was going to find. Time after time I have known the ulnar nerve cut down upon in ignorance that it had reunited and reunited. Recently a patient of my own, in whom the ulnar nerve was united, was operated upon and the nerve exposed, simply because it was not known whether that nerve was united or not. We knew that it was united, and it proved to be so. Anybody who has had experience in this side of practice knows how difficult it was to come to a correct conclusion.

17913. What is the form of sensation which you are able to describe now, which was unknown before your experiment?—You are passing on to my experiment now. What is called deep sensibility.

17914. Would you tell us a little more about it, please?—It was found that after the operation a touch with the finger could be appreciated and localised although the whole of the skin had been rendered insensitive.

17915. (*Mr. Tomkinson.*) By considerable pressure?—No, only a touch. Secondly, it was found that by means of pressure pain could be produced with the same amount of pressure as on a normal hand.

17916. (*Sir William Collins.*) You mean that the sensory fibres apparently travel along with the motor fibres?—They do. Are you surprised to hear that? The surprise in your question is the measure of the new idea.

17917. I express neither surprise nor the reverse. I am asking you a few questions on the result of your own experiment?—The surprise of that question shows the new idea.

17918. I am afraid that you must not argue surprise from the question. Does that experiment then necessitate a revision of our opinions as to the distinction usually drawn between motor and sensory nerves?—No, between muscular and cutaneous nerves, which is a different matter.

17919. Do you distinguish between touch and pain and sensation of temperature?—I do not quite understand the question.

17920. When one speaks of sensation, is it necessary to discriminate between sensation of pain, sensation of touch, and sensation of temperature?—Do you mean from the point of view of the skin or the deep structures, or from the point of view generally?

17921. Either?—Do you mean from the point of view of the spinal cord or the brain or the peripheral nerves, the nervous system you are concerned with? That is the point.

17922. Do you, or do you not, consider it necessary to make a distinction in speaking of sensation generally between sensation to touch, sensation to pain, and sensibility to temperature?—Yes, discriminating also heat and cold.

17923. Would you tell me whether those forms of sensibility travel along with the motor nerves or with the cutaneous nerves?—One form of touch travels along the cutaneous nerves, and one travels along the deep fibres; one form of pain travels along the cutaneous nerves, and one travels along the deep fibres. Heat and cold travel solely along the superficial, along the skin fibres. Localisation of a spot touched travels along the deep fibres. Localisation of a spot touched travels along the superficial fibres; but the localisation of a spot touched travelling along the deep fibres does not carry the power of distinguishing two points; sensory impulses travelling from the skin carry the power of discriminating the two points. You see why I had a difficulty in answering the question.

17924. I am very much obliged to you. May I take it that those views are generally accepted by physiologists now?—No; they are new.

17925. Since when?—Since the work has been going on. I suppose the first publication of it was in 1905.

17926. With regard to your experiments in association with Professor Sherrington?—I was not associated with him. Sherrington was working independently entirely.

17927. I thought that you urged the importance of associating the results that you obtained with those that Professor Sherrington obtained?—That is quite right. We met, but we were marching entirely inde-

pendently. Sherrington published his results in the usual way, and it was my knowledge of his publications that helped me so profoundly in my research.

17928. As the result of those experiments and observations of yours and Professor Sherrington's, whether in association or not, do I correctly understand that you are able to localise the position of stone in the kidney, in the ureter, or the bladder according as the pain is distributed in the thigh or the buttock?—Not by pain only. There is no touchstone in medicine. That is only one of a set of facts which have to be taken into account in making a diagnosis. No diagnosis is made on one method of examination or one set of facts. A diagnosis is made and acted upon only by co-ordinating a large series of facts brought together by different means, and this is only one of them.

17929. Then do I rightly understand that localisation of pain will not localise a stone by itself?—Certainly it will not. A better instance in some ways is the pain down the inner side of the arm, produced by heart disease, which is a thing that was not understood at all.

17930. You spoke of the degeneration of nerve. Have you worked at the regeneration of nerve?—Yes.

17931. Am I right in thinking that there are two schools as regards the regeneration of nerves: those who argue for the peripheral regeneration, and those who argue for the central regeneration?—Yes.

17932. May I ask whether you can tell us your own view on that subject?—No, it would be impossible, because we are beginning to see that the problem is not so simple as that. It would be quite impossible here to explain the position that I hope to adopt in the matter.

17933. We have been told that there are peripheralists and centralists, and one witness, at any rate, classed himself with the one or the other. You are not able to do that?—That is too dogmatic. The problem is a more complex one than that.

17934. Have experiments been made with a view to elucidate that problem?—Yes; those are the very ones that I have been making.

17935. Have both peripheralists and centralists claimed, as the result of experiments on animals, the accuracy of their view?—Yes, certainly, because it is like all those things; we have to work on both sides of the question before we ultimately reach the truth.

17936. You alluded to Sir Charles Bell's work?—Yes.

17937. It has been claimed, I think, that Sir Charles Bell's work was the greatest that had been done in physiology since Harvey. I do not know whether you estimate it as high as that?—I think the knowledge that the posterior root is sensory, and the anterior root motor has had an enormous effect upon our knowledge of the nervous system; that is the way in which I can put it.

17938. Was the knowledge of the nervous system obtained by Galen valuable?—I am afraid I do not know; because I am afraid that I know very little about it.

17939. We have been told by one previous witness, I think, that much of the knowledge of Galen was valuable to-day, and others, I think, have rather disputed that view. I was wondering whether as a neurologist you could give us your view?—The only way in which I should put it is that in 1845 it had no fruitful effect upon knowledge as judged by the ordinary standards of the time.

17940. The experiments of Hierophilus on human beings have also been alluded to; do you consider that they yielded any knowledge?—I do not know anything about them. The point is that 60 years ago our knowledge of the paths in the nervous system was exactly in the condition of a map of Africa, and now we know a number of paths, a number of tracts, and a number of territories. That is the point.

17941. We have had our attention called to the opinion of Sir Charles Bell as to the comparative uselessness of experiments on animals for the purpose of ascertaining the structure and functions of the nervous system. He said in one of his works "Experiments have never been the means of discovery, and a survey of what has been attempted of late years in physiology will prove that the opening of living animals has done more to perpetuate error than to confirm the just views taken from the study of anatomy and natural motion." I gather from what you have told us to-day that you do not agree with that view?—It is not a question really of whether I agree or not; it is a question of pure fact. Sir Charles Bell's statement there is not worth any more than the statement of any other person on that matter. The point is how much more do we know now in consequence of direct experiment. Bell did not know what we know. You cannot foretell. He only made that statement because it was his impression of his own time—that is a long while ago. We know a great deal more since then, and not only do we know a great deal more, but we also know how much more work we have got, so to speak, on our hands.

17942. That was in 1836?—Yes.

17943. At that time had Sir Charles Bell himself advanced our knowledge of the nervous system?—He stated the hypothesis that the two roots had different functions.

17944. Was it only a hypothesis in Bell's time?—That, of course, is a very disputed point as to how far his statement could be taken as a definite proof; it was definitely accepted 10 years later, in 1845. But perhaps I may just read you one passage which you will be interested to hear: "It is commonly believed," says Watson, "that disease affecting the *anterior* columns only of the cord, will be likely to disturb, or to suspend, the *power of voluntary* motion in the corresponding parts" (that is the direct outcome of Sir Charles Bell's statement) "to produce *spasm* or *palsy*, and that disease affecting the *posterior* columns alone will be likely to alter or abolish the *faculty of sensation* in the corresponding parts; to cause *pain, tingling, numbness*, or *complete anæsthesia*. But I have mentioned certain facts which contravene this opinion. Suspend your judgment respecting it. Neither the minute anatomy nor the physiology belonging to the question are yet conclusively settled. There seems no reason to doubt that disease affecting the *lateral* half only of the cord will be likely to derange both the sensibility and the power of movement, in the corresponding parts on the *same side of the body alone*." So you see the state of knowledge in 1845.

17945. Did Brown-Séquard make further observations on the functions of the roots of the spinal nerves?—Mainly on the functions of the spinal cord; most of his observations were on the functions of the spinal cord; there were some on the posterior roots.

17946. Did Brown-Séquard contest the conclusions that Sir Charles Bell had arrived at?—I am afraid I cannot tell you without looking it up. But Brown Sequard was led by experiments on animals to give an immediate answer to that last statement that Sir Thomas Watson put forward wrongly.

17947. You alluded to the localisation of the cerebral functions as as example of the advance that has been made in our knowledge of the nervous system. Is the association of the left lower frontal convolution with the function of speech, one of the cases of localisation of the cerebral function?—You mean the association of Broca's convolution with speech?

17948. Yes?—Yes, but that does not stand on the same level as others.

17949. Do you mean that it stands on a lower level or a higher level?—It has not been proved in the same way as others; that is just one point at present in dispute.

17950. Do you know a recent paper by M. Marie?—Yes.

17951. He, I think, asserts that the third left frontal convolution does not play any special rôle in the function of language?—Yes, it is just that very point that is in dispute. It is one of the points that we cannot settle by experiment, and it is one in which we have to wait for observations, and we have waited all these years.

17952. Was it one of the earliest localisations?—Yes, one of the earliest and still one of the most disputable.

17953. I think you laid it down that no man has a right to be the subject of experiment unless the whole circumstances are well understood?—Certainly.

17954. That was in regard to himself, and I suppose *a fortiori* in regard to others if they voluntarily agree to be operated upon?—Certainly. An accident may happen which may put things wrong; that is where the risk comes in, but you should take every possible precaution to avoid that accident.

Mr. H. Head, M.A., M.D., F.R.S., F.R.C.P.

27 Nov. 1907.

17955. And, as you said, experiments on animals cannot tell us, of course, what human beings feel. That, I take it, is why you call our special attention to your own experiment, as in your opinion solving a problem which no experiments on animals could have sufficed to solve?—No, what I worked upon were the experiments on animals which worked into the whole network of the research. Self experimentation, microscopial anatomy, and experiments on animals all worked in together.

17956. But previous to your experiment, no experiments on animals, I understand, had suggested that sensory fibres travelled with muscular fibres?—Most certainly they had. It was because Sherrington found by experiments on animals that such a large number of the nerve fibres which run with the muscular nerves did not degenerate like motor nerves at all, but degenerated in the opposite direction, that made us determined to test the thing on man.

17957. But I thought you claimed that this revolution in regard to our knowledge of sensation had been the result of your own experiment?—As regards sensation, that is perfectly true. All we knew was that these muscular nerves contained a very large number of fibres which were evidently not motor. Therefore in my experiment I determined to put that to the test from the point of view of sensation. Sherrington could not, of course, test sensation, but he told us that there were a large number of afferent fibres, whatever those afferent fibres did.

17958. But without your experiment on yourself, by experiment on animals alone, could this revolution in our conception of sensation have been attained?—Not of sensation, but the very fact that Sherrington had told us that there were these afferent fibres made it perfectly certain that there must be a sensory function attached to them. What that sensory function was, was a thing that only a human being could tell us, was what we set ourselves to show; but the idea would not have come to us had we not had this elaborate work of Sherrington's, which told us that a large proportion of the fibres in the muscular nerves were not motor.

17959. Was that arrived at by the method of Marchi, which you have already described?—Yes. Waller's law of degeneration and Marchi's method.

17960. (*Sir Mackenzie Chalmers.*) As regards this operation on yourself, did you have it done under local anæsthesia or general anæsthesia?—General anæsthesia.

17961. After the division of these nerves, did you suffer pain above the division; was there great pain above the division?—Do you mean in the other parts of the arm?

17962. Yes—you divided the nerve?—Yes.

17963. Above the division, of course, the nerve would be connected with the central nervous system?—Yes.

17964. Was there much pain there during the healing?—Absolutely none.

17965. Therefore, presumably, in these experiments on animals the animal suffers no pain?—There is nothing to show that it suffers at all, and I did not. I went about my work as usual, with my arm in a sling.

17966. And it healed in the ordinary way?—It healed by first intention.

17967. How long did it take before the nerves again rejoined and re-established sensation?—Fortunately, one of the stitches was cut out, so that I still have a patch of anæsthesia left.

17968. Insensitive?—No, in the peculiar form of sensibility which we are particularly interested in studying, so that I hope it will last. But all the others are healed.

17969. (*Mr. Ram.*) As I understand, the experimental investigation that you were carrying on at the same time as Professor Sherrington was making experiments on animals, was a case in which a correct theory originated by clinical observation, and was confirmed and proved by experiments on animals. Is that the correct way of stating it?—Hardly. It was the general trend of knowledge at the time, experimental and otherwise, led to the correct theory; it was the whole thing put together.

17970. But you were pursuing it by clinical observation?—Yes.

17971. And the theory that you were led to adopt by your clinical observation was proved and, perhaps, corrected by the experiments made by Professor Sherrington?—It was enormously helped, because it was only by his experiments, which were going on at very much the same time, that we knew that there was anything of this kind—namely, that the central nervous system was distributed in this sort of way. That is the way I put it. Let me be quite clear. Dr. James Mackenzie put forward exactly the same view, backed up by admirable observations on similar cases, but he did not carry it as far, because he was not so familiar with the work on the posterior roots.

17972. That is why I put my question as I did. With regard to the experiment on yourself, do I sum it up rightly by saying that it showed the co-existence of nerves affecting the skin with another series of muscular nerves which conveyed the sensation independently of the skin nerves?—Yes, that is quite right.

17973. Does the knowledge that you so arrived at, in your opinion, directly tend to the amelioration of future suffering by more skilful and expert treatment that that knowledge will enable?—Certainly, it has opened up and enabled us to understand things which we did not understand before.

17974. And it tends, therefore, to correct errors either in diagnosis or treatment, which may have existed in the absence of that knowledge?—Yes.

17975. (*Dr. Gaskell.*) I only wanted to make this matter quite clear if I could. Before your experiments had various surgeons sewn together nerves going to the skin which had been accidentally cut?—Yes.

17976. In some cases had they found that sensation was well localised immediately after the operation, when it was tested?—Yes, that is true.

17977. And in consequence of finding out that recovery of sensation, was the conclusion come to that those nerves had healed remarkably quickly?—Yes.

17978. And that therefore the whole process of re-regeneration as ordinarily taught was wrong, and that the two nerves could heal together by direct contact very quickly?—Yes.

17979. That was shown by your experimentation to be absolutely erroneous, because the outcome of it was that the localisation of the deep nerves was very much more accurate than ever had been before suspected?—Yes.

17980. The only other thing that I should like to know is whether in that regeneration of your nerves going to the skin there was a very great difference in time between the regeneration of those fibres which gave you tactile sensation and those fibres which gave you painful sensation?—Yes, there was a difference of nearly nine months before the tactile sensation began to recover so far as the shaved skin is concerned—so far as the naked skin is concerned.

17981. And you gather from that that those fibres which absorb the sensation of touch are not the same as those which absorb the sensation of pain in the skin?—Yes.

17982. And that the nerves which conduct the painful impressions from the skin regenerate more quickly than those which conduct the tactile sensation?—Yes.

17983. Can you tell me at all where you would say the perception of pain is located in the central nervous system?—It is very difficult to say.

17984. You would not say, for instance, that the perception of pain could be located in the spinal cord?—Certainly not.

17985. Therefore, an animal deprived of the upper part of its brain could feel pain?—No, certainly not. I do not think there is anything to show that.

17986. Do you consider that an animal deprived only of the cerebral hemispheres could feel pain?—I should not like to say. I have not enough experience of that at present.

17987. (*Mr. Tomkinson.*) The result of this experiment on yourself, I understand, was a valuable discovery of something that was not known before?—It was an addition to knowledge.

17988. And that was because you, as a human being with the power of speech, could tell the result?—Yes.

17989. And if that experiment had been made upon an animal the same result could not have been arrived at?—You would not have made it on an animal for

that reason—not on the sensory side of the nervous system.

17990. Then how does that bear upon the utility of the practice of vivisection on animals?—It was given as an instance of how the whole of these various methods are all woven together, and the one depends upon the other. That is the point—that they are all woven together; that the one is useless without the other. They are like the re-agents on a chemist's desk. You give him so many re-agents, and then you take away one of them from him; you say to him: You must do all your analyses, but you must not use one particular re-agent, say hydrochloric acid. There are a number of experiments which he could do without that particular re-agent, but in order that he may do his analyses properly he must have his whole set of re-agents in front of him to use. In the same way, these are all methods which are used; and it so happened that in this small research which I have instanced all the methods were used each in its own particular place.

17991. Still, in this particular instance the experiments might have been made on animals for a long time without the discovery which the experiment made upon yourself did bring to light?—That is why I submitted myself to the experiment, otherwise I should certainly not have done it. It would have been an illegitimate thing to do. *Mr. H. Head, M.A., M.D., F.R.S., F.R.C.P.* 27 Nov. 1907.

17992 (*Chairman.*) Had the experiments on animals been useless, do you mean?—No.

17993. Do you mean that you experimented upon yourself because you had not arrived at a final conclusion from experiments on animals?—No, because it would not be the kind of question to which you would expect an answer in that way. You would not expect an answer to a direct question concerning those finer forms of sensation.

17994. Your answer to Mr. Tomkinson's last question seemed rather to suggest that experiments on animals had been thrown away. I did not understand that to be your intention?—No, not at all.

17995. You had explained that before?—Yes.

Mr. A. D. Waller, M.D., LL.D., F.R.S., called in, and Examined.

17996 (*Chairman.*) You are a Lecturer at the University of London, I believe, and a Doctor of Medicine, a Doctor of Law, and a Fellow of the Royal Society?—Yes. *Mr. A. D. Waller, M.D., LL.D., F.R.S.*

17997. And you have been there a good many years, I think?—I have been five years at the University, but I have been a lecturer at a medical school for 20 years.

17998. You do not propose, I understand, to go into general questions about the value of experiments on animals or the morality of them—we have had a good deal of evidence on those points already, as you know—but principally you desire to vindicate, if I may say so, the University of London from some of the suggestions in Miss Lind-af-Hageby's book, "The Shambles of Science"?—Certainly, and I wish to restrict myself to facts within my own knowledge.

17999. You were present, either as lecturer or otherwise, at a good many of the operations therein described?—Yes, I have drawn up a list of the operations which I could identify.

18000. The first was a lecture on December 3rd, 1902. Dr. Pembrey was lecturing then?—Yes, I was present then.

18001. Then there were lectures on February 3rd, 1903; February 19th, 1903; February 26th, 1903; and another on the same date?—That is a point of doubt in my mind. I have identified the dates from my notes as the occasions on which I was present, but this date February 26th is twice quoted in "The Shambles of Science," and one of those dates must be wrong therefore.

18002. Do you mean to say that there were not two on that date?—There were not two on that date.

18003. However, as regards the one that Miss Hageby describes as "A dog injected with a substance derived from a lunatic," and the other as "A troublesome dog." Those two, whatever the date was, you were present at?—I was present at the lecture, and I can identify the "dog injected with a substance derived from a lunatic." As regards "a troublesome dog" on going through the description, I could only say that I saw nothing of the sort.

18004. Do you mean by that, that you were not present, or that you may have been present, but you did not see what she says took place?—I mean to say that I think it is a mistake. I think probably this is relating to some other place. I do not think that this lecture, so far as I can identify it, took place at the University. I cannot identify it.

18005. You say that it certainly did not take place at the date that Miss Hageby puts it at?—It cannot have done so, because I have the laboratory books here, and another lecture took place on that date, namely, "A dog injected with a substance derived from a lunatic." That lecture did take place on February 26th. In "The Shambles of Science" an experiment headed "A troublesome dog" is described as taking place at that date, but it cannot have done so.

18006. Your evidence about that is that you are confident that it did not take place on that date at the London University?—Quite.

18007. And you have not been able to find any trace which would enable you to identify it?—I cannot identify that lecture.

18008. It may have taken place somewhere else?—Yes, it is probably a mistake on the part of Miss Lind-af-Hageby.

18009. Then the next lecture is on March 12th. "The only completely satisfactory method." That is one of the lectures you were present at?—Yes, I was present at that.

18010. I would like to ask you generally about Miss Hageby's book; you read it at the time, I believe?—Yes.

18011. And you made annotations on your copy?—I annotated it.

18012. Which you are willing to leave with us?—Certainly.

18013. Generally, do you consider that the book gives a fair and accurate representation of what took place?—Oh, no; it is a highly coloured representation; a representation coloured by the sentiments of this lady—in perfect good faith, no doubt. I do not say that they are in bad faith at all, but they are obviously seen through her own coloured spectacles, and the amount of discoloration that those spectacles have produced is really very remarkable.

18014. As regards those lectures that you were present at, would you just tell us as regards December 3rd, 1902 (and I will take you through the others very shortly), what the points are that you picked out as being, in your opinion, mistaken?—I will quickly run through my notes. She states on page 11, "He inserts one point of a pair of forceps under the skin behind the skull for a moment."

18015. Are you quoting from the original edition?—Yes. I have not got the later editions. That means that he cut the head off. Then she says lower down, "The animal begins to struggle, quickly moves its limbs to its back, and tries with hands and feet to thrust away the instrument." My note is, "The ordinary reflex movements that do not imply any sensation."

18016. You were present at that lecture?—Yes, and I made these notes.

18017. Have you a remembrance of the lecture, and what took place?—I have none now, I had at that time. On page 12 she says: "The wound is cauterised." My note is, "Presumably the cord is destroyed." That means pithing.

18018. Would that involve a cautery?—No.

18019. You mean that there was no cauterising?—Yes. Then on page 13 is the episode of the frozen rabbit left in an ice-box, and so forth, and the description of its start with horror on the next page. I have made some comments on that, but it is an impossible thing.

18020. (*Sir Mackenzie Chalmers.*) Would you tell us

Mr. A. D. Waller, M.D., LL.D., F.R.S.

27 Nov. 1907.

what really happened?—What happened was that the rabbit was put in an ice-chest, a refrigerator, to lower its temperature, but the refrigerator was not cool enough as a matter of fact, and the animal's temperature was not lowered

18021. Was it anæsthetised or unanæsthetised?—It was not anæsthetised. It was simply put into the refrigerator to show that its temperature did not go down as that of a cold-blooded animal would.

18022. Nothing whatever happened?—No. I have this memorandum "Minimum temperature=8°." It was not low enough to act.

19023. 8° Centigrade?—Yes.

18024. What would that be Fahrenheit?—I make out 46°.

18025 (*Chairman.*) But what do you mean by its temperature? Do you mean its internal temperature?—That was the intention, no doubt. The temperature of a cold-blooded animal in a cooling box would go down; the temperature of a warm-blooded animal would not go down, or at any rate not so quickly. But there was no vivisection at all.

18026. I understand that a rabbit's natural temperature is a little higher, if anything, than man's?—About 37° or 38°.

18027. About the same. I do not understand your bringing it down to 45.—That is the temperature of the box, not of the animal.

18028. I was asking what you brought the rabbit down to.—I cannot tell you. I have no idea.

18029. (*Mr. Ram.*) But there was no vivisection?—There was no vivisection; there was no freezing of the animal. That is pure imagination.

18030. (*Sir William Church.*) When she states, "It was found to be beyond the stage for observation," that leads the reader to think that the animal was dead. I understand from you that the animal was not dead?—The description is, "The animal was taken out of the freezing machine quite unconscious, but frozen stiff, like a piece of wood. With all signs of terror the animal springs back trying to get away, but half paralysed by the cold and half fascinated." My comment upon that is simply that all this is "impossible."

18031. (*Sir Mackenzie Chalmers.*) Was the animal never exposed to a lower temperature than 45°?—No; the cooling box did not act properly, as a matter of fact. I remember that much; but the details about the animal I do not remember. I generally remember this description of an animal frozen stiff, and, with all signs of terror, springing back, and think to myself that was an imperfect description.

18032. (*Chairman.*) There must be some imperfection when they say at the same time, "frozen stiff like a piece of wood" and "the animal springs back"?—I have simply got a joking comment of this as being an obvious impossibility. Then my general comment upon this lecture at the time was, "No vivisection was performed at this lecture (at which I was present)."

18033. Do you mean that none was performed at that lecture or that none was performed whilst you were present?—I was present at the whole lecture, and no vivisection was performed while I was present. My comment continues, "One or two frogs were killed, and their hearts used for experiment. The lecture was on animal heat, and some animals hot and cold-blooded were cooled in an ice-chest and their temperatures compared. That experiment was on December 3rd, and that is misdated again in "The Shambles of Science" as December 2nd, but that is simply a mistake of Miss Lind-af-Hageby's. It should have been the 3rd, according to my laboratory book, which I have here.

18034. Then the next is February 3rd, 1903—"An experimental production of blood clotting by injection of a nucleo-proteid"?—I remember that particularly well, because I was there, and I gave the anæsthetic myself, and there is a description on page 30 of the anæsthetist looking "most careful, as if he were attending the precious life of some human patient," and so forth. It simply means this: It was one of the very first lectures delivered in the laboratory, and I laid great stress upon anæsthesia, and gave the anæsthetic myself, in order to, so to speak, show how it was to be done when done by other people in the laboratory. I have got a long comment here, but I do not think it is germane to anything that you wish to know.

18035. You have made a special subject of anæsthetics, have you not?—Yes; I have worked at it a great deal in the last fifteen years.

18036. You have nothing special with regard to that experiment that you wish to say?—There is a statement, "Have these preliminary operations been done under an anæsthetic?" on page 29, the inference being, of course, that they have not. My comment here is, "Yes, I took charge of the anæsthesia."

18037. What was the animal there, a grey rabbit?—I forget the colour of the rabbit, but it was a rabbit, no doubt.

18038. I might ask you now, as regards all these experiments that you were present at, was there any case in which the animal was operated upon either without anæsthetics or without sufficient anæsthetics?—Certainly not.

18039. Are you satisfied that in every case there was complete anæsthesia during the operation?—Certainly, and I state this in my summary. I state that no experiment has been performed in this laboratory in which an animal has not been completely insensitive to pain.

18040. If there were movements in the animal—if that is accurate—it would follow that it was not from sensation of pain?—Certainly not, in my opinion. They were reflex movements; the ordinary convulsive movements that happen.

18041. Is there anything else you wish to say with regard to the experiment on the 3rd of February?—They ask the question again on page 32, "Now, was the rabbit anæsthetised or not?" My comment is "Certainly." I was there. Then they say, "The animal began to struggle violently." My comment is, "The usual anæmic spasms."

18042. (*Mr. Tomkinson.*) Is that a dog?—No; the same animal—a rabbit. Then they go on, "And would not the tetanic spasms that followed counteract the effect of a possible anæsthesia." My comment in pencil is, "Certainly not." That is all I have to say about that.

18043. (*Chairman.*) Then we come to February 19th. "An experiment that is not supposed to be useful." Have you any observations to make upon it?—Yes; I was present at that lecture. On page 59 they say, "The lungs are exposed, and artificial respiration kept up by means of a pump attached to the operation table, and worked by electricity." My addition to that is "pumping air plus chloroform vapour"—that is to say, the artificial respiration apparatus was attached to an apparatus for producing anæsthesia.

18044. Was that the usual method?—That was the usual method.

18045. And it was satisfactorily performed on this occasion?—Yes, it cannot be otherwise with that automatic apparatus, I think. Then, on page 60, "We can be almost certain that the dog has been also curarised, because it is absolutely still, with the stillness that is characteristic of the 'Hellish Woorali.'" My comment as to that is, "It was not."

18046. It was not curarised?—No; it was not curarised. Then I have a further amplification to this effect: "The animal was absolutely motionless under artificial respiration through a chloroform flask giving between 2 and 3 per cent. of chloroform vapour to the insufflated air. I was present." I had been measuring the percentages at about that period.

18047. Would that be sufficient to account for its being completely still?—Absolutely; and it would run the risk of being overdosed with that percentage.

18048. Then there is the lecture on the 26th February: "A dog injected with a substance derived from a lunatic." Dr. Brodie is again the lecturer, as on the 19th?—Yes; that lecture did take place on February 26th, according to the notes in my laboratory book—"Lecture on the Circulation, by Dr. Brodie," and I find Miss Lind-af-Hageby and Miss Schartau's names as being present there, so that I identify that as the experiment of the 26th February; therefore I do not identify the other one.

18049. You say that it was a lecture on the circulation?—A lecture on the circulation, on the effect of choline, which was the particular thing—one of the alkaloids, one of the ptomaines.

18050. She described it as "A dog injected with a

substance derived from a lunatic"?—Yes; that is all right. It is a description, after a fashion, of choline; it is a substance derived from a lunatic. It was in that case.

18051. I think we have had that explained?—Yes. It is stated on page 76: "The demonstration begins. The lecturer tells us that the animal is anæsthetised with morphia and some chloroform." My statement is, "The animal was fully anæsthetised." I have no other remarks at all on that lecture.

18052. I will not ask you to repeat the general observations that you made about the choline that was given.—That applies to the whole.

18053. (*Sir William Church.*) Miss Hageby, when she was giving evidence on this case here, took exception to the way in which the dog was killed. She states in "The Shambles of Science" that the dog was killed "By blowing a little air into the jugular vein," and the first time that was done she said that the levers continued in motion, "Showing that the flame of life is not blown out." "The lecturer declares that the dog will now be killed. How exceptionally kind and considerate! It is to be killed by blowing a little air into the jugular vein." She says that it was not killed when the air was first blown into the vein, and she rather led one to think that in the intervals between the first blowing into the jugular vein and the second the animal was not under the influence of chloroform?—This is in 1903. I have no comment on that, and I cannot remember every detail of what happened to this animal in 1903; but it does not sound to me probable at all. I have this comment written down, that "The animal was fully anæsthetised"; therefore I do not think it probable. This was written down as soon as I got the book.

18054. Might I read the passage to you, because she made a great point of it in her evidence: "It is to be killed by blowing a little air into the jugular vein. The assisting demonstrator attaches a glass tube to the cannula in the jugular vein and blows some air down the tube, but the levers are still in motion, showing that the flame of life is not blown out. He repeats it and then sits down among the audience. The dog has been killed strictly scientifically." She rather implied I think, in her evidence, that there was a considerable interval between those two blowings into the jugular vein by the assistant demonstrator. Can you tell us at all whether that was the case?—I have no recollection of any such interval.

18055. (*Sir Mackenzie Chalmers.*) During which the dog was suffering?—I have no recollection of any interval, and I am absolutely certain that the dog was not suffering.

18056. The dog was fully under anæsthesia the whole time?—The dog was fully under anæsthesia the whole time.

18057. (*Sir William Church.*) That is what I wish to get out?—Yes, certainly.

18058. (*Chairman.*) Have you finished then with February 26th?—Yes, but I am puzzled by this other thing called "A troublesome dog."

18059. I understand you to say that you cannot trace it?—When I got this copy I realised that I had been present on February 26th, and then I set work to try and remember a troublesome dog, and all my comments are that I never saw anything of the kind; and now my comment is that I do not believe that that lecture ever took place at the University of London.

18060. So I understand. What you tell us with regard to that is that you do not believe there ever was such a lecture delivered at the University of London. Will you tell us about the 26th of February?—That is the one we have just finished.

18061. But Miss Hageby also puts this down as the 26th of February. In your laboratory book is there any mention of such a lecture?—No, there would not be. It would only be in my memory, and I do not remember the experiment.

18062. Dr. Brodie is down there as lecturer on the 26th February?—Yes.

18063. Is he down a second time?—No, only once.

18064. And you have given an account of that one?—Yes.

18065. Then there is a mistake obviously somewhere—I mean on Miss Hageby's part; but whether it is a mistake altogether for some other place, you do not know?—I do not mean that there is an invention at all. It is simply a mistake.

Mr A. D. Waller, M.D., LL.D., F.R.S.

27 Nov. 1907.

18066. Now, as to March 12th, what do you say? That was a lecture by Dr. Brodie, I think?—Yes.

18067. And the title is "The only completely satisfactory method"?—Miss Hageby begins by saying: "He has doubtless found the remedy to be curare," on page 129. My comment is, "No," no curare was used.

18068. You are quite sure that there was no curare used there?—Absolutely. So far as my memoranda go, the footnote I put down is, "Incorrect. The animal was under artificial respiration through the chloroform flask, getting between 2 and 3 per cent.," in the usual way.

18069. You wrote your notes, you say, about how long after the lecture?—The lecture was in March, and the book was in my hands in July, that is four months.

18070. You were clear at that time that there was no curare used?—I was clear at that time there was no curare used.

18071. Is there anything else that you have a note of on that lecture?—Oh, yes. There is a remark made on page 134 to the effect that at the end of the lecture one other—the director of the laboratories—came to try the action of betain. I remember that even now, because it was a preliminary trial of betain that was made, and if any point has been made of that I will explain it; if not, I will not detain the Commission. This is germane to the inquiry of the Commission, I think, on page 135: "When an anæsthetic or narcotic has been given to the animal the students are told so, or they see the anæsthesia being kept up by repeated doses of the anæsthetising agent." My note is, "Not necessarily," but on this occasion the anæsthetic was certainly given.

18072. What do you mean by not necessarily?—One does not mention it on every occasion. At every turn the animal is anæsthetised, but it may often happen that one does not mention it.

18073. When it has been given, the students, she says, are told so?—Sometimes.

18074. She does not say that the students are told about every fresh dose?—No.

18075. "Or they see the anæsthesia being kept up." They would not necessarily see it?—No.

18076. As regards telling them at the beginning; is it usual to tell them?—I really do not know. I should think it might be or it might not be. I do not see any custom. I often do not say anything about it. I take it for granted. I do not think I should necessarily say so myself.

18077. Is it the invariable practice in these operations at a laboratory to give an anæsthetic?—Certainly. I believe that a lecture that I gave immediately after the publication of this book has been put in the hands of the Commission. The first two pages contain my immediate answers to the allegations in this book, but the University was cognisant of it, and took no action, because action was being taken from elsewhere, from University College, and as a matter of fact, the publication of that lecture was delayed for a week or a fortnight, until after a parallel action on the part of University College was over, on the part of Dr. Bayliss.

18078. We have that pamphlet already, have we?—Yes.

18079. There is only one thing, I think, that I want to ask you. You have told us that no operations have been performed in the laboratory except upon animals that were under complete anæsthesia?—That is so.

18080. And that they were so kept?—Yes.

18081. But some witnesses, and I think Miss Hageby amongst them, have drawn a distinction between light and deep anæsthesia, as if light anæsthesia meant that the animal was subject still to pain and deep anæsthesia meant that it was not. Is that so?—It is a question of definition. My definition of light anæsthesia and deep anæsthesia implies that there is no sensitiveness to pain in light anæsthesia, any more than there is in deep anæsthesia.

18082. That is a point I wanted to know. We have had it explained by other witnesses to us, and I do not want to take you through it at length?—I can do it very shortly, I think. I gave a definition of it a few months ago that I came across. "The finger-post between this first stage and the next is quite clear; if when the conjunctiva is touched the eye winks, the

Mr. A. D. Waller, M.D., LL.D., F.R.S.

27 Nov. 1907.

anæsthesia is 'light,' if the eye does not wink the anæsthesia is 'deep.'" That is my definition of light and deep anæsthesia, which I gave in the lecture.

18083. The point I wanted to know is, is the use of the word "light" or "deep" any indication whatever of any degree of pain?—None. In light anæsthesia all sensation and voluntary motion are lost. In deep anæsthesia the movements are more profoundly affected; the eye does not wink in reply to a touch on the conjunctiva.

18084. So that the use of the expression "the animal was under light anæsthesia," would not convey to anyone who understood the use of the word in anæsthetics, any suggestion that the animal was suffering pain?—Not to a well-instructed person who understood the use of language.

18085. As the word is used by surgeons or anæsthetists?—Yes.

18086. Is there anything else you wish to state to the Commission?—In answer to Question 7234, Miss Hageby refers to my "Exercises in Practical Physiology," and says that I give a caution in regard to the use an anæsthetics on page 47: "Unless the animal is too deeply anæsthetised, salivation is acceleration. I wish to state that it is not a caution, but an absolute statement of fact. The only implication contained in the statement is that the animal is liable to be too deeply anæsthetised.

18087. (*Sir William Church.*) I should like to ask you one question, not on the subject of "The Shambles of Science," but you have paid great attention to the administration of chloroform to both human beings and animals, have you not?—Much less in the case of human beings, but I make no distinction really.

18087A. We have had some evidence given before us by a witness, who said that the fall in blood pressure which takes place on the administration of chloroform is produced really by asphyxia and by that alone, and not by the chloroform itself. What would be your opinion upon that point?—I should say that chloroform of itself tends to produce a fall, but that asphyxia tends to produce a rise.

18088. I think the witness's view was that you only got a fall in the blood pressure when you got the respiration interfered with; is that so?—You have respiration interfered with and the heart interfered with, and the respiration activity diminishes and the heart activity diminishes, and the vasomotor centre relaxes, and you have a fall of the pressure and diminution all *pari passu*.

18089. You have no hesitation in saying that the action of chloroform does at times diminish the blood pressure?—No, I have no hesitation in saying so.

18090. Quite apart from any connection with interference with the respiration?—Yes, I should say so.

18091. (*Sir William Collins.*) Did the Senate of the University of London pass a resolution in favour of giving evidence before this Commission?—Yes, I think so. A vote was taken.

18092. What witnesses were to appear on behalf of the University?—Dr. Bradford, Sir Edward Busk and myself.

18093. I think you are the only witness appearing on behalf of the University?—I understood that Dr. Bradford was appearing on behalf of the University in respect of the Brown Institution, which is an institution under it, and I am appearing an behalf of the University in respect of the physiological laboratory, which is an institution under it. That is the status, I believe, respectively of Dr. Bradford and myself.

18094. Was a letter written by Sir Arthur Rücker to the Under Secretary of State for the Home Department in reference to statements contained in the work by Miss Hageby and Miss Schartau?—Yes, in reply to a communication from the Home Office.

18095. Would you desire to put it in?—I mentioned it in my *précis*.

18096. Perhaps you might read the last paragraph but one?—"I may add that when the laboratory was first established, and on several occasions since, I have discussed the performance of experiments on living animals with the director, Dr. Waller. I informed him of my personal wish that no such experiments should be used for the purposes of demonstration except those which were necessary for the instruction of senior students; and I found that this was in exact agreement with his own wishes and intentions. He used the phrase that a vivisection should be regarded as a 'solemn thing.' I have every reason to believe that this view is that in accordance with which the laboratory is being worked." That is the paragraph.

18097. May I take it that it is in accordance with that view that the practice in the laboratory is conducted?—It is so.

18098. You have, have you not, at the laboratory a panel of lecturers containing many distinguished names?—Yes.

18099. And many important publications have proceeded from the laboratory?—A considerable number.

18100. Would you care to make any quotation from the lecture which you have handed in dealing with the particular case of the "Shambles of Science"?—I only refer to it in my *précis* as indicating my state of mind towards the general question, and in reply to Miss Lind-af-Hageby and Miss Schartau's statement in the "Shambles of Science." I would like to place before the Commission what I said. "If the two young ladies under whose name the publication entitled 'Shambles of Science' has appeared, came simply to get copy,' the case is easily understood; but I am unwilling to believe this; and, indeed, the case looks to me much more like that of a pair of very ill-advised busybodies supporting each other through a trying ordeal for the sake of what they imagined to be an errand of mercy. I am sorry they came. I should have told them or any other non-professional women that they had better not come to such lectures, for they would run the risk of being misled and pained by experiments where no suffering to living animals was caused. Indeed, one would look very much askance at the young woman who should be able to look on while an animal was, as she imagined, undergoing torture. For the naked details of even a properly conducted vivisection, ignorantly considered, as must be the case if they are considered at all by an unprofessional person, appear revolting—so do the details of a surgical operation or of the slaughter of an animal for food, or of the proceedings in the dissecting room, and the *post-mortem* room. The minute and graphic account of such details by ignorant women is from every point of view mischievous and deplorable, and I very much regret that these two unfortunate ladies should have obtained the opportunity to torment themselves and their readers by their conscientious misrepresentations. Physiologists, when vivisection is necessary, do not take either pleasure or pain in its naked details, and they systematically take due precautions to fully anæsthetise animals required for experiment. The incredible motives sometimes attributed to physiologists by well-meaning people, and the unlimited adjectives and substantives by which they are held up to public reprobation can only be left to the antidote of their own excess. It is really labour lost to be constantly pleading 'not guilty' to this, that, or the other quite outrageous statement; we can only wonder that well-meaning people can so quietly harbour such infamous thoughts. Nor have we failed to question our own conscience. We well know that physiologists are subject to the common laws governing the human mind, and that habit must tend to engender inattention, and that inattention would be cruelty. We are on our guard against our own inattention, but knowing that we are human, we do not resent as indignantly as might be expected of us the reminder to be on our guard that is contained in the denunciations of our critics. We also know that there is evil in the appearance of evil, that things right and proper in themselves, but offensive of appearance ought not to be exposed. And if exposure by even competent authority must offend and injure the imaginations of ordinary men and women, how much more injury and offence to the public mind will be committed by incompetent and self-deluded women who have entered, what is to their minds, nothing more than a chamber of horrors, where in reality the 'quivering flesh' and 'palpitating heart' and 'tortured nerves' are more often than not only the living parts of dead animals, and where, in any case, an animal, even if alive, has been absolutely deprived of sensation. When one attempts to realise what kind of images must hold possession of an ignorant, prejudiced, and sensitive person—man or

woman—who has seen, without understanding, he ceases to wonder at bad language, yet what can he hope to say that shall reach the mind of the deluded fanatics whose pity has been fanned to hatred by agitators. And can it be expected of us that we should say anything at all to persons who can employ sensational literature to poison the wells of human sympathy. In this laboratory—and no doubt in others—our very first concern is to administer anæsthetics properly when anæsthetics are required. And I make the deliberate statement that animals in this laboratory are anæsthetised with as great certainty and accuracy as are the patients in any hospital in the United Kingdom. Can it be necessary to tell you that we do not juggle with bottles of 'colourless and odourless' liquid as imagined and stated by the two ladies who have visited these 'shambles'? You shall see for yourselves what takes place outside the lecture room whenever it is necessary to anæsthetise an animal. I have chosen cats for my demonstration, since the demeanour of these animals is most familiar to us."

18101. May I ask whether the evidence tendered on behalf of the University of London has been submitted to the Senate?—No, I put it to the Physiological Committee.

18102. Is there anything that you desire to add on behalf of the University of London?—No.

18102A. (*Sir Mackenzie Chalmers.*) Where is the laboratory at which these experiments were conducted?—At the Imperial Institute, on the top floor.

18103. Is it specially under your supervision?—Yes.

18104. Is that laboratory only used for demonstration experiments, or are there research experiments carried out there also?—Research experiments are carried out there as well.

18105. Under your supervision?—Yes.

18106. How long have you been engaged in research and demonstration experiments?—At that place or generally do you mean?

18107. Generally?—Twenty-nine years.

18108. And at this laboratory?—Five years.

18109. May I take it from you generally that as regards the experiments witnessed by Miss Hageby and referred to by her, you are satisfied yourself that the animals were properly anæsthetised and kept under anæsthetics until death?—Certainly.

18110. And that any movements which she saw, and such movements may no doubt have been seen, were reflex movements and not conscious movements of pain?—Yes.

18111. I suppose you have a good deal of experience of physiological laboratories?—Yes.

18112. May I ask whether you are a physiologist only or a practising physician also?—I am a physiologist. I do not practise.

18113. But you have medical qualifications?—Yes; in fact, I have practised formerly.

18114. Now you are wholly a physiologist?—Yes.

18115. Then I can ask you two questions that I want to ask. In the first place, we have been told by a witness that when artificial respiration has to be kept up, and for that purpose tracheotomy is performed on the animal, the tracheotomy is performed before any anæsthetic is administered, is that so?—Not in my practice, most certainly.

18116. Are you aware of any laboratory in England in which tracheotomy would be performed on an animal before the administration of some anæsthetic?—I know of none.

18117. That practice has never come before you?—No.

18118. Would you approve or disapprove of it?—I disapprove of it.

18119. So far as you are aware it has not been done, and it would be both wrong and illegal?—Yes, I think so, certainly.

18120. A great many physiologists now, as you know, are not medical men?—There are such physiologists, distinguished physiologists, even.

18121. And some very distinguished physiologists?—Yes.

18122. As regards the licensing of what I was going to call beginners, who are not medical men, is there not a difficulty. In the case of a medical man you have the guarantee of his profession; but in the case or a man who wishes to begin experimenting as a physiologist have you any such guarantee?—But surely he would be vouched for by some person of experience? I should imagine so. I should think it would always be the case.

18123. That is what I wanted to ask?—A young man would not be licensed in a laboratory to work by himself generally. He would be under the supervision of the director or professor of the laboratory if he were a beginner.

18124. Before his application for a licence was signed would there be sufficient opportunity for making inquiry?—Surely; it has to be endorsed by certain professors and authorities. That works all right, I imagine.

18125. You think that there would be no more difficulty in examining his qualifications than in the case of a medical man?—I do not think there would be. I should not make any distinction for that purpose.

18126. Are there any students of your own studying wholly as physiologists and not men going to take medical degrees?—I have, so to speak, no students directly. Everybody in the laboratory of the University of London is more in the nature of a colleague than a student. The students come to lectures, but I simply see them at lectures. That does not make them practical students of mine.

18127. They are not under your tuition in any way?—No, they are not.

18128. (*Mr. Ram.*) With regard to any of these experiments of which you have told us, and at which you were present, was any curare used?—No; there was no curare used to my knowledge at all right through.

18129. Have you had experience of the use of curare?—Yes.

18130. We have been told that, according to the belief of some witnesses, it is impossible to sufficiently anæsthetise an animal under curare. What do you say to that?—I have no experience of curare in combination with an anæsthetic. But are you asking me whether an animal immobilised by curare could be anæsthetised?

18131. Yes?—It could be.

18132. Have you ever known curare administered without anæsthetics?—Never.

18133. By an anæsthetic we mean, of course, one producing complete insensibility to pain?—Certainly.

18134. (*Chairman.*) I think the question asked was whether, if you gave an anæsthetic to an animal which had been curarised you could have an assurance that it really was under the influence of the anæsthetic?—Certainly.

18135. You could always ascertain and know whether you had it completely anæsthetised or not?—It is immobile, so is a plant immobile, but I know if you give it 2 per cent of chloroform vapour it is of necessity under the influence of the chloroform vapour.

18136. At any rate, you think that you could always satisfy yourself if you were giving an anæsthetic to an animal under curare that it was completely under the influence of the anæsthetic?—I should be satisfied. If artificial respiration is going on with the percentage of chloroform vapour, I should be satisfied.

18137. That is what would satisfy you?—Yes.

18138. (*Dr. Gaskell.*) Because you know that that percentage of chloroform vapour would always keep an animal of that size completely under the anæsthetic?—Yes, and I know that I am on the safe side as regards pain to the animal, and on the unsafe side as regards the life of the animal. I am more liable to lose the animal than to let it out of anæsthesia.

18139. May I take just a question with regard to this attack of Miss Hageby with regard to the dog injected with the substance derived from a lunatic, because she says in answer to Question 7507 "The method of killing is really what is mostly criticised in this chapter besides the nature of the experiment—that the assisting demonstrator did not even take the trouble to see that the animal was really dead," and then she goes on to say in reply to Question 7509: "The demonstrator attached a glass tube to the open jugular vein, and first we were told that the animal was to be killed. Then he blew a little air into the jugular

Mr. A. D. Waller, M.D., LL.D., F.R.S. 27 Nov. 1907.

vein and then sat down, so far as I remember, among the audience, and the lecture went on and the animal was supposed to be dead; but after a minute or two the dog began to struggle and to show signs that it was not dead, and for some time nobody observed it." "(*Sir William Church.*) In what way did it show signs that it was not dead? (A) By struggling. 'It has begun to struggle and seems to be in great pain, at last the lecturer happened to look at the "dead" dog. He says something to the assistant demonstrator, who leisurely rises from his seat, and strolls up to the animal.'" Do you remember anything of all that?—I do not remember the details. They do not sound to me very likely, but what I should imagine might be the explanation of what she saw, or thought she saw, would be that with air in the veins convulsions happened, and in order to make sure, as any person would do, as I should do under such circumstances, the lecturer said "Kill the animal," meaning simply to put the scalpel into the medulla. That would be one's natural action if one saw a convulsion on the part of an animal that had been so treated. One would oneself put a scalpel—I would have done it myself—into the medulla.

18140. Is it not a common thing by that method of blowing air into the jugular vein for struggling to take place?—Yes, it is common, of course, to have struggling take place when the air is in the vascular system.

18141. It is of the same nature as the struggles of asphyxia?—Or anæmia.

18142. (*Mr. Ram.*) There is no sensibility to pain?—Absolutely none. There is just one point which occurs to me which I should wish to mention about the marmot, as I have seen all about this marmot, and an extremely interesting point it is. It was a marmot coming out of its winter's sleep, and coming out of its winter's sleep the front half of the marmot gains its temperature in about one hour before the back part of the marmot, and that marmot came out of its sleep, and was fully awake as to the front part of its body and still asleep as regards the hinder part of its body, and bit the demonstrator.

18143. (*Chairman.*) That is at the time of the lecture?—At the time of the demonstration. I have seen a great deal about it in the evidence before the Commission, and it puzzles people that an animal—it puzzled Miss Lind-af-Hageby quite honestly no doubt—should normally for a time be half-paralysed; but, as a matter of fact, it is an extremely interesting phenomenon. If you study the temperature curve, given by those who have studied it, there is an interval of about an hour while the animal resembles a paraplegic animal completely as to its hind legs just as if it were paralysed, whereas the front end was all alive—so much so that it bit the hands of the demonstrator, a pretty good bite.

18144. (*Dr. Gaskell.*) With regard to the question of light anæsthesia, I should like you as an anæsthetist to tell the Commission how you can tell when a sufficient amount of an anæsthetic has been given, so as to prevent the animal from feeling pain?—One's ordinary quick and practical test is the conjunctival reflex. If the eye winks, more anæsthetic is wanted; if the eye does not wink, it is all right.

18145. You have just told us that that is evidence rather of a deep condition of anæsthesia, but when it is in light anæsthesia, how do you know it? We have been told that there is a very distinct difference between movements that are purposeful and movements which are in the nature of reflex movements?—I should have difficulty in giving you a sharp test while the eye reflexes are present. I suppose one would go by the character of the movement, but then that is not a sharp difference. The differences between the reflex and automatic movements and the convulsions are often very deceptive as indicative of conscious voluntary impulses; but still one would tell by the behaviour of the animal whether the movements were indicative of sensation or not, simply from their general character.

18146. From their general character you think you could tell. As an individual who has given anæsthetics to animals considerably, would you feel any doubt as to being able to tell. One allegation brought here against physiologists is that the physiologist keeps the animal under light anæsthesia, and that really is not true anæsthesia at all. The question has been asked again and again what is meant by light anæsthesia?—In the state of light anæsthesia, one knows that the first movements in the case of a man to disappear are the purposive movements, the obviously purposive movement, and one knows that when that happens there is no sensation; and one judges from the character of the movements that the animal is in an analogous state, having no sensation. Only, as a matter of fact, my practice, and I think the practice of most physiologists, is to go as far as the conjunctival reflex.

18147. Is it not the surgical evidence, and therefore one may say also with respect to animals that when you have once obtained complete abolition of the conjunctival reflex a very considerable time elapses, in which no chloroform is given, before any sensation of pain ever comes back?—Yes.

18148. So that there you have a very considerable time after that conjunctival reflex has been abolished, in which you may be perfectly certain that there is no sensation of pain?—Yes; and I will go further than that. You know that you can keep your animal anæsthetised; that if you have brought it down by 2 per cent. you can keep it there at 1½ per cent., 1 per cent., and a ½ per cent, as time goes on. I have had an animal as long as 12 hours under anæsthetics, and at that time it wants only a very low percentage indeed to keep it under.

18148A. But the practice of all physiologists is to anæsthetise the animal absolutely fully first, so that all conjunctival reflex disappears?—Yes.

18149. And then for a long-continued operation afterwards, smaller doses of chloroform are given, but still you feel confident that the animal is not feeling pain?—Certainly.

18150. (*Mr. Tomkinson.*) Do you consider morphia an anæsthetic?—I should not call it an anæsthetic myself. I should call it a narcotic. It is a question of words again.

18151. Do you consider that the state of stupor arising from morphia or alcohol is a state of anæsthesia?—Not in the ordinary way, but I can imagine the stupor being so profound as to amount to anæsthesia.

18152. You said, I think, that you had no difficulty in keeping animals for a very long period under anæsthesia?—No, none at all.

18153. Dogs?—I have kept dogs under anæsthesia for a considerable time, but my longest periods were with cats. I have kept cats under for a very long time, but dogs I have kept under for three or four hours.

18154. In perfect anæsthesia?—Yes.

18155. You have found no difficulty in anæsthetising dogs?—I have not found any. I have not lost a dog for several years.

18156. The boundary line between insensibility and death is not such a very perilously narrow one?—Yes, it is fairly perilously narrow, but if one administers the anæsthetic strictly quantitatively one can reduce the danger very materially.

18157. But whether the risk of death is run or not, you have no difficulty at all events in keeping the dog absolutely in a state of anæsthesia?—No.

18158. And immunity from pain?—Quite so.

18159. (*Sir Mackenzie Chalmers.*) I want to call your attention to Mrs. Cook's evidence on page 70 of the First Report, Questions 1947-52. What she said was: "I have witnessed some experiments at the Imperial Institute, but only baking and freezing." I asked her "On animals?—(A.) Yes, living animals. (*Sir William Collins.*) Were they cruel experiments in your opinion?—(A.) Certainly.—(Q.) Was there any anæsthetic used in those cases?—(A.) Yes, in one; and it was so difficult to give the anæsthetic successfully that the experiment was given up." Then later on she was asked who the experimenter was, and if you look at Question 2027, she said when "Dr. Waller works there." Have you any explanation that you would like to offer the Commission as to the kind of experiments: can you tell us what they were?—I believe it is the case of the stiff rabbit; it sounds to me like it. My attention is called for the first time to this evidence at this moment, but as I see it, it sounds to me like Mrs. Cook's description of the "frozen rabbit."

18160. (*Chairman.*) Was Mrs. Cook at that lecture?—I have the name of Cook occurring in my attendance book. I do not know what her initials may have

been. I will look it up. I forget which lecture the "frozen rabbit" was.*

18161. She said she thought it was 1903?—Yes, but I could identify it.

18162. (*Sir Mackenzie Chalmers.*) Perhaps you can tell us this. She was asked at Question 2028, "What animals were used, do you remember?" and she said, "I saw a black cat used, and I saw two cats used and a rabbit"?—I remember the black cat very distinctly; I think she is correct there. I have no doubt it was this experiment.

18163. Can you tell us what the nature of the experiments was; was there any pain involved?—There cannot have been. But I do not identify her description yet. First I jumped to the conclusion that it was the stiff rabbit that she was describing, the freezing box and baking looks like that; an ice-chest you may say is a baking machine if you like to think so.

Mr. A. D. Waller, M.D., LL.D., F.R.S. 27 Nov. 190 .

18164. Was any painful experiment performed?—Oh, no, none was performed at any time, of course.

18165. There was no experiment that would expose the animal to such a rise of temperature or such a fall of temperature as to cause real pain?—No heating experiments are ever made in the laboratory. The only ones ever made were on reducing the temperature.

18166. The baking is imagination?—Pure imagination absolutely, and the freezing was never there. I notice the temperature of the ice chest at the time is noted as 8° Centigrade.

18167. And no animal was exposed to a temperature below the freezing of Fahrenheit?—No, certainly not.

FORTIETH DAY.

Tuesday, 3rd December 1907.

PRESENT:

The Right Hon. The Viscount Selby (*Chairman*).

Colonel The Right Hon. A. M. Lockwood, C.V.O., M.P.
Sir W. S. Church, Bart., K.C.B., M.D.
Sir W. J. Collins, M.P., M.D., F.R.C.S.
Sir J. McFadyean, M.B.
Sir M. D. Chalmers, K.C.B., C.S.I.
Mr. A. J. Ram, K.C.
Mr. W. H. Gaskell, M.D., F.R.S.
Mr. G. Wilson, M.D., LL.D.

Captain C. Bigham, C.M.G. (*Secretary*).

Mr. J. Lorrain Smith, M.A., M.D., called in; and Examined.

18168. (*Chairman.*) You are a Doctor of Medicine?—I am.

18169. What position do you hold in the University of Manchester?—Professor of Pathology.

18170. You have been requested by the University, I believe, to give evidence on their behalf?—I have.

18171. I gather from your *précis* that they have passed a resolution or given you some sort of express mandate as to what they wish you to state on behalf of the University?—That is so.

18172. But, besides representing the University, I believe you have also been requested by the Pathological Society of Great Britain and Ireland to give evidence?—Yes.

18173. Then, perhaps, as regards the University, we had better take their expressed view, and we will examine you more generally as representing the Pathological Society?—If you please.

18174. I think you have in writing the views of the University?—Yes. The University is pleased to comply with the invitation of the Commission to give evidence regarding the experiments carried on in several of its departments. The laboratories of Physiology, Pathology, Pharmacology, and Public Health are registered for experiments on animals. Apart from original research, the experiments necessary for the public health investigations required by the Sanitary Authorities for Manchester and the surrounding districts are carried out in the Public Health laboratories of the University. The work carried on in the Public Health laboratories is highly valued by a large number of local authorities, representing about five millions of people, and Officers of Public Health find the reports issued from them of great value as regards the detection and prevention of the spread of disease. Some of the hospitals also avail themselves of these reports, which are often very helpful in diagnosis. The University authorities have endeavoured to comply with the regulations imposed by the Act to the best of their ability. The laboratories are visited by the Inspector several times each year, without previous warning, and the fullest information is given to him regarding the researches which are being carried on. The Inspector on his part thoroughly investigates and examines all the animals under experiment. Any representation which he may make regarding accommodation for animals, etc., is carefully considered, and, so far as can be gathered, has been hitherto dealt with to his satisfaction. The University authorities consider that adequate care is taken to further those objects which the Act was framed to accomplish, and that the present legislative provision for controlling this type of investigation is sufficient. The University has never had reason to find fault with any of the licensees for the manner in which the experiments have been carried out. In view of the care which has been exercised in conducting this type of work in the departments of the University and of the thoroughness of the administrative control by the Home Office, the University considers that further restrictive measures are unnecessary and undesirable.

Mr. J. L. Smith, M.A., M.D. 3 Dec. 1907.

18175. You say, apart from original research, experiments necessary for the Public Health investigations and so forth. Are those experiments on animals?—Yes, for diagnosis in the Public Health laboratory.

18176. Does that include experiments by way of cutting operations, and also by way of inoculation?—It is practically all inoculation.

18177. In your laboratory, then, the experiments which are necessary for the Public Health Act are practically all inoculations, we may take it?—Yes, that is in the Public Health laboratory. The Professor of Public Health undertakes that work.

18178. When you say the Physiological laboratory, I thought it was the laboratory of the University of Manchester?—The University has a laboratory of Pathology and of Public Health; they are separate.

18179. But are they both under you?—No; the Public Health laboratory is under my colleague, Professor Delêpine.

18180. I was going to ask you whether the local authorities that you speak of lower down have laboratories of their own, because I understand the Corporation of Manchester has one in the University?—They arrange with the University laboratory that this type of work shall be carried out there.

18181. But have any other local authorities there a laboratory; has Salford, for example?—No, it has not a laboratory.

18182. (*Sir Mackenzie Chalmers.*) All the local authorities make use of your laboratory?—Yes.

18183. Do they contribute to the expense; do you charge so much for an investigation?—Yes, there is a scale of charge.

18184. There is a scale of charge for a particular investigation?—Yes.

18185. Could you give us one or two instances of the sort of investigation that is useful?—Diphtheria diagnosis and tuberculosis diagnosis.

18186. Will you tell us how the diphtheria diagnosis is done?—I have given you instances of the vivisection part of it.

18187. Will you tell us how animal experiment is used by the local authority, if it is used?—As a rule diph

* *The witness subsequently wrote: The name M. Cook occurs in the attendance-book under November 19th, 1902 (Lecture on Animal Heat, by Dr. M. S. Pembrey).—A. D. W*

Mr. J. L. Smith, M.A., M.D.

3 Dec. 1907.

theria diagnosis is carried out simply by culture, but in a doubtful case you would inoculate a guinea-pig.

18188. Is there anything else?—Tubercle diagnosis is carried out in cases of milk which are suspected of being tuberculous, or in excretions from the human subject which require diagnosis if it is doubtful. They may be inoculated into an animal.

18189. What number of animals, for instance, are used for public health purposes?—Over 2,000 animals a year are used for this purpose.

18190. For sanitary authorities?—Yes.

18191. (*Colonel Lockwood.*) Do your experiments include inoculations in the eye?—Not for diagnostic purposes.

18192. But for any other purposes?—They might use the eye for investigation.

18193. (*Chairman.*) In the Public Health department do you mean?—Yes, if they happen to be doing an investigation on that subject.

18194. (*Mr. Ram.*) In research?—In research.

18195. (*Sir John McFadyean.*) Have you ever known a case?—No, it would only be for a specific purpose.

18196. (*Sir William Collins.*) In what proportion of cases of diagnosis of diphtheria do you find it necessary to resort to other than cultural or microscopic?—A very small proportion.

18197. Less than one per cent., would you say?—I could not say off-hand how many there would be.

18198. Are you able to speak with certainty as the result of inoculation experiments?—With practical certainty.

18199. What are the results in the animal which you regard as satisfactory in cases where the diagnosis remains doubtful as the result of cultural or microscopic test?—You get the evidence of pseudo-membranous inflammation.

18200. You get the false membrane in animals?—Yes.

18201. What animal do you use?—The guinea-pig.

18202. And in cases of tuberculous diagnosis do you find it necessary for Public Health purposes to resort to inoculation?—Yes.

18203. Is that because you are not satisfied with the finding of the bacillus?—Because you fail to find it in doubtful cases.

18204. Then in cases where you fail to find the bacillus are you able to establish the diagnosis as the result of inoculation with material on the animal?—Yes.

18205. Are there any other cases besides tuberculosis and diphtheria in which for Public Health purposes you find it necessary to resort to inoculation of animals?—Those are the chief ones; and possibly in anthrax, but that is a comparatively uncommon condition.

18206. (*Mr. Ram.*) And tetanus?—You might in tetanus.

18207. (*Sir John McFadyean.*) And meat poisoning?—Yes, meat poisoning; but these are things one comes across very occasionally.

18208. (*Sir William Collins.*) In the course of the past year have you had occasion to resort to inoculation of animals for Public Health purposes for other than the diagnosis of tubercle and diphtheria?—It is not my department, of course; I could not answer it without reference. I can add the answer afterwards by consulting Professor Delepine.

18209. (*Sir Mackenzie Chalmers.*) The animals used are guinea-pigs and rabbits chiefly for Public Health purposes?—Yes.

18210. (*Dr. Wilson.*) In injecting into a guinea-pig to test the diphtheria culture would you inject it into the peritoneum?—You might inoculate the throat.

18211. Is that often done?—No, not very often.

18212. Then where is the false membrane found; only when the inoculation is into the throat?—Yes.

18213. You would not expect to find it in the peritoneum?—You would get an inflammation that would not correspond closely to the mucous membrane inflammation.

18214. And what experiment do you carry out in your own department?—Investigation chiefly; I might have a diagnosis, but it is very rarely that that is asked for.

18215. You have conducted a good deal of original research, have you not, at Belfast?—Yes.

18216. And amongst those original researches, researches into conjunctivitis?—Yes.

18217. Those were inoculation, I suppose?—Yes, practically.

18218. Would any anæsthetic be used for the inoculation?—It was self-inoculation really; it was not inoculation in the sense of taking a definite bacillus or streptococcus of a known virulence; it was rather an accidental inoculation which might arise from merely wounding the surface.

18219. Introducing a foreign body into the eye?—In a wound of that sort.

18220. Would not those experiments be attended by a considerable amount of pain?—So far as I could observe there was no great pain.

18221. Did the eyeball slough?—No, never—only a little conjunctivitis. The aim of this set of experiments to which you refer was to avoid severe effects on the part.

18222. (*Colonel Lockwood.*) What happened to the animal after the experiment?—To which animal do you refer?

18223. This animal that you are referring to that was operated on in the eye. Was it destroyed?—Yes. The eye was examined.

18224. How long afterwards was it destroyed?—It was kept for a period, I forget exactly how long—I think a month or two afterwards. Then they were examined microscopically to see if you could discover any trace of inflammation or any degeneration, or even the presence of microbes.

18225. (*Mr. Ram.*) Examined after autopsy?—Yes, but it was all negative; we discovered nothing really by that method.

18226. (*Chairman.*) Is conjunctivitis very painful?—It may become painful, and in severe cases it is painful; but very frequently it is not painful.

18227. (*Sir William Church.*) With regard to Public Health work, could you tell us whether, in the event of suspected ptomaine poisoning, there is any other method by which a result can be arrived at so sure as that of animal experimentation?—No.

18228. (*Chairman.*) You have told us that you also propose to give evidence to us on behalf of the Pathological Society of Great Britain and Ireland?—Yes.

18229. Who are the members of that society?—The pathologists of the United Kingdom.

18230. That is to say, they are all of them educated pathologists?—There is a membership of about 200, and that, of course, includes physiologists and some anatomists, and also a good many physicians and surgeons who are interested in pathology.

18231. But they are what you might call professional men, either professional surgeons, or physicians, or physiologists, or pathologists who have not taken a degree?—Yes, I think you might say that almost without exception. There might be a chemist elected as a member; I am not quite sure. The basis of election is that they shall have done work which bears definitely on pathology.

18232. And there are about 200 members, you say?—Yes.

18233. What is the object of the Society?—To promote the study of pathology.

18234. That means the study of disease, I suppose?—Yes.

18235. Would you tell us a little more in detail how they follow it out?—The first aim of pathological investigation is to describe the structural and other changes which may be observed in the bodies of those who have died from disease. The tissues of the diseased organs are compared with those of normal organs, and it is found that certain changes are the result of the disease. It then becomes possible to explain how, with the occurrence of these changes, there arise the symptoms which the patient showed during life. Pathology has therefore, with the sciences of medicine or surgery, the common purpose of obtaining a knowledge of disease. It attacks the problem, however, by the exact methods

of the physical and biological sciences. The method of investigation by a study of the dead body has been a most fruitful one, especially since Virchow introduced the doctrine of cellular pathology as the basis of investigation, and the working out of this doctrine has been the main occupation of pathologists. For example, the process of inflammation has been carefully studied in order to discover the structural changes which it involves, and by this means much knowledge has been obtained regarding the part played by various kinds of cells. Similarly the processes of degeneration, in which the chemistry of the cell is disturbed, have been the subject of prolonged and careful inquiry, and in the main the observations have been made on the dead body. Till quite recently malignant growth was almost altogether investigated by the study of the structure of tumours obtained from the dead body, or by means of those removed at surgical operations. However valuable the study of pathology on these lines has been, it must be admitted that the method has clearly marked limitations. The tissues which are taken for investigation are no longer living, and therefore our observations are not direct. The evidence we gather concerns what has taken place in the past, but the actual occurrence we do not observe. In the next place a difficulty arises from the fact that we are observing the terminal conditions, and we are left to guess at the nature of the early changes. These conditions may be not only terminal, but also of a secondary nature, and it is of fundamental importance in pathology to distinguish the primary and secondary changes. The primary changes are those which occur when the process of the disease commences, and are directly due to the cause of the disease. It often happens, however, that when once the balance of the tissues is destroyed in the early stages, it is never restored, and in place of normally arranged tissues adapted to each other, and supplying the conditions whereby nutrition is maintained, we may have a progressive disturbance set up which ends only when it has brought about the death of the patient. In this stage of the development of disease the secondary changes may play the chief part. One element of a complex tissue may, for example, be stimulated to overgrowth by an irritant, while the other tissues of the organ are merely damaged by it. As the overgrowth continues, the other elements of the tissue are destroyed. Now since we are studying disease with a view to arrest its progress, it is of the first importance to gain knowledge of the earlier changes. It is during this stage that the opportunity of recovery is afforded. When secondary changes are in progress it is not recovery only, but regeneration, that is required. Recovery may be, and often is, complete, and health is restored, but regeneration is always imperfect. In order to make direct observations in the early stages of disease, we must have recourse to experimental methods. The study of the process by observations on the dead body may afford us certain hypotheses as to the laws governing the phenomena of disease during life, but when we desire to test the truth of these hypotheses we can appeal only to the experimental method. We must reproduce the phenomena and determine the truth of our interpretation of them. The nature of my argument will be most easily seen if I adduce two or three examples as illustrations. I am purposely leaving out of the argument all reference to the bacterial etiology of acute diseases, or to the treatment by bacterial vaccines or antisera. This side of the experimental work in pathology has already been dealt with by Dr. Martin and others. The Pathological Society, in asking me to give evidence before the Commission, desired me to deal with general pathological processes and diseases other than acute infectious conditions, and I have chosen my illustrations with this in view.

18236. This is as to the importance of examining the disease at all its stages in the living body?—Yes. and the fact that the point arrives in the investigation of disease when progress is practically stayed unless one has recourse to experimental methods. Arterio sclerosis is a disease of the walls of arteries of insidious origin, commencing usually at about middle life and gradually progressing until it becomes directly or indirectly a cause of death. It is an extremely important form of disease not only because of its grave effects but because it is so common. It leads to hæmorrhage and softening of the brain, to various forms of heart disease and to a slowly developing form of Bright's Disease of the kidneys. So noteworthy is this condition that it has been said with a rough approximation to the truth, that a man's life lasts as long as his arteries are sound. The cause of this condition is exceedingly obscure. It develops slowly in the course of years and it is therefore difficult to single out one definite factor which can be described as the essential cause. There has been endless investigation of it as it is seen in the dead body. Its various forms have been carefully described, but we do not know its cause, and to gain this information we require to have in our possession some agent which will set up the process. My argument is that this point is reached in all investigations of disease. The means of research which are known have been applied to the problem so far as it can be solved by the study of the dead body, and if we are then possessed of the requisite knowledge we have recourse to the experimental method. Josué made the important discovery in 1903 that repeated injections of adrenalin into the circulation of rabbits set up a form of arterio-sclerosis in the walls of the vessels. This discovery has already led various pathologists to take up the question, and the first paper on the subject from a laboratory in England was published in the Journal of Pathology last October.

Mr. J. L. Smith, M.A., M.D.
3 Dec. 1907.

18237. (*Mr. Ram.*) October of this year?—Yes. The value of adrenalin for physiology has been explained, I observe, already, and also its value for surgery in arresting hæmorrhage. It promises to be of still greater value, since it may enable us to discover the cause of arterio-sclerosis.

18238. (*Chairman.*) That is, in larger doses than you would administer for the purpose of stopping hæmorrhage, I suppose?—Yes. You apply it locally to stop hæmorrhage on the oozing surfaces. The next illustration which I wish to describe is taken from the pathology of respiratory diseases. Pneumonia is one of the most common of acute diseases, and it may be studied in two ways:—(1) The bacteria which cause it, and (2) the conditions of the patient which render him liable to become infected. The second only concerns me now. We carry about with us in our mouths and elsewhere the bacteria which cause pneumonia.

18239. You mean that we carry them about in a healthy condition?—Yes. Hence the question before the pathologist is not merely to explain where the infection comes from, but the conditions of the patient which permit the pneumococcus to spread from its usual haunt in the mouth and throat and find its way to the lungs, where it sets up inflammation. In order to work out these conditions, one point to which to direct attention is the lungs themselves. Can we find an agent which in itself may be used to cause pneumonia without the aid of bacteria? Such an agent has been recently discovered by the experimental method. It has been found that to submit an animal to an atmosphere of oxygen will, ere long, bring on pneumonia.

18240. What do you mean by an atmosphere of oxygen—pure oxygen?—Yes, pure oxygen.

18241. Can an animal live on pure oxygen?—Yes.

18242. Without any of the other gases that make atmospheric air?—Yes. The simplest possible way therefore of working out these conditions so far as the lung itself is concerned is to place the animal in an atmosphere richer in oxygen than the air we normally breathe. Pneumonia has been very fully studied by the methods of morbid anatomy, and the data which have been obtained are of great value in enabling us to understand the cause of the disease but we have yet much to learn regarding the activity of the lung and its relation to the onset of inflammation. It is at this stage of the problem that experimental investigation becomes necessary in order to test the truth of hypotheses suggested by the data which we have obtained. The third illustration I have taken from a study of derangements in metabolism. The commonest and most important of these is fatty degeneration. When the cells of a tissue are damaged by the action of poisons they very commonly show in their substance the accumulation of globules of fat. Such a change is seen, for example, in cases of poisoning by arsenic; but this disturbance may be due to a large variety of causes. It occurs more or less universally in gland cells, and its importance may be

Mr. L. Smith M.A., M.D. 3 Dec. 1907.

gathered from the fact that in the muscular fibres of the heart wall it forms one of the most serious types of heart disease. In regard to this condition a great amount of information has been obtained by means of starvation experiments. It was thought that fat appeared in the cells, say, of the liver in such conditions from dilapidation of the cell substances, but by means of these experiments evidence has been obtained to show that the presence of fat is in many cases to be explained by the absorption by these cells of fat which has been transported by the blood from the tissues under the skin and elsewhere which normally contain fat.

18243. Would you tell us exactly what you mean by starvation experiments?—The starvation experiments which have been used in this case are those where the animal is deprived of food.

18244. What sort of animals?—Dogs and birds, in order to study the kind of fat which is found in the process of degeneration.

18245. What is the process of the experiment; do you starve the animal until it dies?—No.

18246. Or do you take off one or more of its meals as it were?—You deprive it of food until its body contains little or no fat.

18247. (*Mr. Ram.*) Are they kept absolutely without food?—Yes.

18248. With water only?—Yes, with water. You want to deprive them of fat.

18249. (*Chairman.*) You give them no food?—We give them no food.

18250. For how long, for example?—For a week or two, or even for a month, I have seen some experiments recorded.

18251. Will a rabbit or fowl live for a month with only water?—Yes, and dogs also.

18252. Will they live as long as a month without anything but water?—Yes.

18253. At the end of that time will they recover if they are fed carefully?—Yes, they are fed up again.

18254. Do they show any symptoms of pain?—No.

18255. They are unhappy, I presume?—Yes, they are unhappy; there are no particular symptoms. In fact, there is an experiment on record where the milk of a bitch was studied after a period of starvation in this way.

18256. You mean that it had puppies?—Yes.

18257. Was it able to suckle them?—Yes; it was a study of the kind of fat that appeared in the milk.

18258. Do you usually recover animals after a period of starvation?—Yes, for this experiment certainly.

18259.—For this experiment you are speaking of?—Yes.

18260. Your object would not be to kill the animal?—No, they are fed with fat of other animals which is of a different character.

18261. They are fed with fat?—After they have been starved of their own fat. Then you can follow the relation of this abnormal fat to other tissue changes.

18262. That is part of the experiment—feeding them up again with fat from other animals?—Yes, by that means a great deal of light has been thrown on the process of fatty degeneration. Another important branch of this investigation is exemplified by nervous disease. It has been for years a well established fact that one of the earliest changes in nervous disease is a breaking down of the nervous tissue system into fat, which is absorbed by lymphatics and disappears. These changes are found in the dead body in damaged nerves in the spinal cord and brain, and the investigation of them has been carried out by the methods of morbid anatomy with great energy and success. Since it has been discovered that changes of this nature are found in the spinal cord associated with the occurrence of local inflammation elsewhere, as for example, the presence of pus in the pleural cavity, this form of tissue disintegration has been taken up experimentally, and it has been shown that slow absorption of the poisons generated by bacteria takes place along the nerve sheath, and that these poisons on reaching the spinal cord set up fatty changes in the tissue of the spinal cord at the point where the nerve branches off. In other words, we have obtained a new means of attacking the obscure problem of the causation of such diseases as General Paralysis, Locomotor Ataxia and Recurrent Insanity.

18263. Do you mean to say in detecting the approach of the disease?—Yes.

18264. And stopping it?—And ultimately stopping it.

18265. Have you been successful with animals in stopping cases which you believe you saw?—It is rather early to say that, because the research is just in process. I have purposely taken researches which I know are going on at the present time for most of my illustrations.

18266. However, that is the object of the research?—Yes.

18267. And you consider that there is a reasonable prospect of success?—Yes, a very reasonable prospect. Finally, I wish to refer to a disease regarding which we have as yet no knowledge of the causation, rheumatoid arthritis and osteo arthritis. This is a distressing joint disease or group of diseases regarding which a large amount of work has been done, but so far it has been confined to clinical observation of the conditions and a description of the pathological changes in the structure of the joints affected. Quite recently a hospital has been opened in Cambridge for the study of diseases of this type. What in this case is required above all things is the means of experimental investigation of the disease. We do not know the cause, and our resources for arresting the disease are correspondingly small.

18268. Have animals that same disease—can it be created in animals?—Something very similar to it is found in them.

18269. At any rate they are not naturally subject to it, are they?—I could not answer that.

18270. It is not an ordinary disease?—It is merely an illustration, a disease which illustrates my argument that the research is arrested in a sense.

18271. I only wanted to see how far the research was carried on by means of living animals?—So far we have not been able to reproduce it.

18272. Are your researches on this particular group of diseases carried on at all at present by means of experiments on animals?—So far as I know they have not—at least not with any success. The idea of explaining it by bacteria of course suggests that various experiments have been carried out in that way, but there is no definite teaching as yet on this point.

18273. (*Mr. Ram.*) Is it contemplated in this school that is founded now for the investigation of this disease that animals will be employed?—Ultimately they will go on to experimental work. Meanwhile they have merely the hospital for observing and publishing accounts of cases. One volume of reports has been printed.

18274. (*Chairman.*) Are these curable diseases?—No.

18275. (*Colonel Lockwood.*) Have you any objection to the present restrictions placed by law upon operations on living animals?—No.

18276. Do you think that it has placed Englishmen at a disadvantage as compared with other nations?—I do not know that it has very seriously, anyhow.

18277. Can you suggest, or would you have any objection to, any further restrictions as regards, for instance, publicity of the names of those holding licences or a restriction of the number of licences?—You mean to make it more difficult to get a licence?

18278. I will not say more difficult, but to make more public the names of those who hold licences. I will put it in this way: should you have any objection to further restrictions upon the issue of licences?—I think I should be expressing the feeling of pathologists that further restrictions would delay research, and so far they would object to them, I think.

18279. Have you yourself seen many experiments upon living animals?—Yes, a fair number.

18280. Have you ever seen any cruelty connected with those experiments—what I roughly call cruelty?—Certainly not

18281. Have the animals always been under anæsthetics in all the experiments that you have witnessed—not inoculations, cutting operations?—In cutting experiments, yes.

18282. The animal was completely anæsthetised?—Yes, sufficiently anæsthetised.

18283. And the Act always strictly carried out?—So far as I have observed.

18284. As regards the starvation experiments, have you witnessed many of those?—None at all.

18285. Then what were those experiments that you alluded to as regards fat—you said with dogs and fowls—They were not my own experiments.

18286. Nor did you witness them?—No.

18287. Were they carried on in England?—No.

18288. (*Sir William Collins.*) I did not quite gather the point that you were pressing upon the Commission as regards investigations in connection with arterio-sclerosis. Would you be so good as to explain that?—That the investigations into the causation of arterio-sclerosis by the methods of morbid anatomy had practically come to a standstill until this observation of Josué.

18289. Had Gull's and Sutton's work been of value?—Yes.

18290. What have we learnt in addition to that by experiments on animals?—We have learnt that we have got a substance that will cause arterial sclerosis.

18291. Is there anything besides that that we have learnt as the result of experiments on animals on the subject of arterial sclerosis?—They are working out the effect of this substance.

18292. But in addition to the fact that you state that adrenalin is found to be productive of arterial sclerosis, have we added to our knowledge of the subject by experiments on animals?—So far as Josué's experiments are valid we have added to our knowledge.

18293. Does that involve anything more than the statements that you have made that adrenalin is productive of that degeneration?—That gives the means of studying the development of the condition. It is quite a new investigation.

18294. Has it given us the means of preventing it?—Not yet; it is quite a new investigation.

18295. Is that your own?—No.

18296. Did you witness the experiments in connection with it?—No.

18297. Then in regard to the causation of pneumonia, did I correctly understand you to say that the submission of the animal to an excess of oxygen contributed to the production of pneumonia?—It causes pneumonia itself.

18298. Apart from any organism?—Yes.

18299. That pneumonia can originate without bacterial cause?—Yes.

18300. Is that an example of inflammation without bacteria?—Yes.

18301. And is pneumonia in man also of non-bacterial cause?—No.

18302. Never?—The usual pneumonia is caused by bacteria.

18303. But is there any case in man of an analogous disease process called pneumonia similar to that which you can produce in animals by the administration of an excess of oxygen?—It is conceivable that in the caisson disease you might have a certain element of oxygen effect of that sort.

18304. Is the result of your investigations to suggest that oxygen ought not to be employed in the treatment of pneumonia?—I have debated that point with physicians like the late Dr. Dreschfeld. It is rather difficult to answer it definitely. I think he did not use it when he saw these experiments.

18305. If oxygen produces pneumonia, the use of oxygen in pneumonia would be rather a homœopathic remedy would it not?—Yes.

18306. We have been told by a previous witness that the use of oxygen in some respiratory diseases had been the outcome of experiments on animals. Is the result of your research to suggest that oxygen ought not to be employed in respiratory diseases?—That is a debatable point as to how far you should go in using oxygen in acute pneumonia.

18307. It implies a caution?—It implies a caution. I go that length.

Mr. J. L. Smith, M.A., M.D.

3 Dec. 1907.

18308. And that is a very recent research, I understand?—Yes.

18309. When was it published?—In 1899.

18310. Did I correctly understand you to say that morbid anatomy had been of great value in arriving at conclusions in some of the cases to which you referred; I took down your words to that effect?—Yes.

18311. You do not wish to disparage the importance of morbid anatomy as a means of research?—Not in any way. I merely wished to indicate that the natural development of the study of any disease was to commence with morbid anatomy, and that the experimental work was required to test the conclusions.

18312. So I understood you. Then you indicated certain researches that you thought had a useful bearing upon the cause and possible prevention of general paralysis. Do you then accept the bacillus paralyticans as the cause of paralysis?—The experiments that I have seen myself were done by a variety of toxin-producing microbes; the bacillus coli was tried and Gaertner's bacillus and a mixture, I think, of bacilli.

18313. What was the result of those investigations?—That you get definitely degenerative lesions in the spinal cord at the point where the nerve emerges.

18314. Does the evidence point to spinal paralysis being a bacillary disease?—No, on this particular part probably does not; but there has been a large amount of evidence published lately to connect it with a definite bacillus, the diphtheroid bacillus. This investigation was rather to show that experiments have found out a mode of introducing the toxin into the nervous system in a form in which it has local effects.

18315. May the toxin be of various kinds?—Apparently, so far as I have seen the experiments, it may be of various kinds.

18316. Am I right in thinking that the bacillus paralyticans has been alleged as the cause of general paralysis?—Yes.

18317. Is the result of your investigations to prove it or to disprove it?—We have not worked with that particular point before us, as to whether that particular bacillus is the cause or not.

18318. Have you been able to produce the results that you identify with those of general paralysis without the use of this paralyticans bacillus?—Yes. I should say that we have, with ordinary bacilli such as you find in the intestines, been able to produce effects of this order.

18319. And with poisons derived from other than bacillary sources have you tried the same experiments?—No.

18320. Would you tell us where those fasting experiments on dogs were performed?—They were performed by Rosenfeld and Lebedeff.

18321. Where did they work?—That I am not sure.

18322. In Germany?—Yes. Rosenfeld published them in the "Zeitschrift für Klinische Medicin."

18323. When?—I will supply the date. I have not it in my mind at present.

18324. Is that also a recent research?—Comparatively recent.

18325. Have any similar investigations been made in this country?—Not so far as I know.

18326. (*Sir John McFadyean.*) Your own experiments and all those that have come under your observation at Manchester University have been carried out in strict conformity with the Act?—Yes.

18327. Have you any reason to suppose that anywhere else the law is violated in experiments on animals?—It has not come under my observation.

18328. You have seen experiments conducted in other laboratories?—Yes. I began work in Oxford at the Physiological Laboratory. I worked in Cambridge in the Pathological Laboratory. Then I was ten years in Belfast and saw experiments and a good deal of work going on there, both in physiology and pathology; and then I have worked lately in Manchester.

18329. So that as a means of ensuring compliance with the Act, it would be in your opinion entirely un-

Mr. J. L. Smith, M.A., M.D.

3 Dec. 1907.

necessary to legislate, so as to give greater publicity to the names of those who are engaged in vivisection, and to give in fuller details for public information the nature of the experiments?—Yes.

18330. You are familiar to some extent, I suppose with what might be called anti-vivisection literature?—To some extent. I have not studied it very far.

18331. Have you read any of the evidence given before this Commission?—Yes, I have read some of it.

18332. You are aware that there is a pretty widespread opinion among the laity that a great deal of painful experimentation is carried out in this country under the Act, especially by physiologists?—Yes.

18333. You do not agree with that?—I have not seen it.

18334. Do you believe that there is painful experimentation carried out?—No, I have no reason to suppose there is.

18335. You are aware that great trouble has been taken to persuade the public that that is so?—Yes.

18336. Would it in your opinion be justifiable to call these attempts misrepresentations of the facts?—Yes, the statements about the cruelty and pain which are inflicted are misrepresentations, so far as I know.

18337. Do you think that that misrepresentation of the facts may be an honest misrepresentation?—Yes.

18338. But that it might be continued and even increased if the laity were provided with details even of painless experiments?—Yes.

18339. Would it occur to you that that would be one serious objection to publishing fuller information with regard to the details of pathological and physiological researches?—Yes.

18340. Might I ask is this oxygen pneumonia a progressive pneumonia; I mean progressive in the sense in which the bacterial pneumonia is progressive, that you can bring it on by causing an animal to respire an atmosphere of pure oxygen?—Yes.

18341. Does it continue and tend to a fatal issue afterwards?—Yes.

18342. And the tissue at the time of death is found pneumonic?—Yes, consolidated, congested.

18343. But germ free?—So far as I have been able to see I have discovered no germs.

18344. I just want to ask you a question or two about these milk experiments which are carried on so extensively at the Public Health laboratories. Am I right in supposing that these are carried out with the intention of taking advantage of the special powers which Manchester possesses regarding tuberculous milk?—Yes.

18345. The object of the experiments and of the tests to which the milk is subjected is to diminish the number of tubercle bacilli supplied to Manchester people in their milk?—Yes.

18346. Do you happen to know whether it is the opinion of the Public Health Authorities there, that the work has been in any respect successful in that direction?—I can judge from the Medical Officer of Health's report, which contains endless references to the work that is carried on.

18347. Approving of it?—Yes, and relying on it.

18348. From your own knowledge, can you offer any opinion to the Commission as to whether it would be of any real value in that connection to merely make a microscopic examination of milk?—I have tried it frequently without satisfactory results.

18349. Why is microscopic examination unreliable when the result of the examination is a negative?—The result of the examination is that bacilli may still be there, although you have been unable to discover them.

18350. Is that because it would be practically impossible to examine even half a pint of milk in six months?—Yes.

18351. Is there a difficulty in recognising the tubercle bacillus with certainty by the microscope in milk taken from a shop?—Yes, there is, you get it in various conditions.

18352. Are there other bacilli that have the same reactions and agree with it morphologically?—Yes, the butter bacilli and others.

18353. On the other hand, do you think that the inoculation test is a very delicate one?—Yes, it seems to be very delicate.

18354. Can you say whether, as a matter of fact, as employed in Manchester it has led to the detection on different occasions of cows which are actually the subject of tuberculosis of the udder?—Yes, I believe so.

18355. (*Sir Mackenzie Chalmers.*) As regards the inoculation experiments done in the Public Health laboratory, I suppose as soon as the animal unequivocally develops the disease you destroy it?—Yes, so I understand.

18356. It is not necessary to let it die?—No.

18357. You can destroy the animal as soon as the disease unmistakably shows itself?—Yes, say in the glands.

18358. The starvation experiments that you referred to were somewhere in Germany, but you do not know where?—Yes.

18359. In England we have starving men, of course?—Yes.

18360. But by mere observation of them you cannot get the necessary information?—No; you cannot define it; you cannot test it in the same way.

18361. In fact you would want to kill them and make a *post-mortem* examination?—Yes.

18362. What certificates do you hold?—"A" and "B" just now.

18363. "A" is inoculation. Under "B" the animal must be anæsthetised during the experiment?—Yes.

18364. But is allowed to recover?—Yes.

18365. Are you following any particular research under Certificate B now?—I have got the licence, but when I got it I was led off to another investigation.

18366. You are not using it?—I am not using it.

18367. You have experimented under Certificate B?—Yes.

18368. I want to ask you this. When you experiment under Certificate B, do you understand that not only the cutting operation itself, but any subsequent painful part of the operation, such as stimulating a nerve, or sewing up the wound, must be done under anæsthetics?—Yes.

18369. There is no doubt about it in the physiologist's mind?—I should think not.

18370. Are you a practising physician as well?—No.

18371. Your work is professorial?—Yes, and hospital work. I am pathologist to the Royal Infirmary.

18372. You represent the Victoria University. May I ask, do you come here giving this evidence on behalf of the University as a whole, or on behalf of the Medical Faculty?—I represent the Council of the University.

18373. I ask for this reason. In March last we had a witness from the Victoria University, Manchester, Mr. John W. Graham——Not from the University may I be allowed to say.

18374. He described himself as Principal of Dalton Hall in the University of Manchester?—Yes.

18375. Did he represent any Faculty of the University?—No, my evidence is from the Council of the University, which is the Executive Body.

18376. Is Mr. Graham a member of the Council?—No.

18377. (*Mr. Ram.*) What is Dalton Hall?—A hall of residence for students.

18378. Are they taught there?—There may be a little tutorial work.

18379. They study at the University and live at Dalton Hall?—Yes.

18380. (*Dr. Wilson.*) When you speak of the Council do you mean the Medical Council, or the Council of the whole University?—The Executive Body of the University.

18381. Arts?—Arts and Sciences, and Law, and Music, and so on.

18382. (*Sir Mackenzie Chalmers.*) How long have the laboratories been open at Manchester?—I could hardly say that.

18383. Some years?—Oh, yes.

18384. Do you know whether Mr. Graham made any inquiries there as to what went on in his own University laboratories. Has he made any inquiries from you?—Not from me.

18385. Would it be open to him to obtain information as to what went on if he wished?—I should be very pleased to show him anything he might desire.

18386. So far as you know, no inquiry was made by him as to what went on locally in his own University?—That is so.

18387. I suppose as Principal of Dalton Hall he holds a University position, or does he not?—I could not say offhand the relations of these halls to the University. They are controlled in some way or other, but I think he is appointed by an independent committee—the Governors of the Hall.

18388. One question with reference to what you said about general paralysis. You referred to general paralysis of the insane. Is it not commonly supposed that general paralysis of the insane is a sequel of syphilis?—Yes.

18389. Has your work tended to negative that in any way?—Not necessarily. Our work has been rather on the method in which toxins are absorbed so as to localise the lesions in the spinal cord. The toxin variety of toxins may be used for the purpose of the experiments described.

18390. Various toxins might produce the same effects?—Yes, the same degenerative effects.

18391. (*Mr. Ram.*) With regard to these starving experiments you told us that the animals appear to suffer discomfort and so forth?—I am speaking from hearsay only. I have never seen them.

18392. You have never seen a starvation experiment?—No.

18393. Can you tell us what generally happens to the animal at the end? Is it allowed to recover, fed back into life, or destroyed?—It is fed back and then examined afterwards.

18394. Can you tell us of any discovery which has had an actual beneficial effect upon mankind, which has resulted from these starvation experiments?—This of course, bears upon the pathology of fatty degeneration of the heart; that it why I adduced it.

18395. Has the treatment of fatty degeneration of the heart or medical knowledge with regard to it been advanced by these experiments on animals?—Yes, I think it has.

18396. May we put it so high as to say that knowledge has been acquired by these fasting experiments which has been directly beneficial to mankind in the treatment of fatty degeneration of the heart and other diseases?—Directly beneficial in the sense of contributing to our knowledge of these conditions.

18397. Has the treatment with regard to fatty degeneration of the heart, for instance, changed at all in consequence of knowledge derived from these experiments?—It would be difficult to say that.

18398. You do not know that it is so?—I do not know that it is so.

18399. When you say that the animals are brought back to life and are examined, are they examined as live animals?—No, they examine the chemistry of their organs; there is a chemical examination.

18400. The animal is killed?—Yes.

18401. And then by an autopsy the organs are examined?—Yes.

18402. (*Dr. Gaskell.*) Have you read the evidence of the Honourable Stephen Coleridge?—Yes.

18403. I think it would be rather a good thing for this Commission if you would just tell us a bit about that case of Mr. Cecil Shaw to which he referred. His statement is at Question 10491, "Is it now your suggestion that these two gentlemen were saying what is not true, and that Dr. Cecil Shaw did these experiments? (a) That is my suggestion." And then he goes on afterwards to say, "My complaint is with respect to the Irish Government, that they immediately accept what I call the absurd explanation of these two vivisectors." Is it true that Mr. Shaw did experiment without a licence?—No.

18404. Can you tell us what were the facts?—I did the experiments.

Mr. J. L. Smith, M.A., M.D. 3 Dec. 1907.

18405. Is it necessarily the case that Mr. Shaw implied that he did the experiments when he speaks of "my own work"?—No.

18406. He uses the first person, as though that experimental work had been carried out by himself?—Yes, as if he had done the whole of it.

18407. Will you tell the Commission about it?—The circumstances of the investigation are these. The late Dr. McKowan, an eminent opthalmologist in Belfast, appealed to me to undertake this research. I was not specially acquainted with Opthalmology, but I tried to meet him. The best way of doing it was to associate myself with an opthalmologist and it was in these circumstances that the combination came about.

18408. And what part did Mr. Cecil Shaw take in it?—Of course we discussed the whole situation. He practically did the whole research except the vivisection part of it.

18409. Why did your name not appear in connection with it?—It should have done, I admit; it would have been less ambiguous.

18410-11. Still it was not your research really, although you did the experimental work?—Yes. I was working, of course, at this question and have been working at it since. These experiments which I have just recounted with regard to the absorption of toxins along the nerve sheaths is in the line of this investigation; it has engaged my attention more or less continually ever since.

18412. Mr. Coleridge states here "The letter from Dr. Lorrain Smith, who had a licence, to his very good friend Dr. Shaw, who had not, is as follows. . . . Both of them are dated the same day; they must have met in the street and exchanged them." He implies that you met Mr. Shaw and then in the street casually concocted this arrangement of letters and the evidence. Is there any truth whatever in that kind of suggestion?—No. What else could I do? Shaw had written the paper, and, as I explained in my letter to the Irish Office, "I appealed to him at once for what statement he had to make about this, and I enclose his reply." I do not see the ground for any such insinuation. I have explained the whole circumstance.

18413. And your Irish Home Office were satisfied with your explanation?—Yes, they were satisfied.

18414. The experiments were done in Belfast?—Yes.

18415. (*Sir Mackenzie Chalmers.*) At the time of these experiments Dr. Shaw held no licence from the Irish Government?—No.

18416. But you did hold an Irish licence?—Yes.

18417. (*Dr. Gaskell.*) The returns are sent in by you?—Yes. There is a reference that I do not understand to Dr. Shaw having applied with regard to monkeys and dogs to the British Medical Council on the 22nd July last. I know nothing about it whatever. I left Belfast in 1904.

18418. He called it corroborative evidence that he, Mr. Cecil Shaw, is the person who did those experiments, the corroborative evidence being that he applied to the British Medical Council in July last?—Concerning experiments which happened in 1897; I do not follow it.

(*Chairman.*) I do not think it impressed anybody very much as being corroborative evidence.*

18419. (*Dr. Gaskell.*) You mean with respect to the date?—Yes, I had been away from Belfast for over three years. I was attacked another time about doing experiments without a licence myself in a research on bacteria of the intestines of dogs, although I stated in the investigation that the intestine was removed after the animal was dead. I had the same sort of correspondence with the Irish Office as to whether my licence should be taken away and my laboratory shut up.

18420. Do you consider that these experiments did cause the rabbits a good deal of pain?—No, they did not. We did not cause the iritis; we did not succeed in causing iritis.

18421. So that the jequirity did not cause a great deal of pain afterwards, after the operation was over?—No, it was a very minute quantity of jequirity, just

* *The National Anti-Vivisection Society subsequently wrote* (31*st December*, 1907) *that the words "British Medical Journal of* 22*nd July last" in Q.* 10496 *should read "British Medical Journal of* 22*nd July*, 1899," *which correction Mr. Coleridge omitted to make in revising the proof of his evidence sent to him in June.*

Mr. J. L. Smith, M.A., M.D.

3 Dec. 1907.

the least speck of dust on the point of a camel-hair brush.

18422. No inflammation was caused?—No, except conjunctivitis. It was very like an experiment with tuberculin, Calmette's experiment for the diagnosis of tuberculosis in man.

18423. Then the net result of those experiments is negative?—Yes, in no case did we cause iritis.

18424. There is one other question I want to ask you, and that is at Manchester do you demonstrate to students?—I do not.

18425. Are there demonstrations in pathological experiments and experiments involving vivisection?—No.

18426. Do you consider that such experiments might be useful to students?—I do

18427. Would you encourage them?—In pathology?

18428. I am rather thinking of pathology and pharmacology; I was thinking of the course as a whole?—I could quite imagine their being of enormous teaching value. I know how I was impressed the first time I saw a physiological experiment myself. One of the things that stands out in my recollection of Professor Rutherford's teaching almost more clearly than anything else in the experiment of blood pressure.

18429. (*Dr. Wilson.*) You have just mentioned Professor Rutherford. You graduated in Edinburgh University?—Yes.

18430. And, of course, you have often seen his experiments before his class?—Yes, that is to say, I was a year there, and I saw the two or three experiments that he did.

18431. In carrying out those experiments on blood pressure, when it was necessary to keep up the respiration of the dog, for example, by inserting a tube into the trachea, how did Professor Rutherford proceed, I mean as to the anæsthetisation?—I could not tell you what anæsthetics he used. It is no use trying to recollect the details of over 20 years ago. I could not charge my memory.

18432. Was the animal anæsthetised before the tube was inserted into the trachea?—Oh, surely. I have no specific recollection of the point, but the animal seemed to be anæsthetised throughout, and I am sure it was.

18433. That is to say it did not strike you that any cruelty was inflicted during even the severest experiments?—That is so.

18434. And, of course, in all these class experiments the animal was destroyed before recovering from the anæsthetic?—I believe so. I was only a student, of course, amongst hundreds of others.

18435. Then with regard to these experiments which are being conducted to elicit the conditions of arterial sclerosis, is it not generally assumed that experimentation on animals is justifiable in order to discover, if possible, the causation of the disease?—Yes, I think so.

18436. But you could not say that arterial sclerosis is ever caused in the human being by adrenalin?—We are not ready really to say anything about it yet. We are only working it out. We have not yet, properly speaking, defined the form of arterial sclerosis and its causes.

18437. Would you, as a pathologist, say that you can ever induce in an animal the exact disease that you find, even in a diseased animal?—If you mean absolutely identical in every respect, no, I suppose not.

18438. You think not?—Some bacterial diseases are extremely difficult to distinguish, anthrax, for example.

18439. You could not say, then, that this arterial sclerosis which Josué has been able to induce by administration of adrenalin is the same sort of sclerosis that you find in diseased conditions of human beings?—In any case we are not far enough on yet to say so. The first English investigation, as I say, has been published from Dr. Woodhead's laboratory in last October. There are a few others.

18440. Then you say that fatty degeneration of the heart can be caused artificially, or by experiments on animals by starvation experiments?—No, I did not say that. I said that starvation was one of the modes of investigating the nature of fatty degeneration of the heart.

18441. You do not cause it by starvation?—No, you cause it in other ways.

18442. But how is the condition brought about then if after starving animals you find a certain form of fatty degeneration?—You may cause degeneration, say by giving a little phosphorus or arsenic.

18443. But that is not the usual way in which it is caused in human beings?—It is caused there, too. It is a very curious thing that you can cause it in a great many ways. It is caused by lesions, toxins, poisons.

18444. A question was asked you about deciding as to ptomaine poisoning by experiments on animals. May I ask what is the condition of the animal which will enable you to say that a certain food contains ptomaines?—You would kill the animal with the ptomaine.

18445. But what conditions would you expect to see in the animal?—You might even get it infected with the bacillus. There are various forms of bacilli described.

18446. The Gaertner bacillus?—Yes.

18447. Would you expect to find that?—Yes, I have found it in a case.

18448. But you would not expect to find it always?—Not always. I found it in one case that I investigated, and it seemed to have come from meat poisoning, so far as I could make out.

18449. In those laboratory experiments which are carried out for the Corporation, how long would it take to be able to decide in a doubtful case of diphtheria, for example?—I should say within 48 hours.

18450. But supposing that you have to resort to a guinea-pig?—Yes, within 48 hours.

18451. Could you tell from the condition of the guinea-pig within 48 hours that you are dealing with the Klebs-Löffler bacillus?—Yes, I think so.

18452. How long would it take in using the guinea pig to decide whether the bacillus in question is the tubercle bacillus or not?—I think, as a rule, within six weeks. The usual time is about a fortnight or three weeks.

18453. It is now admitted, is it not, that it is exceedingly difficult to dissociate the tubercle bacillus from a number of other bacilli which are found in milk?—There are various ways that would dissociate them experimentally.

18454. The tubercle bacillus would bring about certain pathological conditions in the guinea pig?—Yes.

18455. Animals do not suffer from rheumatoid arthritis as far as you know?—No.

18456. You mean by rheumatoid arthritis, enlargement of the joints?—Yes, and wasting of the structure in the neighbourhood.

18457. But nothing definite has been yet discovered through experimentation with regard to that disease?—No.

18458. (*Sir William Church.*) You have had considerable personal experience in laboratories in which experimentation on animals goes on in Edinburgh and in Oxford, in Cambridge, and in Belfast, and in Manchester?—Yes, I did not have much experience in Edinburgh, except as a student. I have been in laboratories there a little, but not very much.

18459. And I think also you have probably visited other laboratories in this country?—Yes.

18460. We had a witness before us lately who seemed to be under the impression that when an animal was kept under chloroform by means of having a tube introduced into the trachea, and then vapour of chloroform supplied to the animal through that tube, the tube was introduced without the use of anæsthetics; that is to say, the wound was made without the use of anæsthetics. Have you ever seen it done?—Never.

18461. Not in Edinburgh when you were a student?—No.

18462. There is no difficulty whatever in keeping an animal under anæsthesia under those circumstances?—No.

Mr. J. H. Levy, called in; and Examined.

18463. (*Chairman.*) You, I believe, are Honorary Secretary of the Personal Rights Association?—I am.

18464. What is that Association?—It is an Association for the defence of the personal rights of men and women, of course, and secondarily of animals.

18465. That is what I asked you the question for. In personal rights do you include the personal rights of animals?—No, we should not call the rights of animals personal rights, but we are obliged to take into consideration the rights of animals for this reason, that if we did not recognise that the animals have rights, we should be obliged to consider every prosecution for cruelty to animals as an attack on the personal rights of the person prosecuted; therefore in that secondary way we are obliged to take into consideration the rights of animals.

18466. Has your Association any Hall or place of meeting?—32 Charing Cross.

18467. You have offices there?—We have an office at 32 Charing Cross. I may say that we have been in existence since March, 1871, and we have had quite an illustrious band of vice-presidents.

18468. And how many members have you?—From 120 to 150. We are only a small number of people meeting in an upper room, but I hope that will not militate against our evidence being considered valuable.

18469. It is a question we ask of most witnesses who come to represent particular bodies?—Quite so.

18470. I should like to say first before I examine you, and other gentlemen examine you, that we cannot admit as part of your evidence that pamphlet which is appended in print to your *précis* called "The Ethics of Vivisection"; we cannot print it bodily as evidence; but we shall ask you questions on the points mentioned in your *précis* and if there are any answers that you wish to support by the arguments used in your pamphlet, of course you can use them for that purpose?—I am very sorry for that, because although my *précis*, including the appendix, has been on our shelves for nearly twelve months, I consider that if you would read it through——

18471. I have done so?—I am very much obliged to you, my Lord. I consider that it is almost a sufficient answer in itself to the evidence that was given before this Commission by Lord Justice Fletcher Moulton, that is to say, it anticipates that evidence, and I think replies to it.

18472. I have told you what I propose to ask you; it may be that other members of the Commission will take a different view and go into this matter more than I should do, but I propose to ask you with regard to the first two pages of your *précis*, which, I think, open the whole ground of your views?—Yes.

18473. You are going to tell us what you consider to be the case set up by those who are in favour of vivisection as regards its morality?—Yes, that case is almost—if not entirely—based upon the direct balancing of the pain inflicted on the animal and the pain which the vivisectors suppose to be avoided by the knowledge which they may obtain in that way. I have contended, in the portion of my *précis* which is not to be considered now, and I believe that I have contended successfully, that that is not sound ethics at all—that the hedonistic ethics, which Lord Justice Fletcher Moulton put before you (and which I believe to be sound ethics at the bottom) cannot be applied directly in that way; that you have to obtain from it your *axiomata media*, as Austin contended, and apply them, and that any attempt to apply the hedonistic end directly, by the balancing of the evil and the good, is altogether a mistake and unsound ethics. I could show you that by taking a case. Supposing that a man who has a wife and children at home wanting food goes into a railway carriage, and sees there a bag of sovereigns marked "Rothschild." Shall he steal those sovereigns or not? By direct balancing, the ethical verdict would have to be in favour of his taking them; the loss inflicted upon Rothschild could be a very small matter indeed, while the gain in avoiding the pain to his family would be very great. If you decide that matter in the way of direct balancing, the decision will be in favour of the man committing the theft. The proper way, however, of dealing with the matter is to arrive at some mediate axiom—that of honesty in the matter of property, which would decide exactly the other way. And so it is with regard to this vivisection: if you argue it by way of direct balancing you come to one conclusion; if you argue it by your mediate axiom of morals you come to another conclusion.

18474. I see in your *précis* you state the grounds upon which those who approve of vivisection base that approval?—Yes, there are three grounds.

18475. You have dealt with the second of them just now; that is to say, that the pain or cruelty inflicted is more than compensated by the knowledge obtained which enables the medical profession to lessen pain and loss of life, so that the balance on the whole is in favour of happiness?—Yes.

18476. The first I see you state is that animals vivisected within the scope of British law feel no pain, or at all events not such a degree of pain as to constitute cruelty?—Yes.

18477. But do you contend that if an animal is operated on under complete anæsthesia, and is not allowed to come out of it, that is cruelty?—No, you will find on the next page of my *précis* that I deal with that; that if an animal is operated upon after the sentient life of that animal is completed; that is to say, if the animal is under complete anæsthesia and is not allowed to recover from that anæsthesia, so that it dies in that state, then the operation on that animal although technically during its life is after its sentient life is ended and, as I should view the matter, it is more one of anatomy than of vivisection; it is more properly to be called anatomy than vivisection.

18478. Then as regards the first ground, you say that if every animal that was operated upon was operated upon under complete anæsthesia, that is an answer?—Yes, if we could get any adequate guarantee that the animal is operated upon under a complete anæsthesia, and in the preliminary stages of putting that animal under anæsthesia there is nothing done that is objectionable, and the animal is not allowed to survive, that is to say, is not allowed to come out of the anæsthesia, but dies before it does so, then for all practical purposes that animal has been operated upon after its sentient life is ended, and therefore from that point of view may be regarded as a dead animal and the operation itself may be regarded as anatomy. But I am bound to tell you that I very much doubt whether you will get guarantees for anything of that kind being done—that is the point.

18479. You are not yourself, I understand, a physiologist?—I am not, and I do not propose to give evidence in that connection.

18480. We have had a very large number of physiologists before us, the purport of whose evidence has been that the Act has been enforced fairly and properly as regards anæsthesia; if that is so that would deal with the experiments under a simple licence?—Yes; but I do not share their opinion.

18481. But it does not deal with the cases in which the animal is allowed to recover, or where it is desired that the animal should recover afterwards, and be watched, or with the cases of inoculation for disease?—No.

18482. To those cases you object, I understand?—I do. I would like the Commission to understand that when I say that I should have no objection whatever to an animal being vivisected under complete anæsthesia, and killed or allowed to die in that state of anæsthesia, I do not commit myself to saying that any guarantees which have been proposed up to the present time appear to me sufficient for that purpose.

18483. But you would admit that that is a question of fact, would you not? The Act has been at work for 30 years, and it is a question of fact and evidence as to whether or not it has worked satisfactorily so as to prevent anything in the nature of cruelty?—I quite agree with that, provided that it is distinctly under-

Mr. J. H. Levy.

3 Dec. 1907.

stood that I am not saying that I consider it satisfactory.

18484. Quite so. May I take it that you do not see any justification for allowing animals to come to after an operation in order to watch the results?—Provided that there were no pain connected with it of any serious kind, I should see no objection even to that; it is only a question of whether the animal is subjected to serious pain in the matter. I see no objection to an experiment on an animal as such. If anybody proposed to try the experiment of whether an elephant could carry a threepenny bit from, say, Trafalgar Square to the Houses of Parliament, I should not object, and if the load were increased I should also not object up to the point beyond which the load became such that the experimenter would be prosecuted under the Act for Prevention of Cruelty to Animals.

18485. And do you object to inoculation, giving an animal a disease, on ethical grounds?—I consider that the whole of the present practice of the propagation of disease through animals is an abomination which will be swept away at some future time.

18486. Would that be your opinion, although you were satisfied that good results for mankind, and the treatment of diseases of mankind, were obtained by reason of those experiments—would that alter your view?—I do not believe that good results can be so obtained.

18487. I understand that?—But even if you could show me some good physical results which could be obtained in that way, I believe that there are other considerations connected with the matter which ought to condemn the practice, and I feel quite sure that, in the future, the medical profession generally will condemn the practice.

18488. That is to say, that you do not think that the saving of a great number of human lives or a great deal of human pain would justify the operations by way of inoculation of giving a disease to a score of animals?—It is the same thing with regard to all questions of morals. This question does not arise simply with regard to vivisection or with regard to some animal disease; it arises with regard to every moral law that we have. Take the question of lying or the question of murder. Supposing that by committing a murder you think you can save several other lives, the same question arises. Take the case of Eugen Hahn, which I have put in that statement of mine, on which, my Lord, you are to examine me. This surgeon, who took a bit of cancerous matter out of a woman's bad breast and inserted it into her healthy breast. Suppose Eugen Hahn could show me that by his doing that to that woman he could save 50 other lives, 100 other lives, or a thousand other lives, I would say, "No, you do not prove to me that you have done what ought to be considered right. The evil to humanity by allowing such things to be done far transcends any medical gain that you could possibly get in that way." I would contend also that—as I have shown there, and shown most conclusively—these experiments are not confined to animals, and never have been confined to animals; they have always been performed on human beings, as well as animals. Any of you gentlemen who are acquainted with this book by Dr. Smidovich will find the eighth chapter of it full of instances, with references to pages in magazines and medical journals, in which the authors of those crimes have themselves put on record the fact that they have committed them.

18489. That case of Eugen Hahn to which you have referred was a case, judging from your account, in which a surgeon whose duty it was to do his best for his patient took the opportunity of poisoning her?—But why is a surgeon bound to do the best for his patient? Suppose that he can, by poisoning a patient, produce a great deal of good for the rest of humanity, and save a lot of lives, on vivisectionist ethics he ought to do it. Why, if it is a question of direct balancing, should it not be done?

18490. You are putting vivisection ethics somewhat differently from the way in which they have been put before us. You have a right to do it, I suppose, in arguing the ethical question?—I think I have a right to put it so. If it is a matter of direct balance, one way or the other, why should not Eugen Hahn do that which he did?

18491. You think that on the principles of the vivisectors he ought to do it?—I think that if they were carried out logically that is what they would do. I think that they dare not, generally, do it; that is to say, they dare not carry out their principles logically.

18492. Your second ground about the balance in favour of happiness you have already dealt with?—I have dealt with that, I think.

18493. Then the third ground which you put into the mouth of the vivisectionist is that vivisection is part of the procedure of science, and moralists have no right to dictate to science, but, on the contrary, should take their direction from it?—Yes.

18494. Is not that rather a controversial way of putting your adversary's argument for him?—Then let me put my adversary's argument in words out of his own mouth.

18495. Who is the person speaking?—I have prepared an answer to that.

18496. Out of whose mouth?—Not merely out of the mouth of one, but I will give you several. The vivisectionist doctrine, as an ethical doctrine, is the primacy of science over morals. In other words, vivisectionists claim, as scientific men, to be unrestricted by moral considerations, or by public opinion. Professor Metschnikoff, at the conclusion of the Harben lecture on the 30th May of last year, after advocating the vaccination of young girls with syphilitic material— with which he had succeeded in infecting monkeys—in order to fit them for a career of prostitution ("Journal of Preventive Medicine," page 459), declared that "morality should not attempt to lead hygiene, but should rather follow her," and that "modern hygiene, having become an exact and infinitely more precise science than it was formerly," ought "to reign supreme over all moralizing doctrines." This statement was met with loud applause and stamping by an English scientific audience.

18497. Were you present?—I have a letter from a person who was present, and I can put that letter in as evidence, if you like. The lecturer was complimented at the close of the lecture, special reference being made to what he had said about morals and hygiene; and amid enthusiastic applause he was presented with the Harben gold medal. Under these circumstances I cannot dissociate British vivisectors from their foreign coadjutors. One of the frankest of these, Dr. Smidovich, in his book, "Confessions of a Physician," page 152, says: "There is but one way out of the dilemma—that of stifling the reproaches of conscience, of choking down pity, and closing one's eyes to the living agony of the animals sacrificed." In his reply to Questions 3737 and 3738 Professor E. H. Starling said: "It is the greatest asset which a nation can have to have among itself a number of men endowed with this "mere curiosity," men who will put everything second to the advancement of knowledge." In "Nature," a fortnight before this was said (6th December, 1906, page 122), Professor Starling wrote: "A clamour has been raised by certain agitators for a restriction of experiments to those which can be shown to have a direct utilitarian object. Such a restriction is impossible. . . . These researches must be undertaken in a spirit of pure curiosity, from a love of knowledge itself." It will be observed that the argument is everything is second to the advancement of knowledge: vivisection is necessary to the advancement of knowledge; therefore everything is second to that for which vivisection is necessary. Dr. de Watteville wrote to the "Standard" (23rd November, 1883): "I think we, as medical men, should not attempt to conceal from the public the debt of gratitude they owe to the *corpora vilia*—for such there are, and will be as long as the healing art exists and progresses." He pleaded that moral and pecuniary support should not be "refused to hospitals on the ground that their inmates are made use of otherwise than for treatment." He contended that "no amount of hysterical agitation and so-called humanitarian agitation will alter the laws of Nature, one of the plainest of which is that the few must suffer for the many. Sentimentalists who think they know better, who uphold the abstract 'Rights of Man,' and want to push them to their logical consequences, have no other alternative in the question now before us than to condemn the modern course of medical studies." And he concludes: "Whilst defending the moral grounds upon which experimental medicine rests, I allow that there are limits, narrow limits, beyond which it would be

imprudent or criminal to go. But I must emphatically protest against the tendency of men nowadays—and I am ashamed to observe that a few are to be found within the medical profession itself—who act upon the supposition that the public at large form a proper tribunal to decide upon what constitutes a transgression of those limits. Those alone are competent judges who are able to form a correct opinion on the one hand of the ultimate utility, on the other of the proximate consequences, of any investigation *in corpore vili*." Will your Lordship allow me to add that Lord Justice Fletcher Moulton, in his evidence before this Commission, really sustained the same ground—although he put it in words that are more consonant with English feeling, perhaps—when he said in answer to Question 12783: "'Conscience' is too often used where the true expression should be 'emotion.' Emotion may be a good motive power, but it is a bad guide, and in my opinion there is a very great deal of force in the phrase which somebody has used: 'If you want to do good in a particular way and want to know how you can do it effectively, give your heart a rest and your brains a chance.'" You see conscience is turned into emotion, emotion is turned into the heart, and you have to put your heart away; that is to say, you have to do what Professor Metschnikoff tells you, you have to put your conscience away. That is just what Dr. de Watteville tells you; it is the same thing throughout. The ethical ground of vivisection, I contend, is really a repudiation of morals and a contention that the pursuit of knowledge is to be unrestricted by moral considerations.

18498. You are putting it now in a somewhat different way from that in which it is put in your *précis*. You say there that the argument is that vivisection is part of the procedure of science, and moralists have no right to dictate to science, but, on the contrary, should take their direction from it?—Those are almost exactly Professor Metschnikoff's words.

18499. That is not the view which has been taken by the great bulk, I think, of the witnesses who have been before us?—I am very glad to hear it, but it is undoubtedly the view of Professor Starling; it is undoubtedly the view of Professor Metschnikoff, and, so far as I can see, it is the view also of Lord Justice Fletcher Moulton.

18500. (*Colonel Lockwood.*) You said just now that you had reason to believe that anæsthesia was not always complete; have you any authority for that statement?—My idea respecting that has been gathered from what I have read and from the fact that curare is used along with the anæsthetic. I do not see how you can really guarantee that you have got the animal under an anæsthetic if you use curare at the same time.

18501. Then is it a sort of general statement, for which you have no authority?—My conclusion has been gathered from my own reading. As I have told the Commission, I have not come here to-day to give evidence upon any point except the ethical side of the question.

18502. (*Sir William Church.*) Why do you place a limit upon the rights of animals?—Rights must be limited by responsibilty; you cannot make animals responsible in the same way that you can make a human being responsible. I limit the rights of animals; I also limit the rights of children, and I limit the rights of idiots and lunatics, simply because you cannot make them responsible. And there is also another ground for the limit, namely, the ground of sensibility.

18503. You said, I think, that you thought that we had a perfect right to kill an animal for experimental purposes; that if the sentient life of the animal was dead you had no objection to experiments?—None whatever.

18504. What right have you to kill an animal to make an experiment upon it?—If the animal is a domesticated animal it is kept by us—we keep it, and there is no possibility of our carrying on any such intercourse with animals unless we have certain rights over them. We are bound to kill in order to live ourselves, with regard to a great number of animals. We are bound to kill them even for vegetable food; we cannot get any sort of food without killing animals, and there is no reason why this should be limited to the mere obtaining of food. If we can get any other good from them without inflicting upon them any wrong, then we should undoubtedly do it.

18505. If we have a moral right to kill animals to feed ourselves, why have we not a moral right to kill animals to protect ourselves from disease?—We have such a right; I have never denied it.

Mr. J. H. Levy

3 Dec. 1907.

18506. Then you maintain that we have a right to kill, but we have not a right to pain?—Not to torture.

18507. What do you mean by torture?—I mean serious pain that is inflicted for some unjustifiable purpose.

18508. Then it is justifiable to feed ourselves, but not justifiable to try and protect ourselves?—Exactly, it is not justifiable to protect ourselves in that way.

18509. I do not quite understand what you said with regard to the propagation of disease through animals. Animals are used experimentally for the diagnosis of disease, not the propagation of it?—They are used for the diagnosis of disease; that is to say, they are given certain diseases for that purpose; and they are also given diseases, not for the purpose of diagnosis, but for the purpose of experimenting on these diseases; and, in answer to a question from the Chairman, I said that I believed that the whole of that practice of the propogation of disease through animals was a wrong thing; that it would pass away, and that the medical profession themselves would come to that opinion. I give that as my opinion.

18510. I still do not understand what you meant by the propagation of disease?—I mean this. If you give a number of animals a disease, I call that the propagation of disease in those animals. Those animals would not take the disease in the course of Nature, in the ordinary way. If you give an animal a disease voluntarily and deliberately, I call that the propagation of disease.

18511. For the sake of a special observation and experiment?—I do not care for what you do it; that is the propagation of disease. I am not in the least denying that vivisectionists, in a large number of instances, at all events, perhaps universally at the outset, are actuated by good intentions. I have never said a single word against that.

18512. Have you any ethical objection to the use of what are now called sera in the treatment of disease?—If those sera are obtained by vivisectional processes, of course, naturally, I object to that, not because they are sera, but because they are obtained vivisectionally; it is only asking me the same question that I have already answered in another form. I would not allow myself, or any child of mine, to be operated upon seropathically. I may tell you, if you are interested in knowing it, that some years ago, when I was visiting Paris, I was attacked by some disease, and the doctor there proposed subcutaneous injection. I said—What are you going to inject; if it is serum or vaccine, I will not have it on any consideration. No, he said, it is morphine. I said—You may use morphine, if you like. But I would not allow myself to be operated upon seropathically.

18513. Why not?—In the first place, I do not believe in seropathy——

18514. That will do; you need not go any further.

(*After a short adjournment Sir William Church took the Chair.*)

18515. (*Sir William Collins.*) The paper appended to your evidence deals largely with a discussion which you had with Huxley, does it not?—Yes.

18516. I understand you to agree with Huxley that the field of morality is a reclamation from a state of nature?—Yes, I do hold that, and I hold it to be a very important statement of his, which is a landmark, as I think I have said, in British ethics.

18517. I gather that you think that to take the cosmic process as our moral exemplar is fatal to the ethical ideal?—Certainly.

18518. I understand that you quote John Stuart Mill as in agreement with yourself to the effect that the doctrine that man ought to follow nature, or, in other words, ought to make the spontaneous course of things the model of his voluntary action, is irrational and immoral?—That is certainly my principle.

18519. And you lay emphasis, I gather, upon the evolution of the moral sense?—Yes.

18520. That is to say, that things formerly regarded as not immoral may be held to be immoral to-day, and things regarded as moral to-day may be re-

Mr. J. H. Levy.

3 Dec. 1907.

garded as immoral at some future date?—Undoubtedly.

18521. I see that you lay stress upon an opinion which you share that our consideration for animals is not so much subtracted from a fixed stock of sympathy resulting in less being available for our fellow-men and women, but is rather the sowing of a crop of tender emotions?—Certainly; I hold that to be a very important principle. Usually it is argued that it is the opposite—that philozoic sentiment is something subtracted from philanthropic sentiment. On the other hand, I think that not only could it be shown *à priori*, but it could be verified from experience that those who are kindest to animals tend to be kindest to human beings also.

18522. You think that it is part and parcel of the same moral sense that dictates our action towards mankind and towards animals?—Certainly; I think that the basis of all our moral actions is sympathy, and that that sympathy ought to be as wide as sentient existence.

18523. In regard to the question of the balance of advantages, the theory put forward by Sir John Fletcher Moulton, I see that you call attention to the judgment of Lord Chief Justice Coleridge in the case of the "Mignonette"?—Yes, that is a very important point. You will notice there that Lord Chief Justice Coleridge's decision is almost the exact opposite to that of Lord Justice Fletcher Moulton.

18524. I see that the Lord Chief Justice then said:—"Law and morality are not the same; many things may be immoral which are not necessarily illegal; yet the absolute divorce of the law from morality would be a fatal consequence"?—Yes, certainly it would.

18525. You agree that there may be things which may be regarded as immoral, which we ought not to punish by law?—Undoubtedly; it would be fatal to attempt to regulate our whole field of morality by law. And I may say with regard to this question of vivisection, that, although I think something may be obtained by law, still I myself rely more upon such arguments as are put forward in the appendix to my *précis* to affect the medical profession, and scientific men generally, and I think that they will gradually come round to the view which I have put forward.

18526. You agree that not everything that is morally wrong need be punishable by law?—Certainly.

18527. And that it may be a question for this Commission to decide, or to advise the Government upon, as to whether vivisection is or is not one of those things which, though you regard them as morally wrong, should yet be not punishable by law?—Yes, I think that there may be some things in vivisection which we may hold to be wrong, and endeavour to discourage, but still we should not be wise to interfere with them by means of penal enactments.

18528. I see that you rather sum up the opinion of Lord Justice Coleridge in the "Mignonette" case by saying that what would otherwise be a crime is not justifiable by the plea of a specific balance of advantage?—Yes, that is my contention throughout the whole of that essay.

18529. We have often had the question raised in this Commission, whether it is right to ride a horse to death to save a human life. What do you say with regard to that?—If it is a question between the life of a horse and the life of a human being, I should ride the horse to death as I would risk my own life.

18530. Is that adopting the balance of advantages argument or not?—I am placed between two alternatives. I have to do one thing or the other; I have to let the human being die or the horse die, and I am bound to take my choice. But I would not vivisect a horse to save a human being.

18531. You think that is a sound position?—I think so. It is one that has been put to me, and which I have to answer just offhand. I think I would take the risk of the horse dying.

18532. Have you not rather put to us that in the case of vivisection there may be a conflict between the objects of science and the dictates of morals?—Yes, certainly there may be.

18533. Do I correctly understand from you that when that conflict occurs morals should be supreme?—Yes, morals should always be supreme over every thing; otherwise moral law has no meaning at all.

18534. I did not quite understand how Sir John Fletcher Moulton applied his balance of advantages theory in the case of man, because I see that in answer to Question 12735 he says:—"I unhesitatingly say that our right to experiment on men is extremely limited. In the first place, we have no right voluntarily to allow death to occur, even though the man would be willing to permit it." And he says:—"I do not think that we should have the right for experimental purposes to allow a man to infect himself under special circumstances, even though they would assist science with a disease like syphilis in order to add to knowledge." And again he says:—"I do not think that you ought to lessen in any way the feeling of sanctity of human life." What do you say with regard to that?—I do not think the sanctity of human life would be decreased by a man voluntarily submitting himself to experiment, but it certainly should not be done except under the strongest public guarantees that no wrong is being done, because evidently anything like that would be open to the gravest abuse if the public had no means of verifying what was done.

18535. Do you think it would be sound ethically to say that while the balance of advantages argument is applicable in the case of animals, it is inapplicable in the case of man?—No, that is not the case. If an animal could voluntarily give itself up to be experimented upon, I should see no objection to the animal doing it, but I object to an animal being made a vicarious sacrifice in the way that is done, and I object to a man being made a vicarious sacrifice in the same way. If the woman in Eugen Hahn's case, which I have mentioned already, had said:—"I allow you to experiment with my healthy breast," under due supervision, so that it could be verified by the public, I would see no harm in it.

18536. You draw a great distinction between cases in which the voluntary assent of the patient has been obtained and those in which it has not?—Certainly; voluntary self-sacrifice happens every day on the battlefield and elsewhere.

18537. As Lord Chief Justice Coleridge said in his judgment:—"To preserve one's life is, generally speaking, a duty; but it may be the plainest duty, the highest duty, to sacrifice it"?—Certainly; and as that is so in military matters, I see no reason why it should not be so also in scientific matters.

18538. We have had the name of Pirigoff mentioned before the Commission already. I see you make some reference to his work; do you desire to quote from it?—That is a quotation in my essay from the book of Dr. Smidovich.

18539. What does he say?—Pirogoff says, "In my younger days I was pitiless to suffering. One day, as I remember, this indifference to the agony of animals undergoing vivisection struck me with such force that, with my knife still in my hand, I involuntarily exclaimed, turning to the comrade who was assisting me, 'Why, at this rate one might cut a man's throat.' Yes, much can be said in favour of and against vivisection. There can be no doubt that it is an important aid to science . . . But science does not entirely fill the life of man; the enthusiasm of youth and the ripeness of manhood pass, and another period of life ensues, and with it an inner call for introspection; and it is then that the recollection of the violence used upon, the tortures inflicted on, and the sufferings caused to another creature commence to pull at one's heartstrings involuntarily. It seems to have been the same with the great Haller; so it was with me, I must confess; and in these later years I would never be able to bring myself to perform the same cruel experiments upon animals which at one time I carried out so zealously and with such nonchalance." You will observe that Dr. Smidovich says in reply to this, "None of this can be denied. *Mais que faire?* To renounce vivisection were to place the future of medicine in jeopardy, to condemn us doctors for ever to the uncertain and barren paths of clinical observation."

18540. Is it you or Dr. Smidovich who makes this further observation, "As one of the ablest thinkers on medical matters has said, it is not so much the amassing of further facts that is wanted as the ability to think out the logical consequences of the facts already within our knowledge"?—It was I who said

that, and the doctor referred to is Dr. Rablagiati, of Bradford.

18541. Is Dr. Smidovich alive?—I do not know at all. I think he is. This book of his has only recently been published.

18542. What is the date of it?—It is quite recent.

(*Sir William Church.*) It is 1904. It appears to be a young Russian doctor, and it is more a work of medical romance.

18543. (*Sir William Collins.*) Then you made some allusions to some experiments in regard to syphilis?—Yes.

18544. Are they vouched for by Smidovich?—Yes, if you turn to Chapter 8 in his book you will find a heap of experiments on human beings with syphilis, and the references to the medical and other papers in which they were confessed by their authors; and he points out that those experiments in venerology took place because animals could not be experimented upon for that purpose. Since that time, of course, as you all know, Professor Metschinkoff has succeeded in communicating syphilis to monkeys.

18545. Were those experiments made on human beings without their knowledge and consent?—So it appears in Dr. Smidovich's book; some of them with their consent, some of them not.

18546. Is there anything else that you desire to add in reference to the ethical evidence given by Sir John Fletcher Moulton?—I want to point out in the first place that his doctrine is hedonistic, but one-sided; he treats it only from the negative side—namely, salvation from pain. You see at Question 12704 that it is based on direct balancing. We have these words, "He would look at the inflicted pain, which would be to the bad side of the ledger." Those words evidently mean direct balancing. Now this view of direct balancing is argued against by me in detail in the *précis* respecting which I have just been answering, but, in reality, when you come to the after part of Lord Justice Fletcher Moulton's evidence the specific balancing really—or rather I should say the *quid pro quo*—is withdrawn, because at Question 12717 you find him arguing that you should experiment even without that *quid pro quo*—that it should be done as "a matter of pure curiosity," as Professor Starling says. Now this, as I have already said, is exactly the opposite to the view of Lord Chief Justice Coleridge. Lord Justice Fletcher Moulton proceeds by steps. He first says: "I say that if you look round the world the only way in which we can diminish pain is by human action." Well, I suppose it is; the only thing we can do in any direction is by human action; in fact, what we do and human action mean exactly the same thing. But I would point out that science never has any right to dictate human action. However far your generalisations may carry you in science, and to whatever height you may get in what you do in science, your conclusions will always be summed up in the indicative mood. When you pass from the indicative mood to the imperative you pass out of science altogether, and you come to ethics, and the categorical imperative must be decided by ethical considerations. Then Lord Justice Fletcher Moulton said at Question 12708, "I shall trust to show to this Commission that the pole star by which we steer is knowledge." Surely there was no need to demonstrate any such thing to this Commission or to any human being outside of Bedlam. We all agree, of course, that the pole star by which we steer is knowledge. But then he proceeds further on to say that no man who knows anything of science has any doubt that the right way to advance knowledge is by experiment, and then at Question 12716 you have the statement that "The more complex the subject is the more factors there are at work the more essential the experimental method is, and the most complex of all phenomena are those that relate to living beings." I believe I know something of logic, and this startles me as a great novelty, because the fact is really that the more complex phenomena become the more impracticable does experiment become, owing to intermixture of effects, and that is why experiments on animals or on human beings are to a large extent illusory; all sorts of contradictory conclusions are drawn from the same experiment performed by different individuals.

18547. (*Sir William Church.*) Do you make that statement from your own knowledge?—Yes; I am speaking as a logician.

18548. Not as an experimenter?—No; I am speaking as a logician. I am speaking as one who has for a great number of years studied the science of evidence, and who knows the conditions under which knowledge can be obtained. But it must not be supposed for that reason that I am in any way opposed to experiment; that is quite out of the question. As I have said earlier to-day, I am not opposed to experiment, even on animals, under limitations.

18549. (*Sir William Collins.*) Sir John Fletcher Moulton's point was largely that if medicine was a merely observational science it would crawl, but that if it were an experimental science it would advance rapidly?—Yes; I know he said that; he drew a distinction between an observational science and an experimental science, and he said, "You can take the whole range of the sciences, and I would challenge an opponent to name one in which advance, if it has been rapid and striking, has not been through experiment." I suppose it will be allowed that great advance has been made in astronomy and mathematics, and I suppose it would also be allowed that no experiment has helped in that advance.

18550. Did not Sir John Fletcher Moulton say that he thought the science of volcanoes was the only observational science that he knew?—Yes; I did not know that there was a science of volcanoes separate from seismology, but it is evident that that was chosen because it was a laggard piece of science. The fact is that the words "rapid and striking" afford a loophole of escape from any criticism. If they refer to modern medicine it begs the whole question, because those who hold the view that I am putting forward challenge, of course, the advances which have been made in this respect—that is to say, with regard to Pasteurism especially I certainly would challenge it. Then how does Lord Justice Fletcher Moulton prove his hedonistic theory? He gives us first a history of what was done with a dozen guinea-pigs.

18551. Have you been able to find out the origin or source of that experiment?—No; I have not.

18552. I did not get it from the Lord Justice himself?—I observed that you asked him what those experiments were, and that Lord Justice Fletcher Moulton said: "I cannot tell you the name of the doctor because it was not given me, but I heard it long ago in the early days of research in tuberculosis, and I believe it to be true." If that had been brought forward here, not by a Lord Justice, but, say, by some ignorant anti-vivisectionist, I venture to say that you would have laughed very much at such a piece of evidence being brought forward. Then Lord Justice Fletcher Moulton went on to say: "If it was not actually performed it would still hold good as a typical example." A typical example if not actually performed! That is a very curious sort of example. If it is a typical example at all, it is an example of the sort of reasoning that we are expected to accept in this matter. Then further on, at a suggestion of the Chairman, he said: "You may take it simply as an illustration." If we get no evidence that the thing occurred at all, what is the value of it as an illustration? Then there was another illustration that he gave—the illustration of rats in a ship. This is an analogical argument, and, as anybody knows with regard to analogy, the whole of the value of the argument depends upon the justice of the analogy, and there is no analogy here at all. The rats in the ship were not vivisected. I suppose that the passengers, if they were rational human beings, would have been quite willing that the rats should be destroyed, whether they were the cause of the plague in the ship or not; certainly I would, and I do not know any anti-vivisectionist who would take up the ground that Lord Justice Fletcher Moulton there puts forward as that of an objector.

18553. Does that complete all that you have to say with regard to the evidence of Sir John Fletcher Moulton?—Yes, I have looked through the remainder, and I can find nothing in Lord Justice Fletcher Moulton's argument, except what I have put forward—nothing at all. I consider that my essay appended to my *précis* is a complete answer to the main position that Lord Justice Fletcher Moulton took up.

18554. (*Sir John McFadyean.*) I understood you to say that in determining for oneself whether any action was right or wrong one should not endeavour to cast up any account of gain or loss, but should apply cer-

Mr. J. H. Levy.

3 Dec. 1907.

tain mediate axioms. Will you tell us how you arrive at those mediate axioms?—You arrive at them either by induction or deduction from your main principle of ethics, that is to say, the promotion of happiness.

18555. Is that the greatest happiness of the greatest number?—No, the greatest happiness. I have nothing to do with the greatest number.

18556. The greatest happiness of whom?—Of all sentient beings.

18557. That is the greatest happiness of the greatest number, is it not?—No.

18558. Well, what is it?—It is the greatest happiness.

18559. The greatest happiness of all sentient beings?—Yes.

18560. But supposing that they cannot all be happy, is not that deciding what course of action will bestow the greatest happiness on the greatest number. Distinguish, please, between that and the utilitarian doctrine?—There is no distinction; it is the utilitarian doctrine.

18561. You accept that?—Yes.

18562. Do you only object to the hedonistic principle, because you think the account is cast up wrong?—I do not object to the hedonistic principle. If you read my *précis* you will see that I accept it.

18563. But I understood you to say a minute ago that we were not to apply the hedonistic principle, but mediate axioms?—No, what I object to is not the application of the hedonistic principle, but a certain mode of applying it—applying it in the mode of direct balance of advantages, of pleasure and pain. That is what I have endeavoured to show.

18564. Yes, I understand. You think that supposing there might be freedom from pain there are countervailing disadvantages?—No, if you look at the portion of my *précis* in which I have quoted from Austin you will see that Austin himself tells you exactly.

18565. Perhaps you can explain it yourself?—I would rather read what Austin says. He says, "According to that theory"—that is the hedonistic theory—"our conduct will conform to rules inferred from the tendencies of actions, but would not be determined by a direct resort to the principle of general utility. Utility would be the test of our conduct ultimately, but not immediately; the immediate test of the rules to which our conduct would conform, but not the immediate test of specific or individual actions. Our rules would be fashioned on utility; our conduct on our rules."

18566. So that if vivisectors believe that by vivisection they are promoting the happiness of sentient beings, they are acting logically and in a way that you would commend?—Certainly, so far as our judgment of the men is concerned; but, in judging the morality of acts, motive is irrelevant.

18567. That is all I want on that point. You were asked a question as to the rights of animals, and I understood you to say that these rights were limited by the fact that animals are irresponsible, and you classed them along with lunatics and children?—Yes, for some purposes.

18568. It appeared to me that that was an unfortunate classification, because the fact that the individual is a child or lunatic extends his rights as regards protection from pain. Are the rights of animals extended with regard to protection from pain, owing to their being irresponsible, more or less?—I deny your premise. I deny that the rights of children and idiots are extended.

18569. Well, in what respects are they affected? I am merely quoting, so far as I can, what you said yourself; you said that they were limited?—Yes, they are limited; they are limited by being interfered with. A child is not allowed to do exactly what it likes in the same way as an adult human being is.

18570. That is beside the question. We are discussing pain; we are not concerned with limiting the actions of animals?—You asked me a question with regard to the limitation of their rights, and I am answering that question.

18571. I will put it to you again. You were asked with regard to the rights of animals, not with regard to their limitation, and you said that their rights were limited by the fact that they were irresponsible?—Yes.

18572. How does that bear on the question of causing pain to animals? Does the fact that they are irresponsible limit their rights as to freedom from pain caused by human action?—Yes, it does.

18573. That is what I thought?—A moderate chastisement to a horse would be perfectly justifiable.

18574. But is it more or less justifiable owing to the fact that the horse is irresponsible?—It is more justifiable on account of the horse being irresponsible, and the horse is placed under restraints which would not be justifiable if it were responsible as a human being is.

18575. But that is only pain inflicted for that individual horse's good?—I do not know that it is for that individual horse's good. If I drove a horse and gave it a slight flick with the whip, it would not be altogether for the horse's good, it would be for my good in getting forward.

18576. So that that is a case you would think in which it is quite permissible to cause pain to a horse?—Yes, a very slight amount of pain.

18577. Where do you draw the line; what mediate axiom enables you to draw the line between permissible pain and unpermissible pain, which is not for the animal's good?—You cannot do it in practice.

18578. I am content with that answer?—You cannot do it in practice, and you will find that under the Cruelty to Animals Act (Armstrong *v.* Mitchell, 88 L.T. 870), the question of cruelty is reserved as a question for the judges; that is to say, it must be decided in each case by men who have got some empirical idea of what amount of chastisement shall be allowable and what shall not. In all those cases it is so. Nature is not made up in separate compartments for us.

18579. May it be decided in the same way how much pain it is permissible to inflict on animals with a view to extending useful human knowledge?—Certainly.

18580. May I ask whether you would consider it a greater crime to kill a man or to cause him a considerable amount of non-fatal pain?—Certainly, I should say to kill him.

18581. Does that apply to animals also?—No.

18582. What is the mediate axiom which enables you to discriminate in these cases?—With regard to animals, the killing is a necessity of our life upon earth. No man can help killing animals; we could not help it, as I said previously, if we were vegetarians. The ploughshare, when it goes through the ground to get the corn to make my bread, kills, vivisects, if you like, innumerable earthworms; do what we will, we cannot avoid killing animals, but we can avoid torturing them, and it is avoidable evil that we should avoid.

18583. I am afraid I do not quite follow that. What is the evidence that man must everywhere kill animals?—Can you tell me how to avoid it?

18584. Certainly; I could suggest that if men ceased to interfere with the domesticated animals they probably would die out, and it is only the domesticated animals that I am dealing with?—Yes.

18585. Then, supposing that they had died out here, do you suggest that it would be impossible to maintain existence without them?—No, not without them, but you would be obliged to kill other animals in order to live.

18586. Why? Are you a vegetarian?—No, but that does not matter to the point you are asking me about.

18587. Except that we have had people here who are vegetarians, and who are maintaining their existence well enough?—Never mind; those persons who are vegetarians, as I have explained just now, cannot obtain their bread without killing earthworms, and they cannot obtain their cabbages without killing caterpillars.

18588. So that you freely admit that man is entitled to cause a certain amount of pain to animals in protecting himself, for instance, and in feeding himself?—Yes.

18589. In some of which cases he may be justified in killing them, although his life is not threatened but his comfort simply is threatened?—Yes.

18590. What is the mediate axiom that justifies a man in killing an animal and causing pain in killing it to prevent discomfort, but yet forbids his causing it any pain whatever in order to extend useful human knowledge?—I have never said that he may not cause a certain amount of pain to animals in order to extend useful human knowledge.

18591. If you admit that then I am quite content?—Very likely you and I would draw the line at very different places.

18592. Yes, I think that is very likely. Is it justifiable to cause pain to one animal in order to secure benefit to another animal?—It might be so. If I could tie up my dog, and cause it a certain amount of discomfort by being in its kennel, in order that another dog should be free from annoyance by it, I should feel perfectly justified in doing that.

18593. I will put a concrete case to you. Supposing that one had a lot of cattle in which a serious disease had broken out, and one had knowledge amounting to certainty, that by taking blood from one of those animals and injecting it into the others, one could save their lives, and save them a certain amount of suffering too (I ask you to assume that that is so), would a man be justified in doing that?—I think so, so far as I can see.

18594. Would you explain what is the difference in principle between that and infecting an animal in order to secure from it some material which would be valuable for treating other animals?—In the first place, there is no absolute certainty with regard to that. You have given me absolute certainty with regard to the other case. There is no absolute certainty in this.

18595. But I ask you to assume in this case also that there is absolute certainty that by infecting an animal which at present is healthy, you can afterwards obtain from it material which would be valuable for saving the lives of other animals. Assuming that to be certain, would it be permissible?—I do not know all the circumstances. I could not decide that offhand.

18596. Then why did you decide the other one so easily?—It appeared to me that that is a perfectly easy case, so far as I can see. You must recollect that it is by no means an easy matter to decide offhand at a Board like this all the cases of casuistry that you might possibly put to me.

18597. Apparently not?—I am quite willing to acknowledge it. I do not in the least deny it.

18598. Do you mean that it is difficult to decide on the spur of the moment, whether it would not upset a conclusion previously arrived at?—I do not mean that in the least. If, instead of asking me these cases now, you were to write them down and give me a little time to think out each case, then I should be able to give you a much better answer.

18599. If I may I will re-state it, and make it absolutely concrete?—I mean to say this, if you take the greatest lawyer in the land and you put him down at this table and then ply him with all sorts of difficult questions of the application of the law he will not be able to answer you offhand. Very often judges take days to consider their verdict upon these matters, and I should say the same with regard to these matters of casuistry.

19600. Would you like me to understand that the question is too complicated for you to answer offhand?—The question is one that requires consideration.

18601. May I call your attention to this statement in your *précis*: "If there is any validity in the vivisector's logic it cannot stay at the lower animals." That is to say, the logical consequence of performing an experiment on the lower animals is to go on to experiment with man?—No.

18602. Well, what does the statement mean?—The logical consequence of vivisection—that is to say, the direct balancing—is that human beings, as well as animals, will be vivisected if there is a direct balance of advantage.

18603. I beg to call your attention to the fact that you yourself suggested it to be logical that they should go on to vivisect criminals and lunatics?—Yes. I do say that.

18604. Supposing that I point out where the flaw is in this reasoning?—I should be very glad.

18605. If there is any validity in the logic of those who justify the killing of animals for human food, you cannot stay at the lower animals. Then why not kill idiots, lunatics, and babes for human food? It seems to me to be just as logical to stop at the one as at the other?—I do not think it is at all logical; at all events, it does not point out any flaw in my reasoning.

18606. Is it not quite logical for vivisectors to start with an axiom which says that one thing may be permissible with regard to one's actions on the lower animals, but not permissible on man?—One may quite do that. But I say that, given hedonistic direct balancing, you cannot stop at the lower animals logically, and I will go further and say that vivisectors have not stopped at the lower animals. If you take Dr. Smidovich's book, the whole of Chapter 8 is full of experiments in which vivisectors have not stopped at the lower animals, and they have not stopped with regard to cruelty.

18607. Does your objection to causing pain to animals extend to the whole of the animal kingdom?—Of course it varies with regard to the sensibility of the animal. One would not say the same with regard to a black beetle as one would with a dog. There is a difference in sensibility. When the question is one of cruelty the sensibility of the animal must, of course, be taken into consideration.

18608. What do you mean by cruelty?—I have already defined it as serious pain inflicted for an object which cannot be justified.

18609. But as applied to pain caused by vivisection it is begging the question, is it not. To call the pain caused in vivisection cruelty is begging the question which is in dispute?—I never called all the pain inflicted by vivisection cruelty.

18610. Which part of it do you call cruelty?—I say that a great part of the pain inflicted by vivisection is cruelty, and if I had come here to give evidence on that portion of the matter, which I have not done——

18611. Then please do not?—I could give you plenty of proof of it.

18612. That is like saying that you have not come here to give it, but you are ready to give it?—Yes.

18613. But you would not offer to give expert evidence on that?—No; I am not an expert on that matter. I should have to give you the evidence of others.

18614. What do you think about the right of man to cause pain in field sports?—I have noticed that questions of this kind have been put to other witnesses—questions designed to show that there are grievous inflictions of pain on the lower animals, in connection with the rearing of animals designed for food, with the slaughter of those animals, with what is called "sport"; and that those who desire to prevent vivisectionist cruelty are inconsistent in not proceeding at one and the same time against all these forms of cruelty, that by eating ordinary butcher's meat they are *participes criminis* in the castration of animals and the horrors of the slaughter-house. I wonder that the argument was not pushed a step farther, and that it was not pointed out to vegetarians that they obtain their bread by the painful extermination of animals. When the ploughshare—which is an instrument used in the procuring of the corn from which bread is made—passes through the ground it cuts up alive innumerable earthworms; and rabbits and other animals which compete with us for the possession of our vegetable food are killed by methods which undoubtedly involve serious pain. Under the conditions of human existence I do not see how we could avoid killing and the infliction of some pain. In so far as, in the matters referred to, the infliction of pain is avoidable, it ought to be avoided. But I decline to pursue the matter farther. I am reminded of the case of the boy who was told that he might have all the nuts in a certain jar, but that he must take them out with one handful. He found, however, that when he took them in his hand his fist was too large to get through the opening of the jar. I would be glad to abolish all forms of cruelty at a single blow; but I would find the matter in hand too large, and would be unable to get my fist through the opening of the political jar. But why commence with vivisection? Because vivisection sanctifies cruelty by investing it in the garb of science, by making knowledge the primary object of pursuit. It is not only hideously immoral in practice, but sets up an ethical theory of the primacy of scientific curiosity, which is ruinous to the ethical ideal, debauching to the intellect, and demoralising to mankind.

18615. Do I gather from that answer that you would approve of field sports, in so far as they are painful, being put down by law?—No; I must decline to go into that.

Mr. J. H. Long.

3 Dec. 1907.

18616. Do you mean that you decline to answer?—Yes.

18617. Why do you decline to answer?—That is my answer—simply because I will not go into any further matter now. I am attacking vivisection. I do not want my hand too full to get through the opening in the jar.

18618. But that is not the question. I think one has a perfect right to put questions to find out how far you are consistent?—I do not think you will ever find out that I am not; you may try that as much as you like.

18619. But if you do not answer we cannot find out?—I have given you my answer.

18620. No, you have not, excuse me. I asked you whether you would approve of field sport being put down by legislation in so far as it is painful?—That does not appear to me to be the question.

18621. You decline to answer?—Yes; further than I have already answered.

18622. Do you justify the killing of animals in order to convert their hides into leather?—Yes.

18623. You think that is justifiable?—Yes.

18624. Could substitutes for leather not be found, perhaps to man's discomfort, but still, you would not represent it as absolutely essential that men should be shod with leather?—No, I say that if by progress of dietetics and economic progress of the kind you show that we can get rid of killing animals for food and leather and other things altogether, no one would rejoice more than I should, and I think that the future may bring us to it.

18625. But is any question of right or wrong involved in rearing animals in order to kill them to provide us with shoe leather?—I do not think the thing is carried on. I never heard of it being done.

18626. Do you think that the value of an ox's hide does not enter at all into the agriculturist's calculations?—It does, but the ox is not reared for that only.

18627. It is reared in part for this?—It enters into the consideration, but it is reared for its flesh and its horns, and its hide, and its hair; it is reared for the whole. It would be putting a part for the whole to say that it was reared for the purpose of its hide.

18628. I said, was it reared in part for the purpose of its hide?—Yes.

18629. Is there any ethical side to that question at all?—I do not think that there is, as we are situated now.

(*Sir John McFadyean here took the Chair.*)

18630. (*Sir Mackenzie Chalmers.*) In reference to Professor Metschinkoff's lecture, were you quoting from the lecture, or were you giving us a summary of what you thought it meant?—It was a quotation. I have the "Journal of Preventive Medicine" here for you to verify it, if you like.

18631. I refer especially to a passage which I did not understand to be a quotation about the inoculation of syphilis?—That is not a quotation.

18632. What is that?—It is a description of a passage in Professor Metschinkoff's book, evidently too short to be a quotation.

18633. I read the lecture myself, and I should not have abstracted it in the same way?—Perhaps not, but I contend for the accuracy of my abstract, and I shall be quite willing to append to my evidence the passage of which it is an abstract, in order that readers may see whether it is a fair abstract or not.

18634. That perhaps might be useful.* As regards the case to which you have referred of inoculation of cancer by somebody named Eugen Hahn, can you tell us who Eugen Hahn was, and where he performed this experiment?— You will see it in Dr. Smidovich's book.

18635. Can you tell us the date and where it was performed?—You will find it on page 125. "In March, 1887, a woman, suffering from cancer of the mammary gland, applied to the surgeon, Eugen Hahn, of Berlin. The performance of an operation was impossible. 'Not wishing to divulge before the patient the hopelessness of her condition by declining to operate upon her, and so as to relieve and reassure her by the psychical illusion of having performed the operation,' Dr. Hahn removed a portion of the tumour of the patient's diseased breast, and transplanted it into the other healthy one" (*handing in the book*).

18636. The object of this experiment seems to have been to prevent the poor woman understanding that her case was hopeless?—No, that was not the object of putting a portion of the cancerous material into the healthy breast.

18637. I am only reading the words of the book: "'Not wishing to divulge before the patient the hopelessness of her condition by declining to operate upon her, and so as to relieve and reassure her by the psychical illusion of having performed the operation,' Dr. Hahn removed a portion of the tumour of the patient's diseased breast, and transplanted it into the other healthy one; the inoculation was successful." It conveys that idea to me?—But it does not convey that idea to me, and if you notice, the book itself from which this is described is called "Ueber Transplantation der Carcin"; that is to say, the book itself is on the transplantation of cancer, and this was an experiment in the transplantation of cancer.

18638. (*Sir John McFadyean.*) Then do you maintain that that is a false suggestion?—No, I do not.

18639. How do you reconcile that with your interpretation of it?—What do you mean?

18640. This represents that the main purpose of the experiment was to reassure the patient; is that false?—That was a reason for performing some operation on her, but it is not the reason for the transplantation of a portion of the cancer from the one breast to the other breast.

18641. (*Sir Mackenzie Chalmers.*) The passage speaks for itself?—I do not think it does in the sense you mean.

18642. Then we cannot get any further. This book was translated in 1904?—It was published in 1904. I do not know when it was translated; it might have been translated in 1903.

18643. I see that the author of the book "The Confessions of a Physician" seems to have two names?—He published the book under the name of Veresaeff, but his real name is Smidovich.

18644. Is anything known about him except that he was a young Russian doctor?—I do not know very much about him. I know that his book has been translated into various European languages, and from the reading of the book, I judge that although he is a very strong and passionate vivisectionist, at all events his truthfulness has been unaffected, and it gives me the idea of a man who speaks very frankly indeed respecting what he has done. That is the idea the book gives me, certainly.

18645. Have we any reason for knowing that any of his statements were personal experiences, and not a sort of medical romance?—I do not think that anybody who has read that book would say that it was a romance; and the reviews that have taken place (you will find one of them, from the *Times*, appended inside the cover of my book), are of a kind to show that it is a serious book.

* The passage is as follows:—"Only to those persons who are exposed to the greatest risk of acquiring human syphilis could one propose vaccination with an attenuated virus. In point of fact, the hypothesis that this vaccine might provoke more serious complications than true human syphilis is not admissible; at any rate, it is not based on any scientific data. The persons liable to benefit from vaccination would at first have to be selected from among the beginners in prostitution. It is an established fact that these women only in exceptional cases escape syphilis. As almost all of them are, therefore, most liable to acquire this disease, vaccination would be an advantage for them as well as for the men having intercourse with them; but in practice the carrying out of this proposal meets with serious difficulties, since the beginners in prostitution are very young, and almost always minors."

FORTY-FIRST DAY.

Wednesday, 4th December 1907.

PRESENT:

The Right Hon. The Viscount SELBY (*Chairman*).

Colonel The Right Hon. A. M. LOCKWOOD, C.V.O., M.P.
Sir W. S. CHURCH, Bart., K.C.B., M.D.
Sir W. J. COLLINS, M.P., M.D., F.R.C.S.
Sir M. D. CHALMERS, K.C.B., C.S.I.
Mr. A. J. RAM, K.C.
Mr. W. H. GASKELL, M.D., F.R.S.
Mr. J. TOMKINSON, M.P.
Mr. G. WILSON, M.D., LL.D.
Captain C. BIGHAM, C.M.G. (*Secretary*)

Mr. W. E. DIXON, M.A., M.D., called in; and Examined.

Mr. W. E. Dixon, M.A., M.D.

4 Dec. 1907.

18646. (*Chairman.*) You are, I believe, Professor of Materia Medica and Pharmacology at King's College, London?—Yes.

18647. And also Assistant to the Downing Professor of Medicine in the University of Cambridge?—Yes.

18648. And you come here as representative of the Therapeutical Section of the Royal Society of Medicine?—Yes.

18649.—You have given us several heads under which you propose to give your evidence; we will just take them in order, please. First of all, you propose to deal with the advantages which Pharmacology has derived from experiments?—Yes.

18650. Will you give us your views upon that, please?—Perhaps I might say, first, that I do not want to re-duplicate evidence unnecessarily, and that I understood subsequently to sending in my *précis* that I was specially required to give evidence on anæsthetics, so that if you think this first head is unnecessary, I am perfectly willing to eliminate it.

18651. Speaking for myself, the first of your heads seems to be one on which we have had an adequate amount of evidence, and really you are only saying ditto to witnesses whom we have had before, whose views put the matter fully before us?—That is true, I understand.

18652. I think if you will come to anæsthetics, in which you have had considerable experience, there is a good deal in what you say there that we have heard before, but still there has been so much said about anæsthetics, and especially about the efficiency of particular anæsthetics, or rather of different drugs which are used as anæsthetics to produce complete anæsthesia, that perhaps you will give us now in your evidence about anæsthetics and narcotics?—The first point that I wish to make perfectly clear is that there is no essential difference between an anæsthetic, a narcotic, and a hypnotic. There are two classes of narcotics, the one I am not dealing with. There is the class of drugs acting on the brain, which we call specific; I refer to morphin and hyoscin; I am not dealing with those; I am dealing with those drugs of the alcohol series which act on the brain. That is a very large group including alcohol, chloroform, ether, paraldehyde, chloral, urethane, and many more. These drugs all have fundamentally the same action on the brain, they act in precisely the same way, and their differences are determined entirely by differences in the rate of absorption and excretion. For instance, chloroform and ether are absorbed extraordinarily rapidly, because we administer them by inhalation, and they are absorbed from the huge area of lung capillaries, so that they are taken into the blood almost immediately, and their effects are produced almost at once. And in the same way, when you stop administering these drugs they are excreted equally rapidly, so that the effect is a transient one; as soon as you have stopped, or very soon after you have stopped, administering a volatile anæsthetic, its action ceases. If you administer one of the solid substances like chloral, or urethane, it requires a certain length of time to act; it is not absorbed quickly. Chloral, by the mouth, takes from half an hour to three hours getting into the circulation, and it is being absorbed all that time. Supposing it is taken by the mouth, it passes slowly from the alimentary canal, and when it reaches the blood it is not excreted rapidly, so that you get chloral existing in the blood over a very prolonged period. Perhaps I can make my point quite clear if I say that if chloroform had been a solid substance (of course, it is not), then it would have had exactly the same action as chloral, and if chloral had been a liquid substance it would have had exactly the same action as chloroform. With animals, of course, I personally prefer in many experiments to use urethane (urethane I use mostly myself) to chloroform. First of all, perhaps you give the animal chloroform to get it under quickly; then you give the urethane either intravenously or subcutaneously, or into the peritonial cavity—it does not matter which—and it gets into the blood and produces anæsthesia, which lasts from six to eight hours; and then, of course, the total effect does not pass off probably for 24 hours afterwards.

18653. But with a dose of that kind the animal would survive if it were not killed by some other cause?—Yes, it would survive. Perhaps I may make my point quite clear if I may be allowed to read what is the usual teaching to students at the present time, from a page in my Text-Book on Pharmacology. I say there on page 50:—"Narcotics or hypnotics administered in large doses give rise to complete anæsthesia. Urethane, for example, when given to a rabbit in doses of one or two grains behaves as a mild hypnotic, but if an injection of 100 grains is made, it forms an excellent and complete anæsthetic. Such an anæsthetic would not be suitable for man on account of the prolonged action of the drug, about 24 hours, and on account of the difficulty of just gauging the dose, so that whilst anæsthesia is complete, the medulla retains its activity." Of course, the medulla retains its activity, or the respiration would stop. In the case of an animal it does not matter

Mr. W. E. Dixon, M.A., M.D.

4 Dec. 1907.

a bit if respiration does stop; we simply do artificial respiration, everything is ready. In a great number of experiments you do give so much anæsthetic that the medulla gives out, and then you simply perform artificial respiration by means of the pump, which is always handy. The term anæsthetic has come to be used in a limited sense for drugs which are very rapidly absorbed and excreted, *i.e.*, the volatile drugs, chloroform, ether, etc. With such the effect only lasts so long as the administration is continued. They are quite unsuitable as hypnotics because they act for too short a time." There is no fundamental difference between the action of chloroform, ether, ethyl-chloride, and ethyl-bromide, on the one hand, and chloral, urethane, chloretone-paraldehyde, etc., on the other.

18654. You have some evidence at the foot of page 5 of your proof as to the doses for rabbits and man in particular; would you just give us that?—The dose of chloral per os or per rectum necessary to produce complete anaethesia in rabbits is one gramme per kilo of body weight; that would mean for a healthy man weighing 70 kilogrammes a dose of over two ounces; whereas the common hypnotic dose for a man is only 10 to 30 grains, or about 1-70th part of this quantity. In dogs and cats smaller doses are given relatively to the body weight to produce complete anæsthesia. In man chloral is also employed as an anæsthetic. Perhaps I ought not to have put it in this way. It is very little use at the present time for obvious reasons, although I give an example where a Frenchman has used it as an anæsthetic for children in 10,000 cases. He gives it in 3 to 10 gramme doses.

18655. (*Sir Mackenzie Chalmers.*) As an anæsthetic?—Yes, as a complete anæsthetic. It causes, as he says, complete anæsthesia lasting from three to six hours.

18656. (*Chairman.*) We used not to go into that. It is not generally used for men?—No, it is not generally used for men; it is dangerous.

18657. (*Sir Mackenzie Chalmers.*) Dangerous to life?—It is dangerous because it might make the medulla give out; and moreover we do not want to keep the men under it in a trivial operation for six or eight hours.

18658. (*Chairman.*) We are not examining into operations on human beings except in so far as they throw light on the question of operations on animals. But is chloral used for animals generally as an anæsthetic?—Yes, chloral is used for animals.

18659. You were going into the experiments of Mr. Bouchut, speaking of what he could give to a child?—Yes.

18660. You can take it rather short?—Then I give the doses necessary in cases of urethane. The dose necessary to anæsthetise a rabbit is 1½ grammes per kilo body weight, and for a dog or a cat about one gramme per kilo body weight. According to this reckoning the dose to produce anæsthesia in man would be about 70 grammes or 2 ozs., but for reasons already mentioned, it is not employed for that purpose.

18661. Then the next drug you wish to mention is morphin?—Morphin or morphia as it is sometimes called, is of course a little different in its action; it belongs to an entirely different group of drugs. These drugs which I have been speaking of up to now act on all the nerve cells in the brain in much the same way, except that in every case they paralyse the sensory nerve cells before the motor—that is a most important point—so that you can have complete anæsthesia whilst you can still get movement; that is to say, on stimulating an afferent nerve you can get movement when the sensory cells are all obliterated from the brain.

18662. Are you speaking of all drugs now?—I am speaking now of the drugs that I have previously mentioned, the alcohol group of hypnotics.

18663. (*Colonel Lockwood.*) Of which morphia is one?—No, not morphia; drugs other than morphia, those alcohol drugs which act on all nerve cells, motor and sensory, but sensory first. In the case of morphin you have a difference. Morphin is what we call a specific drug; it is not allied to other drugs at all. Morphin acts quite differently; it is quite a distinct thing altogether, and it only attacks the sensory nerve cells; so that if you produce complete anæsthesia from morphin you can still get, indeed you do get, very distinct reflexes. You can administer morphin to man in anæsthetic doses, and you can still—I have frequently done it—obtain quite distinct reflexes, although when the man has subsequently recovered he has never felt anything at all.

18664. (*Chairman.*) When you say that you can obtain reflexes, what exactly do you mean?—I mean that if you simply do something quite as trivial as stroking the abdomen you will produce motion; but if you apply what to an ordinary man is a very painful stimulus such as pressing the supra orbital nerve with your thumb you get no effect at all, not even a reflex, and as I say subsequently the man knows nothing about it. So that we do not use (or very rarely) morphin alone as an anæsthetic, not because it is not one, but because it leaves the motor cells active, and the animal is reflex.

18665. You mean that it would disturb the operation by reflex action?—Yes; by movements. The action of morphin on dogs is precisely the same as that on men.

18666. Is it used for dogs?—Nearly always.

18667. Alone?—No; not alone, because it is necessary to give something to cut out these movements. I should have gone on later to say that it is not used for man for that reason. But it is quite commonly used for man now in Germany, when it is given with some drug which also paralyses the motor cells as well as the sensory, and so in Germany, and to a limited extent in England, it is given with hyoscin (the so-called morphin scopolamine narcosis) for operations where chloroform is deemed unsuitable.

18668. In that combination it both produces complete anæsthesia and prevents reflex movements?—Yes. Then there are two other minor points that I should like to draw attention to. The first is the fact that when surgical anæsthesia is once produced the amount of anæsthetic necessary to continue that anæsthesia is very small. Thus, if it is necessary to give 1·5 per cent. chloroform to anæsthetise a dog, the anæsthesia may be continued indefinitely by the subsequent administration of 0·2 or 0·3 per cent., or even a smaller quantity. Of course, that is perfectly well known to every anæsthetist; it is hardly necessary, really, to draw attention to it.

18669. How are you guided as to when you administer the additional doses—by the appearance of the patient or the condition?—The test which is commonly employed is what we call the reflex test; you simply put your finger on the cornea, and if there is a reflex then you know that the motor cells are beginning to recover their activity.

18670. I was asking the question rather with reference to a case, of which I understand there are some, in which curare is given, as well as a complete anæsthetic. How would you know, in that case, when to renew your dose?—Do you mean a volatile anæsthetic now?

18671. Like the one you have been describing—any anæsthetic which would be sufficient to produce complete anæsthesia, and a proper one to administer to a dog. In some cases we have been told that curare is administered in cases where great stillness is necessary?—May I leave that point? I have put a note on curare at the end.

18672. Very well?—The second point is the great value of giving morphin before administering chloroform. This combination produces a very perfect anæsthesia, the quantity of chloroform necessary being much smaller than would be required if no morphin had been given. These facts have been commented on by many, and are universally recognised, so that I will only refer to the observation of Bernard on dogs, and of Nussbaum, of Munich, Rigault and Sarasin, of Strasburg, and Labbé and Curon on men. Then I refer again to the paralysis of the sensory cells; all anæsthetics paralyse the sensory cells before the motor.

18673. Then you come to curare?—What I would like to say about curare is, first of all, to say briefly what its action is. It is not an isolated drug, having this peculiar action all by itself. There are lots of other drugs having the same type of action. It is, perhaps, the one which has the most characteristic action on the motor nerve endings, but there would be no difficulty in picking out a whole host of others that do the same. All this group of drugs paralyses the nerve cells, the brain, and every one of them paralyses the motor nerve endings, and they may all cause convul-

sions by acting on the spinal cord. Those three facts apply to all of them. Some members of the group have one action well defined, and others another. Thus, nicotine first paralyses the nerve cells, and later the motor nerve endings, whilst hemlock (conium) paralyses the nerve cells and nerve endings almost together. Curare first paralyses the motor nerve endings and later the nerve cells, whilst hemlock (conium)—the poison that killed Socrates—paralyses the nerve cells and nerve endings, roughly, about the same time. I picked those three examples from a group to show the various stages, how one produces its action at one time and another at another time. I mention this to show that even curare given alone is a complete anæsthetic, if enough is given, although we in England, conducting experiments, assume that curare has no action on the nerve cells, and always give enough of some other anæsthetic to completely paralyse the brain. Of course Claude Bernard really started this idea that curare acts on the motor nerve endings and not on the sensory nerve endings or cells. But Claude Bernard's experiments only apply to the spinal cord; he did not prove anything else at all; all that he showed was that the sensory cells in the spinal cord are not paralysed by curare. That was all his experiments meant. None of these other drugs paralyse the sensory cells in the spinal cord in moderate doses. Chloroform, except in the largest doses, does not paralyse the sensory cells in the spinal cord.

18674. But what we are told is that curare is consistent with the animal feelng pain, although it is unable to move, and that that is not the case with chloroform: that if the animal is reduced to apparent insensibility under chloroform it does not feel?—My point is that these ideas about curare originated with Claude Bernard, whose experiments simply showed that the sensory cells in the cord were not paralysed. They showed nothing else at all. Nevertheless, we believe that small doses of curare would paralyse the motor nerve endings before the brain cells were paralysed, but that large doses of curare will paralyse the whole of the brain like chloroform.

18675. But (reducing it to purely lay language) does that mean that the animal would cease to feel pain with a large dose of curare?—Absolutely.

18676. But that with a small dose it might continue to feel pain, though unable to express it by action?—Yes; it would, I think. That is the point I just wished to bring out there—that curare was a member of a certain definite group of drugs.

18677. There is one matter with reference to anæsthetics that I would like to ask you about as it is not in your *précis*. When you are operating on animals, do you have an anæsthetist to assist you, somebody who is skilled, I mean, in the use of anæsthetics?—No, I usually have a box; I put the animal in the box, and pour in chloroform, in the case of cats, and ether in the case of rabbits, and in the case of dogs one has to be more careful, of course, and I give the chloroform by hand very slowly. The whole point about anæsthetising a dog is to go slowly; dogs very easily die of chloroform, but if one goes sufficiently slowly they never die. I never kill a dog by any chance whilst administering anæsthetics to them now.

18678. So far as regards giving an anæsthetic then you do give the animal the best chance; that is to say, you are the most skilled person in your laboratory and you are the person who administers it and reduces the animal to anæsthesia?—Yes.

18679. But as regards the renewal doses which you say may be very small and should be administered at the proper time, of course, whenever necessary, who looks after that?—Usually there are no renewal doses. The animal is placed on the table, and I give it the urethane or chloral (usually, almost always, urethane), and then the animal is anæsthetised and would remain deeply anæsthetised for very much longer, of course, than is required.

18680. I think you told us for six or eight hours just now?—At least that. I have never tried it longer.

18681. (*Mr. Tomkinson.*) How do you give the urethane first?—Inject it into the blood.

18682. (*Chairman.*) And that is what you usually do. And how do you give chloral?—Chloral I do not use much, but I generally give it into the peritonial cavity. Chloral, like chloroform, depresses the heart.

18683. Does it produce the same effect as urethane, complete anæsthesia lasting a long time?—Yes, exactly the same.

18684. So that in almost all operations, I understand that the one dose would be enough, and would not require renewal?—The one dose would be enough.

18685. Then supposing it is an operation in which for one reason or another, the dose requires to be renewed either because of the nature of the drug used for anæsthetising, or from the excessive length of the experiment, or whatever it may be, who does that?—I should do it always.

18686. Would you if you were performing the operation at the moment be able to watch better than or as well as anyone else?—I should watch it the whole time; that is what I should be doing. You watch the experiment the whole time. The preparation of the experiment perhaps takes half an hour for an average experiment. Then when it is prepared your duty is simply to watch and observe.

18687. Supposing, for example, that the managers of the hospital or laboratory in which you were working were to say that they were prepared to give you a skilled anæsthetist to assist you in these operations, would you reject it as unnecessary?—Absolutely. There is no anæsthetist required at all. We are not giving anæsthetics—the anæsthetic has been given. There is one other point about curare which I think is extremely important, and that is that curare is excreted with extraordinary rapidity; so that if you give an animal curare it only remains curarised for a very short time, so quickly is curare excreted that you cannot poison a man by the mouth, because as fast as the drug gets from his stomach into his blood it goes out by the kidneys. I myself have taken a large dose of curare, and have never had any symptoms at all, yet if I had had a cut on my skin and let the curare get in, the curare would, I have no doubt, have paralysed or depressed my motor nerve endings. The explanation of that is that the curare is simply excreted, we know this absolutely, very rapidly. The importance of that is that if you give an animal an anæsthetic plus curare, the curare disappears very quickly, the anæsthesia still existing.

18688. If you give it through the mouth?—No, supposing that I injected curare into a vein, the animal remains curarised, say, for half an hour to three-quarters of an hour. If that animal has got urethane plus curare, the curare action is over in half an hour or three-quarters of an hour, while the anæsthetic action of the urethane continues for eight hours at the least.

18689. But supposing that the animal were not completely anæsthetised, the most painful part of the operation would be without anæsthetics?—But you anæsthetise the animal before you give the curare.

18690. But it is not everybody who is satisfied that the animals are completely anæsthetised, and one has to deal with that. It is suggested that animals are not completely anæsthetised, and at the same time are given curare. In that case, the fact that the curare was worked off in half-an-hour would not be so material because the animal would have suffered the greater part of the pain in that half-hour?—Yes, the only condition in which that could apply would be when giving volatile anæsthetics. Supposing that you were administering chloroform with curare, then it might be said that you are not giving enough chloroform. But you can see whether you are giving enough by looking at the blood-pressure. The blood-pressure is just as delicate an indication of the action of chloroform as the reflexes.

18691. (*Mr. Tomkinson.*) For how long do you take the blood-pressure?—It is always taken.

18692. During the whole operation?—During the whole operation, at least during the whole of my operations. I am speaking of my own operations.

18693. (*Chairman.*) By what is it taken?—By a cannula connected with an artery to what we speak of as a mercurial manometer. It is being recorded automatically the whole time.

18694. (*Mr. Tomkinson.*) Is that inserted under anæsthetics?—Yes, the animal is given an anæsthetic to begin with, and it never recovers from it.

Mr. W. E. Dixon, M.A., M.D.
4 Dec., 1907.

18695. By nerve endings I suppose you mean what we call nerves?—The nerves are white fibres, and they end in either glands or muscles, or something or other, and the drug can act on various positions in various places, and the nerve endings are just one place. A nerve ending is not a muscle, and it is not a nerve; it is something in between the two.

18696. (*Chairman.*) Do you often use curare yourself?—No, I use it very rarely.

18697. In what cases do you use it?—I should use it where vaso-motor nerves, vessel nerves, were concerned where we require to investigate the action of a certain kind of nerves which go to the vessels.

18698. Blood vessels?—Yes, because those vaso-motor nerves, the vessel nerves, are mixed up with the motor nerves, and you must separate the one from the other. You can cut out the nerves to the voluntary muscles by curare and leave the nerves to the blood vessels.

18699. How is it that you can do that under curare and not without curare?—That is what we call the specific action; the drug has just got that specific action; it just attacks those particular nerve endings and leaves the others.

18700. That does not explain it to my mind clearly?—Do you wish to know why the curare goes for those particular nerve endings?

18701. I want to know why curare renders it easier—what is the state of things produced by curare which makes you able to perform an operation when the animal has curare and not able to do it when it has not?—Supposing that I wish to stimulate a nerve, I excite the nerve in one way or another, and I should get, if the muscles were intact, simply contraction of muscles, and I could not observe my blood vessels at all. But if I have eliminated the muscle effect I have only got the vascular effect left.

18702. Those are the cases in which you would use curare?—Yes. It is very rare.

18703. (*Sir Mackenzie Chalmers.*) How often in the last two years have you actually used curare yourself?—I should say three or four times, but I could not give it to you just offhand. It is not common at all; I mean that it is not once a week or once a fortnight—it is nothing like that.

18704. Two or three times in the last two years?—Perhaps more than that—perhaps four or five times. I could let you know, of course.

18705. (*Chairman.*) If you were forbidden to use curare it would only operate upon you, at any rate, to that extent. You would be prevented from performing some two or three operations a year?—Yes, but they would be operations of the greatest importance. It might spoil a whole research.

18706. I am not offering any opinion about it. I am only wanting to know the extent of it. Have you been always satisfied that the animal has not felt pain under curare?—Always—absolutely.

18707. As satisfied as if it had not had curare given it?—Yes, absolutely.

18708. Is that all that you have to say about curare?—Yes.

18709. Then as to your head of modern work, I think really we have had all this before?—You have had some of it, but I would just like to mention one thing, if I may; and, to show you the great advantage of the pharmacological laboratory, I would just like to mention the investigation into West African boxwood. Up to Lancashire, when the masters introduced a new wood, the men making shuttles got symptoms of poisoning, and, of course, the men said that it was due to the wood, and the masters said that it was not. I should also like to say that the doctors said that the men suffered from symptoms which agreed with a cardiac action, and that this drug must have an action on the heart. We got samples of this wood, the masters sent us samples, and we investigated it. We got the alkaloids out, and we found that the alkaloids had a curare-like action; in fact the stuff, so far as it was concerned, might have been curare. It is not curare, it is a different substance, but it is the same type of drug. The essential thing that the men suffered from was great difficulty in getting their breath because their motor nerve endings to the chest wall were depressed—not absolutely paralysed.

18710. How did the poison reach them, because they do not handle the shuttles much?—No, it was the turners, the men who live in an atmosphere of sawdust in the workshops, and get the dust into their chests.

18711. Not the men who look after the working of the looms?—No, it was the men actually mixed up in the sawdust. The place in which they work is, I am told, a cloud of dust.

18712. (*Mr. Tomkinson.*) When once made the reel was inocuous?—Yes.

18713. But it was in the process of making the reel, all the dust in the turning?—Yes, and then in regard to the first part of my *précis*, may I just mention the difficulty of obtaining evidence from clinical experiments, because I really think it is of some importance. I happened to be on a Committee of the British Medical Association for suggesting what drugs shall go in the new British Pharmacopœia, when it became necessary to find out the value of certain new silver compounds. Accordingly we sent out notices—I think we sent out 300 notices—to the leading ophthalmic surgeons, and surgeons attached to Lock hospitals, asking them what was the value of these new compounds, and the results which came in were the most remarkable I have ever seen. It would be thought that in dealing with the action of silver compounds used for eye work, conjunctivis, and various forms of inflammation of the eye, that if it is possible to make any definite statement from clinical observations it would be about a disease which you can actually see; you can apply the drug and say at once whether it has any value or no value. And yet the decisions of these expert physicians and surgeons as to the value of these new drugs were exactly divided. Some of them said, "This drug is our sheet anchor in the treatment of disease." Others regarded the same drug as quite inert and worthless. How are you going to determine between those two views? Of course, the explanation is simple. It means that the conditions in a clinical experiment are never the same; there is no control experiment. You have not two men exactly the same in every respect, except that one is being treated for this particular disease. You have no control, and you never know what action the drug has. You can give a drug, and the patient may get well or get worse; you cannot say in the case of an unknown drug whether it has made him better or made him worse.

18714. Have these compounds that you are speaking of been tested by animal experiment?—No; they have not. It is not necessary to do that by animal experiment. I was simply referring to the difficulty of making clinical observations and determining the action of drugs from clinical observation. It is practically impossible.

18715. I do not quite follow why, if you can get no satisfactory results from clinical observation as to the action of the drug, you cannot expect to get any information from experiments on animals?—In an experiment on an animal you have got exact conditions and control.

18716. But at the same time you say that it is not necessary to test it on animals?—Not these particular drugs, because they are not used for absorption at all; they are used only externally for inflammation.

18717. With regard to the discovery of the poison in boxwood and its operation, was that done by experiments on animals?—Entirely.

18718. Who was applied to to make the experiment?—In the first place the men—the Union—sent to Liverpool and got the wood examined and reported upon by a botanist, Professor Harvey Gibson, who isolated the alkaloid, and tried the effect of the poison on an isolated heart—a heart taken out of the body and working by itself—and he got an effect which corresponded to potassium.

18719. A heart taken out of a human body?—Taken out of an animal body. He got the alkaloids out, and then he tried those alkaloids on isolated hearts obtained from animals.

18720. (*Sir William Collins.*) Frogs' hearts?—Rabbits.

18721. (*Mr. Tomkinson.*) What is an isolated heart?—A heart taken out of the body and hung up and perfused.

18722. Made to beat by electricity?—No; it beats by itself if you send fluid through it. Any part of

the body will go on working by itself outside of the body if you treat it properly.

18723. For how long?—For many hours. A child's heart has been taken out six hours after death and been made to beat for several hours—not in this country, of course.

18724. (*Chairman.*) Detached from the body?—Yes; cut off and hung up.

18725. Made to beat by electricity?—No; by sending fluid through the vessels to it.

18726. You mean if a certain artificial action is applied to it?—No; it beats by itself. The reason why the heart beats is because fluid is going through it's vessels.

18727. That is what I meant when I said some artificial action.—Yes; that is what I meant.

18728. (*Dr. Gaskell.*) Would you not rather say some nutritive action?—Yes. Then the masters, of course, did not approve of this report, and they sent the stuff to us, and a chemist, Mr. Harrison prepared the alkaloids and I did the experiments on animals, which showed that it was a curare-like poison.

18729. (*Chairman.*) You did the experiments?—Yes, and I gave evidence about this drug to the Dangerous Trades Committee.

18730. Was that at King's College?—No; it was at Cambridge.

18731. (*Colonel Lockwood.*) How many experiments on dogs have you conducted during the past year?—Perhaps 18 to 20. I cannot remember.

18732. I understand from you that there is no difficulty in keeping a dog under an anæsthetic provided it is given slowly at first: that you never experience any difficulty?—Never. The danger is that if you give a dog 6 per cent. of chloroform vapour it dies in a minute or half a minute. If you give it 0·1, then go to 0·2, then to 0·3, and so on, it never dies.

18733. How long did these experiments that you have been conducting generally last?—Perhaps two or three hours; never more than three hours, I should think.

18734. And the animal you operate upon is always killed before it recovers?—Yes, always.

18735. Who does that?—I do that.

18736. How?—Generally by injecting air into a vein. You see I have a vein always prepared. I blow in a little air which goes straight to the heart, gets behind the valves of the heart, and the heart stops beating. That is the simplest way.

18737. (*Sir Mackenzie Chalmers.*) You blow into a vein?—Yes, you blow air in.

18738. (*Colonel Lockwood.*) And that is done at the conclusion of the experiment?—Yes.

18739. Before the class?—If it is a class experiment, before the class.

18740. You show these experiments probably among others to classes?—I give a series of demonstrations regularly to classes.

18741. Have you ever seen any levity such as is alleged by one of the witnesses on the part of students?—I have never seen any levity.

18742. They look upon it as a serious business?—It is the most important part of their curriculum without any exception. Lectures can be got up out of books, and they do not matter a bit. If I may just show you, that is a record taken in one of my class experiments (*exhibiting a diagram*). *There* is the heart. *That* is the effect of chloroform on the heart. The blood pressure goes down because the chloroform is given: the heart beats more feebly, therefore the blood-pressure goes down. The men see that actually taking place.

18743. Are you in favour of conducting experiments, the result of which is already known, for the instruction of students?—I think it is of vital importance. I could not over-estimate the importance of it.

18744. In your opinion it is absolutely necessary?—Absolutely necessary, and all my colleagues at Cambridge agree with me.

18745. Do I correctly understand from you that chloroform and curare, if the curare is given in sufficient doses, have both practically the same effect of anæsthesia?—If curare is given in big doses, not in small doses.

18746. But it paralyses the sensory nerves of the spinal cord?—The sensory nerves in the brain. Chloroform does not necessarily paralyse those in the cord.

18747. To put plainly, an animal that was thoroughly curarised with a big dose would absolutely not feel any pain?—I believe not; it could not.

18748. Is that your own idea only, or is it supported by other evidence? Is it a well accepted fact by the profession?—Yes, I think it is a well accepted fact.

18749. Then why do the profession always give curare accompanied by an anæsthetic?—I think there are very few professions which are quite so conservative as the medical profession, and when a drug has once been stated as being used for a certain purpose, although it is shown for years and years to have no such action, it is still given for that purpose. Tannin is still given to stop bleeding from the lungs, although it has no effect; it is all destroyed in the alimentary canal; yet it is still given.

18750. I suppose you are aware that a great portion of the public have looked upon this question of curare with very great feeling?—Yes, I am perfectly aware of it, and I think it ought always to be given with an anæsthetic.

18751. You do think that?—Certainly, because as I have said, it is only in large doses that this central effect, so far as we are certain, comes on.

18752. Then if it is effectual, given in large doses, why not give a large dose?—One objection to that is that it is very difficult to get curare; it is almost unobtainable.

18753. Is it not on the market?—No; you can buy stuff that is called curare which does not contain any curarine.

18754. At all events the public may understand that you can obtain complete anæsthesia from curare alone?—Yes, certainly.

18755. (*Sir William Church.*) We have had a great many positive statements made to us by witnesses that morphia is not an anæsthetic. I should like to ask you one or two questions on that point. On page 25 of the third volume at Question 7308 with regard to the evidence given during the trial of Bayliss v. Coleridge, the witness said: "These attempts to prove that morphia is an anæsthetic are futile," and a little lower down in the same paragraph: "Claude Bernard quite appreciated the utility of morphia from the vivisectors' point of view, though he was honest enough to acknowledge its utter uselessness as an effective anæsthetic for vivisected animals. These are his words: 'The animal still remains sensitive, a touch on the cornea induces the closing of the eyelids, but he is quite still, and lends himself without a movement to the most delicate operation. . . . He feels the pain, but has lost the idea of self-defence.'" You would not agree with that?—I should like to point out in the first place that there is a mis-translation there. The animal remains, the word is "*sensitive*" in French. That is not correctly translated as "sensitive"; "reflex" it the correct translation I should say there. The animal still remains reflex, not sensitive. That is quite a different thing. That is the first thing that I should wish to say. And then, secondly, of course Claude Bernard was perfectly correct in stating that morphin is not a suitable anæsthetic in vivisection experiments, because the animal is reflex, it can move; it is only the sensory cells which are really depressed excepting in enormous doses, of course.

18756. If you would turn to Question 9266, which is on page 105 of the same volume, you will see there "Dogs are but slightly susceptible to the action of morphia." "'Caldwell gave a dog 17 grains without producing serious symptoms; whilst to a number of dogs he gave 12 grains hypodermically, with no bad effect.' Then Claude Bernard refers to a dose of 30 grains." Do you agree with what is stated there to be a fact, that Caldwell gave a dog 17 grains without producing serious symptoms?—No, I do not know how he gave it. Supposing this is absolutely true, then I say that the morphin was given by the mouth, and was never absorbed. People are always talking about drugs; but if they give the drugs by the mouth, how do they know that the drugs have got into the circulation? Many drugs are not absorbed at all.

18757. He is also stated to have given 12 grains hypodermically, with no bad effect. That did not

Mr. W. E. Dixon, M.A., M.D.

4 Dec. 1907.

Mr. W. E. Dixon, M.A., M.D.

4 Dec. 1907.

mean, I imagine, without any effect at all, but without any prejudicial effect to the particular class of experiment that he was conducting?—Yes, you can give enormous doses of morphin to dogs, and nothing happens, except that the respiration gives out, and the animal dies in that way. But morphine has not a depressent action on the heart, so that you can give grammes upon grammes to dogs if you do artificial respiration; indeed I have done so.

18758. (*Sir Mackenzie Chalmers.*) Can you give grammes and grammes without producing anæsthesia; that is the point?—No, you cannot; you will produce anæsthesia then. But you would not kill the heart.

18759. (*Sir William Church.*) So far as regards the action upon sensibility to pain goes, is the action in the dog different from that which it is in man?—It is exactly the same.

18760. Does it require a very much larger amount of the drug to produce insensibility to pain in a dog than it does in man?—No, I should say much about the same.

18761. Therefore you would consider that 3 grains of morphia would undoubtedly produce insensibility to pain in a dog?—Yes, I should.

18762. And as Professor Starling says here, 15 grains would be quite an excessive dose for that purpose?—Quite an excessive dose, quite an unnecessary dose.

18763. By excessive I meant unnecessarily large?—Yes.

18764. At Question 9498, on page 113—this again is with regard to what Claude Bernard says about morphia—a quotation is made from Claude Bernard that the action of morphia differs entirely from anæsthesia. You would not agree with that?—Morphin, I tried to point out, does differ from chloroform. I made two distinct groups.

18765. That is to say, in its action it belongs to an entirely different series of drugs?—Yes.

18766. But I am speaking only with regard to anæsthesia alone?—There would be no difference.

18767. As to insensitiveness to pain it has much the same action upon sensibility to pain as the other series of drug?—Exactly the same.

18768. And it affects, we believe now, the same cells in the nervous system?—Yes.

18769. You have done much work with regard to the standardisation of drugs?—Yes, I have done a good deal.

18770. Is there any way by which many drugs can be standardised, except by watching their effects upon animals?—There are five drugs—digitalis, stropanthus, squill, ergot, and cannabis indica, the chemistry of which we know so little, that we cannot standardise them in any way other than physiologically. Of these two drugs, namely digitalis and ergot, are of the most important in the Pharmacopœia. There are ten different ergots there (*handing in a list*). Those ergots were bought at different chemists' shops. This is simply to show the variation in the action of ergot. A practitioner, say, having to treat with a case of a woman in labour, gives one of those ergots, and probably in three cases out of four it is inactive. The same applies to digitalis.

18771. (*Chairman.*) How do you get rid of those difficulties? Do you go to some special places for your drugs, where you avoid that risk?—You have your drugs standardised.

18772. (*Sir Mackenzie Chalmers.*) When you say that you standardise your drugs, do you mean that you standardise once for all, or do you have to standardise each brew?—Each brew. Certain wholesale chemists standardise each lot that they sell to the public.

18773. (*Chairman.*) The only way by which you can ascertain their action is by experimentation on animals?—Yes.

18774. (*Dr. Wilson.*) What is the test; is it blood pressure?—In that case it is blood pressure for ergot—the height to which the blood pressure rises.

18775. (*Sir William Church.*) Has the absence of this accurate knowledge of the strength of the drugs led to most diverse opinions being expressed by medical practitioners as to the value of certain drugs?—Certainly.

18776. In fact, it has been held that even ergot has no action upon the uterus?—Yes, and the stuff that is sold in many chemists' shops has no action upon the uterus.

18777. Cannabis indica is another drug about which there has been a great difference of opinion?—Yes, it is more usually non-active than active as bought in shops.

18778. Are there any drugs in which chemical processes cannot at present show their real composition and strength?—Yes, for those drugs that I have mentioned chemistry is at present quite worthless.

18779. In these drugs through your not being able to isolate the alkaloids from them with ease, is it very difficult to tell what is the strength of any given specimen?—Yes, that is so; sometimes active principles are sold, and in one case, for example, the "active principle" was extremely active. In another case the so-called "active principle" was beautifully crystalline, and it had no action at all; as soon as you begin to purify them they lose their activity.

18780. Ergotin is an example?—Yes.

18781. (*Sir Mackenzie Chalmers*). Is that passive or active?—It may be either.

18782. (*Sir William Church.*) In Chemistry, microscopy cannot tell the difference between an active crystal and a non-active one?—No.

18783. (*Sir William Collins.*) Then I rightly apprehend that it is not so much by the composition or the ingredients of the pharmaceutical compounds in future, but by their action based on standardisation that we must look for their therapeutical differences?—Not at all; most drugs in the Pharmacopœia can be, and are standardised by chemical means. It is only certain kinds that cannot be, the five that I have mentioned.

18784. Does the remark that you have been making apply only to those five?—There are a few others, but only of those five have I an experience. No one would dream of standardising atropin in any other way than by weighing it, or morphin. Nor would we do so with these drugs if we could standardise them in any other way.

18785. Is the composition of curare ascertained with any certainty?—Curarine has been prepared in Germany, but, as I say, you cannot get it; you cannot buy it. I have once seen a crystal of it as a great curiosity, and that is all. I do not think its chemical composition has anything known about it.

18786. I was going to ask you whether you could give its chemical formula?—I do not think it is known.

18787. I gathered from what you told us that amongst the gauges for determining whether anæsthesia is present or not, are the reflexes and blood pressure?—Yes.

18788. Are there any other gauges besides those?—Those are the two which I myself use. There are other things, of course, like the pupil and the depth of respiration, and so on, showing the condition of the medulla. But the two that one chiefly uses in animals are the reflexes and blood pressure; at least, those are what I go by.

18789. Is it possible in human beings to go by the blood pressure?—No, it is not.

18790. We have been told that there is a mechanism by which blood pressure in human beings can be accurately gauged?—That is so. When I say that it is not possible, I mean that it would be very inconvenient while the anæsthetist was anæsthetising, to have a man taking the blood pressure and recording it all the time, besides which the blood pressure mechanism as at present made for man will only give you the blood pressure for any one moment. You will then have to start it over again.

18791. I wanted to ask you whether any attempt has been made to utilise the blood pressure gauge for the purpose of determining the amount of anæsthesia in human beings?—No, not so far as I am aware.

18792. Is that because you think that the mechanism employed for gauging the blood pressure, apart from the manometer, is unreliable?—My point is, that in

man (we have been doing a lot of work on this point lately), you can take the blood pressure, say, in the arm, at a certain moment, but you cannot take it continuously. You see, it is taken by blocking the pulse, but you cannot keep the pulse blocked; you have to let it out and then take it a minute or so afterwards, so that you get periodic readings.

18793. Did I correctly understand you to say that in the case of morphia the test of the presence or absence of reflex was inapplicable?—Yes, that is so, of the lower reflexes.

18794. By a reflex action do you mean a conscious action?—Oh, no.

18795. An unconscious action?—An unconscious action. Most of our reflexes, of course, are unconscious.

18796. But may not a reflex action be conscious?—No, not conscious.

18797. We have had a notable case, that a Commissioner suggested, that sneezing was a reflex act, and that sneezing was conscious. What do you say to that?—I should say you would still sneeze if you were unconscious. Breathing is a reflex action; we do not know that we are breathing, but, nevertheless, you can breathe consciously, and then it is no longer reflex, so to speak.

18798. Is a reflex act a voluntary act?—No, it would not be reflex.

18799. Is it part of the essence of being reflex that it is an involuntary act?—Certainly.

18800. (*Mr. Ram.*) Would it be accurate to say that a reflex action may be sometimes controlled by consciousness?—That is quite correct.

18801. But that consciousness is not necessarily present to a reflex action?—That is quite correct.

18802. (*Sir William Collins.*) You spoke of the sensory cells in the spinal cord in connection with the curare point, I think?—With chloroform.

18803. Was it not curare?—With chloroform.

18804. At any rate you spoke of the sensory cells in the spinal cord?—Yes.

18805. Is the spinal cord sensitive?—I do not quite know what you mean by sensitive.

18806. Can the spinal cord feel?—Oh, no.

18807. When you speak of the presence of sensory cells in the spinal cord, you do not wish us to assume that the spinal cord can feel?—I mean the cells that receive impulses. There are receiving cells.

18808. Cells receiving afferent impulses?—Yes.

18809. The last Commission referring to curare and Claude Bernard, put this on record in their report: "It has, however, been positively stated by perhaps the highest authority on such a subject, Claude Bernard, to have no effect in producing insensibility to pain," that is curare. Do I correctly understand that you contest that view?—Yes. You cannot expect anything to stand still. That was the best knowledge that the Commission had at the time, but it is not the best knowledge now.

18810. We were told by a previous witness in answer to Question 3617 in the first Report, that "the evidence before us really is not sufficient to my mind to demonstrate conclusively that curare does or does not abolish sensation. On general considerations I would think that it probably abolishes the functions of the higher part of the brain, that is to say consciousness; but we have not sufficient evidence for that." What do you say in regard to that?—In the first place you will remember that I told you that curare must not be regarded as a sort of unique drug, or by itself, that it belongs to a definite group of drugs which all have these three actions; they all paralyse the brain; all of them produce convulsions under certain conditions, and all paralyse the motor nerve endings. Curare first of all belongs to that group very definitely—that is the first point. And secondly, I have repeated Claude Bernard's experiments, and given large doses of curare, and have succeeded in completely cutting out the sensory effect.

18811. Do you, or do you not, agree with that previous witness, who said that we have not sufficient evidence to say whether it abolishes the functions of the higher parts of the brain?—I think there is sufficient evidence that in big doses it does. In small doses I agree with him, no; in big doses, yes.

Mr. W. E. Dixon, M.A., M.D.

4 Dec. 1907.

18812. Is that the result of your own experiments?—To some extent it is the result of my own experiments.

18813. When did you conduct these experiments with curare?—Some three or four years ago now. There have been odd experiments done at odd times, many of them on dead animals, of course—technically dead.

18814. Then did you test whether or not the higher functions of the brain were abolished?—In those experiments that I was referring to, I was doing them on the spinal cord, the receptor cells of the spinal cord.

18815. I was asking you for the evidence by which you were led to conclude that the higher parts of the brain were abolished, as regards their function, by curare?—The only reasonable evidence of that is that curare, as I say, belongs to this definite group of drugs which have these three actions in common.

18816. Do you argue by analogy from its congeners, as it were?—Yes; it is practically impossible to obtain direct experimental evidence.

18817. Why?—Because you have the motor nerve endings gone. You cannot stimulate the brain, of course.

18818. Must it ever remain in doubt then as regards curare itself, apart from analogy, whether it does or does not abolish consciousness of the higher parts of the brain?—No, it need not; but the only experiment which would prove definitely whether small doses of curare abolish pain would be on man. Any volunteer must have the curare injected and artificial respiration must be ready, and some operation must be done on him.

18819. I understood you to say that you had taken curare yourself?—Yes, by the mouth.

18820. In what doses?—A big enough dose certainly to completely curarise a dog.

18821. Did it have any effect upon your own sensibility?—It had absolutely no effect at all.

18822. Or on your motor nerves?—It had no effect of any kind at all. I ought to say that every dose of curare varies. You get one sample and it is very active, and the next sample is inactive, so that you cannot weigh out a dose and say I am taking so much. The only way by which you can be sure that it is very active is by trying it on frogs.

18823. Is it possible to standardise curare?—Yes, on frogs.

18824. (*Mr. Ram.*) Did you standardise all that which you took?—Yes, I knew all about it.

18825. (*Sir William Collin.*) Was it an active or inert specimen?—It was a very active specimen.

18826. Does the commercial curare vary in quality?—Yes, tremendously; it varies from great activity, which is rare, to inertness, which is common.

18827. What is the price of curare in the market?—I would not like to say, but I believe it is about 5s. a gramme. I am not at all sure. Of course, it is a resin, and there is very little active alkaloid in it.

18828. You told us, I think, that there were a great many other drugs that acted in the same way as curare?—Yes.

18829. You said a host of them?—Yes.

18830. You mentioned nicotin, I think, as one?—Nicotin I mentioned.

18831. Conium has been mentioned before this Commission already. Is conium a powerful poison in man?—Yes.

18832. It was denied or doubted by a previous witness. Is it a powerful poison?—Yes, it is the poison that Socrates died of, you remember—hemlock.

18833. Would you name any others in this host of drugs that act in the same way as curare?—Nicotin, cocaine, lobelin, galseminin, apacodin, as I say, this boxwood, and a great number more keep cropping up in literature periodically. I am not personally acquainted with them.

18834-5. You have named some six or seven, but when you speak of a host one rather assumes a larger number?—I meant perhaps twenty or thirty.

Mr. W. E. Dixon, M.A., M.D.

4 Dec. 1907.

18836. You know that there is a restriction under the Act with regard to curare. Should the same restriction apply to the host of other drugs that resemble it?—As I pointed out at the time, most of the other drugs paralyse the brain before they paralyse the motor nerve endings. Let me give you an example. Nicotin paralyses the brain first. Then there is no question there. In the case of curare, it happens to be the other way round; it goes for the nerve endings first, and then to the brain. So that we have difficulty. That is why there is all this fuss about curare.

18837. Would not that suggest that the analogy between curare and the other members of this host is not very close?—Certainly not. I think in all text books on pharmacology you will find them grouped together as one definite group of drugs, having certain three or four actions in common.

18838. And you think you can argue from the action of some of these of which we know more to what the action of curare should be?—You can gauge it at once. For instance, when I got this African boxwood, I found that the African boxwood paralysed certain nerve cells. As soon as I discovered that, I classified that drug immediately into this group, and the other action simply fell out, as a matter of course. I knew what was going to happen before I tried as regards all the other effects.

18839. Is it a characteristic of this group that the ends of the motor nerves are paralysed?—Yes.

18840. Or is it that the ends of the motor nerves are paralysed before the abolition of the higher centres?—No, it is sometimes one and sometimes the other; they vary; and as I told you conium comes in between the two.

18841. The important point for us is to know, if possible, the order in which that paralysis takes effect—as to whether a person's or an animal's consciousness may remain after the absence of movement has ceased?—The only two with which I am acquainted, where the effect comes on first in the motor nerve endings, are curare and the boxwood. In the others the paralysis begins at the nerve cells first.

18842. So that in this important question there may be a lack of resemblance among these members of the same group?—I do not follow you.

18843. You suggested that there are a host of drugs which act in the same way as curare?—Yes.

18844. And that one may argue the action of curare from the known action of some of these congeners?—Yes.

18845. But the very important question of whether the paralysis of movement precedes or not the paralysis of consciousness, is a matter upon which there is a variation within that group?—Yes.

18846. Then is it possible to argue, from what we know of some members of it, what the action will be in the case of other members, in respect of the order of paralysis of motion and consciousness?—No, not with an unknown drug. The order varies. The type of action is the same in all.

18847. It may be that while in the case of curare the paralysis of motion precedes by a considerable length of time the paralysis of consciousness, in other members of the group the reverse may be the case, or there may be a great difference in the time intervening?—Yes, that is correct.

18848. Then you cited the replies of some practitioners in regard to the use of silver compounds in diseases of the eye?—Yes; may I pass you the Report (*handing in the same*).

18849. Thank you. I see you say, "Wide differences of opinion are, however, expressed. Regarding protargol, an ophthalmic surgeon remarks that it is 'inert and quite useless'; while another observer states that, in his experience, it is 'by far the most reliable salt for injecting or irrigating in cases of chronic gonorrhœa.'" I understand that your point in quoting this was to show the variation of opinion by observers of the drug under observation?—Yes, and of the extreme difficulty of making use of clinical experience.

18850. But it points rather to inaccuracy of observation, does it not?—At first sight it does, but that is not, I believe, true. It points to the fact that the conditions are so extremely variable that it is very difficult to draw conclusions.

18851. You may have a plurality of causes in operation?—Yes; quite so.

18852. I suppose that may be true also in the case of an experiment upon an animal as well as in clinical observation?—You have always got the control—that is the point.

18853. Do you mean that in the case of an experiment on a living animal you never have to do with plurality of causes?—Yes, you have plurality of causes; but you have the cause and the effect. You know that the effect is due to the cause, but you do not know exactly the intermediate steps between; you can differ on that.

18854. Is it not a fact that different observers watching the same experiments on animals have drawn different conclusions?—No; they do not differ on the facts. The facts remain the same. They only draw different conclusions as to how the effect is produced.

18855. But even in the case of watching an experiment accuracy in the observation of facts is required?—Yes, absolutely.

18856. Have you not come across instances in which facts have been interpreted differently by different observers in the same sets of experiments?—What I mean is that, supposing you observe such a simple thing as a rise in blood-pressure, there is a fact written down, and you cannot deny it. As to the origin of it, how it has been produced, you may have two schools, one saying that it is produced one way and the other saying it is produced the other way.

18857. Given agreement in observation, you may have variety of interpretations?—Yes.

18858. (*Sir Mackenzie Chalmers.*) You mentioned, I think, that you had a Therapeutical Section of the Royal Society of Medicine?—Yes.

18859. Would you kindly tell us, who are not members of the profession, what the Royal Society of Medicine is?—It is a collection of most of the learned Societies of Medicine joined together recently into one big society, which they call the Royal Society of Medicine, and with various sections; that is to say, the Therapeutical Section is in one group, Diseases of Children is in another.

18860. Has it a local habitation?—Yes, in Hanover-square.

18861. And is it representative of a large body of medical opinion?—A very large body.

18862. There were some parts of your evidence that I did not quite understand, which I should like to know a little more about. You referred to morphia as exercising a specific selective action?—Yes.

18863. I suppose there are a good many other drugs in the same group with morphia, or are there not?—There are a few others, but not very many.

18864. One, for instance, is the substance used in India called Bhang?—Yes, that is Indian hemp, cannabis indica.

18865. Does hachish belong to the same group or not?—Yes; that is the same thing. I classify it in the same group myself, although it has a different type of action.

18866. Does it destroy sensation?—It produces such a weird kind of intoxication that it is difficult to observe. It does to a very large extent, but nothing like to the same extent as morphin.

18867. In your opinion, for certain animal experiments, morphia is a safe, proper, and effective analgesic?—Yes.

18868. You are perfectly satisfied of that?—Absolutely satisfied.

18869. Do you think there is much room for idiosyncrasy in animals as regards the action of morphia?—No; no room at all, I think.

18870. We were told, I think, by one witness that pigs were absolutely insensible to morphia. What do you say to that?—How was the morphia administered?

18871. We were not told that?—There are all sorts of statements of that kind made; one is continually coming across them. For instance, they say henbane is not poisonous to hogs and it is to hens; but that is not true, of course. It is poisonous equally to both of them if you give it in the correct way. Some drugs are given by the mouth and are not absorbed, and people say they are not poisonous.

18872. What I wanted to get at was this: Assuming that the morphia is injected in the way in which you use it in laboratories, has it a very different effect on different animals?—No; it has not. It has precisely the same effect, although it is interpreted differently. If, for instance, you inject morphin into frogs you first of all produce complete paralysis and narcosis; 24 hours afterwards the frog gets strychnine-like convulsions; that is to say, a frog gets convulsions and man does not. How is that? Because you cannot give a dose of morphin to a man like that and then let him recover. If you could he would undoubtedly get similar convulsions; indeed, it is quite common to see a man with these twitchings in exactly the same way, on recovering from morphin poisoning.

18873. Take the case of a man attempting suicide by morphia. Would you get similar results?—Yes.

18874. Is there any reason for supposing that a dog is less sensitive to the action of morphia than other animals of the same size and weight?—There is no reason at all. I should say that it is more sensitive.

18875. And you do not think that there is much idiosyncrasy in dogs?—None at all. I have never seen any.

18876. You have had large experience of giving morphia to dogs?—Yes.

18877. I think we were told that there was one particular family of human beings who are curiously insensitive to morphia?—Now we are coming to a different question. If you take morphin for a certain length of time, you learn to destroy it just as if you take alcohol for a certain length of time in sufficiently big doses, you learn to oxydise it completely.

18878. Or a pipe of tobacco?—Yes, and you learn to use your morphin just as if it were bread and butter. That is done by means of a ferment. This ferment, this power of destroying morphin, might conceivably (although I do not know it, I never heard of such a thing) be hereditary.

18879. Then as soon as you got to that stage you would have what is called an idiosyncrasy?—Yes.

18880. But as regards many drugs there is a marked idiosyncrasy, is there not; for instance, quinin. Some people can take quinin and some cannot?—Some people cannot take quinin because it produces an objectionable action so extremely easily.

18881. (*Sir William Collins.*) Would what you say amount to this: that given a substance which is a poison to any animal if that substance is only properly got into the blood of any other animals it would be poisonous to them too?—Yes, it amounts to that. That is correct. You see there are no drugs with which we are acquainted which have any different action on the heart or on the kidneys of animals from that in man. The only differences which occur are on the brain. For instance, cocaine in big doses causes convulsions. Cocaine acts on the cerebral hemisphere, the big part of the brain. In the frog there are practically no cerebral hemispheres. You can give an enormous dose of cocaine and you can hardly get any twitchings. In the rabbit you want a relatively smaller dose, but still a very big dose. In the dog, in which the cerebral hemispheres are better developed, you want a still smaller dose, in a monkey still smaller, and in man the smallest. So that you can tell the dose of cocaine necessary to produce convulsions by weighing the cerebral hemisphere and then the body; the dose of cocaine varies in relation of these two exactly.

18882. (*Sir William Collins.*) What you are saying if true of chemical poisons will not hold in the case of bacterial poisons, will it?—You mean such as diphtheria toxin?

18883. I am thinking of the case of septicœmia of mice, which we have been told is harmless to one variety of mouse and fatal to another?—They are proteid substances, or bodies allied to proteid substances, and that would not apply, of course. The horse serum, the serum from a horse may be poisonous to one animal and not to another.

18884. You were speaking of the chemical poisons of the pharmacopœia?—Yes.

18885. (*Sir Mackenzie Chalmers.*) Chemical poisons do not multiply in the blood itself?—No.

18886. Some bacterial poisons multiply in the human body?—Yes.

18887. However, the practical point is, that you feel no doubt that as morphia is administered in laboratories in England, it absolutely protects the animal from pain?—Absolutely.

18888. Urethane, I understand you, is a general anæsthetic?—Yes.

18889. I am sorry to say that I do not know what it is?—It is a curious substance, because Schiemerderberg thought out the sort of substance that he wanted. He thought to himself, "I want to get a substance different from chloroform which will have the action of chloroform but which will not depress the medulla." So he made up a formula on paper and then built up urethane from it. It is a combination of urea and alcohol, so to speak.

18890. It is a synthetic substance. Is it made in the laboratory?—Yes.

18891. Then does it produce a sort of uræmic poisoning, or produce alcoholic paralysis?—No, ureia does not produce uræmic poisoning. It produces an action very similar to that of chloroform, but without any depressent action on the heart. It has the exact action of chloroform, or any other member of the group, on the brain. All these drugs of which I call the alcohol group collect in the brain.

18892. (*Dr. Gaskell.*) And you can tell that it will have that action by its formula?—No, you cannot, but Schmiederberg thought that you could, and he built up the formula.

18893. (*Sir William Collins.*) There is a considerable relationship, is there not, between the chemical constitution and physiological action?—There is some relationship, but it is not considerable to the pharmacologist at present, because a small change produces a tremendous difference in action sometimes.

18894. (*Sir Mackenzie Chalmers.*) It is not worked out?—It is not worked out. There must be a relationship.

18895. In your opinion for animals, urethane is a useful and reliable anæsthetic, and an analgesic?—I think it is the best.

18896. There is no danger, if it is properly administered, of the animal suffering any pain?—No.

18897. I did not quite understand, I am afraid, what you said to Sir William Collins, that when either chloroform or curare is administered, the sensory cells of the spinal cord still remain active?—No; it was chloroform. I said that chloroform paralyses the sensory cells. I said that all the anæsthetics paralyse both sensory and motor, but they paralyse the sensory in every case first.

18898. Then I misunderstood you. I understood you to say that even after you had administered chloroform, the sensory nerves of the spinal cord might still be active?—Yes, they might still be active in light anæsthesia. That is quite true. It is complex, and it is difficult to explain everything at once. When you administer chloroform you begin by paralysing the higher centres first. You paralyse control in the brain, power of paying attention and judgment; they go first, and therefore you get, as we may say, a riot of the lower centres; you begin to reel in your gait and do not consider what you say, you lose your politeness, and so on; you lose all external conformities with a polite existence. Then you get the depression progressing still further, and it goes to the motor area, and then it runs from the brain down to the cord; it misses out the medulla; lastly, it paralyses the medulla; but always, in whatever part of the central nervous system the action occurs, you have evidence to show that it paralyses the sensory cells before the motor. Nevertheless, paralysis progresses in this order.

18899. But as long as the sensory cells in the spinal cord would reply to a stimulus might there be pain?—No, appreciation of pain may have gone long ago. But with a smallish dose of an anæsthetic you may pinch the tail or hind limb and get a leg drawn up.

18900. That is purely reflex action?—Yes, that is purely reflex; but the sensory cells are intact in the spinal cord. With a big dose of anæsthetic that action is gone; I mean that the sensory cells are paralysed. In the second case, probably the motor cells also, although these become paralysed only very late.

18901. You spoke of the effect of a large dose of cocaine, but cocaine acts as a local anæsthetic simply

Mr. W. E. Dixon, M.A., M.D.

4 Dec. 1907.

and simply cuts off communication with the brain, does it not?—Yes, it paralyses the fine nerve fibrils. If you inject a little the fine nerve fibriles all round are paralysed by the cocaine. It does not paralyse the motor fibrils because there are not any in subcutaneous tissues.

18902. It simply stops the message going to the brain?—Yes.

18903. When you told us how a large dose produces convulsions, that was not applied locally?—No, that was given internally, of course.

18904. By injection?—Yes.

18905. There is no doubt whatever, I suppose, as regards curare, that it paralyses the motor before it paralyses the sensory nerves?—There is no doubt about it; but it paralyses the sensory cells as well.

18906. That being so, it is essential to keep the provision in the Act that it must only be administered with another anæsthetic?—Yes, I think that is a good provision.

18907. Because otherwise there would be a period of time during which there would be sensation without motion?—Yes, that is the point; that is right.

18908. May I ask you what was the object of your personal experiment in taking curare?—It was taken accidentally. We commonly take our drugs up in pipettes, and while I had a pipetteful to my lips I was attempting to talk to someone, and sucked up the whole, and swallowed it before I knew what I was doing.

18909. And you had an uncomfortable quarter of an hour, I suppose?—Well, I did not know what was going to happen, but nothing happened at all.

18910. Has any attempt been made to determine chemically the constitution of curare?—Yes, in Germany an attempt has been made; they have got pure crystals of curarin, but the supply of curare has given out. We are still dependent, you see, on the natives, who keep the sources of curare a secret.

18911. And for the purpose of chemical analysis you require a considerable quantity, I suppose?—Yes.

18912. You told us about some interesting experiments with boxwood. The result of those experiments was that the dust of boxwood was capable of poisoning human beings through inhalation?—Yes.

18913. Producing heart symptoms?—No, no heart symptoms. The essential symptom was this tremendous difficulty in getting breath; the men turned blue in the face and gasped for breath. The doctors who examined them found nothing wrong with their hearts, except that the heart sounds were very feeble, but they regarded it as and called it cardiac dyspnœa; that is to say, they thought the difficulty in breathing was due to the heart, whereas in reality the difficulty of breathing is due to partial paralysis of the motor nerve endings.

18914. As the result of that, what has been done practically?—I have not seen the report of that Departmental Committee, but I fancy that they are either going to forbid the use of the wood altogether, or they are going to compel the people to wear respirators.

18915. If they wore efficient respirators it could be handled with safety?—Yes, it could be handled with safety.

18916. You mentioned that you thought it was most important to do certain experiments before students. What number of students pass through your hands annually?—I should think 150.

18917. Would your experiments be pharmacological experiments or physiological experiments?—Entirely pharmacological.

18918. Do you think it is important that students should see any physiological experiments or not?—Yes, there are certain things which I assume that they know all about when they come to me.

18919. May I ask, are your students third-year men?—Yes, the third-year men; after they have done their anatomy and physiology and whilst they are beginning their work in the wards.

18920. And you think that at that stage it is essential to show certain experiments on animals to the students?—I regard it as the most important part of their education.

18921. It has been suggested that it has a deteriorating effect on their character and humanity. Have you any opinion on that matter?—I regard that statement as absolutely ludicrous. Watching an operation does not produce that effect; it rather produces the other effect.

18922. It is said that in watching an operation you approach it with a different mental attitude, because the operation is entirely for the benefit of the patient, whereas the other is simply to illustrate a scientific fact?—It is entirely for the benefit of the watcher certainly.

18923. We have been told that it would have necessarily a harmful effect on the students' mind?—I do not think that for a minute. I cannot see how it could possibly affect their minds detrimentally at all.

18924. You mentioned in your *précis* a series of researches, some of which we have not had any reference to?—These are only some of them. They are typical ones.

18925. Have any of these been carried out in your laboratory?—Yes, all of them either are being or have recently been.

18926. Take the first—lymphocytosis. The causation and mode of production of this condition, you say, has been determined. Is that a recent research?—Yes.

18927. Has it any practical effect on treatment?—All knowledge, of course, must have a practical effect. May I explain what it is roughly? There are, roughly, just for the purpose of description, two kinds of white blood corpuscles. There is one kind which lives, so to speak, in the spleen and lymphatic glands, and the other, which has its habitat in bone marrow. In the spleen and lymphatic glands there are muscle fibres, and what we have shown is, that we can send out at any moment many of these leucocytes which live in the spleen and lymphatic glands. And we can do that at any moment by means of pilocarpin. If I want to produce lymphocytosis in a man, I can do it in a few minutes by giving a small dose of pilocarpin.

18928. Excuse my ignorance; these white corpuscles are what are sometimes called phagocytes?—Yes, but of these are mainly the bone marrow variety.

18929. And not a phagocyte?—Not to the same extent as the others.

18930. So that its action would not have a direct curative effect on the wound?—I do not think it would personally, but you know the tendency in phthisis (or it was the tendency a short time ago) was to give drugs supposed to increase the leucocytes. I do not think it is used much now.

18931. But still this research may have, at any time in connection with some other research, an important effect on treatment?—Certainly. It is a fact about pilocarpin which I expect all students to know now.

18932. I suppose this work is still going on?—Yes.

18933. Then the next is "arteriosclerosis." You say that it has been shown that this condition arises from any cause which temporarily raises the blood pressure?—Those are most interesting experiments, because they show this. You know that as we get older we all get certain changes produced in our vessels. One type of this change we can produce artificially. It is due to any cause which raises the blood pressure. In order to produce arteriosclerosis, we raised the blood pressure with one's fingers compressing the abdominal aorta in a rabbit. A rabbit has got a stiff abdomen as we have; you can put your hand down and quite easily compress the aorta. We did that once a day every third or fourth day. Then what happened? The rise of blood pressure cracked across into the elastic fibres in the blood vessels—the blood vessels are full of elastic fibres. Inflammation occurred round these, fibrous tissue developing, and calcareous material subsequently being deposited in the artery. It is a practical point, too; it teaches us what not to do as we get on in years.

18934. But as we get older it is a more important thing to prevent this arteriosclerosis than to produce it artificially?—Yes, but if we know how to produce it artificially we are a long way towards prevention.

18935. So that the pressure caused by nicotin in smoking might be the cause of arteriosclerosis?—Yes,

any cause which raises the blood pressure to a fair extent will produce arteriosclerosis.

18936. Would you feel inclined to say, then, that as we get older we should diminish our smoking?—No; but there is this other point to consider, which you can learn from experiments. If you take a boy and give him a cigar his blood pressure goes up, and later he gets collapsed and blood pressure comes down; if you give him another cigar a week afterwards his blood pressure goes up as before. If you, however, give that boy a cigar every day, after a time his blood pressure does not go up; he has learnt to destroy the nicotin just as you may learn to destroy morphin.

18937. Is the moral of that to begin smoking as early in life as you can?—No, but I think the moral is that it is better to be a moderate and continuous smoker than to smoke in fits and starts.

18938. And never to discontinue your smoking?—Yes.

18939. I see you mention, among other things, the action of tobacco smoke and the origin of nicotin immunity. Is that at present being investigated in your laboratory?—Yes.

18940. In tobacco smoke itself very little nicotin is contained, is it not?—There is a good deal. Practically the whole effect of a cigar is caused by its nicotin; the other constituents are unimportant.

18941. Has it a slightly paralysing effect, or what is its effect?—The first effect of nicotin is to excite. It excites and raises the blood pressure for half an hour; it stimulates everything for half an hour, and then after that you get the depressant action.

18942. (*Sir Mackenzie Chalmers.*) I see among other matters that you are investigating in your laboratories are the action of new cardiac tonics, the action of caffein, urea, and saccharin on the kidneys?—Yes.

18943. Are those experiments animal experiments?—Yes.

18944. Have they an important bearing on human treatment?—In connection with caffein, urea, and saccharin on the kidneys. The point is that we know nothing, at least I think I am right in saying nothing as to the cause of renal disease, how it originates. I had some sort of conception that renal disease might be caused by taking tea and coffee, and therefore we used caffein. Or it might conceivably be due to excessive urea, and therefore we tried urea. Urea has a marvellous effect on the kidneys. Thirdly, saccharin is a drug which is used to produce sweetening in the case of people who suffer from diabetes. A drug allied to saccharin I know will produce renal disease. We knew that, and so these drugs are being given at the present time by the mouth to dogs to see whether there is any effect; that is to say, they are simply being fed, some taking caffein as we take tea, some having their food sweetened with saccharin and some having urea put in their food.

18945. Saccharin at any rate is largely taken by certain classes of people, and it is important to find out whether it has any evil effects as well as good effects?—Yes.

18946. And to some extent, I suppose, the result of your experiments may be either to acquit or convict tea and coffee and certain other agents?—These are excessive doses of caffein.

18947. Still, long continued small doses may possibly have some effect?—Yes, as we know that they have such a marked effect on the kidneys.

18948. You are also investigating the relative action of the new local anæsthetics?—Yes.

18949. Including cocaine or eucaine among the new ones, or strovaine?—No, cocaine is at present a local anæsthetic in the pharmacopœia. e object to cocaine because in a considerable number of cases it produces toxic symptoms, and because it is irritant. Accordingly this Committee of the British Medical Association asked me to have the newer local anæsthetics investigated, so that we could make a report as to which of the many on the market supplied by wholesale druggists and chemists was the best, and this research is just about completed.

18950. It will have a most important effect on minor operations on human beings you think?—Most important. We are every day doing more and more operations under local anæsthesia. Now we inject the local anæsthetics in quite a number of cases into the spinal theca. You inject it through the back, you make the patient sit up and lean a little forward, and inject it into the spinal theca, where, of course, it paralyses first the sensory cells, and the man loses all sensation to pain. Then touch goes next. Pain goes first, then tactile sensation, and lastly motion. That is the sequence that always occurs; no matter what anæsthetics you use the paralysis goes in that order—pain, then touch, then motion. The man cannot feel anything, but he can still flex his toes. If you put these drugs——

Mr. W. E. Dixon, M.A., M.D.
4 Dec. 1907.

18951. (*Mr. Tomkinson.*) Pain goes first?—Yes.

18952. What second?—Tactile sensation; that is to say, a man can feel that you stroke his leg, but he cannot feel any pain. You can put a hot iron on his leg and he would look at it and feel you do it, feel all the sensation, but would feel no pain.

18953. And what goes last?—Motion.

18954. Where does consciousness come?—Consciousness is retained all the time. This is local anæsthesia.

18955. (*Sir Mackenzie Chalmers.*) How do you tell with an animal when the sense of pain is abolished by local anæsthetics? I can understand that you can investigate the action of these things with a human being, who will tell you his sensations, but I cannot understand how you can get any trustworthy results from an animal?—There are several modes, of course, of using those drugs. In this case a number of experiments on the anæsthetic point were done on men, on ourselves. I mean that a man had his arm bared and one drug was injected there, and another drug given here, and you can test it in that way. But where the animals came in mostly was as to the toxicity of these things. The anæsthesia is one property, the toxicity is another. The irritability is another, the toxicity and irritability are tested on animals.

18956. The problem is to find a thing which is a perfect anæsthetic, and at the same time a non-toxicant and a non-irritant?—Yes.

18957. Your name has been referred to in the evidence, I do not know whether you have read the evidence given before this Commission, but I think Dr. Gaskell will ask you about those particular experiments. Has your attention been called to that?—Yes, I have not read it, but I know the point to which I am referred.

18958. (*Mr. Ram.*) Sir Mackenzie Chalmers has asked you nearly all I wanted to ask you, and there are only two or three questions left that I wish to put. With regard to these local anæsthetics, of which you have just spoken of, you said that you could inject one or more of them into the spinal cord and produce anæsthesia by that means?—Yes.

18959. Would that be local anæsthesia or general anæsthesia?—I should not like to say which. It is anæsthesia below the point of injection. You inject it just where the spinal cord ends into the sub-dural fluid there, and it paralyses the lower part of the spinal cord. It is local, of course, in that it does not affect the other part of the body.

18960. It affects the portion of the body below the point at which you insert it?—Yes.

18961. And affects that part of the body universally?—Yes.

18962. And equally?—Yes.

18963. And completely?—Completely.

18964. When once you have arrived at a local anæsthetic which is not toxic and not irritant, is it safer to use a local anæsthetic than such an anæsthetic as chloroform or ether or the A C E mixture?—It is not a question so much of safety as of convenience and necessity, I think.

18965. But there are certain dangers we know affecting what we generally know as anæsthetics, chloroform, ether, and so on?—Yes.

18966. Are there any dangers, so far as you know, incident to the use of local anæsthetics?—With some of them there are considerable dangers. With cocaine you may, in certain people, accidentally inject the cocaine into a vein when you inject it, in which case it produces a toxic action on the brain and a toxic action on the heart. Cocaine is a toxic body. And, secondly, you may get sufficient irritation at the seat of injection to produce objectionable symptoms. I

Mr. W. E. Dixon, M.A., M.D.

4 Dec. 1907.

think we have now got a local anæsthetic; as the result of this work we have certainly determined the best, and are going to recommend that that one should be put in the pharmacopœia.

18967. With regard to all these researches that you have told us of, I gather from what you said that experiments on animals are not necessary for all, but for some?—Yes.

18968. In the case, for instance, of subjecting animals to the action of caffein, urea, and saccharin to see how they act on the kidneys, do the animals suffer any pain?—No, none at all. You can give saccharin to a man; it simply sweetens his food. He may object to having his food sweetened, but you cannot call that pain.

18969. And the same with animals?—Yes.

18970. (*Chairman.*) The animal is not operated on afterwards to find what the result has been?—No, we kill it afterwards.

18971. After what?—After three or four months; after they have been subjected to this experiment for three or four months the animals are killed—they die.

18972. (*Mr. Ram.*) And are dissected as dead animals?—Yes; and sections are cut of their various tissues.

18973. Have you at present found any result from the experiments as to those three matters, caffein, urea, and saccharin?—We have only killed one dog at the present time, and we killed that dog because we found that it was getting ill, that it began to lose its hair, and began to pass albumen in its urine, so that it was killed and its kidneys were found diseased. That was with urea.

18974. Do you attribute the disease of the kidneys to the action of the urea that you had administered to the dog?—We do. We cannot be certain until we have done two more experiments to make sure that it is a constant effect.

18975. With regard to the effect of drugs on blood clotting, have you experimented on animals with regard to that?—Yes, they were all done first on animals, only subsequently on man.

18976. What is the nature of such an experiment as that?—The nature was to take a drop of the animal's blood first. There is a convenient vein in the ear of a rabbit, and you just make a prick with a needle, you get a drop of blood, and take its clotting time with a certain instrument. Say, it is three minutes; then you give the animal a dose of the drug, the effect of which you want to determine. Supposing you give citric acid, you take its clotting time at various periods afterwards, and you find that the citric acid will prolong the clotting time from three to four, and five, and ultimately to fifteen minutes; and then there is gradual recovery.

18977. Does it make the blood more slow to clot?—It would make it more difficult to clot.

18978. When you say ultimate recovery—recovery from what?—The animal is none the worse for the citric acid.

18979. Then, with regard to the standardisation of drugs, you spoke about the necessity of using animals for experiment, and I see in this pamphlet that you have handed to us, which you put it in I think to show the varying nature of the strength of ergot?—Yes.

18980. This caught my eye: "For my part I unhesitatingly express the belief that many hundreds of patients die annually from digitalis and its allies not possessing the virtues which are required of them."—Yes.

18981. That is your belief?—Yes.

18982. If you could get a perfect standardisation for digitalis, for instance, then a doctor administering it would know exactly the strength that he was giving?—Yes.

18983. At present I suppose in many cases he has to give it in absolute ignorance of the strength of the drug he is administering?—In absolute ignorance.

18984. Intending to give perhaps a strong dose of digitalis, and giving a quantity which in a proper preparation would be strong, in effect he gives next to nothing to the patient?—Yes, he gives none.

18985. And the patient dies perhaps?—Yes.

18986. Is that true of what you call the allied drugs which I think you said were strophanthus and squills?—Yes.

18987. When you have arrived at a perfect knowledge of what the dose ought to be, and the strength ought to be, would it be possible to cause the sale of the standardised drug to be universal?—I think so, certainly. If a drug is not sufficiently active, it ought not to be used, and if it is too active it can be diluted to a certain definite strength.

18988. I do not think I made my question quite plain. I am supposing that you have got a quantity of a drug of exactly what you consider the right strength—that you have satisfied yourself of the actual strength by tests on animals?—Yes.

18989. That quantity is sold out to different chemists?—Yes.

18990. Does it retain its standardised strength?—That is the point the Pharmaceutical Society specially asked us to investigate, and we have done it in a number of cases now; it retains its strength for eighteen months, and it is not necessary to go longer.

18991. It would be possible then for any chemist in the country or anywhere else to supply himself, if he went to a proper place, with an amount of this drug or any other similar drug of what was known to be the proper strength?—Yes.

18992. You spoke of taking curare yourself accidentally by the mouth. How is curare generally administered to an animal?—Intravenously. It has no action, of course, when given by the mouth.

18993. You proved that to your own satisfaction?—Yes.

18994. I should just like to ask you one thing before you leave the standardisation of drugs. Is there any pain caused to the animal that is experimented upon, beyond the mere prick of a needle?—I do not think so. Of course we standardise digitalis on frogs which have very little brain.

18995. I ought to have asked you that before, what animals are generally used for standardising drugs?—In the case of digitalis, stropanthus, and squill we use frogs; in the case of ergot we use cats, that is under licence alone and anæsthetised the whole time; and with cannabis indica we use dogs. The drug is injected, the dog becomes intoxicated, it recovers completely, and it is none the worse for it; indeed cannabis indica intoxication is rather pleasant, there is nothing objectionable in it at all. It is greatly used in India as a pleasure.

18996. Then, in point of fact, it comes to this, that in all this standardisation of drugs either the animal is under anæsthetics, or there is no suffering at all?—Yes.

18997. (*Dr. Gaskill.*) I think perhaps some members of the Commission did not quite understand what you meant when you spoke of anæsthetics causing the sensory cells in the spinal cord to be put out of function, while the motor ones still remain, so that reflex actions are still possible?—What I mean is, that you can get a stage in chloroform anæthesia when you can show definitely (this is not a question of opinion at all, it is a question of absolute fact—it is in all the text books of repute) that in the spinal cord the sensory cells are paralysed and the motors are still active.

18998. What do you mean by the sensory cells in the spinal cord. That is what I think the Commission did not quite understand?—There are two sets of cells in the spinal cord, the cells which receive and the cells which give out impulses, and we use from analogy the word sensory to mean receptor—receiving.

18999. Is it possible for reflex action to take place without those sensory cells being involved?—Yes.

19000. So that really the sensory cells, which would be the communication between the cord and the higher centres, would be put out of action; while a simple reflex would still be possible because the motor cells would not be put out of action. That is what you mean?—Yes.

19001. I see that you say in your *précis* that a dose of morphine such as two grains administered to man would lead to deep sleep, from which he is aroused with difficulty, while larger doses are followed by coma and complete unconsciousness?—Yes.

19002. So that you would consider that two grains to a man leads to complete absence of pain?—Yes.

19003. And deep sleep?—Yes.

19004. What I want to know is, does the dose of morphia required bear a distinct relation to the body weight of the animal used?—No, it bears relationship to the amount of brain substance.

19005. And that bears a relation to the body weight?—Yes.

19006. What I mean is that a small dog and a large dog would not require the same dose to produce the same effect?—Certainly not.

19007. Could you draw any relationship between the dose for a man and the dose for a dog, considering the difference in size of the man and the dog?—I should not like to draw any relationship.

19008. But I meant rather if two grains is a dose for a man to produce very deep sleep, would you consider that two grains, or more than two grains, or less than two grains would be required for a dog very much smaller in size than a man?—One grain in a dog, of course, produces a very marked effect. You want much less relatively to the two animals.

19009. Would that be partly on account of the size of the animal and partly on account of the development of brain substance?—Yes.

19010. Both those things would combine in the same relation?—Yes.

19011. And cause a lesser amount of morphia to produce the same effect in a dog as in man.

19012. Then I see that the Hon. Stephen Coleridge included your name in one of the five cases, I think it was, that he prominently brought before us as having infringed the Act—he referred to your paper by Dixon and Brodie in the "Journal of Physiology," Vol. XXIX., No. 2, page 144?—Is that all that was mentioned? I am afraid that I have not read it.

19013. That is what he refers to in his evidence here. The point of it is this, if I might just say what he accuses you of. At No. 10371 he says: "On page 144 these two vivisectors make the following statement: 'In studying these reflexes we have found it of the utmost importance to avoid the use of chloroform or ether as the anæsthetic. The experiments must therefore either be performed upon unanæsthetised animals, upon animals anæsthetised with morphia, or upon decerebrate animals. Our experiments were usually conducted under one of the two latter conditions, but in a few instances were repeated upon animals lightly anæsthetised with chloroform.'" This point is that, as you have said, they must be performed upon unanæsthetised animals, or other, when you speak of light anæsthesia, you really mean unanæsthetised animals. That is what I understand.

(*Dr. Wilson.*) I should say incomplete anæsthesia.

(*Witness.*) I think he ought to have referred in the same paper to the beginning, to page 102 of the same research, which I have here, under the heading of "Animals, Anæsthesia, etc." In that heading it says: "The animals mainly used were cats. With the exception of a few experiments, in which the animals were killed by pithing, all were anæsthetised, usually with ether, but at times with chloroform, or with the ACE mixture. In experiments on dogs we generally administered morphia as well. In a few cases we anæsthetised first with ether and then injected urethane, either intravenously or intraperitoneally." That is the first thing, at the beginning of the paper where one always describes the anæsthetic effect. I know, of course, Mr. Coleridge's Society reported the statement on page 144 to the Home Office, and they replied by pointing out to him this page 102 where we definitely state that all the animals were anæsthetised. If I may just refer to page 144, the words which are quoted are perfectly correct, but in order to understand exactly what they mean, the context is really necessary. These experiments were in connection with asthma, and they were to show that when, by any cause, you excite a certain portion of the septum of the nose, you get constriction of the bronchioles. You never get that constriction of the bronchioles if there is much volatile anæsethetic in the lungs, because a volatile anæsthetic in the lungs paralyses the nerve endings. Accordingly, we state: "The experiments must therefore either be performed upon unanæsthetised animals," which is, of course, quite impossible, first of all because it is not allowed, but also because you cannot do an experiment on an unanæsthetised animal where the whole point is absolute stillness. You must not even let a man walk across the laboratory when an experiment of this kind is going on. The movement of a hair would spoil the whole thing, so we say, "Upon animals anæsthetised with morphia or upon decerebrate animals. Our experiments were usually conducted under one of the two latter conditions"; that is to say, the animals were decerebrate or they will have had chloroform first and then morphin, and then subsequently when everything was quite still, no more chloroform being given, the excitation of the nose was done. The least little bit of sensation of any kind would, of course, immediately have produced a big effect on the animal absolutely vitiating the experiment. That was the experiment. Then we say at the end that the experiments "in a few cases were repeated upon animals lightly anæsthetised with chloroform." There is really nothing to comment upon on that. They were anæsthetised. An ordinary surgeon, when he does an operation, only deeply anæsthetises his patient when he wants to relax the muscles, when he wants all the muscles, say, of the abdomen to be relaxed so that he can feel a tumour at the back of the peritoneal cavity. Then he puts the patient under deep anæsthesia. But in ordinary cases he uses light anæsthesia, and, personally, I think the lighter the anæsthesia the better.

Mr W. E. Dixon, M.A., M.D.
4 Dec. 1907.

19014. (*Dr. Gaskell.*) Mr. Coleridge's comment is: "They cover up the anæthetisation, in my opinion, by speaking of them as 'lightly anæsthetised with chloroform,' because if they were anæsthetised properly with chloroform, according to their own description, the experiments would be valueless"?—Of course, if a man says that the animals are not anæsthetised, it is his business to bring evidence to show it. All I can say is that if there were the very slightest movement or were the sensory nerve centres acting in any way, the animal would move, and one movement of any kind would vitiate the whole experiment. May I pause to show you the delicacy of the tracing referred to? It would be impossible to take a thing like that with the slightest movement (*handing in a tracing*).

19015. Then, so far as I understand it, your remark, "The experiments must therefore either be performed upon unanæsthetised animals," etc., did not in the smallest degree imply that you yourself ever performed experiments on unanæsthetised animals?—Certainly not. That is stated clearly at the beginning of the paper. The pages are given on the outside of the book. There are two pages—144 and 102.

19016. Now I think you would like to tell us some few points with respect to the administration of the Act as at present. You have not referred to anything of that sort, although I see it is down in your *précis*. We should like to know what, in your opinion, are the difficulties and the annoyances which the present Act causes to workers?—At Cambridge we encourage the men when they are qualified to come and spend six months in the laboratory learning to observe, doing a piece of useful research work which shall enable them to take their M.D. in research. Those men come, and I suggest some useful object for them to work upon in their six months; but often they cannot start; they are kept delayed sometimes as long as two months waiting about until they get their licence to begin. They lose heart; it is difficult to give them anything to do, and altogether it is a most discouraging thing to the men.

19017. (*Dr. Wilson.*) They have the M.B.; they are qualified?—Yes, they are qualified medical men, but we require a man to show something of his own capacity before we give him the M.D. Then I have had a good deal of correspondence with the Home Office, because I wrote up and asked for certificates for painless experiments, and they replied, "If you want to do painless inoculations you do not want any certificate at all; you can do those as much as you like—they do not come under the Act." But they added, "If you do them you must do them on your own responsibility," which means that one can be prosecuted at any time for doing these experiments, and as one does not quite know how the Act is going to be interpreted, one has, of course, to say that they are not painless, but painful, and you get your certificates. Then at the end of the year, when you send in your report, you have to state whether the experiments performed were painless or painful.

Mr. W. E. Dixon, M.A., M.D.

4 Dec. 1907.

19018. What sort of experiments are you referring to?—Inoculation experiments.

19019. (*Sir Mackenzie Chalmers.*) The results may be painful?—The results that I am speaking of in these cases were painless.

19020. And you knew they would be painless?—You have moral certainty. For instance, the injection of caffein must be painless; it cannot be otherwise. Yet you must have a licence, and you have to put in at the end that the experiment was after all painless. It seems to me rather absurd to have to go through all that. Of course, the Act at the present time says, "Experiments calculated to give pain." In my opinion most experiments are not calculated to give pain; in fact, in ordinary vivisection none of it is calculated to give pain. I have a perfect right, according to that, to perform experiments without a licence at all, because they are not caluclated to give pain. If they were calculated to give pain you would find very few people who ever performed experiments. Then, as a second point, what I recommend in order to avoid this trouble to be rid of all these complications and make the thing as simple as possible, would be to have one licence and to give a comprehensive licence to the head of a laboratory or to any other responsible person.

19021. (*Dr. Gaskell.*) Do you mean by that to abolish all certificates?—Yes.

19022. But upon the licence you would state the experiment that was intended to be done?—No, I should not. I should give a complete comprehensive licence to responsible persons, heads of laboratories; and to workers, to people who were not so responsible or who were not heads of laboratories, and so on, I would give an endorsed licence, only allowing them to do certain experiments, and indeed only doing those experiments under the control or supervision of someone who had had more experience in research than they had.

19023. Again without any special certificates?—Yes.

19024. In fact, you favour the abolition of the certificates altogether?—Altogether.

19025. Then, I suppose, you would require, were such licence to be given, that a report of the whole experiment should be sent into the Home Office at the completion of the experiment?—Certainly, of everything that was done. I think that would be an excellent provision. At the present time, supposing you start a research, it does not matter what it is, it never leads to where you think it is going. As soon as you get into it you find that there are branches in all directions. You have to follow one branch; you have to use different animals from those you put in your certificate. There is delay of a fortnight, three weeks, or a month, it may be, before you get that certificate back. You may have to perform inoculations interperitoneally instead of subcutaneously, and there is more delay again in getting fresh certificates. At the present time I have had, I think, several certificates A, each fresh one allowing me to do a different thing. I have had a number of Certificates A—I do not remember the exact number.

19026. With respect to these senior students, would you restrict this licence limited by endorsements to students who had already taken a degree, or would you allow it to students who were in *statu pupillari*?—If the experiments are done under the control and supervision of a responsible person, I do not see why any intelligent and educated man should not be a fit and proper person to do them, whether he happened to have a degree or not.

19027. It is hardly necessary to ask you would you consider it for the benefit of the men themselves, who are sending in these theses for M.D., this form of research is valuable and good for humanity at large?—I think it is one of the most valuable parts of their education. I am quite sure that the men who have done six months' research work look upon the subject in an entirely different fashion. They have learned in that six months to observe; they see things in the simplest experiments that they never observed before.

19028. And you would rather encourage an increase in the number of advanced students doing the research work of this kind than discourage it?—Certainly, I would thoroughly encourage it.

19029. (*Sir Mackenzie Chalmers.*) I suppose that if advanced students were allowed to do research work you would impose this condition, that it should be done under the immediate supervision of the head of the laboratory, and that the anæsthetic should be given by some person who understands anæsthetics?—Yes, I think that is most important. With regard to anæsthetics, anæsthesia at the present time is a very simple process. We do not use chloroform; it is altogether too much trouble; you have to be continually looking at your animal and its reflex the whole time, adding a little more and stopping it.

19030. You prefer urethane?—I use urethane.

19031. Because the worst that can happen is that the animal if kept too long under the anæsthetic may die?—Yes.

19032. Have you ever had to perform a painful experiment on an animal without any anæsthetic?—Never. I have never seen a painful experiment on an animal.

19033. Without anæsthetics?—No, I have never seen a painful experiment on an animal.

19034. (*Mr. Ram.*) Would you advocate students being allowed to vivisect animals under a lethal dose of an anæsthetic in order to acquire manual dexterity?—No, I would not under licence.

19035. You think that manual dexterity can be sufficiently acquired without using animals?—Do you mean for surgical operations?

19036. Yes?—It is a very large question, I think. It is used at the present time largely in America. The man has to go out into practice. Where does he get his practice now? He gets it by practising on man. A country practitioner who is qualified, and gets his M.D. at Cambridge or London, may have had no experience, perhaps he has been house surgeon; but wherever he goes he has to learn to do his surgery on human beings.

19037. That is why I asked the question. Do you think it would be well to allow the use of animals under a lethal dose of anæsthetic to enable students who are perhaps qualified medical men to gain manual dexterity in the performance of operations on human creatures?—Yes. I think it would be a wise provision to make for the sake of humanity.

19038. Do you think that experimenting on the bodies of animals would give such manual dexterity? Is the formation of an animal's body so similar to that of a human body that a man by experimenting on an animal could gain manual dexterity when he came to operate on human beings?—I am quite sure that he could. I am quite certain on that point.

19039. (*Mr. Tomkinson.*) You claim that morphin and similar narcotics are an absolutely satisfactory preventive of sensation if properly administered?—Yes.

19040. Their action is first upon the sensory nerves?—Yes, the sensory cells.

19041. And afterwards upon the motor nerves?—Are you referring to morphin now?

19042. Yes?—In the case of morphin you want very large doses to affect the motor cells. I made a distinct difference between morphin and the alcohol anæsthetics. I said that there are two groups, the morphin group and the alcohol group.

19043. Is the first symptom something approaching stupefaction?—Yes.

19044. Stupefaction or very deep sleep?—Yes.

19045. Then you claim that the sensory nerves are rendered insensitive to pain?—The sensory cells become quite inactive.

19046. Although there might still be motion?—Although you can still get reflexes. The motor cells are intact.

19047. Then before the discovery of chloroform was it used?—Yes, it was to a limited extent.

19048. To any general extent?—I do not think it was used to any general extent.

19049. Was not the discovery of chloroform hailed as one of the most beneficent discoveries, and the first real alleviation of the horrors of the hospital?—Certainly, quite commonly operations were done without any anæsthetic previously.

19050. And it was generally accepted that an operation was a terrible ordeal; that amputations of limbs

and other operations were so terrible that people could not survive them or live under them?—Yes.

19051. Morphia was not recognised then certainly as anything at all in the same class?—The point about morphia, you see, is that you dare not give it beyond a certain dose, because the respiratory centre gives out. In animals it does not matter if it does give out, because you can do artificial respiration.

19052. (*Dr. Gaskell.*) In those days was it not given by the mouth as laudanum? Did the hypodermic syringe exist in those days?—No; and then the morphin took a huge time to act. It was not morphin; it was opium.

19053. (*Mr. Tomkinson.*) The idea of instilling it through a vein or the skin was not known?—No.

19054. And that was the great difference?—That was one great difference.

19055. Then curare is an anæsthetic in a large dose. I understand you to say that to be effective it must not be given through the mouth in the way that you accidentally took it, but instilled by inoculation?—Yes.

19056. Then it becomes immediately effective?—Then it becomes immediately effective.

19057. I did not quite grasp what was the first step in the experiments in regard to wood poisoning by which animals were utilised. The men were suffering from a certain complaint?—Yes.

19058. Was a drop of their blood taken?—No, the wood was sent to us, the shuttle wood, in the form of sawdust, and the alkaloids were extracted from the wood; then we tried the action of the alkaloids on animals, and the effect on animals was exactly similar to the effects that were being produced on men.

19059. By inoculation?—Yes.

19060. That was not a painful experiment, nor did the animals suffer much?—No.

19061. But they showed the same symptoms that the men suffered from?—Yes.

19062. In regard to the causing of death by blowing air into the vein, would that be a very painful death to an animal not under anæsthesia? It stops the action of the heart, I understand?—Yes, immediately. It would be just as if you were shot, I take it. It is an immediate cessation of the heart's action. There might be a moment's pain. I could not say.

19063. Is that the common way of destroying animals before they recover consciousness?—I think it is the quickest and easiest way by which you can kill them. Sometimes I kill them before the class with chloroform to show them exactly what happens to the heart and respiration. I might sometimes kill them with morphin.

19064. When you speak of the brain being paralysed, does that mean insensibility to pain?—Yes.

19065. That is the form that the anæsthetic takes?—Yes.

19066. It paralyses the brain and arrests its receptivity?—Yes, it cannot receive any impulses from outside, and so the animal or man becomes unconscious.

19067. With regard to cocaine as a local anæsthetic, that is introduced through the skin?—Yes, subcutaneously.

19068. At the part which it is desired to anæsthetise?—Yes, it is injected under the skin.

19069. For a local operation?—Yes.

19070. How deep will it extend?—The anæsthesia extends to the muscles. The muscles are not very sensitive, of course. It would not extend far beyond the skin.

19071. We have had it stated here by one witness on the subject of veterinary operations on a farm, that he sometimes uses it in the case of castration, in your opinion would it be a tolerably effective anæsthetic in that case?—I think it would, because there is such a lot of cellular tissue there; there are no muscles, and it would very readily get at all the nerves.

19072. Is it introduced by injection?—Simply by injecting it into the scrotum.

19073. You spoke of injecting into the spinal cord. That would be rather an important operation, would it not?—No, it is quite painless. You simply, if it is a man, make him sit up and bend forward, and you take the needle and put it in; it has to go in quite a long way, a surprisingly long way, until you feel the bone or front part of the spinal cord, then you withdraw it a little, and you get the spinal fluid coming out. Then you fix your syringe on to the needle and squirt as much of the local anæsthetic as you require into the fluid of the spinal cord.

19074. (*Mr. Ram.*) Have you done that on man without anæsthetics?—Yes.

19075. And was there any pain?—No, no pain at all.

19076. Just the prick of a needle?—Just the prick of a needle.

19077. (*Mr. Tomkinson.*) You strongly deny and protest against the idea of demoralisation being caused by familiarity with vivisection experiments?—Certainly. Familiarity with pain would be quite a different matter in my opinion.

19078. (*Mr. Tomkinson.*) Have you any knowledge of the system carried on in Paris, I believe without anæsthetics?—No, I have no knowledge of it.

19079. Have you never heard of the Veterinary Surgical Establishment in Paris?—Are you referring to the Pasteur Institute?

19080. At Alfort, where experiments were carried out upon living horses in the Paris veterinary schools?—I am afraid I know nothing about it.

19081. With regard to the question of demoralisation resulting from familiarity with vivisection experiments, it has been stated by an English veterinary surgeon, who had gone over there to study, that the demoralisation of the French students and their apparent entire indifference to the torture of animals, was something too terrible for him to even stand?—I do not know the fact; I have not heard of it, but I can quite believe it. But, of course, there is no comparison. No student in England has ever seen pain in an animal experiment.

19082. Then your position is that you totally deny that under the system, as carried out in England, any pain is inflicted?—Certainly. My students, practically all of them, are graduates of the University, and most of them have taken an honours school previously. Surely one would not show a man of that stamp experiments involving pain.

19083. Not if they could help it?—They would be the first to protest if such a thing were possible even.

19084. You are aware, I suppose, that there is on the part of the public, rightly or wrongly, considerable doubt and scepticism on the point of there being no pain inflicted in vivisection experiments?—Of course.

19085. Would it, in your opinion, be satisfactory if there were to be a freer right of entry or permission of entry, to witness these experiments by independent, properly accredited witnesses, in order to reassure the public, if possible, on that point. We all know that certain people are prepared to observe what they wish to observe?—It is a perfectly common trait in all forms of life. If the people were responsible people, that is to say, if they had had a medical education, I should not object at all.

19086. I purposely said, I think, properly accredited people, not violent partisans who went there in order to make a case?—Precisely. Then I should be the last person to object; whenever I do an experiment before a class, I have perhaps 40 or 50 witnesses.

19087. (*Sir Mackenzie Chalmers.*) Do you have any of your advanced students at your research experiments?—Yes.

19088. Besides yourself, when you are doing a research experiment, there are a certain advanced students allowed to be present?—I have a considerable number of advanced students working in the laboratory doing these experiments.

19089. Under licences?—Yes, six or seven, I should think.

19090. They are licensees and qualified men?—Yes.

19091. What I meant was, when you are doing research experiments, are they always done absolutely in the presence only of yourself and a laboratory assistant, or are advanced students allowed to be present and see what goes on?—I never do them alone.

Mr. W. E. Dixon, M.A., M.D.

4 Dec. 1907.

When I do an experiment, it is such an educational advantage to other people to come in and see it that I should be the last person to prevent their coming in. Any one who wishes can always come in.

19092. (*Dr. Gaskell.*) The question is, do they?—Yes, they do, certainly.

19093. (*Sir Mackenzie Chalmers.*) They do, in fact, advanced students do come in and see the experiments?—Certainly.

19094. Then we have not only your word for it (I do not say it in any offensive sense), that these animals are properly anæsthetised, but we have got certain other qualified persons there who are also able to judge whether the animal is properly anæsthetised?—Yes, at practically every experiment.

19095. (*Dr. Wilson.*) You would still agree that experiments on animals should be regulated by Act of Parliament in this country?—I certainly think so. You might have all kinds of irresponsible people doing them otherwise.

19096. You also contend that certificates should be abolished?—Yes, they lead to continual complication and bother. A man might quite easily, unless you take the most stringent preventives, do experiments under the present complicated system which he was not entitled to do.

19097. You object to them on account of the delay which is sometimes entailed on application to the Home Office?—The delay and the complication.

19098. Now, as the General Medical Council is responsible for the education of medical students throughout the kingdom, would you be prepared to advocate that that Council should be held responsible for the issuing of licences rather than the Home Office? The Home Office has to see that the Act is carried out, but in difficult cases the inspector is consulted as to whether it is advisable to permit experiments or not?—Yes, I think it would be a very good plan that some responsible body of that description should have the power of issuing licences. I had not thought of it before.

19099. Are all the experiments carried on in your class room on animals painless experiments?—Yes, all painless.

19100. And it is perfectly understood by your class, I suppose, that they all must be painless experiments?—Yes, we always discuss it. I discuss with my class the anæsthetic which the animal is under and the men all come up and examine it; and they learn from that fact alone. And then we go on with the experiment. I think it is a most instructive thing.

19101. Would you object, then, to a notice being put up in the class room to the effect that "all experiments carried out on animals in this class room shall be painless," because I suppose a good many students do not know much about the Act?—I suppose that a good number of them do not, naturally.

19102. Would you object to such a notice?—I should have no inherent objection. I do not know whether I should approve of it.

19103. Would you be prepared to certify that, to the best of your belief and endeavour, for example, all experiments which you have been carrying out have been carried out painlessly, in reporting to the Home Office?—Yes.

19104. Would you be prepared to append a certificate to that effect?—I always do append a certificate to that effect. I think in two or three cases I put down that they had experienced "slight pain," or something of that kind. After a subcutaneous injection of some drug an animal feels ill after it, and you have to say that it feels pain.

19105. Now with regard to the experiments carried on for the standardisation of drugs, those experiments, I suppose, are carried out for the Pharmaceutical Society?—They have been. We have done them simply to try these special drugs. This standardisation of these drugs was a new thing, and we did it in order to show how variable these drugs were naturally.

19106. But certain manufacturing chemists, I suppose, employ experts to carry out experiments for them?—Yes, I believe they do.

19107. There are only, I suppose, a very few drugs about which there is any real doubt as to their physiological action?—As to their strength. The more important ones, far and away more important than any others, are, of course, digitalis and ergot and stropanthus.

19108. And so long as these drugs are used you contend so long must experiments be carried out on animals to standardise them?—If a time arose when we understood sufficiently of the chemistry to estimate the active bodies chemically, then the need for animal experiment would disappear at once.

19109. But until that time arrives you must continue to experiment on animals?—Yes, it is the only way.

19110. In experimenting upon man, ergot is generally given by the mouth, is it not?—Yes.

19111. Always?—No not always, it is sometimes injected. In fact, if you want to be sure of its action in these days, and you want a quick action you inject ernutin or ergotoxin; you then get its action quickly and certainly.

19112. And are these preparations as reliable as ergot itself?—They are standardised.

19113. With regard to those experiments on African boxwood, of course, the alkaloid was absorbed by the workmen during the process of manufacture by inhalation?—By inhalation.

19114. You did not try any experiments by using the sawdust on animals in that way?—I made beds of sawdust for the animals and they did not show any ill effects at all. But then these people work in a cloud of dust—you cannot see across the room I am told; it is an absolute cloud of dust; one could not be continually shaking up an animal's bed.

19115. But with the perspiration there might be some absorption through the skin?—I do not think so. Drugs are not absorbed through the skin except under very rare circumstances.

19116. (*Sir William Collins.*) I understand you to suggest the abandonment of certificates under the Act, but that you think it would be well to retain the practice of licensing under the Act?—Yes.

19117. May I ask whether that is in the interests of the public or of the animals or of those who practise vivisection?—I should say that it was on behalf of the public and those who practise vivisection. I do not think the animals come into it. I do not think they are affected. They would be the same in either case.

19118. The advantage then would be on behalf of the public and those who practise vivisection?—Certainly.

19119. What advantage do you think accrues to the public?—That you are able to do researches quickly and able to do them more efficiently, and therefore, as all the results are for the good of the public, they must benefit.

19120. But why are you able to do researches more quickly if you require licensing than if you do not?—The trouble at the present time is with the complication of certificates.

19121. You did not understand me. I am agreeing for the moment, for the sake of argument, with your suggestion that there should be no certificate. I understand that you suggest that there should be a licence under the Act?—Yes.

19122. What advantage is it to the public that there should be a licence under the Act as against having no licence at all?—As against having no licence at all, I beg your pardon, I misunderstood your question from the beginning.

19123. I thought so. Perhaps I had better put it from the beginning again?—Thank you.

19124. I understand that you suggest the abandonment of certificates, but that you think it well to retain the practice of licensing under Act of Parliament?—Yes.

19125. Is such licence in your opinion to the advantage of the public, or of the animals, or of those who practise vivisection?—It is to the advantage, I think, of everybody.

19126. Will you tell me in what way you think it advantageous to the animals?—Because you might have irresponsible persons—anyone could do it—making experiments. I do not think that irresponsible persons should be allowed to do that, and I do not think that experiments should be made except in proper places.

19127. Do you think that there were irresponsible persons making these experiments in this country before the Act of 1876?—I think there is not the slightest doubt about it.

19128. (*Sir William Church.*) Before 1876?—Yes, before the present Act. I should say there is not the slightest doubt about it.

19129. (*Sir William Collins.*) It has been stated before the Commission that the Act was superfluous because there was no occasion for legislation?—It is a question that I have not looked up. I am not prepared to give you facts and figures, but I think so far as I remember my reading that there is no doubt that unnecessary experiments were done before that time.

19130. Do you think that the effect of the Act has been to reduce the amount of vivisection in this country?—Undoubtedly; especially directly after the Act; it absolutely stopped a long series of experiments that were going on. Very many people were unable to continue their experiments entirely owing to the difficulty of the Act, and researches were allowed to lapse for a time.

19131. Do you think that there has been less vivisection this year than there was in the last year before the Act of 1876—that is, in the year 1875—in this country?—No, much more. But you take into consideration the leaps and bounds that medicine has been making in this time. It is just the time that medicine has been making those great advances.

19132. Do you think that if the Act were repealed now that there would be danger of animals being unnecessarily employed for purposes of vivisection?—I think the medical profession would be strongly against the Act being repealed now, because, as I say, any medical student, any irresponsible person, could make all kinds of experiments if he wished to do so at his private house.

19133. We have had one physiologist here present who said, and I think he said his opinion is shared by others, that the Act had operated altogether antagonistically to the advance of physiology. Is that your opinion?—I do not agree with that.

19134. Then you think it would be unsafe to repeal the Act for fear of unnecessary and irresponsible vivisection?—I think so, certainly.

19135. Would you tell me what advantage you think the Act secures to the public?—I think it does, or at all events ought to, give them confidence that animals are not unnecessarily subjected to pain.

19136. And what advantage do you think it secures to those who practise vivisection?—To those who legitimately practise it, those responsible persons, I do not think it makes any difference, but they would be subjected to less abuse if it was known that there was an Act in existence than otherwise, of course.

19137. You think that the Act affords protection and security to those who practise vivisection?—Undoubtedly. We are not liable to be wantonly prosecuted; there is no doubt about it; it forms, of course, a very great protection.

19138. Then you would not agree with those medical witnesses who think that it would be a matter of indifference to those who practise vivisection if the Act were abolished altogether?—No. I should like to see some kind of Act still continue.

19139. You do not think it should be described as an Act that the vivisectionists are ashamed of?—No, certainly not.

19140-1. (*Mr. Ram.*) You spoke just now of certain experiments which were in course of being made when the present Act passed, and which had to be suspended or stopped in consequence of that Act. Can you tell us how did those experiments militate against the Act, so that the Act caused their suspension?—I have not followed the experiments. I was referring to Sir Lauder Brunton's experiments for one, on snake poisoning, and then there were some other experiments.

19142. Did they involve such suffering to animals as the Act forbade?—No, but as I understand it, there was very much more difficulty in obtaining certificates in those times than there has been in more recent times.

19143. Then the difficulty, I understand, so far as your recollection goes, is not that they were experiments which would now be illegal?—No.

19144. But they were experiments which, because the machinery had not got into operation, were delayed in consequence of the failure to obtain the necessary permission?—That is what I believe.

19145. (*Dr. Gaskell.*) Do you consider that before 1876 there were irresponsible persons who practised vivisection for mere curiosity, or because they took delight in cruelty? You speak of irresponsible persons who, you think, did vivisection before the Act was passed, but I am curious to know what class of person you think they were?—I should say they did it from curiosity.

19146. Do you think they were connected with the medical profession?—No, I think they were not necessarily connected with the medical profession. It is the medical profession who want the Act, in order to protect themselves.

19147. But is this remark, may I ask, that you have just made about the possibility of such persons existing simply a pious opinion of yours, or have you anything to go upon?—It is absolutely nothing that I know; it is simply a possibility.

19148. (*Sir William Collins.*) Would not that class of irresponsible persons that you have in your mind be amenable to the ordinary Act for the Prevention of Cruelty to Animals, if this Act had not been passed?—Yes, I think they would.

19149. So that for the prevention of that form of irresponsible vivisection, the ordinary law would have sufficed?—Yes, that is so.

19150. (*Sir William Church.*) I should like just to ask very much the same question that Dr. Gaskell has asked you. You meant that there was a possibility before the Act for irresponsible persons practising vivisection?—Yes.

19151. I understood you at first to say that you were of opinion that superfluous experiments were done before the Act?—No, I meant that there was a possibility; of course, there was no control.

19152. That is a very different thing, I might say I should like also to ask you a question in relation to what Dr. Wilson asked you. He asked you if you were in favour of the General Medical Council, rather than the Home Office, being the body which should grant licences and certificates, and you said that you would be in favour of a body. But he, I think, referred to the existing General Medical Council. You would not consider that, as now constituted, with the duties that it has thrown upon it by Act of Parliament, it would be a good body to refer to?—Not as it exists at the present time, because, of course, there are not necessarily the right people members of it, but there should be a reference to some responsible body, which should be composed, of course, of people who were, at least some of them, experts.

19153. Do you think that the Home Office is likely to get assistance from the Association for the Advance of Medicine by Research? You know that all applications for licences go before that body? Yes, certainly, because that body practically consists of the highest scientific opinions in the country.

19154. On the other hand, witnesses have stated before us here, that they are the worst possible body, because they are vivisectors, and so strongly in favour of vivisection themselves?—Of course, in a case of that kind, it is absolutely necessary that those giving the advice should be the people who know.

19155. That leads me on to what I want to ask you. Therefore you feel sure that it would cause very great dissatisfaction among all physiologists and researchers into all forms of experimental investigation by means of animals, if the question of granting a licence for special work was not referred to a body of what I may call experts in that subject?—To a body who are acquainted with the needs of the subject, certainly.

19156. (*Sir William Collins.*) Reverting for one moment to the question I asked you before, and putting aside the irresponsible persons with whom you have dealt, I should like to understand from you what

Mr. W. E. Dixon, M.A., M.D.
4 Dec. 1907.

advantage you think it is to the public to retain the licensing under the Act, in dealing with responsible vivisectors; do you think that the present inspection and machinery under the Act give any real security to the public?—Certainly.

19157. Have you known of instances in which inspectors have detected irregularities?—No, because I do not see how irregularities could occur in a licensed laboratory. If a man has got his licence, I do not see what he can do that is seriously wrong if he does not exceed his licence and certificate.

19158. Then what is the nature of the security that the public receive as the result of such inspection and machinery under the Act?—In what way do you mean?

19159. Do you think that the inspection, as carried out, of vivisection by responsible persons gives any security to the public?—Yes, it gives them a sense of security, I admit.

19160. Can you tell me of any case of irregularity which has been detected thereby?—No, there have been none in my laboratory.

19161. Do you think, as we have been told by other witnesses, that we might reasonably trust to the responsible vivisectors under the Act without inspection?—Certainly, I think so; but at the same time there is no objection to any number of inspectors. Practically whenever one does an experiment, although there are a great number of unofficial inspectors, it is perfectly true that there is not an official inspector. It would make no difference whether the inspector happened to have an official mark on him or not.

19162. Then what is the value of the official inspection to anybody?—I do not know that there is any special value as regards his inspections. I am referring entirely to the vivisection as I explained in the last answer.

19163. (*Sir William Church.*) When the inspector visits your laboratory he does a great deal more than merely walk into the laboratory, does he not?—Yes.

19164. Would you just mention in what the visit of the inspector generally consist?—The inspector, as it happens, has come in several times just when I have been doing an experiment. He has come in twice to my knowledge when I have been giving a demonstration—in the middle of a demonstration to the men. He always examines the animal with interest, and he waits until the demonstration is over, observes the result of the demonstration, and then examines the animal, and sees it killed. Those are exceptional occasions, because he does not usually hit off the time when there is an experiment on. Under ordinary conditions he comes and perhaps asks to see the laboratory book, and asks to see the experiments going on. He sees every worker in the laboratory if he is about. He inquires after the animals, sees every animal under experiment, and sees the condition of the cages in which they are kept; and he would, I presume, make objection if they were not properly housed, and so on.

19165. Therefore he is a security to the public that these animals are kept in a condition in which they suffer no pain before they are experimented upon, and that they are kept in such a condition as to be as healthy as they can be, apparently, under the circumstances after they are experimented on?—Yes, I suppose he is a security to the public in that way. It would make absolutely no difference to any conscientious man whether there was inspection or not.

19166. That is an important part of the inspector's duty, is it not, that he should inspect the condition of the laboratory and of the premises connected with it?—Yes, to see that the animals' cages are suitable ones and that kind of thing.

19167. (*Sir William Collins.*) After that explanation may I again repeat my question: What is the value of the official inspection to anybody?—I do not quite know what answer you require. The value of inspection is to give the public a sense of security that everything is being done according to the Act.

19168. But I understand you to add in one of your answers to Sir William Church that no one would make any difference if he had not an inspector?—No, naturally not, because the people who vivisect under the Act are not criminals nor have they criminal instincts.

19169. So that what is the value of the official inspection?—To give the public a sense of security.

19170. Is it superfluous so far as the vivisectors are concerned?—I think so. Of course, it is conceivable (anything is conceivable) that you might get an unscrupulous and brutal vivisector, as you might get an unscrupulous and brutal man in any profession.

19171. But you think, that the Act gives valuable protection and security to those who practise vivisection?—Yes, I think that.

19172. Is that, do you think, one of the most important reasons for retaining it?—It is a reason for retaining it. And I gave my other reasons before, that some sort of Act ought, I certainly think, to be in existence, as I said, to prevent irresponsible persons, unsuitable persons, from obtaining a licence. There are lots of men to whom we would not give a licence.

19173. Who have applied for them?—Before they apply they would come to me and I should regard them as unsuitable men, and I would not have them in the laboratory, as not being the proper kind of men to do the work.

19174. Have many unsuitable persons applied to you for assistance to obtain a licence under the Act?—I would not say many.

19175. Have any unsuitable persons applied to you for assistance to obtain a licence under the Act?—They have approached me.

19176. How many?—I am not prepared to give any number.

19177. (*Dr. Wilson.*) Is it on account of their inhumanity, may I ask?—No, because the only men who do this kind of work are really what I call the very best men. We use the very best men.

19178. (*Sir William Collins.*) I should have liked to have known if you could have told me whether one, two, or many unsuitable persons had applied to you for assistance to obtain a licence?—People come and talk to you and say, I should like to do a piece of work on such and such a subject, and you do not say, "I am not going to have you in the laboratory"; you are not so foolish as that. You are tactful and suggest they should do something else.

19179. You would not like to tell me how many of those persons there are?—I could not tell you. I do not suppose I could remember.

19180. (*Mr. Ram.*) With respect to inspection you, as I understand, think that with regard to all the persons, and all the licensees you know, their conduct is such that they are not restrained from misconduct by the presence of the inspector?—That is my point.

19181. On the other hand, very many members of the public think that there is either danger that they might act illegally, or, at any rate, it is desirable that exactly what they do do should be known.?—Yes.

19182. In other words, that exactly what does take place should be known?—Yes.

19183. Does the presence of the inspector in your opinion give such security to the public?—Yes, I think it does. That was my point.

19184. Therefore, although in your opinion such security may not be necessary, for the sake of those who do not share your view, it is desirable as you think to retain inspection in order that such persons may receive the security which inspection may give them?—Certainly, that is my view.

19185. (*Sir Mackenzie Chalmers.*) Take, for instance, the inspection of factories. A well-conducted factory is inspected just as much as any other factory?—Yes.

19186. And it is desirable that all factories should be inspected, and, therefore, is it not desirable that all laboratories should be inspected?—Yes, I think it is for the same reason.

19187. (*Sir William Collins.*) Have you heard of any ill-conducted laboratory in this country?—I have not heard of any.

19188. (*Dr. Wilson.*) But, after all, in spite of any amount of inspection, the question of painless experi-

ment depends entirely on the experimenter, does it not?—Entirely.

19189. That is to say, in some experiments, when artificial respiration is being carried on, the inspector really could not tell?—You mean with curare?

19190. No, with any anæsthetic, except on your own assurance that the animal was thoroughly under anæsthesia during the whole experiment?—Yes, certainly he could. The animal would have no reflexes; exactly the same as with man, you can tell if a man is under an anæsthetic.

Mr. W. E. Dixon M.A., M.D. 4 Dec. 1907.

19191. But with curare it would be difficult?—With curare he would simply know that you had administered the anæsthetic, and he would be able to tell from the blood pressure. Those are the two points.

FORTY-SECOND DAY.

Tuesday, 10th December 1907.

PRESENT:

The Right Hon. The Viscount SELBY (*Chairman*).

Sir W. S. CHURCH, Bart., K.C.B., M.D.
Sir W. J. COLLINS, M.P., M.D., F.R.C.S.
Sir J. MCFADYEAN, M.B.
Sir M. D. CHALMERS, K.C.B., C.S.I.
Mr. A. J. RAM, K.C.
Mr. W. H. GASKELL, M.D., F.R.S.
Captain C. BIGHAM, C.M.G. (*Secretary*).

Mr. CHARLES R. J. A. SWAN, M.B., M.R.C.S., L.R.C.P., called in and Examined.

Mr. C. R. J. A. Swan, M.B., M.R.C.S., L.R.C.P. 10 Dec. 1907.

19192. (*Chairman.*) You live at 3, Chester Place, Hyde Park?—Yes.

19192A. Do you practise in London?—I have practised for the last fifteen or sixteen years.

19193. As a physician or surgeon?—I do not do any surgery; I know nothing about it, I am afraid.

19194. You are a Bachelor of Medicine, and also of Surgery of Oxford?—Yes.

19195. And you have various other qualifications?—I believe I was examined by one of the Commissioners, Sir William Church.

19196. You are a member of the Royal College of Surgeons, and a Licentiate of the Royal College of Physicians?—Yes.

19197. And Consulting Physician to the Consumption Home, Gloucester Place?—Yes, it is only a small hospital.

19198. You are appearing here at the request of the Canine Defence League?—Yes, they wrote to me and asked me if I would come.

19199. You have come to give us evidence in favour of the opinion that dogs ought not to be subjected to vivisection, whatever may be the case with other animals?—Yes. I do not want it to go out to the world in general that I am one of those people who say that vivisection must not be. I think it is a painful necessity, and we cannot blink that fact.

19200. You think that experiments upon live animals properly conducted are essential to the medical profession?—Yes, they are.

19201. I will bring you at once then to the point that you are going to speak on, viz., Why the dog should be exceptionally treated. The two main points appear to be, first, the question of ethics or sentiment, or whatever you like to call it, in the case of an animal so much the companion of man?—Yes, that one gets so attached to.

19202. And the other is as to whether or not the examination of the living dog is of special importance, having regard to its resemblance in its construction in some respects and its want of resemblance in others, to the construction of man?—Yes.

19203. As regards the first point, I understand from what you have said about your love of dogs that that influences you?—Yes. I admit it is to a great extent a sentimental feeling, and, if I may so, what I am anxious to know is, whether the Commission could not find some means of using other animals and obtaining the same beneficial results to mankind, letting the dogs alone.

19204. That comes rather to the other head that I was speaking of as to the special qualifications or usefulness of dogs for experiments. As regards your feeling about it, I do not think we need ask you more; we quite understand that view, and it has been put before us at considerable length very often. You have that feeling yourself very strongly?—I have.

19205. As regards the usefulness of dogs for the purpose of experiment, that depends a good deal, no doubt, upon how far the dog resembles man in its structure?—Yes.

19206. We have had a good many eminent witnesses before us who have pointed out that in certain parts of their structure dogs do resemble man very nearly, and that in others they differ from him, and therefore are not specially valuable in respect of certain experiments; would you give us your view about that?—Going back to one's early days, I have seen the old muscle and nerve experiments, what we call the classical muscle and nerve preparation experiment. We did them first of all on frogs, which was perfectly simple. You isolated your sciatic and stimulated it and made the whole experiment work. Then I remember at one time it was tried on a dog at Oxford and it was a very difficult matter to see; there was a mass of blood about, and if I had not known my procedure and learnt it from books and diagrams first, I do not think I should have been much the wiser. I remember then it struck me how much simpler it was to take a lowly-organised animal like a frog to do your simple experiment. I thought, when I get qualified one day, if ever I do, I will stick to that way and not use dogs for demonstration purposes before students if one can avoid it.

19207. You never have been licensed yourself?—No.

19208. Nor have you performed experiments of this kind?—Only on a frog. The laboratory arrangements at Oxford were that we had all our frogs, and pithed them or not, as we liked, and made muscle and nerve preparations with Burdon Sanderson.

19209. It was not what you would call a very serious training in physiological experiment?—It was all we had at the beginning.

19210. (*Sir Mackenzie Chalmers.*) How long ago are you speaking of; ten years ago?—In 1883. I began my scientific work at Oxford the same day that Burdon Sanderson came into the laboratory for his first lecture. Then there was another time when we were doing a pressure experiment, a manometer experiment on the jugular, that was done, I believe, on a dog. I know it was a warm-blooded animal, and I frankly confess that I may have been stupid or dense, but it was impossible to see the mercury rising or falling properly in the manometer.

19211. How many were present?—I should think about ten.

19212. And only the physiologist himself who was performing the experiment could see it. It may be difficult sometimes for the pupils to see?—That is a thing I could not be sure of. If I may state my own

Mr. C. R. J. A. Swan, M.B., M.R.C.S., L.R.C.P.

10 Dec. 1907

conviction about it, it is that errors in manipulation are so manifold and easy, that you are very likely to get a wrong result; then you repeat your experiment, and go on till you get your results to agree with what they ought to be.

19213. (*Mr. Ram.*) Have not things improved very much since those days?—I am not in a position to say, and I do not want to dogmatise on what I am not qualified to dogmatise upon.

19214. (*Chairman.*) That experiment that you were last speaking of, on the blood pressure, is an experiment for which the dog is said to be particularly fitted?—Yes, but my own feeling is that one now understands the whole thing, and I am perfectly willing to accept the fact that that experiment has been done—the vagus stimulated and the blood pressure made to fall—and for the purpose of teaching other students I should be anxious that it should be taught by the aid of diagrams.

19215. Of course, demonstration before students is a branch of the question only?—Yes.

19216. But do you consider now with your present experience that experimenting on dogs with reference to blood pressure, always under anaesthetics, of course is a desirable thing?—If it is done under anaesthetics I do not think one ought to be inclined to veto it.

19217. And that the results of such experiments on dogs are more useful, or more possible one ought to say perhaps, than results by examining rabbits and guinea-pigs?—I cannot see why rabbits should not be as useful. I have thought it over anatomically, and I do not see why the distribution of your vagus should not be equally effective in a rabbit. I may be wrong in my histology, my minute anatomy; but that is my idea. You can get at the jugular of the rabbit easily enough.

19218. Has not size something to do with it. The dog that would be used for this purpose would be larger than a rabbit?—You mean on account of a clot of blood spoiling the tube?

19219. I am not myself a medical man, and I would not like to express it in detail, but I am giving you the views which were given by some witnesses that we have had before us?—I cannot honestly say that I do not think you could do it as well with a rabbit. I should think that you could do it with a big rabbit. I have never seen it tried.

19220. What you say then is that the dog is an animal in which the blood pressure can be watched and tested as satisfactorily as in any other animal, but whether it could not be just as well done on a rabbit you are not prepared to say?—That is so. I am not trying to hedge in my evidence. I want you to understand exactly what I mean.

19221. That is just why I have summed up what I understood you to say, to see whether you assent to it. Then, as regards questions relating to the digestive and nutritive organs, is the dog suitable for those?—I should think so, but without wanting to be conceited about it, I have managed to estimate the condition of my own and other people's stomachs with perfect comfort without making a gastric fistula.

19222. Without making it on an animal, do you mean?—Yes. I estimate the condition of my own stomach for experimental purposes often.

19223. I was not aware that it was the practice of the profession to make gastric fistulæ for the purpose of examining what the state of a patient's stomach is?—I did not mean that. My idea is that there are cases which are quoted in lectures by those who wish to state what is going on in the stomach. There was an old experiment, as the member of my profession who is present will remember, in which you made a gastric fistula of a dog, and held a piece of fried bacon to the dog's nose to see the gastric juice spread to the fistula, and it struck me that you could just as well do that by syphoning. I have made a great hobby of the treatment of gastric disturbances, and I constantly sample the contents of my own stomach to see how it is going on.

19224. That is hardly what you would call a painful experiment?—No, but my idea is that you can arrive at the benefit on yourself and your friends just as easily without experimenting on a dog with a gastric fistula.

19225. Do you mean by that for the purpose of physiological study and research?—With a view to treating mankind. I thought that all research was really with the object of treating mankind in the end.

19226. I suppose that is the pathological side of it, but then there is the purely physiological side, is there not?—I only look at it from the chemical side.

19227. But not necessarily with a view to the immediate result of a particular experiment which shall give you a particular remedy, but that by greater knowledge of the working of the human frame and of its diseases, you can get knowledge which ultimately will prove useful. It does not follow that the physiologist, as I understand from his own account of it, is necessarily performing the experiment for the express and immediate purpose of the discovery of a remedy for some known disease, but because it is very important to know how the machine works. Is not that so?—My view is that you can ascertain just as well how the machine is working by syphoning the stomach at different intervals.

19228. (*Sir William Collins.*) Is your point that any light which may have been thrown upon the human digestion by experiment on dogs by way of gastric fistula could equally have been obtained by syphonage on man?—That is my view, whether right or wrong, and it is backed by my having experimented a great deal on myself, and my friends occasionally, by means of which I have been able to treat cases.

19229. (*Chairman.*) When you say that you investigate the state of the stomach by syphonage, does that include every stage of the condition of the stomach? You do not acquire all knowledge that is useful about the stomach from that, do you?—I do not see why you should not acquire all the knowledge that you would get from a fistula.

19230. You think that you can add nothing by experimentation on animals to the knowledge which you can obtain by use of the syphon?—I think that you would get as good results by the syphon.

19231. (*Sir William Collins.*) Is that limited to the stomach, or would your remarks go to the digestive process in the pyloric end of the stomach?—That is where the difficulty comes in, I know. You mean with regard to absorption?

19232. I mean with regard to absorption and secretion beyond the stomach?—Yes, I think you would have to make your fistula, but there, again, one would be anxious to take some animal which ate a mixed diet other than the dog.

19233. Such as——?—A pig is an excellent animal.

19234. (*Chairman.*) *Apropos* of that, is your reason for preferring a pig that you think it is not so intelligent as a dog, or so friendly?—Partly. I have no affection for a pig, and if you want to trace anything in a pig's liver, the member of my own profession who is here will allow that there is nothing so beautiful to examine under the microscope as a piece of pig's liver. Is not that so?

19235. (*Sir William Collins.*) I am afraid it is the privilege of a Commissioner to ask questions?—I beg your pardon; I am sorry. That is my view of the matter.

19236. (*Chairman.*) I gather from your *précis* of evidence that you consider that a dog has anticipation of pain?—I know that it has.

19237. What exactly do you mean by that; under what circumstances has it anticipation of pain?—I will give you an instance of a dog of mine which had cancer in its ears. We decided that we must curette them. We curetted one ear first of all without an anæsthetic.

19238. Will you explain to us what curetting is?—Scraping the diseased tissue away with a half sharp instrument, to get a clean space; it is much worse than cutting.

19239. Did you do that under an anæsthetic?—I could not, the dog was discharging so very much.

19240. This was not an experiment?—No, it was for the benefit of the dog; the dog was so bad. We did one ear, and then it had had enough of it. It was perfectly intelligent, and never tried to bite. Then, when the veterinary surgeon and I, about two days afterwards, tried to do the other ear, the dog simply shook, and I thought it was anticipating pain.

19241. That is when you came there in order to scrape the ear?—Yes.

19242. Did you scrape it?—No, we could not; we

had to give it an anæsthetic. We got it down, and the dog shook and whined.

19243. And you had the knife ready for the purpose?—Yes.

19244. That I can quite understand. That is what you mean by being sure that a dog anticipates pain?—Yes.

19245. (*Sir William Collins.*) Based upon a reminiscence of suffering?—Yes.

19246. (*Chairman.*) Is experimentation on the kidneys of a dog a thing which you consider useful?—That is a thing which I should, perhaps, not have put in my *précis*, because what I have to say on the other side is purely clinical.

19247. I do not quite know what that means. Do you mean that clinical observation will teach you everything that can be learnt about the kidneys and their action?—I should think that you could learn two-thirds of it, and that you might do as well with the kidneys of other animals as with those of dogs—of the cat, for example.

19248. Do you think that in the sphere of clinical observation, which was the method of observation for, I suppose we may say, thousands of years, there is as much to be added to your clinical knowledge as there can be to your experimental knowledge?—I think that you must have experimental knowledge too, but I would exempt the dog if possible.

19249. You have not quite answered my question. Do you think that there is as large a field for new knowledge to be obtained by clinical observation as there is for new knowledge to be obtained by experiment?—There is a field in both.

19250. Is there as large a field for new clinical knowledge, considering that our clinical knowledge has been of such long standing, as there is for experimental knowledge?—Yes, but our clinical knowledge now starts on a very much higher level since we have had the knowledge obtained from experimentation to help us.

19251. Then one of the results of knowledge obtained by experimentation is that it enlarges your clinical observation?—Yes.

19252. And you know where to look?—Yes.

19253. And what to expect to find?—Yes, one cannot deny the benefits of experiment.

19254. Have you any suggestion to make as regards the present law; would you have it altered in any way?—I would urge, if possible, that all dogs should have their experiments conducted under anæsthesia, and if, for the sake of arriving at a conclusion, you want to prolong the animal's life after the experiment, you should keep it under morphia.

19255. So as to dull the pain?—Yes, and give it freedom from pain.

19256. Is that always practicable?—I should think it was a thing that might be tried, and that you should use other animals where it is not practicable at present, and then, of course, if it is found that mankind is suffering, or the knowledge of the world is suffering, the question must be reconsidered.

19257. I am speaking in entire ignorance, and I ask the question for my own information. After a dog had recovered from an operation would observation while it was under morphia be as useful as observation would be without morphia?—That would depend upon the organ upon which you were operating. If you were operating upon the kidneys it would be equally useful, but if you were going to do one of those operations where morphia would alter your results, you should try first and see whether you cannot use some other animal. One has to speak temperately on this subject because it is such a very important one.

19258. I rather gather from what you say that assuming that animals are not brought out of anæsthesia for future observation except in cases where it is strictly necessary, and if possible not using a dog, you do not object to such observation after operations?—On animals, no; but I would strain every nerve to leave the dog out.

19259. (*Sir William Collins.*) Was the handbook of Burden Sanderson, Klein, and Brunton used in the laboratory at Oxford when you were there?—Yes; but it was not a handbook; it was not bound; it was loose sheets.

19260. Was the matter contained in that book used before students in the laboratory?—At Oxford, I think it was what is called the handbook now; they were loose unbound sheets that Sanderson always issued and Gotch used to take round.

19261. Was that the material upon which the ordinary student or the advanced student worked?—That was what we all of us worked by—the thing that we saw. You had the experiment for the day, and the apparatus required, you know.

19262. If experiments on dogs for scientific purposes were always conducted under anæsthetics would all your objection to using dogs be met?—Yes.

19263. You have no objection to what has sometimes been called exploiting dogs, using them for that purpose provided that it is painless?—No, for this reason, that if you are going to benefit your race I do not think you have any right then to let your sentiment come in the way. I would say always, if possible, try to use some other animal. If you can assure me that you have a right to know more about these matters than any of us who are engaged in other work, and you say to me that you know that the dog is the only animal that will answer the purpose satisfactorily, and if you also say that the dog shall not suffer afterwards, then I say I am sorry that it has got to be so, but mankind must come first, and you must take it.

19264. Would you exempt the monkey as well as the dog?—I have not got the same affection for the monkey. I only had one.

19265. (*Mr. Ram.*) And you were glad to be rid of it?—It bit everybody; there was no affection about that animal.

19266. (*Sir William Collins.*) Your objection then is based upon affection and not upon the proximity to man by way of evolution?—That I do not know. I have some relatives who like monkeys, but one has not the same sentiment about a monkey that one has about one's dog.

19267. It is based then on affection, or sentiment?—Yes, I admitted that.

19268. You spoke of experiments on the kidneys and you suggested that clinical experience was rather against their value, I understand?—I did not mean against their value, but I was thinking of a case where we had cut down—at least I did not, but the veterinary surgeon did—upon the kidney, and we expected to find stone, whereas we found the whole kidney instead of having stone in the hilum was simply riddled. The case was a woman, and from watching how the kidney was working we took the trouble to catheterise through the bladder or ureter separately to see how much the other kidney was helping it. That seemed to me indirectly valuable information It was done for the patient's benefit, of course.

19269. In your *précis* you state: "Experiments on the kidneys objected to. Careful clinical work preferred"?—I do not mean altogether to say preferred; I mean what I said just now, that you can supplement your experimental work.

19270. Has the treatment of kidney disease by providing the capsule been the outcome of experiments upon animals?—Yes, it has.

19271. Is that a valuable mode of treatment?—A most valuable; one cannot get away from those facts.

19272. Do you find the views that you hold prevalent amongst the profession?—I was surprised to find how prevalent they were.

19273. They were or they are?—They are. There are many men, of course, who think the other way, and I feel great diffidence in coming here and opposing them, because so many of the men who think otherwise than I do are my intimate friends, and men for whom I have the highest regard. One of my dearest friends, for instance, is Victor Horsley, so that I feel a certain amount of diffidence over this; but my object in coming was to try and get that one animal exempted wherever it was possible—not to let it suffer.

19274. (*Sir Mackenzie Chalmers.*) Have you seen any experiments yourself lately—any research experiments at all?—I have not, and I explained that to the Canine Defence League.

19275. The last experiments that you have seen were lecture experiments at Oxford?—Yes.

19276. About twenty years ago?—In 1883 or 1884.

Mr. C. R. J. A. Swan, M.B., M.R.C.S., L.R.C.P.

10 Dec. 1907.

Mr. C. R. J. A. Swan, M.B., M.R.C.S., L.R.C.P.

10 Dec. 1907.

19277. Rather more than twenty years ago?—Yes. My experiments were finished at the time that I had a talk with Sir William Church.

19278. Who were your examiners?—Sir William Church was one of them, Dr. Bristow the other.

19279. We should all like, of course, if we could, to restrict experiments on dogs, therefore I want to ask you one or two questions to see how far you go. You agree that superfluous dogs have to be destroyed, I suppose?—Certainly.

19280. And you are aware, as a matter of fact, that about 30,000 dogs a year have to be destroyed in London in the lethal chamber?—Yes.

19281. Have you any doubt yourself that a dog can be properly chloroformed and anæsthetised?—I have not the slightest doubt that a dog can be chloroformed, and I have had some little difficulty in persuading the gentlemen of the Canine Defence League to that effect. I will tell you why I think so. Any of you gentlemen who probably are used to dogs will know that taking out a dog's dew claws is most intense agony. Every dog that I have in the country—I dare not do it in London—has to part with its dew claws, because it would be a misery to itself and everyone else. I have tried everything, cocaine and ukaine, but a local anæsthetic does not do. When I chloroform a dog it will go absolutely to sleep. I took both dew claws off an Irish terrier; we did it in the morning, it did not have its food in the morning, it went dead asleep under the chloroform, and I know that by one o'clock it was growling over a bone, perfectly happy, and it never evinced any pain.

19282. Having ascertained your opinion on this point, I was going to ask you a further point. Seeing that a great many dogs have to be destroyed, if the animal is put under anæsthetics till death do you feel any objection to a dog being experimented upon during the process of dying?—No, I think you are justified.

19283. Therefore, experiments under a licence alone without a certificate you have no objection to?—I do not quite follow you.

19284. When a gentleman holds a licence under the Act, but does not hold any certificate, the condition is that every animal experimented upon must be put under anæsthetics, and he may perform what experiments he likes provided that the animal never recovers from the anæsthetic, but is killed during the time of anæsthesia. You would not object to that?—No, I do not think it would be right to say that you shall absolutely forbid it provided that the animal is not going to suffer.

19285. (*Mr. Ram.*) Provided that it dies under a lethal dose?—Yes. You should treat it kindly first. Do not knock it down if it is going to be a benefit to mankind. If it has to die, there is no reason why it should not be made use of in that way, provided that it will not know anything about it.

19286. (*Sir Mackenzie Chalmers.*) Have you any reason to believe that any of these animals are ill treated in any physiological laboratory; have you any knowledge of it?—No, of recent years I have not had any means of knowing.

19287. Can you quote to us any experiment that you know anything about in recent years which has been in your opinion objectionably conducted?—No, I am not in a position to state that during the last few years.

19288. Have you followed the course of experiment lately. Do you carefully read up the physiological experiments?—To a certain extent; but it is very hard; I read it by fits and starts. A man in full practice does not find it very easy.

19289. Coming to the first certificate, certificate A authorises the experimenter to experiment on an animal without anæsthetics, but does not authorise anything more than a skin-puncture, for instance, the prick of a hypodermic needle; but, of course, that involves the inoculation of the disease. What do you say about that?—I would exempt the dog from it until it can be shown that the dog and the dog alone will be of benefit to humanity.

19290. But if that can be shown, then you think that the dog must give way to humanity?—If that can be shown, then I do not see that one has any right to neglect to take means to save human life.

19291. Now I will come to the next point. Take the case of distemper. You know what a dog suffers from distemper, and what valuable dogs are lost through it?—Yes.

19292. Do you think it is justifiable, for the sake of discovering a remedy for distemper, to use experiments on dogs?—You mean to let one dog suffer in order that many dogs may escape?

19293. Yes?—Of two evils I should choose the less.

19294. Now, may I ask you which is the less. Do you think it is justifiable to experiment with dogs in the hope of curing or mitigating distemper some day?—It is in the dogs' interest, therefore you must do it.

19295. It is not in the interest of the particular dog that is experimented on?—No, but it is in the interest of dog-land.

19296. It is in the interest of the canine race?—Yes. It is no more than we do to human beings.

19297. You think that the particular dog must suffer for the rest?—Yes.

19298. Does not that argument carry you this far, that if we can do anything for the human race by sacrificing dogs, we are bound to do it?—I come back to the other point, if you can satisfy me that the dog and the dog alone can answer the purpose; but I should require to be satisfied on that point first.

19299. Have you read Professor Starling's evidence on that point?—No, I have not. I meant to have done so.

19300. I am rather sorry that you have not, because he gave us certain reasons why he said that it would be almost impossible for research to go on if dogs were excluded: that there were certain cases where the dog was the only appropriate animal. I should have liked your opinion on that?—I may say that I only had notice that I was to give evidence three days ago, and I have not had time to read it.

19301. Therefore you cannot give us any opinion upon it?—I cannot.

19302. Now I want to come to Certificate B. Under Certificate B, if any operation is to be performed on an animal, the animal must be kept under anæsthesia throughout the whole operation, including, of course, all the subsequent stages, but the animal may be allowed to recover. There, as I understand you, is where you would draw the line with dogs?—Yes.

19303. Is that because you think that there must always be subsequent pain?—I think there is always some subsequent pain.

19304. We have been told that in many cases there is nothing more than small discomfort?—I know, but I have my own personal experience the other way. I have had various things done to me when I have been damaged at boxing and fencing, and have had little bits of me removed, and I have always had pain afterwards.

19305. That is personal experience?—Yes, I had a fatty tumour removed from my neck and the surgeon told me afterwards that I had no pain. I told the surgeon that it was my neck not his, but he said I had had no pain at all.

19306. Then Certificate B is really the part of the Act to which you object?—It is.

19307. On the ground that during the period while it is necessary to watch the animal you think that in most cases there must be not only discomfort but a certain amount of pain?—There is pain.

19308. And that the experiment would be frustrated if the animal was killed as soon as bad symptoms of pain appeared?—Yes.

19309. But you admit that you have not watched the particular experiments?—I have not, and therefore I am not in a position to dogmatise, and that is why I felt that I was almost taking up the time of the Commission under false pretences.

19310. (*Mr. Ram.*) I have very little to trouble you with. Everything turns, I take it, in your opinion, with regard to the use of dogs, upon the presence or absence of suffering of the dogs either mental or physical?—Yes.

19311. If you were sure that no pain was caused either mental or physical, in the interest of science you would not preclude the use of dogs?—No.

19312. With regard to physical pain Sir Mackenzie Chalmers has asked you some questions. With re-

gard to mental pain you gave us the instance of that dog whose ear you curetted, and who, next time you endeavoured to do it, showed great signs of fear. Did that dog show signs of fear on the first occasion?—It became nervous when I came to touch the tender part.

19313. But before you touched the tender part, when you produced the knife did it show any signs of fear?—No.

19314. Its terror on the second occasion then would be due to memory?—Yes, recollection.

19315. I want to put a question on your *précis* with regard to a statement that I am not clear about. Do you think that a dog can be said to have a greater anticipation of pain than any other animal if you eliminate all idea of memory?—No more than a child or a man. Human beings have no sensation of pain the first time. If you try to take a tooth out for the first time from a child it does not mind.

19316. Apart from memory, then, would you say that there is any anticipation of pain?—Perhaps I used the wrong word when I said anticipation of pain; my *précis* was drawn up in a hurry.

19317. There is another sentence in your *précis* that I want to put to you. You say with regard to the treatment of gastric troubles that you are entirely with the vivisector or anybody else—that he may vivisect himself or any of his friends or any dog if that is the only way by which he can arrive at the state of the stomach at a given moment, by a gastric fistula. That is your view?—Yes, because I believe with regard to the stomach that you can do anything you like with a tube.

19318. In that sentence, therefore, do you mean to go the length of allowing a fistula to be made in a dog to be kept perfectly open and the dog to recover from the anæsthesia?—No, I was putting a *reductio ad absurdum* knowing that you would not say that that was the only method or taking it for granted that you would not.

19319. Then I am not quite sure that I follow your view about this. Does it mean that if it be essential that a dog should be used and no other animal, then under anæsthesia it should have a fistulous opening, and be allowed to recover, the wound being treated aseptically?—No, I meant it the other way. I am so sure that you can get the same results by intubation of the stomach that if anybody could prove that it was absolutely essential to make a gastric fistula I should say, do it, but I am absolutely certain that you can do it by syphonage.

19320. I am glad I asked you the question, because that makes it perfectly clear. Your attitude of mind, as I understand, would be that if it could be proved that it was absolutely necessary——?—I say that the world would come to an end; it is absurd.

19321. You do not think it is absolutely necessary?—I am sure that it is not.

19322. In the mode that you adopted of examining the stomach you evacuated the stomach?—I took a little out of it. I often test my own stomach. I have tested the digestibility of different foods on myself. I wait a certain time, pass the tube down, and draw off what I want, and test it for acidity and parapetones and peptones.

19323. But you do not get pure gastric juice?—I could get pure gastric juice if I chose to wash the stomach down first.

19324. But do you by that method get pure gastric juice?—I never tried for pure gastric juice, but I should think I have.

19325. What you have tested would have been gastric juice, plus other contents of the stomach?—Yes. I do it to test the process of digestion.

19326. I think the summing up of your evidence is this, is it not, that you would like to narrow as much as possible any operation on dogs?—Yes.

19327. That you have no objection to an operation on a dog if it be a desirable animal, provided that it dies under the anæsthetic?—Yes.

19328. And that if it could be proved to the satisfaction of competent persons that it was necessary that dogs should be allowed to recover, if such proof were forthcoming, you would not object even to that?—Allowed to recover and suffer?

19329. Yes?—I could not go so far as that.

19330. I put it to you only in the event of such persons as the President of the Royal Society, the President of the Royal Society of Edinburgh, the Presidents of the Royal Colleges of Surgeons and Physicians, and such persons being satisfied that for the advantage of mankind it is necessary that a dog should be allowed to recover, being effectually treated?—I should want to know all the details of it.

Mr. C. R. J. A. Swan, M.B., M.R.C.S., L.R.C.P.

10 Dec. 1907.

19331. (*Sir Mackznzie Chalmers.*) That would be *carte blanche*?—To give leave to do that would be a large order.

19332. (*Mr. Ram.*) There is no question of *carte blanche*. The person who certifies has to know what the operation is that is to be done, and he has to satisfy himself that the experiment will be necessarily frustrated unless it is performed on an animal similar in constitution or habits to a cat or dog, and no other animal is available for such experiment?—Then take a cat.

19333. You would take a cat in preference to a dog?—Yes.

19334. Supposing that there were no cat available?—You can always find a cat.

19335. You would sacrifice the cat to the dog?—Yes.

19336. Does your view depend upon the amount of suffering that is subsequently caused? Supposing that the amount of suffering upon recovery is very slight indeed, should you object even to that?—It would be a dangerous precedent.

19337. You have said that you would substitute every other animal for a dog, and you suggested a pig. You know that experiments can only be made in licensed places?—Yes.

19338. And that those licensed places are almost always laboratories attached to hospitals, medical schools, and so on?—Yes.

19339. A dog or cat can be kept without discomfort in such places, but a pig could hardly be kept under those circumstances, if at all. You realise, therefore, the difficulty of using pigs?—There were some experiments I believe on pigs in the Oxford Laboratory.

19340. (*Dr. Gaskell.*) I understand you to say that you have not seen any experiments under Certificate B which allows the animal to be kept alive under the experiment and to recover?—No, I have not.

19341. Therefore you are not competent in the slightest degree to consider really what the condition of the animal is afterwards?—No, I am not.

19342. And you have made no inquiries into the matter?—It has always struck me that inquiries are biassed on one side or the other. Unless you can see the operations you cannot judge.

19343. That is what I mean. You have never seen an operation yourself—it is very remarkable to see?—I stated at the beginning that all my experiments are 20 years old.

19344. Do not you think from your knowledge of physiological laboratories that the vivisectors themselves would agree with practically all you have told Mr. Ram just now?—I believe they would.

19345. Do not you think that they do as a matter of fact choose other animals rather than dogs if they can?—Yes, I think so, and I am very glad of it.

19346. And do you not consider that that is partly because they have the same feeling with respect to dogs as you have?—I am sure they have. I stated at the beginning that that is my difficulty in giving evidence, because so many of these men are my personal friends.

19347. In addition to that is it not the case that dogs are more expensive than other animals, so that the very lowest of motives, the motive of the pocket alone, would cause them to prefer other animals?—You can steal a dog anywhere.

19348. You do not mean to imply, do you, that the dogs used in physiological laboratories are stolen, and not paid for?—I have stolen dogs in my early days.

19349. Do you think that they are not paid for?—I thought honestly that the dogs are taken from the Dogs' Home for nothing. I was told so, and I said that I would accept the statement with salt.

(*Sir Mackenzie Chalmers.*) It is forbidden by the Statute.

19350. (*Dr. Gaskell.*) I do not know how much you

Mr. C. R. J. A. Swan, M.B., M.R.C.S., L.R.C.P.

10 Dec. 1907.

are acquainted with other laboratories than that of Oxford?—That is the only one I know.

19351. Was it not a fact that all the dogs were paid for there?—I should think so.

19352. And that they were more expensive than other animals, so far as that goes. I am not saying that that is the sole motive?—Yes.

19353. (*Sir John McFadyean.*) I suppose you have sufficient acquaintance with dogs to know that they are the subjects of certain diseases quite peculiar to the canine species?—Yes, they are.

19354. And I daresay you also know that there is a great deal of ignorance with regard to some of those diseases?—Yes, there is.

19355. Therefore you will agree that it is advisable that they should be further investigated?—Certainly.

19356. You would also admit that if they have to be investigated by experimental methods only dogs would suffice since the disease is not transmissible to other animals?—Yes, but if you are going to carry that further you can only experiment on man if you want to improve the state of man.

19357. I did not mean that. In the case of a disease which is only transmissible to man you cannot experiment at all?—No.

19358. You have assented to the statement that certain diseases are peculiar to the dog?—Yes.

19359. I ask you further to assent to the view that if those diseases have to be experimentally investigated you must use the dog?—Yes.

19360. Now take such a disease as distemper. You are aware that it causes a tremendous amount of pain and suffering to dogs?—Yes.

19361. Do you think it is desirable that it should be experimentally investigated if there appears to be a reasonable prospect that you might thereby get a knowledge that would save future suffering to dogs?—My practical experience is that I have had many dogs with distemper, and if you keep them warm, and give them an occasional aperient you will not lose a dog from distemper; it will get well comfortably.

19362. Will you assume, please, that that is an exceptional experience, and that you can have an immense amount of evidence to show that it is a very deadly disease in special outbreaks, and that the dogs are undoubtedly very ill and uncomfortable?—I may have been lucky in my experience.

19363. You think it is desirable that it should be experimentally investigated if there is a reasonable prospect that you could get a remedy?—That is what I should prefer.

Mr. R. J. Cowen, L.R.C.P.I., L.R.C.S.I., called in; and Examined.

Mr R. J. Cowen, L.R.C.P.I., L.R.C.S.I.

19364. (*Chairman.*) You live at 15, Half Moon Street?—Yes.

19365. Do you practice there?—Yes.

19366. As a surgeon?—As a surgeon.

19367. I believe you are a Licentiate of the Royal College of Physicians, Ireland, and of the Royal College of Surgeons, Ireland?—Yes.

19368. Are you a Fellow of the Gynecological Society?—Yes, and several other societies.

19369. You attend to give evidence at the request of the Canine Defence League?—Yes.

19370. Are you a member of that Society?—No.

19371. I believe you desire to give evidence on the anatomical differences between dogs and men, with a view to suggesting that there is no utility in examining dogs in order to study their diseases, and how the remedies for those diseases act on the body of man?—That is so.

19372. Would you put it so high as to say that dogs are so different in their structure that no such information can be gained by examining their bodies with regard to man?—No. I would put it that information could be gained more readily, and the conclusions would be less liable to be erroneous, if the experiments were made upon animals more similar to human beings, mixed feeders, for instance, such as pigs, and especially animals that perspire.

19373. You look upon the pig as more allied to man?—I look upon the pig as having a closer resemblance to man, and being on that account more suitable for experiment.

19374. You say that the pig is a mixed feeder?—Yes.

19375. Is not the dog a mixed feeder?—The dog was not intended to be a mixed feeder. The teeth of the dog show plainly that he was intended to be a carnivorous animal entirely.

19376. What was man intended to be?—I always hold man to be a mixed feeder.

19377. I suppose that would depend upon where he lived, and how he could get his food?—Certainly; but his teeth vary much from the teeth of a dog and think we have considerable evidence in favour of the fact of his being intended always to be, and his being, a mixed feeder.

19378. A feeder on one substance in one place, and another in another, do you mean?—Or a feeder on two or three different substances in the same place.

19379. But supposing that a man was living as a naked savage on a barren plain, where there is but little vegetable food, would he not be then an animal feeder entirely?—The difference, I think, is that man can support life upon the fruits of the earth; a dog cannot. If a dog was only given uncooked vegetable food it would die; it could not live on it.

19380. You think that is the crucial difference?—It is an important difference.

19381. And one that you think makes experiments on dogs valueless?—Undoubtedly it does to a large extent.

19382. You go as far as that?—I go so far as to say that conclusions drawn from experiments made on the digestive organs of dogs must necessarily be erroneous.

19383. I do not know whether you have read the evidence that has been given before us?—I have read some of it.

19384. Then you are aware, probably, that a large number of very eminent physiologists, some of the most eminent in the kingdom, have given evidence that they consider experiments on dogs to be really valuable in many cases of research?—Yes, I am aware of that. I have gone very carefully over the experiments performed abroad and here where dogs are used, and I have not yet succeeded in finding one single experiment which could not have been performed quite as well, if not better—I hold better—upon some other animal.

19385. In books?—Both in books and personally in laboratories abroad and from reading the researches of others.

19386. Have you held a licence yourself?—No, I have not.

19387. Where have you studied—in what laboratories?—In Germany, in Bonn, in Leipsic, and in Paris with Pasteur. I cannot say that I have studied there, but I have spent time there, and gone over with them and gone into the work.

19388. Did you belong to the class of Dr. Pasteur?—No, I did not belong to the class.

19389. Or at Leipsic?—No, I was only a visitor.

19390. As such did you frequent the laboratories or did you visit them once or twice?—I suppose I visited each of them a dozen times or more.

19391. Is that the extent of your experience in operations on live animals?—That is the extent.

19392. Would you tell us what you consider to be the special points of difference between men and dogs? In the first place the teeth. We do not find in a dog the same shaped molars that you nearly always find in mixed feeders, or in vegetable feeders. The position of the canines also, the over-lapping canines, is a very important distinction.

19393. That is a distinction in structure; but it is not a distinction which bears much, or at all, upon the question of experiments upon dogs?—That is so; the canine teeth do not bear upon that because they are intended almost entirely as weapons of defence, but the shape of the molars is very distinctive.

19394. What I rather meant by internal structures are those examined in experiments. You do not examine a dog's teeth by vivisection?—I was going down from that. The next difference is the digestive

tract in the dog, the dog bolts its food and as a consequence the stomach has to do the greater part of the digestion—the stomach and the intestines. As a result of this, relatively speaking, the digestive tract is very much shorter and the digestive juices are a great deal more concentrated and more powerful; they will digest more powerfully than the similar juices of the human being.

19395. Have you observed in the evidence of the witnesses before the Commission that that distinction has been pointed out to us by some of the gentlemen who still think that for many purposes experiments on dogs are extremely important?—No, I did not notice that. I have not had time to go over the whole of the evidence.

19396. What is the next distinction that you find?—The position of the heart and the character of its beat is a very important distinction. The intermittent pulsation of a dog's heart is very different from the steady regular beat of the human heart.

19397. Do you consider that an experiment to ascertain the blood pressure on a dog, and the action of different drugs upon it is not a proper subject of research?—I cannot conceive how it is possible to draw conclusions as to human blood pressure from experiments on an intermittently pulsating dog's heart.

19398. Have you read the evidence which has been given on that point as regards experiments on dogs?—Yes, I have, and some of it I cannot agree with at all; with much of it I cannot agree.

19399. You differ from those gentlemen who have said that for purposes of blood pressure, experiments on dogs are valuable?—I differ very much.

19400. Exceptionally valuable?—I object to the term "exceptionally."

19401. You do not object to the term "valuable"?—It is just possible to conceive a condition under which an intermittent pulsating heart might bear close resemblance to a deceased human heart and consequently might have some value in that way, but otherwise it would be impossible.

19402. Is there any other point to which you wish to call attention as regards the difference between a dog and a man?—The brain is a curious thing. A careful analysis of the chemical composition of the brains of different animals and the relative amounts of phosphorus which they contain shows that the larger the proportion of phosphorus in a general way the greater are the signs of intelligence shown by the animal that owns the brain. In a dog's brain there is a very considerably larger proportion of phosphorus than in that of any other animal—next to it comes the horse—but the dog has a very much larger relative proportion of phosphorus in its brain. I think that is important.

19403. I see you say that one of the reasons why dogs are so often made the subject of vivisection is that they can be cheaply and readily procured?—That is so; it has always been so.

19404. I suppose that rabbits and guinea pigs can be more cheaply procured?—Not quite so easily, and perhaps not so cheaply.

19405. Have you ever bought guinea pigs or dogs for the purposes of experiment?—No, I have not, but I have gone into their prices more or less. I have ascertained what they cost, what they could be bought for, and how they could be obtained.

19406. But you yourself have not bought any?—No.

19407. We have been told that dogs are more expensive to experiment on than guinea-pigs or rabbits by those who do use them. I do not know whether you are prepared to dispute that evidence?—I can only dispute it on hearsay.

19408. What animals do you suggest should be used instead of dogs?—Almost any other animal that is a mixed feeder would be more suitable for experiments, if experiments are necessary.

19409. A cat, for example?—A cat is undoubtedly more suitable, although the cat is a domestic animal, and can hardly be called a mixed feeder.

19410. You have given us the reasons why you think that a dog is less suitable. Do you say that it is less suitable than a rabbit or a guinea-pig?—Undoubtedly. I think that is proved by the action of different drugs. If we compare the action of different drugs upon a dog and upon a human being, it is very different. I have noted down two or three here. For instance, camphor, while undoubtedly causing sleep in most animals, has no effect whatever upon dogs. Take, again, citric acid, the acid of lemons, which is a deadly poison to most animals.

Mr. R. J. Cowen, L.R.C.P.I., L.R.C.S.I.

10 Dec. 1907.

19411. Do you think that a skilled physiologist, if he wanted to experiment with camphor or citric acid, would choose a dog for the purpose?—I am taking only a few out of a very large number of drugs.

19412. You are stating that there are a good many substances which do not affect a dog?—Yes.

19413. Do not you think that a skilled physiologist would be aware of those substances and would not use a dog for the purpose?—Yes, but I am taking the case of a new drug. Supposing that he is experimenting upon the action of quite a new drug, about which he knows nothing, he makes the experiment on a dog, and finds a definite result; he finds, for instance, in one case *cocculus indicus*, or say another drug such as woody night-shade, which is deadly poison to a dog, he finds that it kills the dog, and comes to the conclusion that it is a deadly poison necessarily to man, whereas it is quite harmless.

19414. Do you think that mistakes of that kind have been made? Have you ever seen any accidents occurring through such mistakes?—I have seen a very serious mistake made and carried out in many medical journals that calomel has no effect in increasing the bile flow in a dog, and, therefore, it must be so in a human being, whereas the medical profession for almost centuries have known the value of calomel. It was found that a mistake had been made.

19415. How was that discovery made—by experiment?—By experiment in the first instance that it would not produce bile, and it was then published that calomel was really of no good to cause an extra flow of bile. Gaurana is another drug. Gaurana intoxicates a dog, but is absolutely harmless to a human being.

19416. Do you consider that dogs can be fully anæsthetised and yet kept alive for the purpose of examination?—On account of the intermittent pulsation of a dog's heart, of which I have spoken, I think it is practically impossible to keep a dog fully anæsthetised for any length of time.

19417. I think you said that you yourself had not operated upon a dog?—No, I have not.

19418. Or anæsthetised dogs during an operation?—No, but I have watched it very carefully. I am wrong in saying that I have not anæsthetised a dog. I did it once in order to remove a little tumour from a pet dog of my own. I used every possible care in the case, and I am perfectly aware that the dog felt and could not help feeling it. It was a pet dog, and I did my best to avoid giving it pain. There will be an anæsthetic I think in the immediate future that can be used with animals to produce a more perfect anæsthesia.

19419. Do you consider that any struggle in an animal or man while under an anæsthetic is an indication that they must be suffering pain?—I do. In the case of a human being, when your patient is being put on the table he passes through the usual stages of delirium, excitement, and so on, and then sleep. So long as he is sleeping really perfectly anæsthetised and there is no movement he is absolutely painless, but then there comes a period when he is just recovering, a period which I have noticed you have had described in the evidence before you, when if you put an extra stitch in, the patient will give a cry and pull away from you. When the patient awakes in most cases he will say that he felt no pain whatever, but having forgotten the pain is no indication that it did not exist.

19420. Then do you draw a distinction between a person who comes to and is not conscious of having been hurt at all and a person being hurt who has actually felt pain; do you consider that there is any difference between the two?—I think that wherever there is any purposive movement, where there are any of those reflexes that one sees when the skin is touched with a knife, that animal, human or other, feels a pain, but in many cases of anæsthesia apparently they have forgotten the pain when they awake, but the pain was there.

19421. Do you attach importance to that?—Yes

19422. Do you consider that a person who has an operation and struggles, and whom you think is under pain, but when he comes to and is asked about it when the operation is over says that he has felt noth-

Mr. R. J. Cowen, L.R.C.P.I., L.R.C.S.I.,
10 Dec. 1907.

ing, has suffered shock of any kind more than he otherwise would?—Undoubtedly. We find in the case of surgical operations which were performed before the introduction of chloroform, and even since then——

19423. I am speaking of since the introduction of chloroform. Supposing that a person is operated upon under apparently complete anæsthesia, and when he comes to, feels and remembers nothing, is he in any worse condition if he has shown some signs of struggling during the operation from a man who goes through exactly the same thing and has not struggled?—I think he is in a worse condition from two points of view, because pain increases the risk of surgical shock, and he has also felt the pain whether he has forgotten it or not.

19424. Can you point to any case in which a patient has suffered severely from shock in consequence of having felt pain during what was apparently complete anæsthesia?—If it was apparently complete anæsthesia, they would not struggle or give any evidences of pain whatever.

19425. The question is whether it is an evidence of pain?—I think the purposeless movements that one sees very often, reflex movements, and excitement, have nothing to do with pain, but I have many times seen persons under apparently complete anæsthesia, when you can touch the eyes and prick the skin and they will not be affected, but there is a certain very painful part of the body, and the moment that you touch this one part with a knife it is a sure test, because if the anæsthesia is incomplete the patient tries to struggle away; and with a little deeper anæsthesia these movements will be abolished, and the patient will lie perfectly still.

19426. You would exclude dogs from the operation of the Act?—I would exclude them from all experiments.

19427. And you think that science would not suffer at all in that case?—No. I cannot see why in the later Act stray dogs should be given privileges which kept dogs have not got. Stray dogs are expressly forbidden to be used for vivisection purposes.

FORTY-THIRD DAY.

Wednesday, 11th December 1907.

PRESENT:

The Right Hon. The Viscount SELBY (*Chairman*).

Sir W. S. CHURCH, Bart., K.C.B., M.D.
Sir W. J. COLLINS, M.P., M.D., F.R.C.S.
Sir J. McFADYEAN, M.B.
Sir M. D. CHALMERS, K.C.B., C.S.I.
Mr. A. J. RAM, K.C.
Mr. W. H. GASKELL, M.D., F.R.S.
Mr. G. WILSON, M.D., LL.D.
Captain C. BIGHAM, C.M.G. (*Secretary*).

Mr. L. E. SHORE, M.D., called in; and Examined.

Mr. L. E. Shore, M.D.
11 Dec. 1907.

19428. (*Chairman.*) You are, I believe, a Fellow of St. John's College, Cambridge, and Doctor of Medicine?—Yes.

19429. And University Lecturer on Physiology?—Yes.

19430. Do you remember some experiments that were made by Professor Gaskell and yourself (you were assisting, I believe, in them) with a view to ascertaining what the method of action of chloroform on the heart was?—Yes, I remember them perfectly.

19431. Were there a series of experiments by you and Dr. Gaskell?—Yes, there was a series by Dr. Gaskell and myself which were carried out in the years 1890 and 1891.

19432. Do you remember Colonel Lawrie coming to Cambridge to see some experiments of the same kind?—Yes.

19433. Which, I believe, were experiments made for the purpose of showing them to him?—Yes.

19434. In what year was that?—That was in July, 1894.

19435. There were two experiments made in the presence of Colonel Lawrie, I understand?—Yes.

19436. Were those of the same nature as the experiments that you had conducted previously in 1891?—Yes, of the same nature with a slight improvement in the method.

19437. Will you just tell us what the experiment was; was it what you call an experiment by the method of cross circulation?—Yes.

19438. Will you just explain very shortly what it was?—The object of the experiment was to decide whether chloroform causes a fall of blood pressure by an action on the heart or an action on the vaso-motor centre in the medulla, which could be absolutely decided by taking an animal and so ligaturing the arteries of the brain that its own blood could not reach its own brain—the brain of the animal being supplied with blood from another animal. When that was done one could send chloroform either to the brain or to the heart of the first animal.

19439. Then two dogs were operated upon side by side at the same time?—Yes.

19440. And then the vessels of one which would lead to the brain, and bring blood to the brain, were fastened up, tied up with ligatures?—They were tied with ligatures and in some cases divided between the ligatures. The animal with the vessels divided to separate its blood from its brain we call the fed animal; the other animal we call the feeder; it delivers blood to the brain of the fed but to the brain of the fed only, and the blood is returned from the brain of the fed back to the feeder.

19441. What is the process by which you ascertain what the effect of chloroform on the heart directly is without the possibility of its coming through the brain? A record of the blood pressure of the fed animal is taken and a fall of that pressure can only be brought about by a change in the heart when chloroform is administered to it, because the chloroform administered to it cannot reach its brain, because the blood vessels leading to the brain of the fed animal are completely ligatured.

19442. The object being by giving chloroform to the fed dog and at the same time cutting off the supply of blood to the brain of the fed dog, to test what the direct action is of chloroform upon the heart without the possibility of the brain affecting it?—Yes.

19443. You carried out that operation, or practically the same operation, I understand, in 1891 and 1892?—1891.

19444. Were those operations successful?—Yes.

19445. Were they carried out successfully in the sense of ascertaining what you wanted to ascertain?—Yes, they satisfied us that we had definitely proved the point that chloroform does act directly upon the heart and that a fall of the blood pressure is due in the main to that.

19446. Then in 1894 you carried out practically the same experiment twice in the presence of Colonel Lawrie you told us?—Yes.

19447. Were those two operations both successfully carried out or was there any failure in either of them?—The first experiment was quite successful.

19448. Proving, to your satisfaction at least, what?—Proving the point that we wished to demonstrate to Colonel Lawrie.

19449. That there was a direct action on the heart?—Yes, but he criticised our experiment and thought that some chloroform was reaching the brain of the fed; so we offered after the death of the dog to inject some coloured solution, a blue solution was used, to see whether our ligatures were all perfectly tight and that no chloroform was reaching the brain. We found that a small amount of our blue colour did reach the brain.

19450. You forced it, I suppose?—It was forced by a

syringe. There is no proof from that that any chloroform got up by the same path as the blue colour did because the conditions of the pressure in the brain were totally different during life and very probably the blood did not leak up past those ligatures, but even if it did it did not vitiate the experiment in the slightest degree.

19451. And the first experiment was not vitiated in any degree?—It was not to our mind. But we offered to do the experiment again in four days' time before Colonel Lawrie once more, taking particular care, and in that case we divided the blood vessels between the ligatures and took the greatest care that nothing whatever could leak up.

19452. Then Professor Gaskell, I understand, communicated what you had ascertained about the possible vitiation to a certain extent of the first experiment to Colonel Lawrie?—Yes, we offered to do that straight away and the result of it was that we offered to repeat it again?—But afterwards there was a letter written. Then when the first experiment had taken place, Professor Gaskell wrote and explained what had happened?—Yes.

19453-4. That is a letter that has been communicated to us by Colonel Lawrie?—Yes.

19455. And then this second experiment was held four days afterwards, and it went all right?—It was a perfectly satisfactory one; there was no leakage whatever in that case of any sort.

19456. That is the full account of what is referred to the Question 16972 and the following questions in the evidence?—Yes.

19457. Then there is another matter—I think it is probably an accidental error of Colonel Lawrie's. At Question 16869 he is asked this question: "You also say that you saw another physiologist perform prolonged vivisection experiments on dogs under a ten-drop dose of morphin solution, this dose being equal to one-twelfth of a grain of solid morphin. Had they no other anæsthetic of any sort or kind?" and he answers, "I believe not, until the observations began on the action of chloroform." Is it correct that this was one-twelfth of a grain?—No. I suppose Colonel Lawrie is referring to these two experiments that we did?

19458. It would look so?—In each of those two experiments we had two dogs. Of the two dogs, one dog received ten cubic centimetres of a 2 per cent. solution of hydrochloride of morphia, and the other dog six cubic centimetres of the same solution.

19459. Will you just explain what the difference is between that and the statement of Colonel Lawrie?—A 2 per cent. solution of morphia contains 30 grains in the 100. As the dog had received 10 cubic centimetres, it therefore had 3 grains of morphia, not one-twelfth.

19460. The dose was really 36 times stronger than what appears from Colonel Lawrie's statement in his *précis*?—Yes, and the other one which, as I have said received only six cubic centimetres of the solution, had received 1·8 grains.

19461. That may be accounted for, I suppose, by his having thought that it was a 10-drop dose of a different solution from that actually used?—Perhaps he made some mistake of that kind.

19462. However, it is inaccurate to the extent of 36 times?—Yes.

19463. And that dose that was given was a completely full and satisfactory dose?—Yes. I see in the statement that Colonel Lawrie implies that no chloroform was given until the test was purposely made with the chloroform. That is not the case. In addition to the morphia, chloroform was given to the animals before the skin was cut, and during the cutting operation the A C E mixture, just as it was required.

19464. Were the animals kept in a state of anæsthesia before the cutting began and up to the time of death?—Absolutely.

19465. (*Sir William Church.*) Others were present at these experiments besides Colonel Lawrie, yourself, and Dr. Gaskell?—Yes, at the first experiment there were two of Colonel Lawrie's students from India. I suppose they had been helping him in his own experiments in India, and they were present. And at the second experiment Sir Thomas Clifford Allbutt was present, and Dr. Anderson, as well as ourselves.

19466. And during the experiments the various steps in the operations were recorded as they took place?—They were written, nearly all of them, automatically, by the tracing of the animal and by clocks and other automatic arrangements.

19467. And the record, such as it was, was gone over by all those present at the end of the experiments and signed by them, was it not?—Colonel Lawrie did not actually sign the experiment. He was present at the time, and confessed that the experiment was a success, and that air was properly entering the animal, and other details that we asked him.

19468. Did the others who were present sign?—No. They did not actually write their names on the record.

19469. (*Dr. Gaskell.*) Surely they did?—No, we wrote down the statement that they were present on the record, but they did not actually sign it.

19470. My impression is that they did?—No.

19471. (*Sir William Church.*) Do you know what became of that record?—I have it in my possession.

19472. Was a copy of it sent to Colonel Lawrie, such as it was?—The tracing was analysed and a report of it was sent out to Colonel Lawrie to India, as was agreed, for him to sign there, and then for it to be published.

19473. (*Dr. Gaskell.*) That report that was sent out to him was signed by the other people present, if I remember rightly?—I do not remember.

19474. You signed it, and I signed it, and Sir Thomas Clifford Allbutt, and Dr. Anderson all signed that report if I remember rightly?—I do not remember their signing it. I signed it, and I think you got their signatures afterwards.

19475. My impression is that they all signed when it was sent out to Colonel Lawrie?—Yes, I know that we agreed to do that.

19476. Have you ever had that report back?—Colonel Lawrie has never sent that report back to us for publication.

19477. (*Sir William Church.*) Did he send any reply at all to the communication?—None whatever.

19478. (*Dr. Gaskell.*) There is another matter, but I think that the Commission will be interested in it. You have had chloroform as an anæsthetic yourself?—Yes, on two occasions.

19479. Could you tell the Commission whether on those two occasions you endeavoured to test the length of time after the anæsthetic had been administered before unconsciousness supervened?—On the two occasions that I had to undergo an operation, and was given an anæsthetic, I decided to see whether I could tell the length of time that intervened from the commencement of giving the drug to the period of unconsciousness, and I decided to do it by carefully counting my regular respirations. On the first occasion I was able to count ten respirations, and then I became absolutely unconscious. On the second occasion I could count twelve. That makes considerably less than a minute before unconsciousness supervened. But one ought to remember that in that case I was receiving as an anæsthetic nitrous oxide and ether, which are known to be fairly rapid. I have no experience as to whether chloroform alone is equally rapid, but we know that chloroform is a stronger anæsthetic, but its full effect may not come on so soon. The second point which those personal experiences led to is also interesting. In the middle of the operation I heard the surgeon make a certain definite remark about the operation, but I could feel no pain whatever. When the operation was completely over, and I recovered consciousness, some four hours later, I inquired of the surgeon, and he told me that the remark had been made when the operation had been in progress about half an hour. That experience, I think, points out that the sensation of pain is more easily abolished than such a sensation as hearing, and it is interesting to note that in local or peripheral anæsthesia, which is now very much used, we have the sensation of pain much more readily abolished than other sensations. Many years ago I made some observations with cocaine on the tongue, when I found that the different sensations of the tongue disappear in definite and precise order according to the dose of cocaine or the duration of the cocaine action; and the first of all sensations to disappear is the sensation of pain, then of sweet, and then bitter, then salt, and then acid, and last of all the sense of touch. It is quite striking to notice that

Mr. L. E. Shore, M.D.
11 Dec. 1907.

when the tongue is touched with the needle you feel the touch, but although the needle is thrust into the tongue you feel no pain. So we see that also in local or peripheral anæsthesia painful sensation is the first, I think, to be abolished.

19480. May I ask was the operation in which you heard distinctly the surgeon make a remark, and correctly heard it, of the nature of a fairly severe operation. I mean was the anæsthesia that you had supposed to be full surgical anæsthesia?—The operation was certainly severe. I was put under the drug at 9 o'clock in the morning, and I did not recover consciousness till 1 o'clock in the middle of the day.

19481. Would a surgeon, do you think, with your experience, say that that anæsthesia was rightly described as light anæsthesia, that they were attempting to put you under, at all events? We have had a great deal of discussion here at this table about the meaning of light anæsthesia and deep anæsthesia, and it has been said that light anæsthesia is never given in the case of operations. Therefore I presume you were under comparatively deep anæsthesia; you were supposed to be fully anæsthetised?—I was supposed to be fully anæsthetised, but at the time when I heard the remark, no doubt the anæsthesia had been allowed to go light.

19482. But yet there was not the slightest sensation of pain?—Absolutely none.

19483. (*Dr. Wilson.*) You say that these animals that were experimented on were absolutely unconscious of pain during the whole time of the experiment?—Absolutely.

Mr. A. Guillum Scott and Sir Frederick Banbury, Bart., M.P., called in; and Examined.

Mr. A. G. Scott and Sir F. Banbury, Bart., M.P.

19484. (*Chairman.*) (*To Mr. Scott.*) You are a Member, and, I believe, Chairman of the Royal Society for the Prevention of Cruelty to Animals?—I am.

19485. They have drawn up a *précis* of the evidence to be given before the Royal Commission on Vivisection, which they have printed, and sent to us?—That is so.

19486. I do not quite understand, seeing that there are two witnesses before me, whose *précis* that is. Is it a *précis* of the evidence which you propose to give, or which Sir Frederick Banbury proposes to give, or both?—It is evidence of the Society. It was decided upon at a meeting of the council that the representatives should give this evidence on behalf of the council and the Society.

19487. Then, perhaps, instead of calling it a *précis* of the evidence to be given, we had better call it a statement of the views which the Society have resolved to be their views?—Yes, that is so.

19488. And, therefore, to begin with, and probably to shorten matters, we will put it upon our notes as such?—If your Lordship pleases:—"The Royal Society for the Prevention of Cruelty to Animals was founded to protect animals generally, and not for the suppression of any kind of cruelty in particular. The members of the society are drawn from all classes, and there is a considerable difference of opinion amongst some of them upon various subjects, although on others they are practically agreed. On the question of vivisection, for instance, there is a wide diversity of opinion, many persons objecting to any kind of vivisection; while others object only to painful experiments; others again consider that vivisection is necessary for the advancement of science in the interests of mankind. The attitude taken up by the society, almost since its foundation, has been that it deprecates all experiments on animals which cause pain, but as regards experiments which cause no pain there is no ground for interference by the society, because the question of cruelty does not arise. The society, therefore, is of the opinion that all severely painful experiments should be carried out while the animal in question is completely under the influence of an anæsthetic, and that it should be destroyed before the effect of the anæsthetic has been removed. The society has, ever since the passing of the Cruelty to Animals Act, 1876, repeatedly pointed out that the supervision of experiments carried on under licences granted under that Act is totally inadequate. It may not be possible that every experiment should be performed in the presence of an inspector, but all those should be which cause pain, either in their initial stages or afterwards. All severely painful experiments should only be performed in a particular place or places, so as to facilitate inspection; and all painful experiments should be prohibited except in the presence of an inspector. The number of experiments has increased since 1876 from between three and four hundred in that year to over 46,000 in 1906, and the number of inspectors (originally two and now three) is entirely out of proportion to the increase in the number of experiments. The number of Inspectors is absolutely inadequate if a proper supervision is to be exercised over the licensees. The Inspectors occasionally witness experiments, but very few. The inspectors' reports are drawn up from the information culled from the reports made to them by the licensees. It is impossible for the Inspectors to exercise proper supervision while experiments are going on every day in all parts of the country. The society is strongly of opinion that additional inspectors, who shall not necessarily consist of medical men, should be appointed, and that such inspectors should visit all licensed places frequently, at various times, unknown to the licensees, and that all holders of licences should be required to declare that no experiments, except those duly reported in accordance with the terms of the licence, have been performed, and the licensees should be required to make a return of all animals acquired by them, and how obtained. With a view of securing and maintaining the confidence of the public, the necessity of obtaining the consent of the Home Secretary for the prosecution of a licensee for an alleged offence should be abolished, and it should be left to the discretion of the magistrates, who are empowered to refuse a process if they consider an application is vexatious. The period for taking proceedings should be extended, so as to be within six months of the publication, or the giving information of that which is impugned. The society, soon after the Act of 1876 came into force, successfully instituted a prosecution under Section 6. The society has not been interested in or promoted any other prosecutions."

19489. In the case of the Royal Society, where something of the same kind was done, we thought it necessary to call the President of the Royal Society, so that any questions might be asked which occurred to any members of the Commissions arising upon their views, and we are following the same course in calling you and, as the society wishes it, another well-known member of the society. I do not know for myself that I have any questions to ask you, except whether there is anything that you wish to add to this statement of the society?—I do not know whether I might say that we are as anxious as the most extreme persons to abolish unnecessary pain, and we differ from them only in not attempting impossible legislation, while trying to improve legislation on this subject. That is our effort. The anti-vivisection societies, of course, occupy a special position, and carry out a special work, which could not be undertaken by an institution organised to conduct general operations by various modes of action, jeopardising other objects of a kindred nature on a far more extensive scale. For instance, drinking fountains have a society, and the Dogs' Home another of a special character.

19490. Your society has a very large number of members?—A very large number of members.

19491. Can you say how many?—I cannot really tell you that, but I can tell you how many officers we have. We have about 160 inspectors all over the country.

19492. And you spend a considerable income?—We spend in every way about £60,000 a year.

19493. When was your society established?—In 1824 I think it was.

19494. And it has been in existence ever since?—Yes.

19495. And in full operation?—Yes, and it has been growing and growing in the most extraordinary manner. I may, perhaps, say that I am what is called a man of leisure and, therefore, give up a great deal of my time as Chairman to the society. There is not a day passes when I have not some communication. I mention that to show that there is a great deal of work.

19496. A man of leisure means an unpaid busy man?—It seems so, and in my case I think I may say it is so.

19497. I think, perhaps, the best plan would be that we should hear Sir Frederick Banbury, and then if any of the members of the Commission wish, as I dare say some of them will, to ask questions first of you and then of Sir Frederick Banbury it will be better; but I think it is better to have first the general views of you both?—If you please.

19498. (*To Sir Frederick Banbury.*) Will you tell us what view you wish to speak to?—I, of course, only come here to represent the view of the society and not my own particular views upon the question of vivisection, but I think I can say that, speaking broadly, the view of the society is that while vivisection is permitted by law and animals are called upon to undergo, not for their own benefit, but for the benefit of man, operations which in their nature involve not merely the sacrifice of the life of the animal but the possibility of considerable suffering, every precaution should be taken to prevent pain to the animal creation. They are called upon to bear this burden for the general benefit of men; that is the idea, I believe.

19499. Of men and animals?—Men and animals; and it would seem to be an obvious principle of humanity and justice that man should concede to these dependent creatures all those safeguards against pain that he naturally demands for himself if he is undergoing a similar operation for his own benefit. Therefore, I think I may say (and Mr. Scott, I think, will agree with me) that the opinion of the society is that there are not a sufficient number of inspectors in order to see what actually is going on. Next, I think that, in the opinion of the society, it is not necessary that the Inspector should always be a medical man. I would not for a moment suggest that he should not be a medical man, but that that should not be an essential qualification, but that if there are other qualifications they should be considered perhaps before the qualification of being a medical man. Further, I think that another important point is that the Inspectors should give their whole time to the duties of their office and not hold any other appointment. In the Report of the Commission of 1876 I believe there is an observation that "publicity is the antidote of suspicion," and I am rather afraid that that observation of that Commission has not been carried out by the law, because I think there is a strong opinion amongst members of the society that the Inspectors obtain their reports very often, not from what they have seen themselves, but from what they are told by the people conducting the operations.

19500. Was that phrase, "publicity is the antidote of suspicion," used with reference to operations in laboratories, or was it used in the Report with reference to reporting cases brought into Court by the society?—I am afraid I cannot answer that. I have not referred myself to the Report; it has been given to me on, I think, good authority, that there is that statement in the Report, but whether it referred to experiments in laboratories or whether it referred to the case you have mentioned I cannot say.

19501. (*Sir William Collins.*) I have the passage here: "Publicity is the antidote of suspicion, and we look to the reasonable superintendence of constituted authority as affording the means of reconciling in the public mind the sentiment of humanity with the desire for scientific knowledge."

19502. (*Chairman.*) That looks as if it referred to laboratories?—Yes, I was not quite sure. I do not want to say anything that I am not absolutely certain about. I think that practically that is all I have to say. I do not know whether Mr. Scott bears me out.

(*Mr. Scott.*) Yes, I do. I think the inspection of returns should be the inspection of experiments; that is to say we want more inspectors. They seem to be able to inspect the returns, but they do not, I believe (in fact they could not) inspect all the experiments.

19503. You say that there were 46,000 experiments in 1906?—Yes, that is so.

19504. You are aware that the vast majority of those are inoculations?—Yes, quite painless.

19505. You do not mean that every one of those should be inspected?—No.

19506. Would you confine the inspection to any particular class of experiment. Some, of course, which are cutting operations are extremely slight?—Yes.

19507. And some are very serious?—Yes. What we say in our statement is that "All severely painful experiments should be carried out while the animal in question is completely under the influence of an anæsthetic."

Mr. A. G. Scott and Sir F. Banbury, Bart., M.P.

11 Dec. 1907.

19508. That answers my question?—Yes.

(*Sir Frederick Banbury.*) Might I say one word? I did not quite finish. I ought to have said that with a view of facilitating the work of inspectors, the society is of opinion that the number of registered places should be to some extent limited.

(*Mr. Scott.*) Yes, that is so. The words of the Statute are, "Cruelly ill-treating, abusing, or torturing animals." Where no cruelty and certainly where no pain is caused in an experiment interference is not called for any more than when animals are destroyed for food.

19509. You are referring to the original Cruelty to Animals Act?—Yes, the original 1849 Act.

19510. Not the 1876 Act?—No.

19511. That is your most important Act?—Yes, the improvement on Martin's Act.

19512. (*Sir William Church.*) In your statement you say, "The society, therefore, is of the opinion that all severely painful experiments should be carried out while the animal in question is completely under the influence of an anæsthetic." Might I ask you what you consider a painful experiment?—It is rather difficult to define. I cannot give you anything in the way of a professional opinion. I am sorry to say I cannot do that, but there are operations which are, of course, notoriously painful, and such a one, we think, should be under an anæsthetic and the animal should be destroyed before the effects of the anæsthetic had been removed.

19513. Is not that the present law?—Is that so? We have been reading in the papers about the brown dog at Battersea—I have seen something about that. That is a case in point.

19514. As you have referred to that, might I ask you what the circumstances are with regard to the brown dog at Battersea?—I do not know them. I only know that I read in the papers that the students, I am not surprised, were annoyed at some inscription.

19515. Before you advance that as an instance should you not know something of the circumstances?—The dog, I understand, was twice operated upon. I thought it was understood that it was brought round (I do not know it of my own knowledge, but I understand that it was the case) and operated upon again and suffered a great deal of pain; the forceps were in the dog.

19516. Might I ask for a little more particulars about the dog, as you have instanced the brown dog of Battersea. Do you know when it was first operated upon?—No, I do not know, I am sorry to say, but I understood that that was the case.

19517. Do you know what the character of the operation was?—No, I do not. I believe it was a painful one.

19518. Was the dog under anæsthetics at the time the operation was done?—I understand so.

19519. Do you know when the second operation was done upon it?—No.

19520. At what interval of time after the first?—Very soon I am told.

19521. You are not aware that between two and three months elapsed?—Is that so? It was about the third day, was it not?

19522. Are you aware of the condition the brown dog was in during the two or three months that elapsed between the first operation and the second?—No, I am not. I think there were three operations altogether. (*Sir Frederick Banbury.*) If I might answer the question, because I happen to have read the evidence at the trial, the evidence at the trial to the best of my recollection (I have not refreshed my memory with it to-day) was that there were three operations upon the brown dog: that the first operation took place some two or three weeks, or a month, before the second, I could not say which, but that at the end of the second operation the dog was handed over to another operator, the operator who performed the first operation quitted the building, leaving the dog in the hands of the operator for the third operation. That, to the best of my recollection, was not denied in Court.

Mr. A. G. Scott and Sir F. Banbury, Bart., M.P.

11 Dec. 1907.

19523. Was the dog allowed to recover from the anæsthetic between the second and the third operations?—Is it possible for a dog to be under an anæsthetic for so many hours as that dog was without recovering consciousness?

19524. I suppose you will not take it from me that you can keep a dog under anæsthetics as long as you like almost, that is to say, up to six, eight, ten or twelve hours?—I am not an expert, but I am informed by experts that it is almost impossible.

19525. You have no knowledge of your own on the subject?—No, I am not an expert.

19526. Would you accept it from me that the dog was under anæsthetics at the end of the second operation, and was not allowed to recover from that anæsthesia until after the third operation was performed?—My desire is to accept everything that you say, but in this particular case I do not think I can.

19527. (*To Mr. Scott.*) I should like to go back to what is considered by your society a painful operation, because you say that you have no objection to inoculation experiments?—No, we have none, I think. They are classified, certainly, in the return to the Home Office under different heads.

19528. With regard to inoculation experiments you say apparently that your society does not regard them as painful?—We believe them not to be painful.

19529. But we have had a good many witnesses here who have objected to inoculation experiments very strongly, saying that they are extremely painful in some cases; not the inoculation itself, but the result of the inoculation. What is the view of your society about that?—That all painful experiments should be prohibited except in the presence of an inspector.

19530. That is just my point. I am speaking of these inoculation experiments. You say that they are not painful, but we have had a good many witnesses who have objected to them on the ground that their results are painful?—If the Inspector is present and pronounces an experiment not to be painful I suppose we should accept it.

19531. (*Chairman.*) I understood you to say when you spoke of 46,000 operations that you were aware that a very large majority of those were merely in the nature of inoculations, and that you never thought of there being any necessity for inspectors to be present at those?—No, I do not consider, speaking for myself, that those would be painful, and I think that is the view of the society, unless they produce pain, which we do not think they do.

19532. (*Sir William Church.*) But my question was this. I wished to know whether your society objected to inoculation experiments on the same grounds as many witnesses have, that the results may be painful?—Yes, in that case we should.

19533. But you cannot tell what your results will be?—We say, "All painful experiments should be prohibited except in the presence of an inspector"—he must be the judge.

19534. Do you know what these inoculation experiments are chiefly done for; are you not aware that the large bulk of them take place in laboratories connected with public health for the purpose of diagnosis of disease and preventing its spread?—Yes, I think that would be a very noble and proper thing.

19535. But that is what the large bulk of these inoculation experiments are done for?—Yes.

19536. And, of course, you cannot tell whether the result of an inoculation may cause discomfort to an animal or not until after the proper time has elapsed to see what has been the result of the inoculation?—Our view, as we have expressed it, is that it is not possible that every experiment should be performed in the presence of an inspector, but that all those should be which cause pain either in their initial stages or afterwards.

19537. Then am I to take it that your society does object to inoculation experiments for the purposes of diagnosis?—Anything that causes pain to the animal afterwards we should object to.

19538. The Inspector would have to be present then and give his consent or not according as he thought that the result of an injection experiment might or might not be painful. Is that what I am to take from you?—I think so.

19539. That, of course, would put a stop to the use of inoculation experiments, possibly for the purposes of public health?—I am sorry to say that not being a professional man I am not able to follow some of these questions.

19540. Might I put it in rather a different way. Would your society prosecute a man who overrode or overdrove a horse when going to the assistance of another man?—I think very likely if we had all the facts of the case before us we probably should not.

19541. But yet you would not allow an inoculation experiment which might or might not have the result of saving a great many human lives, I mean by preventing the spread of an epidemic or anything of that kind, unless the Inspector was assured that the result of the experiment could not be painful?—That is the line we take. We want to defend the animal as much as we can—that is our object—what the society exists for. I only give the general views. I am not giving my own opinions at all.

19542. I want to get the opinion of your society?—Yes, I am trying to give it you.

19543. I think you will admit that it would be very hard for the Inspector, unless he had some fixed rule whenever any material was going to be injected that might give rise to pain or discomfort in the animal, to say that it was not to be allowed; he would have great difficulty in knowing what injections he should permit and what he should refuse permission to?—We say, "All painful experiments should be prohibited except in the presence of an inspector."

19544. Might I ask what you would consider the qualifications for an inspector?—I should imagine that the man should know something of anatomy and surgery generally, and I suppose that really he would have to have some knowledge of hospitals and something of that sort. I suppose that would be necessary before the man could give an opinion.

19545. You think that they should not all be medical men?—Not necessarily medical men. There seems to be an idea that they might be men of some experience who were not medical men.

19546. Still, I should like to have some more definite idea what you think should be the qualifications for an inspector?—We have no objection, so far as I know, to the qualifications that exist now, only we say that there are too few of them.

19547. (*Mr. Ram.*) Too few inspectors?—Yes.

19548. (*Sir William Church.*) Hitherto all the inspectors have been, I think, medical men?—That I am not sure of. They are appointed by the Home Office. I should think they most likely were, but there are very few of them.

19549. (*Chairman.*) Do you understand that these inspectors are to be persons who should have authority to say to a professor of physiology in a university, who is going to perform an experiment under anæsthetics with a certificate from the College of Physicians, that the animals should be allowed to recover, and therefore feel pain, "In my opinion this will cause pain to the animal, and it must be stopped." Surely all he has to do is to report any breach of the law?—I should say yes.

19550. He would not have any preliminary authority to stop experiments which appeared to be in conformity with the Act, although they caused pain?—No. If a license has been granted for a painful experiment we say that it ought to be performed in the presence of an inspector.

19551. (*Sir William Church.*) You cannot, therefore, give the Commission any assistance with regard to what the qualifications of these inspectors should be?—I am afraid very little.

19552. Has Mr. Coleridge placed before your society his amended Bill for experimentation on animals?—I do not know whether he has or not. I rather think that he has very much taken up the lines of the Bill that we ourselves proposed.

19553. Have you sent us a copy of your proposed Bill for the prevention of cruelty to animals?—No, we have not. Nor have we one.

19554. (*Sir Mackenzie Chalmers.*) Have you not got one?—No. (*Sir Frederick Banbury.*) I introduced one in the House some two or three years ago.

19555. (*Sir William Church.*) But not by your society?—Well, with our approval. It was not drawn up by the society. It was really Mr. Stephen

Coleridge's Bill amended by myself—his Bill of that date.

19556. (To *Mr. Scott.*) You are aware that in his amended Bill he proposes that before a man receives a licence for being allowed to experiment on animals he should get a certificate of humanity?—This is what you refer to, I think: "A certificate recommending that the application be granted on account of the applicant's reputation for humanity, which must be signed by two or more of the following persons, that is to say, a Justice of the Peace, a minister of any religious denomination in the United Kingdom."

19557. Yes, that is what I refer to. Is that approved by your society?—No, I cannot say that it is. We have not had it before us.

19558. Do you think that that certificate would be of any value?—I do not think it would be, really.

19559. Then you would also approve of its being in the power of anyone, without the consent of the Home Office, to institute a prosecution against anyone who is stated to be guilty of cruelty in experimentation?—Our view is, "With a view of securing, and maintaining, the confidence of the public, the necessity of obtaining the consent of the Home Secretary for the prosecution of a licensee for an alleged offence should be abolished, and it should be left to the discretion of the magistrates who are empowered to refuse a process if they consider an application is vexatious." That is what we prefer.

19560. At the present moment anyone can prosecute a person guilty of cruelty to animals under the Cruelty to Animals Act?—Yes.

19561. And your proposal would amount to a similar method of prosecution in the case of those who hold licenses for experimentation. That is the meaning of it?—We mean that it should go before a magistrate in the same way as anything else, and should not be left to the Home Secretary, which, of course, causes necessarily a great deal of delay, and very often no proceedings can be taken, because the period has passed when we get the information of anything like an abuse of the Act.

19562. You do not think that that might be a very vexatious clause to those who are engaged in this work in laboratories?—It did not occur to me that it would be so at all.

19563. Considering the statements that you must be aware are made about the experimentation that goes on in laboratories, do not you think that very often cases would be brought forward before magistrates who could not judge at all of the rights of the case, which would be vexatious?—No, I think the ordinary magistrate would be a man of common sense, who would grant a summons or not, as he thought right, and the process would not go on.

19564. In judging whether an experiment is cruel or not, is not there a considerable amount of what is generally considered physiological knowledge required?—I should say certainly.

19565. Is that possessed by the public and the majority of magistrates?—I should be afraid not.

19566. Therefore is it not only possible but probable that in perfectly innocent ignorance, a great many prosecutions might arise?—So far as the society is concerned every possible care is taken never to prosecute unless it is absolutely necessary. We meet and discuss these matters. No prosecution can take place without the consent of the parent body.

19567. You are speaking now of your society; I am speaking of the general public?—I beg your pardon; I did not follow you. It did not occur to me in that way. So fas as we are concerned, I am quite sure that we should not prosecute unless we had a very good case.

19568. Have your society any evidence whatever that unnecessary cruelty is practised in laboratories?—We have never had but one prosecution, and that was for advertising, under the Act of 1876. That is the only one we have had, and it is very curious that it should be in that connection. I have it here, if I may just read it to you. This is from our report for 1876: "First conviction under the Vivisection Act.—The Cruelty to Animals Act, 39 and 40 Vict., c. 77, came into operation on the 15th of August last. Three days later Dr. Abrath, of Sunderland, issued a large placard headed, 'The Balham Mystery,' announcing his intention to deliver a lecture at Sunderland on 'Antimony,' when he would perform experiments on animals to show the effects of poisons, and to demonstrate his theory that Mr. Bravo was not killed by that drug. The branch of the Royal Society for the Prevention of Cruelty to Animals at Sunderland immediately reported the matter to the secretary in London, and prompt measures were taken to prevent the learned gentleman from performing his experiments. According to the 6th Section of the Statute named above, an offence had already been committed by the announcement of a public exhibition of experiments on animals, and Dr. Abrath, having spoken contemptuously of the new Statute at his lecture, and provoked the derision of a portion of his audience against it, instead of apologising for his projected defiance of the Act, was summoned to appear yesterday before the Sunderland Borough Bench, at the instance of the R.S.P.C.A., when he was fined for publishing the illegal placard alluded to."

19569. Might I ask who Dr. Abrath was? Was he the holder of a licence at the time?—No.

19570. Then that case did not come under the Act?—Yes, it came under it in this way. This is the section: "Any exhibition to the general public, whether admitted on payment of money or gratuitously, of experiments on living animals calculated to give pain, shall be illegal."

19571. That is, illegal to the holder of the licence?—"And any person publishing any notice of any such intended exhibition by advertisement in a newspaper, placard, or otherwise shall be liable to a penalty not exceeding one pound." This man's offence was under that Act, of asking the public to come and see this experiment, and for advertising that he was going to perform it.

19572. But the gentleman in question was not the holder of a licence?—No.

19573. He did not propose that these experiments that he wished to show to the public should be done under the Act?—His offence against the Act was that he proposed that there should be a public exhibition; that is where the offence came in.

19574. That had nothing to do with the Act regulating experimentation on animals. In that Act there is a special clause that an experiment should not be performed in public?—That is just what I was saying. You were asking me about these matters. It is the only conviction we have ever had, and that was simply for advertising.

19575. He was not a licensee?—I am not able to say that, but his offence was advertising the performance of the operation.

19576. Then your society, which has, I understand, £60,000 annually at its disposal, has never been able to bring forward instances of unnecessary or wanton cruelties having been performed in laboratories?—No, I have no case.

19577. Might I not infer from that that the probability is that wanton and unnecessary cruelty does not exist in laboratories?—That is a difficult question for me to answer. We say that there are not enough inspectors, and that the Inspector inspects the returns but does not inspect the experiments. Only three inspectors cannot possibly do that.

(*Sir Frederick Banbury.*) If you give us leave to be present at an inspection we will answer the question.

19578. (*To Mr. Scott.*) Do you think it possible for an inspector to be present at every operation done in a laboratory?—I think at a great many they might be. At present it is not possible.

19579. Have you any idea of the number of laboratories that there are in this country?—I have a list of them here. I have not counted them.

19580. Do not you think it would be a great drawback to science if a man's work had to be stopped in order that a communication might be made with the Inspector that he was to be present at such and such a time, and then the Inspector said he could not be present at such and such a time?—Then I think they should arrange between them that the Inspector should be present, as it is the law that he should.

19581. How many inspectors do you propose there should be for the Kingdom?—It is impossible to say.

19582. What sort of remuneration would you give these inspectors?—Whatever they are satisfied with

Mr. A. G. Scott and Sir F. Banbury, Bart, M.P.

11 Dec. 1907.

now I daresay others would be satisfied with. I daresay it would be very costly, but it would be money well expended, would it not?

19583. What grounds have you for thinking that an inspector would be more likely to tell the truth or to stop what should not go on than the gentlemen who at present are in charge of these laboratories and are responsible for what goes on in them?—I have the greatest admiration for your profession, I assure you——

19584. I beg your pardon, you are under a misapprehension. A large number of the heads of these laboratories in which experimentation on animals goes on are not members of my profession, or not necessarily members of my profession?—I thought you would hardly throw that back at me.

19585. But as a matter of fact some of the most distinguished experimenters on animals are not members of the medical profession, but men of science?—Yes, men of science certainly.

19586. What reason is there for thinking that the Inspector would be able to keep better—I will say order—in the laboratories than these gentlemen themselves?—It is the law that they should be inspected, and therefore I think that it should be carried out; that is all.

19587. Besides the experiments in laboratories, are you aware what other points the Inspectors direct their attention to?—No; I am not.

19588. You do not know that it is part of the duties of the Inspectors, which they always do, to examine into the condition of the laboratories?—I understood that they were licensed after being examined.

19589. The manner in which the animals are kept, both before and after experimentation?—Yes.

19590. You were aware of that?—Yes; I knew it.

19591. Although visits to laboratories are not very frequent now, do you consider that they are sufficiently frequent to enable the Inspector to form an idea whether every proper care is taken of the animals or not?—I should think not. I do not think that there are enough inspectors to be able to do that.

19592. How frequently do you think visits to a laboratory should be made by an inspector to see that the animals are properly taken care of?—I should think almost weekly—every day almost.

19593. Daily and weekly?—Yes; something of that sort. I do not see how a man can say that a thing is properly done unless he goes frequently to see that it is so.

19594. You do not have your dairies daily or weekly inspected?—No; but I inspected my own stable every day. I did not trust them, however good the men might be.

19595. Therefore it would be almost necessary to have an inspector for each laboratory?—I do not think so. I should think they would have districts, could they not? A man could pay a surprise visit on Monday to one, and on Wednesday to another, and so on. We do not think there are sufficient inspectors. If there are to be inspectors there should be a certain number of them.

19596. I wished to gather from you some idea of what number you thought would be necessary?—A sufficient number to look after these laboratories and other places and keep them up to the mark.

19597. If a laboratory has to be visited daily a man could only visit one or two if they happened to be near to one another on the same day?—More than that I should have thought.

19598. How many do you think?—I should imagine that if they are close to one another it would not be a difficult thing for a man to visit many in a day to see that the laboratory is properly conducted, and that the animals are being well looked after.

19599. And to be present at every operation?—Yes, he would have to make those arrangements to fill up his time. I mean to say he would have to arrange his time.

19600. Therefore, taking such a small place as London no operations could be done on several days in the week in some of the laboratories because he would be visiting others?—But "a small place like London" the laboratories, I should assume, and not the size of the place.

19601. I mean small as regards its area for travelling?—Yes.

19602. (*Sir Williiam Collins.*) Your society gave evidence before the last Royal Commission in 1876, did it not?—Yes.

19603. Through Mr. Colam?—Yes, the secretary.

19604. And they put in a letter addressed by command of her late Majesty the Queen to the president of the society?—Yes, to Lord Harrowby.

19605. And there was a good deal of documentary evidence put in by Mr. Colam purporting to show the existence of painful experiments?—I believe so. I was not there then.

19606. In the report of the Royal Commission of 1876 there is an allusion to your society. They state "We were reminded by the secretary that the Royal Society for the Prevention of Cruelty to Animals is not the society established for the total abolition of experiments. The Royal Society for the Prevention of Cruelty to Animals has prepared its Bill upon the supposition that experiments of a nature to cause pain are justifiable if they are performed when the animal has first been rendered wholly insensible to pain and is destroyed before the effect of the anæsthetic ceases." Is that still the position of your society?—Yes.

19607. Then another allusion is made to your society in the report of the previous Commission. They say, "The secretary of the Society for the Prevention of Cruelty to Animals when asked whether the general tendency of the scientific world in this country is at variance with humanity, says he believes it to be very different indeed from that of foreign physiologists; and while giving it as the opinion of the society that experiments are performed which are in their nature beyond any legitimate province of science, and that the pain which they inflict is pain which it is not justifiable to inflict even for the scientific object in view, he readily acknowledges that he does not know a single case of wanton cruelty, and that in general the English physiologists have used anæsthetics where they think they can do so with safety to the experiment." Is the experience of your society still in that direction?—Personally, I say so certainly.

19608. You have told us of one prosecution instituted by your society successfully?—Yes.

19609. Is that the only prosecution that they have instituted?—That is the only one we have ever had.

19610. Has your society any reason to think that there is considerable suffering to animals under the operation of the existing Act?—It has been suggested to us that there is.

19611. The Commission was told by Dr. Starling in answer to Question 3451: "Though I have been engaged in the experimental pursuit of physiology for the last 17 years, on no occasion have I ever seen pain inflicted in any experiment on a dog or cat, or, I might add, a rabbit, in a physiological laboratory in this country, and my testimony would be borne out by that any one engaged in experimental work in this country." Have you any remark to make with regard to that?—I should think that is very strong evidence in favour of what you have read of Mr. Colam's evidence; it is corroborated very much.

19612. We were told by Dr. Thane, the Inspector under the Act, in answer to Question 457: "On the other hand it is certain that in some cases of this group, that is, experiments performed under Certificate A, the infection or injection is followed by great pain and suffering. I may mention the injection of tetanus toxin and the infection with plague; also the insertion of certain drugs." Have you any remark to make in regard to that?—No, that is the experience of a surgeon, is it?

19613. It is the Inspector?—I beg your pardon.

19614. What I want to gather is what would be the wish of your society in regard to such cases in which after injection or infection there is great pain and suffering.

(*Sir Frederick Banbury.*) We think the animal ought to be destroyed.

19615. Then a question has been put as to the difficulty of determining in which cases of injection or means so many inspectors according to the number of infection considerable suffering may result. Do I correctly understand your suggestion to be that in all

cases in which such result may happen the animal should be kept constantly under the eye of the Inspector?—If there is any risk of serious suffering, yes, I think so.

19616. That would almost necessitate the residence of an Inspector on licensed premises, would it not?—No, I do not think so, because the Inspector would know that a certain operation was going to take place and the operator would know when the result would begin to show itself. When the result began to show itself then I think the Inspector should see, if there is pain, that the animal should be destroyed.

19617. But I am afraid that in the case of some of these injections or infections the date at which the operation of the particular injection begins to take effect may be doubtful even in the mind of the experimenter. What I am anxious to know is what suggestion the society would make with a view to secure as far as possible that no case of suffering should result in animals subjected to injection or infection?—I do not think that the society could take upon itself to suggest a law which should never make mistakes. It is one of those things that we should have to accept as inevitable. I think the opinion of the society is that if vivisection takes place pain must sometimes result. The wish of the society is to limit that pain as far as possible.

19618. I think I gathered that you stated that the society would wish the number of licensed places to be as few as possible?—I will not say as few as possible.

19619. Or reduced?—Yes, and grouped together more.

19620. Was that with a view to secure more frequent inspection?—Yes, certainly.

19621. Do you think that valuable results have attended the operations of the Inspectors in the past as regards preventing or detecting breaches of the Act?—I do not think that any result has happened at all. We cannot give an opinion upon that because so far as we know many of the Inspectors do not really ask what has taken place; they take the opinion of the operator. It may be all right, but it may not be. You have already instanced an Inspector who says that pain has taken place. Previously to that you instanced one eminent man of science (I believe not a member of the medical profession) who says that no pain ever does take place. I cannot say which is right. I have my own opinion.

19622. We have had evidence from witnesses in both directions, some setting great store upon inspection as being valuable, and others regarding the present inspections as superfluous. I was rather anxious to hear from either of you gentlemen what view you take of the present inspection so far as it goes. Is it superfluous or is it valuable?—I think it is better than nothing.

19623. Then I should like to know, if possible, what opinion the society has in regard to a question that has also been raised here by witnesses as to the effect of repealing the Act of 1876. Do you think that animals would be in a better position *qua* scientific experiment if the Act were repealed and they were left to the operation of the ordinary law, than if the present Act were maintained or modified or amended?—That is a legal question. I do not think I could answer it as to what power a society like our own would have under the ordinary Prevention of Cruelty to Animals Act. (*Mr. Scott.*) I am sorry to say that I cannot answer it.

19624. (To *Sir Frederick Banbury.*) I understand that you introduced a Bill into the House which had the approval of the society?—Yes.

19625. In what direction did that Bill go?—Unfortunately I live in the country, and have not got the Bill with me, but it more or less was Mr. Stephen Coleridge's Bill altered in a way that I thought would be more acceptable to the House of Commons. My recollection goes that it left out the clause with regard to the certificate for humanity, because I do not see how that is practicable; or the object of the Bill was to prevent experiments being made for the purposes of illustrating a lecture or to demonstrate facts which were already well known; experiments could only be made in the presence of the Inspector and in order to ascertain something which had not already been ascertained. That was, roughly speaking, the object of the Bill.

19626. Did it prohibit experiment on animals which would be painful?—No. All that it did was to say that they must be under anæsthetics and the animals must be destroyed, but it did not prohibit experiment, provided that the animal was under anæsthetics and was destroyed before it recovered, and provided that it was shown that it was in the interest of humanity to discover something which had not previously been known.

19627. Would it have prohibited an injection experiment which might have resulted in painful disease?—I do not think it would; but the result would have been that when a painful result ensued, the animal would have been destroyed.

19628. (*Sir John McFadyean.*) (To *Mr. Scott.*) You have already explained that this statement of evidence has been drawn up by, or has been before, your council?—It was drawn up by the council.

19629. Does it contain anything that you are not prepared to subscribe to yourself?—I am only here as representing the council, you know.

19630. Does it contain anything that you are not prepared to subscribe to yourself?—I do not think that it does. (*Sir Frederick Banbury.*) I think I subscribe to everything.

19631. (To *Mr. Scott.*) I thought, very likely, you did subscribe to it. Your society was founded for the Prevention of Cruelty to Animals. Would you mind telling us what is the society's definition of cruelty?—"Cruelly ill-treating, abusing or torturing animals."

19632. Take cruelty by itself without the torturing. What do you understand by cruelty?—I see a good many forms of it. I think cruelty would be to over-bit a horse, if you want an extreme case.

19633. I can get what I want better in this way. The term "cruelty" is not used as if it were synonymous with the expression "pain," is it—for preventing pain to animals?—It would be certainly for preventing pain.

19634. Do you think you would quite express the views of your society if you were to substitute "pain" for "cruelty?"—I think so. I think to starve an animal would be painful. There are so many forms of cruelty that I do not wish to commit myself to the fact that it must necessarily cause pain. We call ourselves the Society for the Prevention of Cruelty to Animals, and I have no wish to alter the word at all.

19635. But the point is really this: Do you think that your society recognise that it is ever justifiable to cause pain to an animal for some other purpose than that individual animal's own benefit?—In all painful experiments we consider that the animal ought to be protected by being under anæsthetics.

19636. That is to say, it should be prevented from suffering any pain?—Yes.

19637. That seems to be an affirmative answer to my question?—Yes, pain should be prevented.

19638. Then your society denies the right of man to cause pain to an animal except for that individual animal's own good?—Oh, no! I do not say that, under an anæsthetic, we say.

19639. But that would not cause pain?—It might.

19640. You mean that it must be an efficient administration of anæsthetics?—Yes.

19641. In which case there would be no pain?—No. (*Sir Frederick Banbury.*) It depends upon the amount of the pain.

19642. If you do not mind, I will deal with your Chairman in the first instance. (To *Mr. Scott.*) Do you think it would perhaps better express the objects of your society if, instead of substituting the word pain for cruelty, that is to say, "for the prevention of pain to animals," you were to put in "for the prevention of unnecessary pain." Is that what you mean by cruelty—unnecessary pain?—That would answer the purpose very well. It is unnecessary pain that we desire to prevent. A man spurs a horse unnecessarily very often to get it over a bit of timber, and so on.

19643. In its operations does your society find it necessary to discriminate between necessary and unnecessary pain?—No, but we do discriminate between a man ignorant very often of what he is doing, and a man who is not ignorant, but does it of set purpose and knows what he is doing. You may have an ignorant man inflicting pain from ignorance.

Mr. A. G. Scott and Sir F. Banbury, Bart., M.P.

11 Dec. 1907.

19644. But all pain inflicted by an individual who was conscious that what he did would cause pain you would regard as cruelty?—Yes.

19645. But I thought you had already told us that your society would not proceed against a man who rode a horse to death on the chance of saving a human life?—It would depend altogether upon the case. We should consider that matter. If the circumstances were such it would be a matter of very grave consideration whether we should prosecute in such a case. There might be a difference of opinion.

19646. But if the case came before your council, you think it would really cause them some difficulty to decide whether a man who had ridden furiously to save a human life, and had saved it, but had caused the horse's death, ought to be prosecuted?—It is a question whether the same object might not have been attained without causing the pain.

19647. I will ask you to assume, please, that there was no evidence to show that the human life could have been saved in any other way?—That means to say that the horse could not be galloped fast enough without spurs, do you mean?

19648. No, I mean that if this particular horse had not been ridden to death the human life would have been lost?—I say that if we knew that the man knew that he was going to kill that horse we should prosecute him.

19649. Supposing that there were a possibility that he might, by riding the horse furiously, save a human life without causing the horse's death, you will admit that he would cause the horse very great distress and pain?—Yes.

19650. Would your society prosecute then?—If it was unnecessary pain—for instance, if the man rode the horse with spurs and could get the same pace out of the horse without spurs.

19651. It is not a question of spurs at all; it is a question of causing pain?—But if the man could have attained the object without killing or ill-treating the horse we should then prosecute him, because the same object could have been attained without cruelty.

19652. But I ask you to assume that the object could not have been attained in any other way?—Then I should put it before the council.

19653. You think possibly that the council might consider his action justifiable?—Possibly.

19654. On the principle that the life of a man is more valuable than the life of a horse?—Yes, I agree "of more value than many sparrows." I believe that certainly.

19655. Can you tell me how you discriminate between a man's action in that case and the action of a person engaged in research who causes a certain amount of pain to an animal in the confident belief that he can thereby gain knowledge that will afterwards be useful for the saving of human life and alleviating human suffering, and, also, perhaps, alleviating suffering among animals too. The case is this: you justify the sacrificing of the horse's life to save a human being in the particular circumstances that I put to you?—I did not quite agree to that.

19656. Then I will put the question again. I asked how do you discriminate between that and another case in which an experimenter would sacrifice a horse's life to extend knowledge which might be useful, and which he believed would be serviceable for saving human life. I asked you to discriminate between the two, and you said that possibly your council would not proceed against the individual who rode a horse to death to save a human life, but I understand from you that they would object to any pain being caused to a horse to obtain knowledge that would be useful for saving human life?—That is so.

19657. What is the principle that enables you to discriminate between the two cases?—One is certainly a chance and the other is a fact. We say: "The society if of the opinion that all severely painful experiments should be carried out while the animal in question is completely under the influence of an anæsthetic"; and if in the case in point the animal is under an anæsthetic we say that we should agree to it, but that it should be destroyed before the effect of the anæsthetic has been removed.

19657A. That is no answer to my question at all. The hypothetical case that I put to you was one in which the animal would be caused a certain amount of pain in an experiment?—We object to that.

19658. When you advise us that there ought to be inspection in all cases in which the experiment is of a severely painful character, does that cover also those cases in which the licensee has to have the animal thoroughly under the influence of an anæsthetic all the time. Do you call that a severely painful experiment?—I should imagine it would be.

19659. Although the animal is under an anæsthetic all the time?—Yes. That is the protection which we think the animal ought to have.

19660. But you only mean that it would be severely painful if the animal were not anæsthetised?—Yes, that is what I understood you to mean.

19661. What is the purpose of having an inspector present; is it to judge as to whether the anæsthesia is efficient or not?—I assume that that is one of the reasons.

19662. What other reason would there be for his presence?—Because by law he has to be there to see that the thing is properly carried out.

19663. You think that under the existing law the Inspector must be present?—Yes, that I believe to be the law.

19664. Have you read the Act?—No.

19665. Do you think you could find any passage in it which lays that down?—We look upon it in this light. I have already said that we think the Inspector refers to the returns and not to the experiments—that the Inspector guarantees the returns, but that he has never seen the experiments.

19666. I do not think we have ever had it suggested that the Act lays it down that the Inspector is to be present at every experiment or even at every painful experiment?—We consider that all painful experiments should be prohibited except in the presence of an inspector.

19667. Does that mean that you think that that is the state of the existing law, or that the law should be amended in that way?—If it is not so we think it ought to be so.

19668. I ask you your view?—You see how we refer to that: "It may not be possible that every experiment should be performed in the presence of an inspector, but all those should be which cause pain, either in their initial stages or afterwards." That is the question you asked me, I think?

19669. No. I asked you to give us the reasons why you thought it necessary to have an inspector present. Is there any reason beyond his being there to judge of the efficiency of the anæsthesia?—That is what we mean.

19670. Was there any other reason?—Yes, to see that the experiment was properly carried out, and that it was under the particular certificate that is granted.

19671. You have expressed already a high admiration for medical men in general?—Yes, I have, and have reason to believe so.

19672. In spite of Sir William Church's partial disclaimer I am afraid that we must admit that the great majority of those who experiment are members of the medical profession?—I thought so.

19673. Have you any reason to think that at the present time any one of the licensed experimenters would willingly violate the law. For instance, do you think that there is any licensed experimenter who would deliberately or even carelessly neglect to administer an anæsthetic in sufficient quantity in those cases in which the certificate prescribes the use of anæsthetics?—I do not know—it is quite possible.

19674. I did not ask you whether it is possible; I asked you whether you think it is at all likely?—I repeat what I have already said. I believe the medical profession to be very highly honourable men and men who from a high sense of honour would do the best they could to carry out what they undertook to do. But we know that in all professions there are men who are not what we wish them to be. We cannot help that.

19675. Have you read the Act?—No, I have not.

19676. Are you aware that the application for a licence has to be accompanied by a recommendation?—Yes, I know that. I have it here.

19677. Does not that appear to you to be a sufficient guarantee that the individual will be at least an average member of the profession?—Yes, certainly, I put him a bit above that.

19678. Then unless you have some very strong misgiving as to whether the Act is violated or not in such a way as to cause cruelty to animals, does it appear worth while to go to the great expense that will be involved in having every experiment witnessed?—We classify them here by saying that all "severely painful experiments should only be performed in a particular place or places so as to facilitate inspection; and all painful experiments should be prohibited except in the presence of an inspector." That is our view.

19679. I suggest, though you may not have calculated it out, that that would be very expensive?—Yes.

19680. And I further suggest that unless you have a very strong misgiving as to the way in which experimentation is carried on at the present time it does not appear to be worth while to incur that expense?—That has always been our line, I think, ever since the Act passed. I think we have always taken that view that there were not enough inspectors.

19681. (*Sir Mackenzie Chalmers.*) You told us that your society had had one prosecution?—Yes.

19682. That was about 1877?—I think it was in 1876, soon after the Act came in.

19683. And it was perfectly effective?—Yes.

19684. It stopped once and for all any attempt at a public demonstration?—I think it did; we have never had another case.

19685. That was a successful piece of work?—Yes.

19686. I take it that the object of your society generally is to prevent cruelty and not pain—cruelty to animals, that is to say, pain which is not justifiably caused?—Yes.

19687. You do not disapprove of sport, do you?—Personally, I do not.

19688. I mean that necessarily there is a great amount of pain caused to animals in sport which might be saved; there are a great number of wounded animals?—Yes, I am afraid it must be so always.

19689. But that is not cruelty; the pain is not caused intentionally?—No.

19690. The intention is to kill; therefore it is outside the scope of your society?—Yes. If a man overrode a horse out hunting that would be cruelty; or sometimes we have had cases of cruelty brought to our notice with carted deer.

19691. But it would not be cruelty if a man overrode a fox?—I wish we could take the fellow up for it, but you cannot.

19692. (*Chairman.*) You have prosecuted for overspurring in a race?—Yes, we have.

19693. (*Sir Mackenzie Chalmers.*) And for overflogging in a race?—Yes, for over-flogging too.

19694. I suppose you have never considered whether the amount of pain that is caused in the whole of the laboratories in this Kingdom would be equal to the pain caused on one day's rabbit shooting?—No, I have never considered it in that light.

19695. Your society again would not, I imagine, touch commercial operations, would it? For instance, every horse, as we known in London, is gelded?—That we have never taken up, of course.

19696. That is for commercial purposes?—Yes, it has never been taken up. (*Sir Frederick Banbury.*) We have taken up docking and we should take up gelding if it was done by an unskilful person and done without the necessary precautions.

19697. (To *Mr. Scott.*) As a matter of fact it is very seldom done under anæsthetics, is it. Perhaps you have not gone into it?—I have never had one done.

19698. It would be outside the scope of the society?—Yes. Of course it is mutilation in a sense, but it is considered a necessity.

19699. Under the Vivisection Act no such operation would be allowed to be done without anæsthetics and under the aseptic condition?—I believe as a rule it is done very young with a horse, and in later life when it has been done I believe it is done under chloroform.

19700. We have had some evidence on the subject, but I need not trouble you with it if you have not considered it?—I once had a stallion I used as a hack, but it is very rarely this is done.

19701. I want to get at your ideas about inspection. I quite understand that the public would feel more confidence if there was more inspection?—That is our view.

19702. But I want rather to try and see what would satisfy the bulk of your society, because there are some difficulties to be considered. Last year 20,795 inoculations were made on mice for the Cancer Research Fund, and I want you to take that as an example. The object of the inoculation is to produce cancer for the purpose of watching it and seeing whether any alleviation can be obtained for a most horrible human malady. Do you suggest that the Inspector should be constantly watching those mice as the tumour may develop?—There are difficulties of detail like that, I confess. I see what your point is, of course.

19703. 20,000 experiments are half the experiments performed in the whole year. I will give you the exact figure: 20,795 inoculations on mice out of 21,082 inoculations made for the Cancer Research Fund and 1,200 on other small animals. You have considered that?—I have not considered that the Inspector should watch every one of those. I do not think it would be reasonable.

19704. Within the principle that you have laid down the initial operation would be painless as being inoculation, but afterwards more or less painful symptoms would develop in those mice. Cancer is sometimes painless and sometimes not?—Yes.

19705. Then there is another point which shows the difficulty. 2,144 experiments were to produce tubercle, and tubercle produced in an animal may or may not give rise to a considerable amount of pain. Would there not be a difficulty there if you laid down your principle?—There would, of course, be considerable difficulty. I quite admit all that.

19706. We all agree, I think, that some extra inspection would give extra confidence?—That is really what we want to secure—the confidence of the public.

19707. But you agree that there are difficulties if you state a proposition in an Act of Parliament which would be unworkable?—Yes, I quite see all these difficulties, and I am very glad that you have pointed them out.

19708. Then 6,000 experiments were performed for Government Departments, County Councils, Municipal Corporations, and other public authorities. Those would be chiefly in testing food. There again there would be somewhat the same difficulty?—No doubt.

19709. Now I should like to ask you about what most people call vivisection—namely, cutting experiments. As I understand your evidence, you have no objection to experiments done under a licence alone. You know the difference between a licence and a certificate?—I think so.

19710. May I put it to you, and then we shall see how far we agree. Under a licence alone, which is granted by the Secretary of State, an animal that is experimented on must be put under an anæsthetic, and any operation may be done upon it, but the animal must never recover from the anæsthetic. The animal must be put under an anæsthetic, and there is no limit to the time, provided that the animal never recovers from the anæsthesia until death puts an end to it. Have you any suggestion to make as to that?—That is just what we say.

19711. That is, under a licence alone?—Yes.

19712. Then you know if any departure is to be made from that a special certificate, signed by two eminent authorities, has to be obtained?—Yes.

19713. Under Certificate B, if any cutting experiment is to be performed more than the prick of a hypodermic needle, the animal has to be under anæsthetics the whole time, but then the animal is allowed to recover, and may be kept alive until the object of the experiment is obtained. Have you any objection to that?—That is where we do object. We say that the animal should be destroyed before the effect of the anæsthetic has been removed.

19714. Then that would render impossible any physiological experiment, would it not? Have you any comment to make upon what the Inspector says in his last report, where he is referring to Certificate

Mr. A. G. Scott and Sir F. Banbury, Bart, M.P.

11 Dec. 1907.

B: "The operations are required to be performed antiseptically, so that the healing of the wounds shall, as far as possible, take place without pain. If the antiseptic precautions fail, and suppuration occurs, the animal is required to be killed." Does that go far enough to meet you?—(*Sir Frederick Banbury.*) If that is correct it would more or less meet our views.

19715. That is the report for last year?—But everybody makes mistakes, even doctors and inspectors sometimes. Our only desire as a society is that if pain ensues the animal should be destroyed, and we do not for a moment say that it is possible to make a state of affairs under which pain can always be stopped. Accidents will occur we all know; but, so far as possible, pain should be stopped.

19716. I wanted rather to separate cutting operations under Certificate B from mere inoculations under Certificate A, and to ascertain the opinion of the society on these two points?—Certificate A is what we desire, so far as we can have it, but Certificate B we object to unless it is absolutely modified in the direction laid down by us. If what you have read is correct, and there is no pain, then we do not object to it.

19717. I am afraid we are not quite understanding each other. So far as I know, great pain may be caused under Certificate A?—But the animal is under anæsthetics, and is destroyed.

19718. No; the quotation from Professor Thane, that Sir William Collins read, referred to Certificate A, and Certificate A deals with inoculation of disease. For instance, very recently what appeared to be very necessary experiments were carried out with plague—that is to say, animals were inoculated with plague for the purpose of testing the mode of transmission of plague. Do you object to that?—If the animal is allowed, after the inoculation has taken place, to remain alive and suffer pain, if that is the question.

19719. It may be necessary for the disease to develop to a certain extent, or death would come on very quickly. I am asking whether you would object to that?—I think we should object to the animal being kept alive when the operator knew that it was suffering pain.

19720. Even though thousands of animals are dying all round from the same disease?—Yes, I think so.

19721. To take another instance. Supposing that some work is undertaken with reference to finding a cure for distemper, which is a very distressing disease to animals, it may be necessary to inoculate an animal with distemper and to try various modes of treatment in order to find out a successful mode of treatment. Must not that animal necessarily be kept alive until the treatment can be applied, and the treatment may fail?—(*Mr. Scott.*) Yes; in the same way that we keep a dog alive, supposing that it is mad, and watch the results. (*Sir Frederick Banbury.*) I have a considerable knowledge of distemper in dogs, and I should myself have said that distemper is not painful. The animal gets very weak, and I have had, unfortunately, dogs die of distemper, but I do not think there is actually any pain. They have been weak and they will not eat their food, and they fall away. I think those are the chief symptoms.

19722. But when you come to legislate in the sense that you propose you admit that there is a good deal of difficulty?—There is no Act of Parliament that has ever been passed—I think your Chairman will bear me out—through which you cannot drive a coach and four. A perfect Act of Parliament will never be passed.

19723. I was rather putting it the other way—that you would pass an Act which would hit all the cases that you did not mean to hit?—There are means of getting round that, I think.

19724. (*To Mr. Scott.*) I was not quite sure from your evidence whether you wanted this present Act of 1876 amended, or whether you wanted further inspection to enforce it. Do you think the Act requires any amendment?—I think personally what we say in our statement: "The Society has, ever since the passing of the Cruelty to Animals Act, 1876, repeatedly pointed out that the supervision of experiments carried on under licences granted under that Act is totally inadequate"—that is our position. We want more inspectors.

19725. Are you aware that the Inspectors continually see animals under experiment, though not the initial experiment?—I can quite believe it.

19726. Have you ever yourself been over any of these laboratories?—No, I have not. I have studied the matter a little in a very small way. I was once a student at the college at Cirencester, and I read privately with a veterinary surgeon, so that I have some little knowledge, but I should not have presumed to mention it except that I thought you asked me whether I had ever had anything to do with it.

19727. Have you ever asked to see over any of these laboratories?—No, I have never done so.

19728. Do not you think it would be a good thing to do so?—We would go with pleasure if some of you gentlemen would do us the honour to ask us.

19729. We have had several witnesses here from laboratories who have said that if any person with a sense of real responsibility and not from mere curiosity desired it they would be perfectly willing to show them round?—We should think is a great privilege to be allowed to go.

19730. But, as a matter of fact, up to date, you have not yourselves asked to see any of these experiments?—No, neither of us.

19731. And you have no specific cases about which your society knows anything, or enough to bring to the attention of the Commission?—I do not think so.

19732. I do not want to go into the case of the brown dog, but I want to put this question to you. Supposing that an animal was experimented upon, and then was allowed to recover for the purpose of some observation—I am putting a hypothetical case—you know that under the law, as it stands, at the end of the observation that animal must be destroyed painlessly?—Yes.

19733. Since that animal has to be destroyed, do you see any objection, after the anæsthetic has been administered to that animal, to its being again the subject of experiment for demonstration purposes. It has to be destroyed in the case I am putting?—(*Sir Frederick Banbury.*) While it is still under the anæsthetic?

19734. Certainly?—That is a very difficult question to answer, because my view (I do not know whether Mr. Scott agrees with me) is that if one were certain that it is possible to keep an animal under an anæsthetic, and provided that the experiment is carried out at once, our point is met. (*Mr. Scott.*) I should say so. (*Sir Frederick Banbury.*) But then the question arises whether it is possible.

19735. That is outside my question. I am assuming that the animal can be kept under an anæsthetic, and does not recover. Do you see any objection?—I do not think so. Our objection is entirely to pain. (*Mr. Scott.*) And it should be destroyed before the effect of the anæsthetic has been removed.

19736. Even though an incidental effect is that it has two operations; that is to say, that it saves two animals being operated upon, instead of one?—(*Sir Frederick Banbury.*) As long as pain does not ensue is all I can say.

19737. (*Dr. Wilson.*) The question, I understand, is this. The animal is operated on for a certain physiological experiment, and is allowed to recover, say, after taking out a portion of the kidney or the pancreas; then after a time, when the results of the experiment have been sufficiently studied, that animal has to be destroyed; it can be destroyed, of course, painlessly, by administering chloroform. Do you think that that animal should be handed over for another experiment?—No, decidedly not. I did not understand the question. I thought that the case put to me was that of an animal which is brought into the room and put under anæsthetics, an operation takes place, and then another operation takes place immediately. To that I should not object, because I presume that pain does not ensue; but I do object to an animal being operated upon and being allowed to recover, and then being brought forward again and operated upon. I think we both agree as to that. (*Mr. Scott.*) Yes.

19738. (*Sir Mackenzie Chalmers.*) I am not quite sure now whether we have got the point. The animal has been operated upon, and is allowed to recover. That animal has to be killed, and has to be killed painlessly. Do you object to that animal being put under

chloroform before death occurs, and another operation being performed upon it?—Yes, certainly.

19739. You would rather that a fresh animal was sacrificed?—Certainly.

19740. On what ground, if the animal suffers no pain?—On this ground. My contention is that the animal ought to have been killed after the first operation, and that if that sort of thing were allowed as it is difficult always to get animals, the tendency would be to keep one wretched animal for many months in that sort of state, and your argument would always hold good, because you have broken the first contention—that after an operation the animal should be killed, and you might multiply it indefinitely.

19741. Then your objection is not to an animal being experimented upon when it has to be killed, but to the animal being kept alive after the first operation?—I object to the animal being operated upon if pain ensues, except under anæsthetics. But I object to the animal being experimented on and kept alive, and then experimented on again and kept alive again, and experimented on again, and so on.

19742. That is not the question I put to you?—But it might result.

19743. (*Mr. Ram.*) I want to ask you a few questions, if I may, because I am very anxious to get the views of your society, which we value greatly on certain points. First of all, with regard to your definition of cruelty under your Act, I want to clear up that point, if I can. I take it that by cruelty you mean—you will tell me whether I am right—the infliction of unnecessary pain?—Yes.

19744. Not necessarily the infliction of any pain?—No, the infliction of unnecessary pain. (*Sir Frederick Banbury.*) I do not admit that.

19745. Then I must address myself to you gentlemen individually, and I will take Mr. Scott first, if I may. (*To Mr. Scott.*) I put the question, do you by cruelty mean the infliction of any pain in any circumstances on any animal, or do you limit it to unnecessary pain?—The wording is "Cruelly ill-treating, abusing, or torturing animals."

19746. I want to get at a definition of cruelty, if I can. Let me put an instance to you. A cab horse is drawing a cab, it may be a lazy horse, or it may not, at any rate, that horse is every now and again struck by the cabman with a whip, not excessively, but probably every time it is struck the horse feels some pain, and without that pain it would not go at all. Then there is a second case, in which the horse is made to draw an excessive load, or is whipped with barbarity and cruelty to make it do that which it is very painful for it to do. Do you view those two cases as coming exactly under the same definition of cruelty, or do you draw any distinction between them?—I draw a distinction between them.

19747. The first case would not, in your opinion, be a case of cruelty?—No.

19748. The first case is simply whipping the horse, perhaps a lazy horse, enough to make it do a task which is within its power?—Yes.

19749. You would not call that cruelty?—No.

19750. That is, however, the infliction of pain upon the animal?—But it is necessary pain, like when one used to get the cane at school.

19751. Yes, we had necessary and very beneficial pain?—Exactly.

19752. Then I take it that you at any rate will agree with the definition that I suggested of cruelty, namely, the infliction of unnecessary pain?—I think so.

19753. (*To Sir Frederick Banbury.*) Might I ask why you do not agree with that definition?—Because it depends upon the extent of the cruelty.

19754. Shall we say rather the extent of pain?—Yes. I beg your pardon. I should not admit that a cabman had a right if he has a lazy horse to thrash it severely in order to make it go. If you ride a horse at a fence sometimes you may get a horse that will not jump, and I think you are justified in inflicting a certain amount of pain by using spurs, but I do not think that you have a right to have five or six fellows with hunting crops, slashing and hitting at the horse, although the result that you may desire may ensue. I maintain that you must do it by gentle means.

19755. Perhaps I may get you to take my view if I suggest the addition of one word to my definition of cruelty and say that it means the infliction of unnecessary and excessive pain?—I should say excessive pain and leave out the "unnecessary."

Mr. A. G. Scott and Sir F. Banbury, Bart., M.P.

11 Dec. 1907.

19756. (*To Mr. Scott.*) Has this Act of 1876, which we are dealing with now, ever been pronounced upon as an Act by your society?—We have it in that book of ours as one of the Prevention of Cruelty to Animals Acts. (*Sir Frederick Banbury.*) You mean, have we ever given an opinion upon it?

19757. Yes?—I do not think that we have.

19578. (*To Mr. Scott.*) I understand, I think, that neither of you gentlemen has read the Act?—Only portions of it. I was reading our book only this morning. (*Sir Frederick Banbury.*) I have read the Act, but it is some little time since I read it, and I could not stand a cross-examination upon it if you have the Act there.

19759. I am not going to attempt to administer one. (*To Mr. Scott.*) I think I gathered from your answer to Sir Mackenzie Chalmers that you would not abolish the present Act?—I do not think so.

19760. Your society would not wish to abolish it?—I do not think that they have ever considered it. I do not think they have any reason for wishing it.

19761. You have suggested that the Act should be amended by increasing the number and perhaps making some new regulation with regard to the Inspectors?—Yes.

19762. Can you help the Commission at all by making any other suggestion as to the way in which, in the opinion of your society, the Act might be amended, or may I take it that that is the only one matter in which you think it requires amendment?—That is the only one that occurs to me, at all events.

19763. (*To Sir Frederick Banbury.*) I think you began your evidence by saying that throughout the claim of your society has been that animals should be given by man the same protection as regards the infliction of pain as man asks for himself?—Yes, I said so.

19764. That is to say with regard to anæsthetics and with regard to aseptic treatment in case of recovery from wounds?—Yes.

19765. Do you know that that is the protection which is now given to animals under the Act?—Yes, the Act provides that.

19766. With regard to anæsthetics, the animals have the pull over mankind in this respect, have they not, that whatever the subsequent pain of an operation may be to a man he can only be given such an amount of anæsthesia as implies his subsequent recovery, though it may be accompanied by much suffering?—I suppose so.

19767. In all cases of operations upon men it is intended that they should recover, however much they may suffer subsequently?—Yes.

19768. With regard to experiments on animals in a vast number of cases, at any rate where the experiment is a painful one, the animals are under an anæsthetic from which they never recover. To the extent to which that takes place your society, I gather, has no objection to such experiments?—No.

19769. Again, with regard to the advantage that an animal would have, if an animal is operated on under anæsthetics and is allowed to recover and is treated aseptically or antiseptically, should it be found that the treatment is insufficient or that it does not effect its object—in other words, if the animal suffers, that animal can be, and in the vast majority of cases would be, destroyed at once?—Yes.

19770. That is not so with regard to man. Man, of course, when he recovers from the effects of the anæsthetic must suffer pain, whatever pain it is necessary he should suffer in the course of recovery?—Yes.

19771. Now, with regard to inspection, I am anxious to have your views. So far as the animal is operated upon and never allowed to recover you have already told me that your society would not object, and the presence of the Inspector has no particular effect one way or the other there; it ensures that the animal is under anæsthetics and is destroyed before it recovers?

19772. What I want to put to you as a matter which strikes me as being much more important is this:

Mr. A. G. Scott and Sir F. Banbury, Bart., M.P.

11 Dec. 1907.

Would it meet the views of your society if, in cases where the animals are allowed to recover, there should be an enactment that those animals should be visited by the Inspector, say, shortly after the operation, and again at a short period, in order to see whether those animals that were allowed to come out from a state of anæsthesia were in a state of suffering or not?—I do not think it would. That is a question to which I would rather not give an answer at such short notice, but I do not think it would. I can only repeat our statement, which I think is clear, that when pain ensues then the animal must be destroyed.

19773. I am sure you recognise that I am anxious to have your assistance so that we may get something workable?—Certainly.

19774. Sir Mackenzie Chalmers has pointed out to you, and I think you both accepted it as I should expect, the difficulty of acting stiffly with regard to the Inspector seeing every experiment, viz., that you will either stop everything or you must have an army of inspectors; therefore, I want to see whether you can help us to make it workable. Would it *pro tanto* meet the views of your society if it were enacted that all animals which by reason of coming out of anæsthesia may be liable to suffering, should be inspected by the Inspector at a certain period shortly after recovery and again after a short interval?—(*Mr. Scott.*) It would be a step decidedly. I should not like to commit the society with regard to that; it is a very important question. It seems a very reasonable suggestion indeed, but, speaking for the council, I do not think I could commit them without further consideration.

19775. I think there is only one other matter that I need trouble you with. I am not going into the case of the brown dog, but are you aware that the brown dog was the subject of the action of *Bayliss v. Coleridge*?—Yes.

19776. Have you read the report of that case?—Yes.

19777. And you know what was stated in that case. It was tried before the Lord Chief Justice and a special jury at great length and the jury found for the plaintiff for £2,000?—Yes.

19778. (*To Sir Frederick Banbury.*) In your statement, you say that all severely painful experiments should only be performed in a particular place or places, so as to facilitate inspection. Are you aware that with regard to all experiments for scientific purposes, whether painful or not, under the Act they can only be performed in a particular place or places?—I think our idea there is that there are too many particular places licensed, and that we would rather restrict the number of places licensed or restrict the area, so that inspection may be easy.

19779. (*Dr. Gaskell.*) You mean that you would restrict it simply for the purpose of making inspection easy?—Yes.

19780. Not because you think there are any signs, in consequence of the increased number of places, of violation of the Act?—No, we do not know anything about that. (*Mr. Scott.*) It is not for that reason.

19781. It is to facilitate inspection?—Yes.

19782. But you would not advocate that if you thought that by so doing you were going to hamper research?—(*Sir Frederick Banbury.*) I do not think that our society takes the line that we are to sacrifice everything to the advance of research. It is a very difficult question for us to answer, but, personally, I do not think that we should hamper science. We might perhaps inflict a little more trouble upon the scientific gentlemen, but we should not object to that. (*Mr. Scott.*) No, we should not.

19783. (*Dr. Gaskell.*) (*To Mr. Scott.*) I think you told us that you looked upon it as a noble and proper thing for experiments to be made by means of inoculation for the purpose of curing diseases; you consider that a thing which ought to be done?—Yes.

19784. And therefore the people who do that, you believe, should be recognised as benefactors to humanity?—Yes, I think so.

19785. Would you say the same if it was a question of inoculation, not for the purpose of curing an actual disease, but for advancing knowledge; that if the experiment was for advancing knowledge it would still be a noble and proper thing to do?—Yes, I think so.

19786. Therefore, you would also say that men who performed such inoculation experiments are actuated by high principles of humanity for the purpose of helping on the human race and the animal race?—I think we may go so far as that. I do not wish to impute anything but proper motives.

19787. The experimenters in physiological laboratories, you will agree with me, are actuated by high motives?—I would say, probably. I would not for a moment suggest that they were not. That would be a reflection upon a body of gentlemen which I have no wish to make.

19788. The object of their experimentation would always be to get the best results, would it not?—I think that is the assumption.

19789. Therefore, if the results were better obtained by the animal being kept quiet under an anæsthetic, the tendency would be to take care that the anæsthetic was thoroughly given, for their own sake and for the sake of the experimentation?—Yes.

19790. And also in the other cases you would agree, would you not, that when the animal is kept alive after the operation it would be for the benefit of the experiment that that animal should be well cared for, should be well looked after, and should be kept free from suppuration?—Yes.

19791. So that the object of the experiment necessitates in the minds of these high-minded people the absence of pain as far as possible?—Yes.

19792. Then what I want to understand is in what way you consider the present inspection deficient. I am not concerned with inoculations here—we have already talked about them—but in a physiological laboratory there are two kinds of experiments. The first is an experiment under a licence, in which the animal is anæsthetised and is killed before it recovers from the anæsthetic. If that is properly administered there would be no pain there?—No.

19793. Therefore, if you have evidence, or if you can believe, that the anæsthetic is properly administered, you would not require a large increase of inspectors for that purpose, would you?—No.

19794. The second class of experiments consists in an operation for the removal of an organ, or the removal of a nerve, say, with the purpose of keeping an animal alive in order to see what happens to its economy in consequence of that removal?—Yes.

19795. Those are operations under Certificate B?—Yes.

19796. The first part of such an operation is perfectly painless, because the animal is anæsthetised. The only place where pain may come in afterwards is when the animal has recovered in the laboratory; there it is possible for some pain to occur?—Yes.

19797. Do I correctly understand that it is for that particular part of the work done in physiological experiments that you would require more inspectors?—Yes, we should.

19798. Then, may I ask, do you know what the Inspector at present does; do you know what the present Inspector does?—No; I know what he is supposed to do. I understand that he has to be present at these experiments, but I do not see how it is possible that he can be.

19799. But the experiment in question, which is the one for which you have just allowed that you want more inspectors, is not a cutting operation, but it is followed possibly by pain in the animal which has recovered from the first operation, but is in, so to speak, the ward of the hospital—that is, it is in the laboratory, and is alive?—Yes.

19800. That animal can be inspected, can it not, by any inspector who comes at any time, because the experiment, if you call it so, is going on all the time, is it not?—Yes.

19801. Then I want to know when the present Inspector comes now into a laboratory, does he not see all those animals which have been operated upon under Certificate B, and which are in the laboratory at the time?—I really do not know.

19802. But the present Inspector has told us that he does; it is one of the main duties of the Inspector. Does he not go round and see the animal house, and see how the animals are kept, and see every animal

that has been operated upon?—That is what I think he should do, but I did not think that there were anything like enough men to do it.

19803. But it only requires one man?—Then I have misunderstood some previous question. It would only require one man for that particular place, but if this experimentation is going on in many places you want many men.

19804. No, pardon me; supposing that an experimenter makes an experiment on a cat to-day, and makes an experiment on another cat to-morrow, and makes an experiment on a third cat the next day, and each of those cats is kept alive, if the Inspector comes on the fourth day, he can see all those three cats?—That is perfectly right if he does.

19805. But he does, does he not?—I understood a Commissioner at the further end of the table to say that if you had inspectors to inspect these matters we should have such an army of them that it would be a very great expense.

19806. I want to draw a distinction, if I can, between animals which are being operated upon and animals which are kept in the laboratory after an operation. All those animals which are kept in a laboratory after an operation can be seen, and very often are, by one inspector at one moment, can they not?—Yes, I should say so.

19807. And he comes at unknown times and sees all these animals?—Yes.

19808. Is there any advantage in having another inspector coming on another day to see those same animals?—No. If that man can see those animals, as you say, that is what we want.

19809. That is exactly what is done now, do you not understand?—I understand what you say, but I understood that it was impossible, that there are not enough inspectors for the work that is done. If you say that there are enough inspectors, that shakes me very much, because I read of so many experiments and I cannot understand how the three Inspectors that there are can look after them all.

19810. I will put the question in this way: A surgeon in a hospital has two duties, has he not; one is to operate upon the patients, and the other is to go into the wards and inspect those patients upon whom he has operated?—Yes, he does that every day.

19811. And he does that, as you say, every day. The Inspector comes into a laboratory where he sees the operation that is being performed; that is one duty?—Yes.

19812. He also goes round the wards and sees all the animals which have been operated upon?—Yes, that is right.

19813. Those are two duties?—Yes.

19814. You yourself say that the latter animals are those in which pain is likely to exist?—Yes.

19815. So that those animals in which pain is most likely to exist he sees most thoroughly whenever he comes to the laboratory, do you understand?—Yes.

19816. He is like a surgeon going into the wards; he sees all the animals in the wards and inspects every one of them with the same care that a surgeon would inspect his patients with?—Yes, I quite follow you.

19817. Is not that inspection in that respect efficient inspection?—I should say that it was very good inspection.

19818. I want to understand from you why it is necessary to have an army of inspectors to do that. If a man comes down at any moment into a laboratory just as a surgeon comes to the ward of a hospital at any moment, and inspects all the patients there, do you think he is likely to find any great difference if he comes another day?—If that is done that is what we mean—if you can say that it is done.

19819. That is exactly the point. I thought you were under a misconception?—You said every day, did you not?

19820. No, I said if he comes down and inspects on one day, is there any reason why he should find anything different on another day. If you were to go into the ward of a hospital——?—Which I have often done.

19821. For the purpose of judging how that hospital is getting on, and you went round the surgical wards one day, would you consider it necessary, or that there would be any point in it, to go round those surgical wards again the next day and the day after?—You are putting to me the case of a surgeon going round.

19822. No, I say supposing you as the Inspector went round?—As you say, I should pay these chance visits, but I cannot see how these men can do it when there are such a number of places and so many experiments.

19823. What I mean is this: in each laboratory there are at any one moment of time a number of animals which have been operated upon, and when the Inspector pays his chance visits he investigates the condition of all these animals?—That is what we wish.

19824. But he does?—If you say so I admit it.

19825. The Inspectors have told us so themselves, as you know if you have read their evidence?—Yes, they have told you so.

19826. What I do not see is how you, or anybody else, would get more advantage than that by increasing the number of Inspectors if the Inspector comes a certain number of times by chance and sees all these animals?—If he comes often enough.

19827. Why do you say that?—Because fresh animals come in and go out.

19828. Why should there be any difference in the arrangements of the animals and the nature of the animals from one time to another?—From Monday to Wednesday, do you mean?

19829. No, I mean at any one moment of time there may be six animals which have been operated upon in the laboratory?—I do not quite follow what you mean. Do you mean that a man might come on Monday and again on Wednesday or on Friday or at an interval of a month?

19830. I mean at any time you like, whenever he chooses, casually. Why should you suppose that there should be any difference in the condition of things in the laboratory from any one day to any other day?—Only that there may be fresh patients.

19831. So there are in a hospital?—Yes, and there, of course, the surgeon visits very frequently. That is what I mean, whether the Inspectors make these visits frequently.

19832. Another point is that the animals should be well looked after?—Yes.

19833. Would you not again consider it sufficient if the Inspector on a chance visit does tell us that the animals are well looked after?—Yes, that would be a very great thing.

19834. That would be sufficient?—It would go a long way towards efficiency.

19835. You see, it is to aid the experimenter that the animals should be well looked after, because otherwise, the experiment would fail?—Yes, I quite see that.

19836. It is his interest to look after that?—Yes.

19837. Then there is one other point I want to put to you. At the present time the law says that the animals must be kept in a licensed place, and those licensed places are, as a rule, in towns. Do you not think it would be better that the wards of hospitals for animals after they have been operated upon should be out in the country so that they should have every opportunity of the best air and the best food?—Yes.

19838. Would it not be better, instead of their being obliged to be kept in licensed laboratories in towns, where they are now, that they should be free to go out into the country?—It seems very reasonable, indeed.

19839. At present the law does not allow that, as you know?—I think it would be a very good thing. It is hardly, perhaps, a proper illustration, but I may say that in the case of our dogs' home we started a country branch, but unfortunately we cannot make it answer at all. People do not seem to care to go to the country. In addition to our home at Battersea we took a place at Hackbridge, because it is much better for the dogs, but it has not been a success. As I say, I do not know whether I ought to have mentioned that, but it seems the same kind of thing. And

Mr. A. G. Scott and Sir F. Banbury, Bart., M.P.

11 Dec. 1907.

your suggestion would seem a very reasonable and right thing, in the same way as we have convalescent homes.

19840. (*Dr. Wilson.*) I gathered from what Sir Frederick Banbury stated that objection is taken by your society to experiments on animals being carried out for teaching purposes in the presence of students. Do your society take up that position?—Yes, they do very much.

19841. They object to all experiments for teaching purposes?—There is an objection on the part, I think, of a good many members on that ground.

The Hon. STEPHEN COLERIDGE recalled; and further Examined.

The Hon. S. Coleridge.

19842. (*Chairman.*) I understand that you wish to say something about what has taken place in reference to Professor Gotch's evidence?—Yes, but also the night before last I had placed in my hands Sir Victor Horsley's evidence, and with your kind permission I should certainly like to say a few words on the subjects that he has dealt with, not at all with respect to any things which the Commission may think are answers to anything that I said, but I wish to deal with the accusations of a personal nature made against me as a man and a gentleman, which I think certainly need my reply as they will be published.

19843. In that case before we allow that, I think you must tell us precisely what the points of fact are, because we could not hear anything in the nature of a speech in reply to Sir Victor Horsley?—No, of course not.

19844. But if Sir Victor Horsley has made a statement of fact relating to you personally which is untrue, or which requires explanation, that explanation, confining it to the matter of fact, we might think you entitled to give, but it must be confined to that, because this enquiry is a very long one; you have yourself given evidence for three days, and in the course of that evidence you have felt it your duty to attack a good many people?—I never said a word against Sir Victor Horsley.

19845. I am not speaking of that. I am only saying that we could not have everybody who considered that an attack had been made upon him called back again to give evidence, because something must be left to us—when we have heard both sides—to say whether we think it is of importance, and what importance we attach to the statements on each side; and it is only when there is a clear misstatement of fact which is capable of correction relating to yourself that we ought to allow the matter to be gone into. Otherwise many witnesses would say, "I wish to make a reply on certain branches of the case that Sir Victor Horsley touched upon." We must avoid anything of that kind?—Well, my Lord, I have been accused by him of "deception," "constructive misstatement" (Q. 15728), "gross misrepresentation" (Q. 15905), and "dishonesty" (Q. 16052), while my methods of controversy, it is insinuated, are ungentlemanly (Q. 15729, 16011), and have been subjected to "exposure" (Q. 15978). Those I took out as things which he said against me personally. They involve material of this kind. They involve the question of my *bonâ fides* about the publication of the catalogue of instruments for vivisection, upon which I wish to defend myself of course; they involve a statement that I made a perfectly false statement to you about the meeting at the Mansion House for the purpose of instituting a Pasteur Institute in England, a statement on the subject accompanied with considerable personal imputations.

19846. You do not complain of that, Mr. Coleridge, do you? Many witnesses here, yourself included, have not hesitated, when they thought that a thing deserved strong language, to use it?—Certainly.

19847. Therefore, it is a question of fact, and not of a comment on the fact?—Yes. He is wrong in his facts, and I am prepared to show that he is wrong in his facts. Then also he is wrong on the question of muzzling. I can show you that my Society has never said a word against muzzling; on the contrary, I have always regarded the muzzle as the opposite treatment to Pasteurism, and have supported it. I supported Mr. Long in his muzzling order, so that Sir Victor Horsley is utterly wrong, and I can show it.

19848. He speaks of your Society?—Yes, he says that we actually got up meetings against the muzzle. It is absolutely false, we did nothing of the kind. He has mistaken our society for another. I do not attribute anything more than that.

19849. But we had a witness only the other day who spoke very strongly against muzzling?—Yes, from the Canine Defence League.

19850. Who said that his Society originated the opposition to the muzzle?—Yes, that is so. Sir Victor Horsley has mistaken us for the Canine Defence League.

19851. I am only pointing out there that it would be very much shorter for you to say, "This is quite a mistake. Our Society has always been in favour of muzzling, and it is evidently a mistake for the Canine Defence League?—Yes, that is all I want to say. I have got eight headings, and they will not take very long; they are all quite short and all of that nature.

19852. We will deal first with Professor Gotch's evidence, and as to that we could not hear you to discuss the value of the whole of the evidence; it is only if there is something about yourself personally that we can hear you?—That is all I wish. I do not wish to prolong the thing at all. I am very reluctant to come back again. The first matter is at Question 13668. You, my Lord, said: "Some questions were asked as to what Mr. Coleridge knew, and of course he said he knew nothing about it personally, but that these gentlemen had given him this information, and he had no doubt that they were speaking the truth." I do not think that I ever said I had no doubt that they were speaking the truth.

19853. You did not use those words, but that was no attack upon you. I was not in saying that making anything in the nature of an attack upon you at all?—No, I am only raising it because as a matter of fact I never said it.

19854. But you said something rather like it?—No, my Lord, I did not.

19855. You said something to the effect that they were credible persons?—I sent their statement down to Dr. Gotch, that is what I did with it.

19856. I should have thought that that was not a matter which you need have brought forward?—I had some doubt because I sent it down to Dr. Gotch. If I had had no doubt I should not have done that. I did not accept their statement without further explanation. I read out the letters, and the comment upon them begins at Question 11455.

18957. You say at Question 11444 that you received a letter, and you say, "I should like on this to show you the kind of evidence that is constantly brought before me"?—Yes.

19858. Then you go on to say at Question 11446, "I am only showing the sort of evidence that comes before me. I did the obvious thing that a gentleman ought to do. I wrote at once to the head of the laboratory, told him the information that I had received, and asked for his explanation; and he gives the lie to the six gentlemen at once. All I can say is that in a court of justice the six witnesses would go against the one?"—Yes.

19859. That surely is saying that Professor Gotch's evidence is not to be believed as against that of those six gentlemen?—I do not think that.

19860. Surely it was not a very unfair representation for me to put it shortly as I did?—Surely, it is a question of the weight of evidence.

19861. I think we should hardly have recalled you as to that?—Then at Question 13668 you, my Lord, say: "The language probably which he (that is, Mr. Sharpe) did not when he wrote it intend to be read out to the Commission or anybody else"; you are alluding there to Mr. Sharpe's letter to me, in which he says: "Professor Gotch is a liar." When your Lordship drew that inference——

19862. This is really replying. This is not a question of fact. I did not think so, but after that there was

a letter from Mr. Sharpe, who said that he did give you leave, or leave was given to you in a second letter to read it out to the Commission, but he did not think it would go into the Press?—I want to defend myself upon this very strongly, because I sent a letter down to this young gentleman by messenger. I sent him the following letter because I was coming before the Commission in a day or two afterwards: "Dear Sir,—I am forwarding you by special messenger copy of a letter which Mr. Coleridge wrote to Professor Gotch, and his reply. Owing to the nature of his reply, do you think you could send me any fresh information which would explain all the discrepancies between the accounts before Wednesday, as Mr. Coleridge is to give evidence before the Royal Commission on Vivisection there?" So that it was in answer to a deliberate invitation to him to give me more evidence that I might put it before this Commission that he wrote the letter, which I am now vilipended for producing here.

19863. I do not see that you are vilipended. I said what seemed extremely natural from the evidence which I had before me?—Further on I am attacked equally by Dr. Gotch. He says at Question 13700 that he is bound to say he cannot acquit me. Then, further, there is a letter from the Warden of Keble, who actually writes in these terms——

19864. (*Mr. Ram.*) Will you give the reference to it, please?—It is Question 13668, near the bottom: "They" (that is, the undergraduates) "made some attempt to make inquiries, but the attempt was obviously inadequate, and I think that Mr. Coleridge treated them a little badly in accepting and making public the second letter without further investigation on his own part." This young man knew, therefore, that this letter would be read out to the Commission. I asked him for a letter to read here.

19865. (*Chairman.*) Are you complaining of what the Warden wrote?—Yes, I am, very bitterly; most decidedly I am. He cannot have known, I presume, that this young man had an invitation from me to write that letter that I might produce it here or he would not have accused me thereafter of producing it here. What else could I do.

19866. I do not see anything further than that the letter is one which shows that the Warden thought you ought to have made investigations not merely by asking these young men, but by finding out what really happened at the laboratory?—How could I do that? I have no warrant to enter the laboratory.

19867. You had as much power of finding out as they had?—Quite so.

19868. What do you expect us to do? You are now making a speech upon the Warden's letter?—No, my Lord, not a speech.

19869. You are not contradicting any question of fact; you are making observations upon the Warden's letter as not being fair to you?—Quite so; it is not; it is extremely unfair to me. Now I go further, and I will say this: I wish to point out that when these various people announced that these gentlemen had withdrawn and apologised, the fact is that they have never withdrawn and apologised for the only thing that I think is of any value at all in their original letter. Dr. Warren, the Vice-Chancellor, says that he has had placed in his hands "a complete apology by these undergraduates to Professor Gotch, a recognition by them of the correctness of Professor Gotch's statements, an explicit and unqualified withdrawal of the letters and statements sent and made by them to Mr. Coleridge." I say that no such withdrawal has ever been made. They contend, and they have never withdrawn it, that they heard the howls of dogs in agony.

19870. Is not this a speech upon the evidence?—No, my Lord.

19871. Surely it is. Here are the letters before us, and you are saying that those are not an unqualified apology. We have before us the fact; we have what the letters are, and we have the statement which you have just made, that this was an incomplete apology. We must judge of that. We cannot call upon you as counsel to make a speech?—I have got a letter here from Mr. Sharpe, in which he says that he does not apologise.

19872. Has that letter been read here?—No. I have another letter from him to myself.

19873. All I can say is that if Mr. Sharpe writes a letter apologising, and then writes another saying that he has not apologised, we should not pay much attention to anything that he said?—No, he does not say that. He has only withdrawn the statement made to him by the laboratory attendant that such and such things took place in the laboratory. He has not withdrawn that he heard the howls of dogs.

19874. He says that in a letter to Mr. Tomkinson, which was read?—Yes.

19875. If you say that the only thing of importance is whether the dogs howled, although they were not being vivisected——?—That is all I referred to.

19876. We must judge of that?—That is the only evidence that had the slightest weight with me. What the laboratory attendant said to him I do not care.

19877. I venture to think that there are other things in the matter which will have weight with us?—Very well. Now, my Lord, I want to speak about the catalogue.

19878. Which question is that?—This is in the evidence of Sir Victor Horsley at Question 15729, in the middle of the first column, where he says that this catalogue was corrected in 1902. He said that 50,000 copies had been sent out, and then he said: "It was corrected, as I said before, in 1902, and Mr. Coleridge stated to this Commission, at Question 10559, that where he was shown anything which was wrong he liked to correct it. I may say, in parenthesis, that he has never corrected anything which he has been shown repeatedly was incorrect, nor has he ever apologised." My comment upon that is that it is perfectly true that a Dr. Grünbaum, of Liverpool, wrote to me, and said that certain items in the translation of the catalogue were, in his opinion, incorrect, but he said that they were not of any very great moment. I therefore sent his letter on to the gentleman who translated the catalogue for me, and asked him what his view of it was. He wrote back to me that he did not agree with Dr. Grünbaum's suggested corrections. And as the person who translated it for me was appointed by the librarian of the British Museum, at my request, I presumed that he was an impartial man. I had never even seen him, and I did not see why I should correct my catalogue at the instance of a licensed vivisector, but I printed his letter and published it. Therefore I do not see why I should accept that correction. I did what I think anybody would do—I laid the correction before the original translator, who refused to adopt it, and there I left the matter. I do not see how I am blameworthy there at all.

19879. What is the next point?—Then a little further down on this subject, those being the facts, you will find at Question 15978 Sir Victor Horsley speaks of "the exposure of the catalogue of instruments, and Mr. Coleridge's action"; that is the way he speaks of it. All I say is that I did what any gentleman ought to have done, and left undone nothing that a gentleman ought to have done. I do not want to go into the general question, unless you wish it, of the verity of that catalogue, but I can hand in copies of it if anybody likes to see it. I have got 13 copies here.

19880. No; confine yourself, please, to the specific contradiction?—Then the next point is that I stated in one of my opening statements that I prevented a public meeting being held at the Mansion House for founding a Pasteur Institute. With regard to that Sir Victor Horsley, at Question 15594, said: "In the first place, Mr. Coleridge informs the Commission that that meeting was prevented by his society from taking place. It is not so. The meeting took place at the Mansion House," and so forth. Then he says: "It was not called for the purpose of establishing a Pasteur Institute in England; it was called" for other purposes. Therefore he gives me the lie there. My position is this. It was originally intended to be a public meeting, and I and my friends were determined that if it was to be a public meeting we would take care that the opposition was properly represented. Accordingly, I went myself to the Lord Mayor, and told him that if it was a public meeting the Lord Chief Justice of England and Cardinal Manning proposed to speak in opposition to the resolutions, whatever they were, upon which the Lord Mayor said: "It is not a public meeting; it is a private one," and I said, "Very well, if it is a private meeting the Lord Chief Justice and Cardinal Manning can have no part or lot in it. You can have as many

The Hon. S. Coleridge.

1 Dec. 1907.

private persons as you like, and pass any resolutions that you like, and there will be no opposition from anybody." From that moment it was changed from a public meeting to a private meeting. I can prove this by the "Daily News," of July 1st, page 7, which is a perfectly impartial thing. There is the heading—"To-day.",

19881. I am glad to hear of a paper that is impartial upon such questions. I should hardly have classed the "Daily News" as such?—It was only an advertisement of the meeting, and it was 20 years ago, and they were not anti-vivisectionists then.

19882. But does the Lord Mayor take the chair at a private meeting to discuss a question of this sort? I never heard of the Lord Mayor taking the chair at a meeting of this kind, which was private?—That is exactly what it was. That is exactly what we turned it into. We enforced that upon them by my visit to the Lord Mayor.

19883. How was it advertised—as a private meeting?—Yes.

19884. Would you kindly read the advertisement?—This appeared in "The Times": "The Lord Mayor's secretary, replying to a letter from G. Candy and Co." (I think that should be G. Candy, Q.C.), "informs him that at the meeting which is called at the Mansion House on Monday next to discuss the subject of the prevention of hydrophobia, no one will be admitted who has not received an invitation." That proves that it was a ticket meeting.

19885. In that sense I see what you mean. I thought it was not a private meeting?—It was a ticket meeting. I mean that nobody was admitted without a ticket. Then, as I say, in the "Daily News" you have the heading "To-day, Meetings, Proposed London Pasteur Institute—Mansion House, 3."

19886. Is there not a possible explanation? Supposing that somebody gives notice that there will be a very strong hostile party——?—That is what I did.

19887. Which you did. The Lord Mayor would particularly dislike presiding over a meeting at which there were likely to be signs of disturbances?—No doubt.

19888. Therefore nobody would be admitted without a ticket?—That is exactly the history of it. It was turned from a public meeting into a private one, and my statement to you was that there was no public meeting held—that I stopped a public meeting being held, and I did so. Then the second statement that I made was that the meeting was originally intended for the purpose of founding a Pasteur Institute for London, and I say there is the "Daily News," which actually heads the meeting: "Proposed London Pasteur Institute."

19889. You are not going to cite an announcement of a meeting in the "Daily News" on a question so very controversial as being positive proof of what the object was?—No, it is only evidence of my *bonâ fides* in making this statement. And the "Times" had the same.

19890. If I wanted evidence I should not go to a paper that took strong views?—I think it was against us then, but I will not be sure. The "Times" has always been against us.

19891. (*Mr. Ram.*) Is not this really a very minor point?—Yes.

19892. There was a meeting?—Yes.

19893. You have shown that it was a ticket meeting, apparently in consequence of what you said?—Yes.

19894. That was not known to the witness. He thought that there had been a public meeting?—No doubt.

19895. (*Chairman.*) And certain resolutions were passed?—Yes, but Sir Victor Horsley also said that there was no intention of founding a Pasteur Institute. I said that there was originally, until we intervened.

19896. Sir Victor Horsley must be the person who knows best what the object of the meeting was?—I quite agree that when the meeting did assemble they had made up their minds not to push a Pasteur Institute for England, and no such proposal was placed before the meeting.

19897. That is not quite what Sir Victor Horsley said. You had said: "The intention was to hold a meeting the object of which was to start a fund," and so forth; and Sir Victor Horsley said: "The object was not as he states it; it was not called for the purpose of establishing a Pasteur Institute in England, it was called," and then he quotes, "for the purpose of hearing statements from Sir James Paget and other representatives of scientific and medical opinion with regard to the recent increase of rabies in this country, and as to the efficiency of the treatment discovered by M. Pasteur for the prevention of hydrophobia." That is his version of it?—Yes.

19898. Surely it is a very small point whichever way one considers it. You say that it was meant for the purpose of starting a Pasteur Institute?—No, my Lord, that is not my point. I say that the original intention, until the anti-vivisection party intervened, was to have a public meeting to promote a Pasteur Institute for England, and by our intervention it was changed into a private meeting, with a perfectly harmless resolution, saying that Monsieur Pasteur was a wonderful man, and they would like to subscribe and give him a testimonial, to all of which we had not the slightest objection.

19899. (*Sir William Collins.*) At any rate, was the meeting that was held one to which the public had access?—No, they were excluded.

19900. (*Sir Mackenzie Chalmers.*) It was like all those meetings that we have every day from which suffragettes are excluded?—I have not been to any of those, but I thought they always got in.

19901. (*Chairman.*) I quite understand you. It is quite easy for you to point out that it was not a public meeting in the ordinary sense, but one to which admission was by ticket?—Yes, that is all my point. Then Sir Victor Horsley says that we opposed the muzzle.

19902. What question is that?—It is Question 15597. He says: "Immediately this point of universal muzzling was raised the anti-vivisection party, Mr. Coleridge's society in particular, entered upon a virulent campaign against us," and so forth. I say that he has mistaken us altogether for the Canine Defence League. We did nothing of the kind, and he ought to have been more careful in making these accusations, because he holds a very prominent position, and it is rather careless for a man to come and make that kind of statement without any ground whatever. The slightest inquiry would have shown him that he was mistaking my society for some other with which we have no connection at all.

19903. Has your society never opposed the muzzle?—Never.

19904. Has it never put forward the view that rabies was not a disease?—We are against Pasteurism; we regard the muzzle as an excellent antidote to Pasteurism, and we think we have proved it to be successful.

19905. (*Mr. Ram.*) And to rabies?—Yes, it has kept both Pasteurism and rabies out of the country. We are entirely in favour of universal muzzling. It has nothing to do with any cruelty, and is an admirable method of stamping out an abominable disease. Then the next point is what Sir Victor Horsley says about the Anti-Vivisection Hospital, at Question 15592. He says: "I have placed upon my *précis* a very brief reference to the Anti-Vivisection Hospital, because the money for that hospital was originally collected many years ago, by Mr. Coleridge's society in part, on the idea that medical practice could be conducted without any reference to vivisection." There is nothing unkind in that, and I do not in the least find fault with it. I merely want to point out that it was true from February 7th to October 6th only in the year 1897, and on October 6th, I proposed the following resolution with success to the council of my society: "That inasmuch as the object of this society is to maintain a constant fight against existing vivisection and not to erect institutions from which the practice shall be excluded, the council declare that its committee should not actively participate in the project of founding and maintaining an anti-vivisection hospital." So that really almost as soon as I had any authority with the society at all I passed this resolution, saying that we would have nothing to do with the promotion of an anti-vivisection hospital; therefore it is a little unfair to put it upon us in that way, not that I do not feel an extremely friendly interest in the Anti-Vivisection Hospital, but I did not think that it was

a proper thing for our society to have it actively participating in it.

19906. (*Chairman.*) Sir Victor Horsley only says that you did in part collect the money?—Yes.

19907. And for a time you did?—Yes, for a few months only.

19908. It was hardly worth while making that correction?—I only wanted to put that straight. Then at Question 15738 Sir Victor Horsley said: "The Home Office had not given me, to use Mr. Coleridge's words, unrestricted leave to do experiments when I liked, where I liked, and what I liked." I never used those words in my life, or anything like them.

19909. Yes, I remember he did put those as your own words, and it struck me at the time that before us, at any rate, you did not use those words?—I never did.

19910. You did say that he was allowed powers which he ought not to have been allowed?—I only quoted what I found in the yearly report, which was accurate. I found that he had permission to vivisect where he chose. I also deduced that he could not be inspected under the Act in an unregistered place, and, therefore, if he chose to vivisect in an unregistered place he could not be inspected. I think that statement is absolutely correct, and I am sure that Sir Mackenzie Chalmers will say it is so. It was in the yearly report for seven years, I think.

19911. (*Sir Mackenzie Chalmers.*) You accept Sir Victor Horsley's account of what the restrictions were now that you have read it?—Yes; the restrictions put upon his licence to vivisect where he liked have nothing to do with the point. My point was that he was allowed to vivisect where he could not be inspected.

19912. (*Chairman.*) There is power, you know, under the Act, to allow vivisecting in other places than laboratories?—Yes, I did not say that there was not. I did not say that what was done was illegal. I said that I objected to what was done because it placed him outside the possibility of inspection. That was my objection.

19913. Sir Victor in his evidence gives here a specific explanation of why he was given that certificate. The point is that it was absolutely necessary, if the experiment was to be done at all, that it should be done in a hospital, and by the bedside. That is his explanation?—Yes; I am defending myself from an attack upon me; that is my position. I still say that what I said was perfectly true—namely, that he could vivisect where he chose, and that he could not be inspected. And I further go on to say that what I said was perfectly true about his leave being withdrawn from him just at a time which synchronised with the appointment of this Commission.

19914. I think your suggestion was that he was receiving an extraordinary favour, and that the Home Office was going outside its duties, if not its powers, in doing what it did?—I protested against it, and I had protested two years before in vain, but the appointment of this Royal Commission synchronised with the withdrawal of that permission.

19915. I must say that although I do not think you did use the very words before us which Sir Victor Horsley puts into your mouth, his evidence, to my mind, did very much alter the complexion of the matter as stated by you?—I do not see that, my Lord. I stand to every word that I said, and I have said nothing which is not carried out by the published document from the Home Office. If you look at what I said, it is absolutely carried out in the Home Office document, which I have here, and can show you. I decline to admit for one moment that I said anything which I could not stand to in the letter as well as the spirit. I adhere to every word of it.

19916. Is there any fact which Sir Victor Horsley states about that operation that you say is incorrect?—My Lord, he is accusing me of inaccuracy. I am here defending my accuracy. I am not here to attack Sir Victor Horsley.

19917. You do not want to correct any statement of fact except the fact of your using those words?—It is a matter of indifference to me what was done under those extraordinary provisions. I did not attack Sir Victor Horsley. I attacked the Home Office for giving him permission.

19918. (*Sir William Collins.*) Did you ever say that Sir Victor Horsley had been given power to vivisect when he liked, where he liked, and what he liked?—No; I did not.

19919. (*Chairman.*) What is the next thing?—Here is what I consider an extremely offensive answer at Question 16011. This is with regard to Sir Victor Horsley's evidence at the trial of *Bayliss* v. *Coleridge*. Your Lordship asked him, "Was it your evidence he was quoting from?"—that is, I was quoting from, and Sir Victor Horsley says, "It is my evidence he professes to be quoting from, but from my experience of Mr. Coleridge, and especially after what he has admitted to this Commission, I accept nothing that he produces in the way of evidence of what I have said, unless I have the context. . . . Mr. Coleridge's was quite a false rendering of my evidence in the way he presented it to the Commission." I have brought the evidence here to present it to the Commission, that they may see for themselves that I was absolutely right. I should like first of all to know what he means when he says, "especially after what he has admitted to this Commission." What have I admitted derogatory to my accuracy or to my honour to this Commission. I want to know? I think it is a most offensive phrase. Now, as to the question itself. This is the question and answer, Question 834. "(*Mr. Rufus Isaacs.*) Would it be possible to perform the experiment or the demonstration which we know took place if the dog had been conscious?—No, absolutely impossible unless the dog had been fixed up with all manner of apparatus to absolutely fix every bone. You can fix an animal with apparatus of that sort (*pointing to the operating board*)." That is the evidence I quoted. I quoted it absolutely verbatim, and I really fail to see what he means. If Sir Victor Horsley does not like the evidence I cannot help that. Those are his words.

19920. Are you reading from the shorthand notes of the trial?—Here are the actual shorthand notes of the trial. I consider that I am entitled to quote the evidence given at the trial by Sir Victor Horsley without having this sort of innuendo.

19921. Are those words in the shorthand note—"absolutely fix every bone"?—Yes, there is a split infinitive, I cannot help that; the words are "had been fixed up with all manner of apparatus to absolutely fix every bone."

19922. That is what you were reading from the shorthand note?—Yes.

19923. That is what we have in Sir Victor's evidence?—Yes, you will see that I quote it absolutely verbatim.

19924. He goes on to say, "I showed the Lord Chief Justice what I meant by fixing every bone with a rod passing through the bones. Of course, it is an absurd position, you observe. It is impossible to fix every bone in an animal"?—There is no report of that demonstration to the Lord Chief Justice in this report.

19925. "I said, 'You can fix an animal with apparatus of that sort (*pointing to the operating board*). That is the answer to that—you can fix an animal on that board, and he pointed to it; they had it in Court'"?—That is right.

19926. You quoted that?—"Pointing to the operating board." I then say, I suppose, "That is my answer to that."

19927. Are not those words, "You can so fix an animal," what he says that he said, following on?—"You can so fix an animal with apparatus of that sort (*pointing to the operating board*)"—that is in the report.

19928. Does he go on to say, "That is the answer to that"?—No, those are my words.

19929. Then the inverted commas are put wrong?—Yes, that is what I said to you.

19930. Then it is a mistake in inverted commas being put here as if those words were also part of his evidence?—Yes, that is what I said. That is all I have to say about that. I fail to see any justification for that kind of language. Now I come to Dr. Crile's experiments, and the letters to the surgeons, Question 15712. The question is, "He says, 'We are told in the control experiments, as well as in this, the dog was not under full anæsthesia.' Do you know by whom he is told?" and Sir Victor Horsley says, "No, that is Mr. Coleridge." It is not, it is Dr. Crile. Here is the book; I will read it out of the book. "In the control

The Hon. S. Coleridge.

11 Dec. 1907.

experiments, as well as in this, the dog was not under full anæsthesia. In the former the animal struggled on application of the flame; after the injection of cocaine he did not. There was apparently blocking of the sensory impulses from the paw." That is the quotation.

19931. What is the page of the book?—In the big book it is pages 118 and 119 in "Surgical Shock." Sir Victor Horsley attributes to me what is found in the book, so that that was a mistake of his.

19932. If I follow you, you say that those precise words at Question 15712 were taken by you from the book?—Yes, absolutely from the book, and the book is here. Then the next point is at Question 15728—this is the most important thing of all. "In 1899 Mr. Coleridge attacked attacked Dr. Crile at the Home Office, and, after he had been fully informed by the Home Office as to the meaning of this term 'complete anæsthesia,' he then wrote to several surgeons and asked them a question about incomplete anæsthesia, and he informed this Commission that he wrote exactly in the terms in which the Home Office had written to him. As a matter of fact, he did not write exactly in the terms of the letter of the Home Office, because he omitted the all-important sentence which defined this term 'incomplete anæsthesia.' And the result was that he deceived these surgeons into thinking that it was suggested that operations were done upon human beings in hospitals without adequate narcosis." If you can follow me I can show you exactly how wrong he is about this. The letter received from the Home Office had these words: "But short of this is the condition termed by Dr. Crile 'incomplete anæsthesia' in which the creature is quite insensible to pain, although the corneal and other reflexes can still be obtained." That statement was a statement given to me by the Home Office as a statement given to them by their advisers, and it contained in it the whole question at issue between me and the Home Office. It stated that the condition of the corneal and other reflexes being obtained was a condition of insensibility to pain. That was the crux that I wished to ascertain; therefore, when I wrote to the surgeons I naturally did not tell them that the Home Office thought that it was a condition of insensibility to pain, but I asked them what their opinion was about the condition of a human being when corneal and other reflexes can still be obtained; and it was in answer to that question that they wrote me those letters. The suggestion that I deceived them is wholly false. I deceived them in no way whatever. I asked them practically whether they agreed with the Home Office in saying that that was a condition in which pain was absent, and their answers were tantamount to saying that they disagreed with the Home Office. That is the whole of that. The only alternative to my mind is that, if it be suggested that my letter deceived the doctors, it must be suggested that I deceived them into telling the truth—that I tricked them into telling the truth, which they would not have told if I had not tricked them, which I think is a strange thing to suggest about the heads of a great profession. I do not make the suggestion. I think their answers to me were perfectly true when they told me that they did not commence operations upon patients in hospitals until the corneal and other reflexes were entirely abolished. I believed them. I believe them now. I do not believe for one moment that any surgeon would commence an operation until the corneal and other reflexes were abolished; and that is what they told me, and there is no deceiving in the matter at all. I asked them a perfectly plain question, and the surgeons gave me a perfectly plain reply. My motive in asking the question and their motive in making the reply have no bearing whatever upon the question. Their answer to the question was either a true answer or an untrue answer. I maintain that it was a true answer, and the allegation of deceit against me is wholly unfounded. I do not think I need say any more, except this:—At Question 15588 Sir Victor Horsley says: "Mr. Coleridge's society, to take that alone, have collected from the public £86,000, and have not added one item of knowledge to us for the relief of suffering or the prevention of disease." We are not a society for the collection of knowledge; we do not spend our money in that way. And let me say in conclusion, before I leave this Commission, that if, as the result of this Commission, inspectors are appointed who will look without protest at live dogs struggling while they are burnt with flames, the certain result will be that I for one, and, I believe, all the humane people of this country, will unite utterly to abolish what we regard as an abominable wickedness.

19933. (*Sir Mackenzie Chalmers.*) There are only two questions that I would like to ask you. I want to understand now, do you accept Professor Gotch's statement to us that during last year no experiments were made on dogs in his laboratory when the undergraduates heard this howling?—Was he there all the time himself? I should want to know whether he was there all the time.

19934. I am only asking you whether you accept his statement?—I accept his statement that, so far as he is aware, no operations were performed there, of course, but unless he is there all the time he does not know what happens in his absence. The students might operate there in his absence.

19935. Do you really suggest to us that any operation was performed there?—I do not suggest anything. You ask me whether I accept a statement of a man as to whether a certain thing is done or not done at a place where he may not have been. I will accept his statement that it did not happen when he was there, certainly; but I am not prepared to accept that he knows what happens in the laboratory when he is not there. No one would accept that.

19936. (*Chairman.*) It is not merely a person who was not there. He is the person who is the head of the laboratory, and there could hardly have been any vivisection of dogs without his knowing it. And, mind you, the statement in the letter is that this happens every day?—The howls of dogs, yes.

19937. And "in consequence of vivisection," the letter goes on to say?—Yes.

19938. Do you mean to say that Professor Gotch is not to be believed?—I have not said that. I carefully do not say that.

19939. You are carefully refraining from saying that he is to be believed?—I am not indeed. I believe his statement so far as he has a right to make it.

19940. Then has not the head of the laboratory a right to say, "There was no vivisection in my laboratory"?—No, no more than a magistrate has the right to say that no crime happens in his district.

19941. If you think those two things are the same?—But many things may happen in a laboratory when he is not there.

19942. (*Sir Mackenzie Chalmers.*) May I put it in this way? Without more hypotheses, are you satisfied yourself that no experiment took place upon a dog in that laboratory during that year?—Sir Mackenzie, you ask me that question. Am I not entitled to ask how Professor Gotch explains the fact that six young gentlemen say that they heard these howls? He does not suggest an explanation. I should have liked him to be asked that. No one asked him how he explained that these six young gentlemen, with no motive of any kind except that of humanity, should have said that they heard day after day the howls of animals in agony.

19943. (*Chairman.*) He does explain that?—How?

19944. Anyhow, he explains it in a sense. He says that the only explanation he can offer is that there were puppies there, and these puppies were very noisy, and that these gentlemen who were so ready to attribute illegal vivisection to him were perhaps a little predisposed to think that they were the howls of dogs in pain.

19945. (*Sir Mackenzie Chalmers.*) I only want to know, is your mind quite relieved on the subject of what happened there or not after having heard Professor Gotch's explanation?—No, it is not quite relieved. I am quite ready to accept Professor Gotch's statement that, so far as he knows, no vivisection has taken place there, and I am sure that he did not do it himself; but the explanation of the puppies I do not think sounds to me a very adequate explanation. These young gentlemen say that they know well enough what the cries of puppies are, and they say that these were not the same; and it is half a dozen young men, with no other motive, so far as I know, except that of humanity.

19946. (*Dr. Wilson.*) But they apologised?—No, they have never apologised for saying that they heard

the howls of dogs. They maintain still that they did hear the howls of dogs, and they have not withdrawn it; they decline to withdraw it.

19947. (*Sir Mackenzie Chalmers.*) Do they decline to withdraw the statement that the howls of dogs which they heard were the cries of dogs in pain?—Yes, absolutely; they still say that they heard the howls and they still think that they were the howls of dogs in agony. What they have withdrawn is that they had been told by a certain official that vivisection had been going on. This certain official says that he did not say so, and they accept that.

19948. (*Mr. Ram.*) At what date did you first learn that they had made the withdrawal which they have in fact made; was it before you gave evidence here or afterwards?—The whole thing was afterwards—long after I was here, of course.

19949. (*Chairman.*) The first letter in the Oxford paper was in October?—Yes. I had no withdrawal when I came here.

19950. And your evidence was given in June or July?—Yes. I had heard no whisper of withdrawal when I was before you.

19951. (*Mr. Ram.*) Did you receive a letter from these young gentlemen in which they did make such withdrawal as they did make; because I see they state that they sent you a letter?—Yes, they told me that they had to withdraw.

19952. "An explicit and unqualified withdrawal of the letters and statements sent and made by them to Mr. Coleridge." The date of that is October 19th, 1907?—I have the letter here, because I wrote at once in reply—I want to point that out—and said, "Am I to understand from you that you withdraw the fact and you now say that you did not hear the howls of these dogs?" and they wrote back, "Oh, dear me, no; we do not withdraw that."

19953. What they did withdraw was this; it is in a letter to Mr. Tomkinson of the 19th of October, in which one undergraduate writes, "I am sorry to say I have no more evidence to give. I have found that on closer investigation the facts which were told me as true—viz., that a dog and rabbits had been cut up, and had been yelling—were entirely false. I felt therefore compelled to withdraw these statements, and to apologise to Professor Gotch for my language concerning him when I heard he denied this." That is what they withdrew?—That is all they ever did withdraw.

19954. Since you received that letter in which they withdrew that statement have you published anything which has incorporated any facts concerning this undergraduate case either in your evidence or otherwise?—I do not think so. I have not dealt with it at all until I came here.

19955. I think in one of the papers which some one has been good enough to send to me there is an intimation that the evidence which you have given before us here was either published or about to be published?—Yes, it has been published by the Commission.

19956. But I mean otherwise published?—I have reprinted in a large type for our own use just a facsimile, and we have had an index put to it.

19957. Has that been circulated?—Not sold.

19958. (*Sir Mackenzie Chalmers.*) How many copies have been circulated?—Oh, a lot.

19959. Some thousands?—Yes, it has been circulated widely.

19960. Will it be circulated further?—Yes, I presume so. We have got about 200 or 300 copies left.

19961. (*Mr. Ram.*) Is it your intention with regard to either a further circulation of this particular book or the further circulation of your evidence, to give the withdrawal as given in this letter to Mr. Tomkinson of the 19th of October?—I propose to incorporate my evidence of to-day with it.

19962. And the evidence of to-day will, therefore, incorporate what I have just put to you as to the withdrawal which these gentlemen have made?—Yes, every bit of it.

19963. (*Chairman.*) But you are not proposing to incorporate in your book the whole of Professor Gotch's evidence on this point?—No, I shall not do that. At least I might do it. I had not really considered that.

19964. (*Sir Mackenzie Chalmers.*) Would it not be rather more fair to include Professor Gotch's evidence?—I only want to do what is fair. I will consider whether I will not incorporate everything that has to do with it.

19965. (*Chairman.*) It should be made sufficiently clear that the statement is contradicted by Professor Gotch and withdrawn to the extent that it is withdrawn by these gentlemen and in their own words?—Yes. My Lord, if it would give you any satisfaction I should be very pleased to submit what I propose to incorporate to the Commission, so that they may see that it is fair.

19966. I think I will not take that responsibility upon myself, but I really think it is a responsibility that you ought to undertake yourself, not only as being fair to Professor Gotch but because I really doubt whether you might not be made answerable at law for publishing anything without it?—Now that you mention it, I will consider whether it would not be proper to put in what Sir Victor Horsley said against me before I put in my reply to him.

19967. (*Mr. Ram.*) One question, please, with regard to the matter which you have just dealt with as to Dr. Crile's experiments and the question as to whether they were under incomplete anæsthesia or otherwise. What was put against you was this: "Mr. Coleridge attacked Dr. Crile at the Home Office and after he had been fully informed by the Home Office as to the meaning of this term 'incomplete anæsthesia.' He then wrote to several surgeons and asked them a question about incomplete anæsthesia, and he informed this Commission that he wrote exactly in the terms in which the Home Office had written to him. As a matter of fact, he did not write exactly in the terms of the letter of the Home Office, because he omitted the all-important sentence which defined this term 'incomplete anæsthesia.'" The question I want to ask you is, did you receive a letter from the Home Office in which there was a sentence defining the term "incomplete anæsthesia"?—Yes, I did. "One of the last of these reflex movements to disappear is the blinking of the eyelids when the surface of the eyeball is touched, then called the 'corneal' or 'conjunctival reflex.' But short of this is the condition termed by Dr. Crile 'incomplete anæsthesia,' in which the creature is quite insensible to pain, although the corneal and other reflexes can still be obtained."

19968. That is in the letter from the Home Office?—Yes.

19969. Did you in writing to the surgeons omit any sentence of that letter?—Yes, I left out that sentence that that was a condition in which they were insensible to pain. I did not call that a definition.

19970. Then the allegation that you omitted a sentence of that letter, which sentence defined the term "incomplete anæsthesia," is correct?—No, I do not say so. I do not consider that that is part of the definition. That is an assertion that an animal when its corneal and other reflexes are not abolished is insensible to pain. I do not agree to that assertion, and I wrote to the surgeons for the purpose of ascertaining whether it was true or false.

19971. May we take it that a sentence in that letter was left out in your letter to the surgeons?—Yes.

19972. And it was a sentence which Sir Victor Horsley considered did define the term "incomplete anæsthesia"?—Yes, I quite admit that Sir Victor Horsley said that it defined it.

19973. And that sentence which he said defined the term "incomplete anæsthesia" did appear in the letter of the Home Office, but was not quoted by you in the letter which you sent on to those surgeons?—Yes. Those words were left out certainly, because they were the issue between us. I never said in the letter to the surgeons that I was quoting the whole of the letter from the Home Office. I asked them one definite point, did they perform operations on patients when the conjunctival reflex was still obtainable.

19974. I was only dealing, of course, with the allegation?—Quite so.

19975. Then there is only one last matter I should like to mention. You have been good enough to send me a letter, dated the 24th of October, in reference to your qualification of the word "pain" in your previous evidence. In reply I wrote to you, and said that I would take care that that letter should come before the Commission, and that your correction should appear?—That is so.

19976. I think, perhaps, the best plan will be, as we have the advantage of your being here to-day, to give

The Hon. S. Coleridge
11 Dec. 1907.

that correction now, so that it may appear on the notes as part of your evidence?—If you please. Will you read my letter then?

19977. Yes. Then the letter will appear on the notes, and you will say whether that is your evidence. You say: "Dear Mr. Ram,—On reading over my evidence and considering it with due care, I cannot but feel that it would be unwise to qualify the word 'pain' with any adjectives in my Bill. I write to you to say this because under examination by you, at Questions 11265, 11266, and 11267 I said I would agree to add the word 'serious.' This, I think, was a somewhat hasty concession. The addition of the word 'serious' or 'severe' before the word 'pain' would, I sincerely fear, lead to the legal permission of pain to an amount I could never think morally justifiable.—Very faithfully yours, Stephen Coleridge"?—I am very much obliged to you for putting that letter on the notes.

19978. That is the correction that you wish to make?—If you please.

19979. (*Dr. Gaskell.*) With respect to Question 15712, I should like to get clear what the words of Dr. Crile are. You say: "We are told in the control experiments, as well as in this, that the dog was not under full anæsthesia"?—Yes.

19980. I have not got in my own mind what Dr. Crile's words were. It is in Experiment CXXXIII.?—These are the words: "In the control experiments, as well as in this, the dog was not under full anæsthesia. In the former the animal struggled on application of the flame; after the injection of cocaine he did not. There was apparently blocking of the sensory impulses from the paw."

19981. That is all right. I wanted to know where those words actually occurred?—Yes, they are in the book.

19982. (*Chairman.*) Of course, Mr. Coleridge, when I suggested that it would be advisable to put some statement as to Professor Gotch's evidence in whatever you intend to publish you will understand that I was not myself suggesting at all the publication of any evidence taken before the Commission?—Quite so.

19983. I say that simply because it is not a matter for the Commission; it is a matter, as you know, for the Stationery Office?—Certainly. We have only done it because the official report is in such small type, and we wrote to the Stationery Office about it.

Note.—Mr. Coleridge subsequently requested the Commission to allow the following extract from an article by Mr. Edwin Wooton * in the Dublin Journal of Medical Science for 1885 (Vol. 80, p. 290) to be added here, as he had intended to call the attention of the Commission to it while dealing with the question of the attitude of some vivisectors. The extract is as follows: "I, some time since, began the study of experimental phenomena in the brute world in relation with tuberculosis and other major diseases, and have continued it until the time of writing. It is a pursuit full of difficulties—legal, social, and scientific. The investigator is hampered by absurd anti-vivisection laws, to evade and defy which is his simple duty; and he is annoyed by the sentimentalism of weak-minded neighbours or acquaintances who may become aware that he is engaged in research, and who regard him as a nineteenth century 'six hundred three score and six.'"

FORTY-FOURTH DAY.

Tuesday, 17th December, 1907.

PRESENT:

The Right Hon. The Viscount SELBY (*Chairman*).

Colonel The Right Hon. A. M. LOCKWOOD, C.V.O., M.P.
Sir W. S. CHURCH, Bart., K.C.B., M.D.
Sir W. J. COLLINS, M.P., M.D., F.R.C.S.
Sir J. McFADYEAN, M.B.
Sir M. D. CHALMERS, K.C.B., C.S.I.
Mr. A. J. RAM, K.C.
Mr. W. H. GASKELL, M.D., F.R.S.
Mr. G. WILSON, M.D., LL.D.

Captain C. BIGHAM, C.M.G. (*Secretary*).

Mr. D. J. HAMILTON, called in; and Examined.

Mr. D. J. Hamilton
17 Dec. 1907.

19984. (*Chairman.*) You are Professor of Pathology at the University of Aberdeen?—Yes.

19985. And you have been nominated by the University of Aberdeen to give evidence before us?—Yes.

19986. I believe the University of Aberdeen, like some other universities, have not been desirous to give evidence on the general question, after having read the evidence which has been given by other physiologists?—Quite so; they deem that sufficient evidence has been given on that line already, and that there is not any further necessity for it.

19987. And they only now desire you to come forward with a view to your giving evidence about some special inquiries which you have made with regard to diseases in sheep, in the course of which you had recourse to experiments on animals?—That is so.

19988. I believe the experiments which you are going to tell us of were first of all carried on privately?—Yes.

19989. And then afterwards, at the suggestion of the Highland and Agricultural Society, who desired you to continue them?—Yes.

19990. And then you were Chairman of a Departmental Committee which was appointed by the Board of Agriculture in 1901?—That is so.

19991. And who issued their Report in 1906?—Yes.

19992. That Report is contained in three parts presented to Parliament, numbered Cd. 2932, 2933, and 2934?—Yes.

19993. And in that Report there is a detailed account of the researches which have been spread over four years?—That is so.

19994. I will take you at once then to your evidence on that subject. The Committee was appointed as you told us, in 1901, by the late Mr. Hanbury, then President of the Board of Agriculture?—Yes.

19995. And the object was to investigate the two diseases of sheep known as louping-ill and braxy?—Yes.

19996. Would you explain to us what the extent of the mischief was?—These two diseases of sheep that we were appointed to inquire into are extremely disastrous, and the cause of enormous mortality all over Great Britain more or less, especially in Scotland, the northern counties of England, and also in Ireland; they prevail in all three divisions of the British Isles, and the mortality from them is something terrible, so much so that in certain districts where they prevail sheep farming as a profitable industry is so hampered that it is threatened with extinction, if that has not already occurred in many places.

19997. Has that been going on for many years?—It has been going on for a great many years—as far back as we have any records, apparently.

19998. Has it been worse of late years?—Yes, I think so.

19999. One has not regarded sheep farming as being an industry that was in danger; the general public were not aware of the extent of the mischief, at any rate, until recently?—Some parts of Scotland have become depopulated on account of the enormous loss. As much as a quarter of a million of money, it is said, is lost from braxy alone, and that is probably an under-estimate of the total.

* *This gentleman's name does not appear in the Medical Register or Directory for* 1885.

20000. A quarter of a million of money altogether, do you mean?—Annually.

20001. It affects particular areas, you say?—Yes.

20002. But it spreads?—Yes, it has been endemic more or less all over the west of Scotland for as far back as anyone can remember, at any rate as far back as the sheep industry goes. The sheep industry in Scotland on a large scale commenced only at the beginning of the last century. Previously to that the country was all laid out in cattle; about the beginning of the last century the sheep industry on a big scale commenced, and the disease has prevailed on the west coast of Scotland ever since; in fact, long before that apparently. There are records of its being a very old disease.

20003. You say it is very destructive. Up to what percentage has it been destructive in the farms most affected?—In the case of braxy I have known from my own experience, 10 to 15, 25, 50, 80, and 100 per cent. of mortality over certain districts in certain farms. From louping-ill the mortality is usually not so high, but sometimes comes up to 15, and 20 to 25 per cent.

20004. There is a great loss from mortality, and, I suppose, great interference with business in not being able to transfer sheep?—Not only in the transference of sheep, but in the whole farming operations. The mortality interferes with the regular routine of the sheep farm.

20005. I think that you propose first to deal with louping-ill which is what you first dealt with in the Committee?—Yes.

20006. Will you tell us what steps you took in investigating that disease?—Our first experience of the disease was gained in the valley of the north Tyne, the Duke of Northumberland's property. His Grace very kindly furnished us with a station there and fitted it up for us, so that we could undertake the investigation.

20007. There are large sheep farms there?—Yes, very large sheep farms. We lived in the district for two seasons of something like two or three months each, and most of my experiments were carried out in this neighbourhood on that particular disease.

20008. Will you tell us what the symptoms of the disease are?—The first thing you notice probably is that the sheep will appear duller than its mates, and separate itself from other sheep in the same run, and it shows then more or less pronounced toxic symptoms, looks almost as if it was suffering from alcoholic intoxication sometimes, a reeling gait, giddiness, and a tendency to lean up against any support. Then perhaps in 48 to 60 hours after these symptoms have shown themselves, the animal is unable to stand, and falls over on its side. It now passes into the second stage of the disease in which it is convulsed, the limbs are spasmodically contracted, and so on. The animal's intelligence does not seem affected, it recognises objects perfectly well; but after these phenomena have lasted, say, from four to five days, in the second stage, the animal passes into the third stage in which it becomes more or less paralysed in all its extremities.

20009. Does it fall to the ground?—Yes, after it once falls over on its side it never gets up again; it is quite incapable of standing, and the limbs hang listlessly down when it is held up by the fleece.

20010. After lying in that condition for some time it dies, I suppose?—It usually goes on from bad to worse. Sometimes it may linger. I have known them linger as long as five weeks in some very chronic cases, but usually within a matter of a week to ten days after the commencement of the disease the animal is dead.

20011. Does the disease always terminate in death?—My own experience favours the view that the great majority of cases terminate fatally. Shepherds will tell you that in some cases recovery takes place; they will point out individual sheep to you which have suffered from the disease in the previous season; but my own experience leads me to doubt whether these were cases of louping-ill at all.

20012. How did you proceed to investigate the cause of the disease?—We began, of course, by studying the phenomena of the disease so far as we could make them out by mere visual and other external means of examination, and an examination of the carcases of animals that had died.

20013. What did you find?—We found so very little that was tangible in this particular disease that we for a long time were puzzled.

20014. You mean that the organs appeared to be healthy?—The organs appeared to be healthy. In the vast majority of cases, if you see the animal immediately after its death, or if you slaughter it in the height of the disease, the organs appear to be practically healthy; a few punctiform hæmorrhages along the intestine are perhaps the only residue you will find; the brain is apparently quite healthy, and the spinal cord also so far as one can make out by mere naked eye examination; the membranes of the brain and the spinal cord are healthy.

20015. And the blood?—I could never find anything wrong with the blood. I examined it over and over again. I must have examined, I daresay, thousands of samples of blood.

20016. Then having learnt nothing as to the cause from what you call your *post-mortem* examinations, did you proceed to experiment on living animals?—We did. We found it absolutely impossible to get any further before we tested whether there was any materia peccans, anything pathological in the liquids or the tissues of the body.

20017. And will you tell us what you found by experiments on living animals?—We found that we produced no result by inoculating the blood.

20018. And the cerebro spinal liquid?—Yes, the same; it had no effect, the blood and cerebro spinal liquid were negative.

20019. You found it had no effect deleterious or otherwise upon the sheep, did you?—No apparent effect whatever.

20020. Did you then proceed to investigate the abdominal cavity when you found these punctiform hæmorrhages in the intestine?—Yes. As a last resource we investigated the liquid in the peritoneal cavity, the abdominal cavity. We noticed that very often it presented a turbid appearance, especially a few hours after death, and on inoculating this subcutaneously we killed the animal practically in every case.

20021. The inoculated animal?—Yes, the inoculated animal.

20022. Did you say what you found in the peritoneum?—The bacillus, a long rod-shaped organism, was present in the peritoneal liquid; where we were perfectly certain about the nature of the disease it was found practically in every case; it had peculiar characters and the same characters in each case.

20023. Did you find it in the intestines also?—Yes, both in the abdominal cavity and in the intestine. In the intestine sometimes the bacilli were in tremendous numbers.

20024. (*Colonel Lockwood.*) Was it like the anthrax bacillus?—It is something like. It resembles the anthrax bacillus in so far as it is rod-shaped, but it has morphological differences, and grows differently from the anthrax bacillus, although probably there is a certain relationship between them. I have always had a notion that they may belong to the same family.

20025. (*Chairman.*) You injected, I understand, the liquid containing these bacilli into the sheep?—Yes.

20026. With the result as you have told us that you killed them?—Yes.

20027. You killed them more quickly than the natural disease did?—Usually much more quickly. When one inoculated under the skin, the animal usually died in from 36 to 48 hours. Some cases, however, were protracted.

20028. (*Mr. Ram.*) Did the inoculated animals show all the usual symptoms?—That depends apparently upon the time that the animal lives after inoculation has been performed. In most cases the animal dies very rapidly from the toxic poisoning; it is dead within a few hours afterwards; but in those cases where the animal has lived over, say, four or five days, I have seen the most perfect reproduction of the disease—not only in the sheep, but also in the rabbit—the tremblings and spasms, and so on, and paralysis of the limbs, all exactly as in the natural disease.

20029. (*Chairman.*) Would you tell us the conclusions that you came to form these experiments?—The conclusions that we came to were that the disease was caused by a specific bacillus inhabitating the intestine, and under certain circumstances getting over into the peritoneal cavity.

Mr. D. J. Hamilton.
17 Dec. 1907.

20030. Did you come to any conclusion as to the nature of the propagation of the disease which I believe up to that time you had not ascertained?—Yes, we did; we came to the conclusion that the disease is spread through the dejecta of the animal through the manure, and also through the carelessness of farmers in leaving the carcases about everywhere.

20031. You mean that these bacilli would in that way get into the mouths of the feeding sheep?—The spores will lie in the soil for a long time apparently, and they are taken up by the second host, the second sheep, and in that way the disease is reproduced.

20032. That was the result of your investigation of louping-ill?—Yes, so far.

20033. Now as to braxy, will you tell us what your investigation was, what the course of it was?—Braxy is due to an organism of the same nature, although not identical with that of louping-ill. It was discovered in Norway originally.

20034. Was it discovered by Nielsen?—Yes.

20035. And he discovered the bacillus that you believed to be the cause of the disease?—Yes, he did, and our investigations corroborated it.

20036. Do you know how he discovered it?—By looking for it and by experimenting with it. No one thought it worth their while to look for it before.

20037. Did he experiment on living animals for the purpose?—Yes.

20038. That was how he discovered it?—Yes.

20039. And what was the habitat of that bacillus?—We discovered that the habitat is the same as that in louping-ill—that the intestine is full of it practically, absolutely swarming with the organism.

20040. The symptoms of the disease are quite different, are they not?—Yes.

20041. Is it a very short disease?—It gets the name of braxy, I believe, from an old Scandinavian derivation, signifying the suddenness of the disease—the suddenness of the fatality of the disease. Bradsot it is called in Scandanavia and our word braxy is probably a lineal descendant of the same.

20042. Does "bradsot" mean quick or sudden?—Yes, quick disease.

20043. Had it also been ascertained by Nielsen that sheep might be inoculated with the bacillus, and so take the disease?—Yes; that is so.

20044. Accordingly you began your investigations in braxy with rather more knowledge; you were more advanced in your knowledge than you were in the case of louping-ill?—Yes.

20045. But so far you seem to have satisfied yourselves in both cases; in the one by your own investigations and in the other by the investigations of Nielsen, that you have ascertained what the cause of the disease is?—Yes; certainly.

20046. And its bacillus?—Yes.

20047. Did you accept Nielsen's experiment, or did you experiment yourselves for that purpose?—We made a great many experiments.

20048. To find this bacillus?—To find this bacillus, and in the way of prevention afterwards.

20049. I am coming to that. I was dealing with the question of finding the cause?—Yes.

20050. As to remedial measures for both these diseases, would you tell us what you had to look to. Was there any remedy that you could discover when the animal once got the disease?—No; there was no remedy that we could discover. There were any number of popular remedies, but nothing that was really founded on any scientific basis, and I think they were all equally bad, so far as I know.

20051. You were obliged to look to prevention, therefore?—Yes. When once an animal is attacked with either of these diseases anything in the way of treatment, from my experience, has very little effect upon it.

20052. Could anything be done in the way of prevention by merely segregating the animals that were attacked with it?—That has been tried over and over again, shifting them from one pasturage to another. It is practised by farmers only as a last resource; shifting them, say, from hill pasture down to low pasture, and so on. My own experience is, and I have seen it done frequently, that they go from bad to worse.

20053. I rather meant as soon as the animal showed any signs of the disease, separating it so that its manure after it was diseased did not affect the pasture of others?—I do not think that has the slightest effect—the disease is so widespread.

20054. And the object, I suppose, you had was to immunise the animal?—Yes.

20055. Was that the only remedy that suggested itself to you?—It was the only feasible remedy so far. The animal dies within a few hours after it is seized by braxy, and there is no time to apply any remedy.

20056. Did you experiment with that view of obtaining immunisation?—Yes.

20057. Will you tell us about your experiments and the result of them?—We thought first that the most likely method of producing immunity in an animal would be that which is frequently practised upon animals—namely, that of the introduction into the system of the animal of the organism in an attenuated condition; in a weakened condition, that is to say, when the full virulence of the organism is lessened by certain procedures. We found that that method, although it occasioned apparently a certain amount of immunity, was a dangerous one.

20058. Why?—By no meanst infrequently we killed the animal, and, moreover, the carrying out of this method on a large scale in sheep-farming districts is impracticable; it entails the use of a delicate instrument in unskilled hands; and hence we gave it up altogether.

20059. In looking for some method of immunisation, had you any guide from the manner and time at which braxy attacked the animals?—Yes, we had. Braxy is essentially a disease of hogs.

20060. That is first year sheep?—Yes. Farmers look upon their two-year-olds as practically safe. Sporadically a case occurs now and again, but the great mass of their sheep after the second summer are safe. That suggested to us that immunity, if it is an acquired immunity, must be acquired through some agency residing in the soil, and manifestly the idea struck us that the spores of the organism getting into the alimentary canal, are Nature's agent in inducing this immunity.

20061. Are sheep more liable to take braxy at one time of the year than another?—Yes; there are certain months of the year in which they are more susceptible. This is just about the height of the braxy season at present; it begins usually in September—or at any rate, what farmers call braxy—and goes on to about the middle or end of February.

20062. Is it your suggestion that the sheep which took these spores into their system, and were only immunised by so doing, and not killed, took them in at a time when braxy was not prevalent, or that they were exceptionally strong sheep?—Most of them had very likely become immunised in their infancy, whilst still lambs; that is my strong impression.

20063. You mean that they would not be so susceptible?—They would not be so susceptible. Others probably enjoy a partial immunity, and are more resistant. But my strong impression is—and I am not alone in this, I have heard it from sheep farmers—that all the animals pass through a mild attack of the disease.

20064. How did you proceed to deal with it then, when you had all these facts before you?—The method of dealing with it was that we got the organism in a pure state first of all, and isolated it in a pure condition, and after that grew it artificially. We grew it from the peritoneal liquid when it was very abundant, the abdominal liquid, we may call it, and then this was administered as a drench.

20065. That means as a liquid?—Yes, poured over the throat of the animal.

20066. Administered by the mouth, you mean?—Yes.

20067. And at any particular time of the year did you do that?—Yes, at the time when sheep are practically immune from the disease, in the month of August.

20068. Have you carried out your experiments on those lines for any length of time—that is to say, having discovered the bacillus, having ascertained

that the only mode of prevention was by administering a drench of this culture, did you experiment with this drench?—That is so; we have experimented for several years progressively—experimentally I mean—in so far as we might modify the method and study what the effect would be over a whole braxy season.

20069. And ascertaining what would be an effective dose, I suppose?—Yes, ascertaining what would be an effective dose, and in what form the bacillus ought to be administered, and so on; all these things we had to work out experimentally.

20070. At present do you consider that you have arrived at success?—Fair success, but by no means what we anticipate in the way of still further progress.

20071. I suppose all this was done by experiments upon living animals?—Yes.

20072. What animals?—Sheep, and other animals as well; rabbits and guinea-pigs, but chiefly sheep; almost entirely sheep.

20073. Do you consider that you have arrived at a true immunising remedy?—There is very good evidence to show that we have. What is defective still is apparently the method of preparing it. I think we can prepare it in the spore stage instead of the bacillary stage, and if so, there will be a much better chance of its immunising the animal.

20074. How many sheep have you administered this preventive to in the course of last year?—During August we treated, I think, some 13,000, and in the springtime, in February of this year, I think some 4,000; something like 17,000 odd have been treated this year.

20075. Are you speaking of braxy, or both braxy and louping-ill?—Both braxy and louping-ill.

20076. You treated them both in the same way?—In one line of treatment we did. A very important point was to make out experimentally whether one could immunise an animal to braxy and louping-ill at the same time, as that would mean that one could treat the animals at the same time and save the farmer gathering his sheep twice or three times a year; and these experiments are still going on.

20077. You say that you administered this drench to 17,000 sheep. I suppose you rather look upon it as medical treatment of them?—Yes, that is the view we take of it.

20078. But for the purpose of obtaining the right dose, and seeing what the effectiveness was, and so forth, you experimented upon certain sheep in the first instance?—Yes, individual sheep in small numbers.

20079. About how many?—I do not know that I could give you the figures exactly from memory.

20079A. Was it 50 or 100?—Sometimes we have used 50 or 100 sheep, or more, I dare say.

20080. Were any of those killed by the experiment?—That depended upon the nature of the experiment a good deal. In the case of subcutaneous inoculation we certainly killed a good many. There is no doubt we did.

20081. That was a line which failed?—That was a line which failed, but by administration by the mouth, if given at the proper time of the year, I do not think I can recall any death that we had from that method.

20082. Did the animals seem to take the disease to a certain extent; did they seem to be made ill by it?—Yes, sometimes they would remain ill for a day or two in the case of louping-ill. One proprietor described it as if they were all intoxicated. He thought they were all going to die, but he said, most remarkably, they all recovered, and he did not lose a single one of them.

20083. After you took to this method of administering the preventive by a drench instead of subcutaneously, there were practically none lost, I understand?—I do not think so. I do not think I can trace one. At any rate, in this present year's experiments I have had no complaints of that kind whatever.

20084. Now to what extent can you say that you have ascertained any benefit to the flocks—that is to say, to what extent, if any, do you consider that you have suppressed this disease?—Perhaps it will serve your purpose if I give you an individual instance.

20085. Yes?—A proprietor on the west coast of Scotland, who was determined that he would see the experiment carried out properly, took the very greatest pains. I may tell you that it is very difficult to get these experiments carried out as one would wish among sheep-farming people; but, being a man of education, and determined to see the thing out, he made the crucial experiment of drenching 400 sheep.

Hamilton.
17 Dec. 1907.

20086. Were those the whole of his first year sheep?—He had 20 others, and that comprised his whole stock of 420. They were put under exactly the same circumstances, the first lot treated against braxy, and the second lot in its natural state. Of the 400 drenched sheep he lost 30 up to the end of May, many of them, it was said, from louping-ill. I examined the peritoneal liquid from the carcases of 11 of these, and could not discover that there were any deaths from braxy, or only two, which were doubtful.

20087. Do you mean he lost 30 from all causes?—Thirty out of 400 he lost from all causes; whereas in the case of the 20 undrenched sheep he lost 19.

20088. (*Mr. Ram.*) Were they examined after they were dead?—Yes, I examined a large number—not the animals, but the liquid from the abdomen. I got the liquid from the abdomen, and had it very carefully examined.

20089. What did it show?—It showed that they died from several other diseases, and very few, if any, from braxy.

20090. Of the 30?—I was speaking of the 30. Of the others there is no doubt there was any amount of it. That has been my invariable experience. If one has a chance of comparing two lots like these, in the one case the number of braxy cases you get is something appalling.

20091. Can you tell us what proportion of the 20 were proved after death to have died of braxy?—I am sorry to say I have not got my figures here, and perhaps I should not enter too fully into that matter as yet, as I shall have to report to the Board of Agriculture first about my year's experience.

20092. Did you examine them yourself?—I did.

20093. And did you find that a considerable number of them showed symptoms of braxy?—Yes.

20094. (*Chairman.*) Do I correctly understand—I want to have it clear—that you examined the 11 that died out of the 400 that were drenched?—Yes.

20095. And you also examined the whole of those that died that had not been drenched?—No.

20096. Take first the 11, please. The 11 you did examine?—I examined as many as possible. I provided the shepherds with means of sending in the liquid, but a shepherd, as I daresay you know, is rather lax, and it is very difficult to get him to pay attention to a thing of this sort. I got as many as I could.

20097. You examined most of the 30?—Eleven of them.

20098. I did not quite understand. Did you find any trace of braxy in any of the 11 that you examined?—I think there were two cases, so far as I remember, I do not remember more, and even these were doubtful.

20099. And I think you said the whole of those that were undrenched died?—Well, 19 of them.

20100. Of those, when you say the whole died, about how many were there?—Twenty.

20101. How many of these 20 did you examine?—I really cannot tell you.

20102. Did you examine half of them, or a quarter of them?—I should say something like a quarter of them.

20103. What did you find in those cases?—In those cases I found braxy bacillus constantly occurring in the liquid sent in.

20104. What do you mean by constantly—that you found a great many bacilli in each, or you found some free of bacilli and others apparently killed by them?—Some free from the bacilli of braxy, others containing it.

20105. You mean in many instances amongst those you examined?—Yes. It is a very complex question, and I see you are a little puzzled about it. I should tell you that there are some braxy-like diseases which are continually called braxy among farming people, but these differ from braxy in the scientific sense of the term, and a certain proportion in each case, both of the 400 and of the 20 died from these braxy-like diseases, with which we had nothing to do.

Mr. D. J. Hamilton.

17 Dec. 1907.

20106. It is a complicated matter, and I agree that the distinction between braxy and braxy-like diseases are too complicated for me. I want to know, did you ascertain to your satisfaction whether three dozen or so sheep out of the 20 that you seem to have examined died from the disease which your drench was intended to prevent?—Certainly a large proportion had died from braxy in the proper sense of the term.

20107. You say a large proportion of the 12?—No, of the 20.

20108. But you only examined one-quarter of the 20?—Yes; a large proportion of them did not come under my own observation. I could only take the word of the shepherds of the total mortality.

20109. As regards the remainder of the 20 that you did not actually make a *post-mortem* examination, did you see any symptoms that that was the disease that they died of?—I did not. It was a long distance off, in a wild district.

20110. Then I must ask you generally, you have given us a particular instance which, I suppose, was as good an instance as you could get for the purpose of ascertaining?—Yes, a very good one.

20111. What conclusion did you come to as to whether or not you were on the right track?—We came to the conclusion from the returns that we got, the evidence we had heard, and the examination of the peritoneal liquid, that, with certain exceptions, the mortality in those cases treated by us was considerably lower than in those which were not treated.

20112. When you say with certain exceptions, what do you mean; do you mean on certain farms?—On certain farms where, apparently, the disease that they suffered from was not braxy at all—it was very often a disease known as blackquarter, but which they call braxy very often in a loose sense of the term.

20113. Was your prophylactic intended to meet the case of blackquarter?—No, not in these particular instances that I am referring to.

20114. Now as to the experiments which you performed; were the experiments made on the farms?—They were made on the farms and also made in licensed premises that I have in Aberdeen.

20115. The others on the farms?—On the farms a large proportion—the majority, in fact.

20116. You were acting then for the Board of Agriculture, I understand?—I was.

20117. And had you a licence for performing them on a farm?—I had.

20118. I think we have heard so much evidence about the amount of pain that is caused—if it be called pain—by mere inoculation experiments, that we need not trouble you about that; but as regards the consequences when you were giving the disease to the animals as a preventive, did they seem to suffer at all from it?—Not the slightest when administered by the mouth, with the exception of their being a little upset for a day or two, and giddy occasionally, but only occasionally.

20119. You have told us roughly the number of sheep that you had to operate on in these experiments; can you tell us what the number of sheep was that died from braxy and louping-ill, on an average, in the years that your inquiry was going on—say in 1901, 1902, and 1903?—It is very difficult, of course, to say; it varies in different years, and it varies on different farms, but as a general statement you may say, as I think I mentioned before, from braxy 15, 20, 25, 50, and 80 per cent., or even total annihilation.

20120. I was not asking you the percentages; you gave us those; but is there any return made to the Board of Agriculture of the actual number of sheep—the thousands of sheep that died from these two diseases, say in the years 1901, 1902, and 1903. Did 500 or 5,000 die in a year. I do not know what 25 per cent. of the sheep in Scotland is. Sir John McFadyean tells me there are no statistics?—If you mean statistical returns, I do not think there are any.

20121. But the number of sheep fed upon these parts where braxy prevails, I suppose, amounts to many thousands?—Yes; it must be enormous.

20122. So that if your experiments were successful, even to the extent of reducing it 5 per cent., that would mean a great many more lives saved than were lost by your experiments?—Certainly; enormously so.

20123. (*Colonel Lockwood.*) All these experiments, of which you have conducted a very large number, were conducted under licence?—Yes.

20124. Were the 13,000 sheep treated experimentally or not?—No.

20125. Do you claim that before you began the experiments on the sheep you had tried any other means of investigation?—In what way? I do not understand exactly what you mean by investigation.

20126. I mean by watching their symptoms or trying to discover by any other means except experiment on a living animal?—The first thing we set ourselves was to examine the symptoms and note those with the very greatest care, the *post-mortem* changes, and so on, but as I have explained in evidence already, it was always too late, we could not get any further with the inquiry, and it was necessary to resort to experiment to elicit further knowledge.

20127. Do you claim that by those experiments you have obtained any satisfactory results?—I think we have got extremely satisfactory results. Were it only that we now know something definitely about the nature of the diseases which stimulated inquiry, it would be an enormous result. But I think we have got more than that, I think we are on the lines calculated to prevent the diseases.

20128. But you do not claim yet to have discovered any cure?—I do not think, as I explained before, that you can cure these diseases. I have never seen anything that did the animal any good when once it was attacked by braxy.

20129. Do you claim that these experiments of yours have produced a preventive?—I do.

20130. (*Sir William Church.*) Is anything yet known of the life of these bacilli outside the body?—There is a great deal known about them.

20131. I meant whether any experiments had been made with soil or any form of vegetation to see whether they can maintain their life?—That has all been worked out. One of the original ideas, I remember, so far back as 1882, when I began working at these diseases, was that there was something contained in the soil or the nature of herbage, which was the cause of them. The Highland and Agricultural Society appointed a Committee to investigate that among other things, with the result that nothing of the kind which you refer to has been discovered from the herbage point of view.

20132. I meant that at present you do not know whether this bacillus continues to live and grow, and probably go through the state of sporification in the soil?—It is voided in the soil; the spores are voided into the soil through the manure, and through the carcases of the animals, in enormous numbers, and I know this, so far by experiment, that I have kept such spores in their natural habitat, in the natural liquid of the body, for from five to six years in full virulence. I might illustrate this by an experiment which we performed over and over again, and which bears upon the question you have asked me, that of taking a sheep from what we call a "clean" farm, where there is no disease known, louping-ill let us say, where they are perfectly free from it, and bringing these sheep on to a louping-ill field or a braxy field, you will find that two-thirds of them will be dead—if it is the proper season of the year—within ten days afterwards.

20133. And that, of course, is your reason for thinking that it is impracticable by clearing the ground for a certain time of sheep to get rid of the disease?—I will not say that. I will not go so far as that. If you could put cattle on for something like a matter of 50 years or 100 years, I should not wonder (Sir John McFadyean will, perhaps, bear me out) that the ground might be cleared under those circumstances.

20134. I should like to be quite clear about your experiments—not as to the cases treated medicinally, but your experiments. I understand that of those that were drenched 30 died, and some of those you examined and verified yourself, by finding the bacillus, that they died of braxy?—In the undrenched ones.

20135. Out of the number all of which died, you personally only examined a few of the bodies?—A few of the animals. The drenched ones were sent in to me especially, because I had given instructions that they were to be sent in; the others, the undrenched ones, were sent in more at the will and wish of the proprietor.

20136. But in the case of the 20, 19 of which died, those who were present and observing them during their illness thought it was braxy?—Yes.

20137. And by saying that you do not know that they died of braxy, you simply mean that you had not an opportunity of verifying it by finding the organism?—That is so; they were quite of opinion that they died of braxy.

20138. (*Sir William Collins.*) May I take it that the evidence that you have been so good as to give the Commission this morning is offered by the University of Aberdeen as an example of the valuable results which may be obtained by experiments upon living animals?—That is so; the Medical Faculty thought that perhaps you had not had so much evidence of this kind as bearing upon the brute creation directly, and that possibly it might be acceptable to you on that ground.

20139. Did I correctly understand from you that there are several contagious diseases of sheep, between which it is necessary to discriminate?—Yes, that is so.

20140. How did you find the organism in the case of braxy; was it by microscopical examination of the intra-peritoneal fluid?—You find it in braxy all over the body, especially in the peritoneal cavity. If there is any part of the body where you find it, it is in the peritoneal cavity.

20141. By microscopical examination?—Yes.

20142. Did you cultivate it on various media?—Yes.

20143. Are the other diseases from which you consider it necessary to discriminate braxy, those of blackquarter, malignant œdema, and louping-ill?—That is so, these are among them.

20144. May I take it that you have the means by bacteriological investigation of discriminating accurately between those four diseases?—I think so. They belong to a family, doubtless, and they have certain points in common, but by the method of culture and one thing and another, we can distinguish them with great readiness. I will not go so far as to say that there do not occur exceptional cases where I should be in doubt, but usually by means of prolonged culture and inoculation more particularly, they can be differentiated.

20145. Should I be right in saying that an expert ought in any case to be able to discriminate accurately between louping-ill, braxy, blackquarter, and malignant œdema?—I think so.

20146. Did I correctly understand you to suggest some possible relationship between braxy and anthrax?—I should not wonder if they belong to the same family. I will not say that it has anything to do with anthrax, or any anthracoid diseases; but in the manner of growth, and one thing and another, it has in some respects a resemblance to anthrax.

20147. If these be four separate diseases, should I be right in thinking that it would be necessary to employ different methods of protection against each of them?—I have tried protecting against the whole of them simultaneously.

20148. Has it been successful?—I do not know yet; it is being tried this year.

20149. Do you mean by administering some polyvalent dose?—Yes.

20150. Would that be mixing the preventive fluids against the four diseases?—Yes.

20151. But would a preventive fluid that was good against braxy be good against blackquarter?—No.

20152. Or *vice versâ*?—No. I do not think so, at any rate, my experience leads me to suppose that it would not be.

20153. You think that a prophylactic which was found to be good against blackquarter, could not be relied upon as protective against any of the other three?—I think so.

20154. There has been some confusion, has there not, in the minds of some investigators, as to these four diseases which you regard as distinct?—There is a very great deal of confusion. I think the matter wants clearing up.

20155. Has your attention been called to an outbreak that occurred on Romney Marsh?—Yes.

20156. What was the nature of that disease?—It was what that call "struck."

20157. Was that a case of braxy?—No, not what I saw of it, at any rate; the cases I saw of it were not braxy certainly. Everything else points to its not being braxy.

20158. Was it blackquarter?—I do not know; I have not had sufficient experience of it. I have not seen a sufficient number of cases. I went down to Romney Marsh and investigated it there as well as I could, but I have not had sufficient experience to say whether it is blackquarter or not.

20159. I see on page 9 of Part I. of your Report it is stated: "The disease has been pronounced by Principal McFadyean to be blackquarter"?—I do not know whether Sir John is of the same opinion still; but it is quite possible that it is blackquarter. I do not know, I would not like to say that it is not, possibly it is; only it did not look to me as if it was blackquarter.

20160. After considering that suggestion, I see on page 10 of your Report the Committee say: "The question of louping-ill being blackquarter in the sheep may, therefore, be put out of court; the two diseases are opposed to each other in all essential respects"?—Yes, I think the view is quite untenable.

20161. Then I see on page 27 of the same Report you say, "We must sound a note of warning, however, as to the result to be anticipated"; that is in regard to preventive treatment?—Yes.

20162. "Let it be clearly understood that our treatment is projected against louping-ill and nothing else. One of the first objects to be ascertained is whether the mortality upon a particular farm is caused by louping-ill or by one or more of the many other contagious diseases of the sheep which are so often associated with louping-ill and mistaken for it. Thus, we have found that malignant œdema prevails in many districts, and has been confounded with louping-ill over and over again, even by the most experienced sheep-farmers and shepherds. This is quite excusable, seeing that the symptoms of malignant œdema might easily be mistaken for those of acute louping-ill. Then stray cases of braxy and of the braxy-like diseases occur among sheep during the louping-ill season, and particularly among those which have been wintered on the east coast of Scotland, and which have returned in the spring to their native pastures in the West Highlands. The confounding of these with cases of louping-ill, of course, tends to vitiate any results obtained by our method of prevention." They think it is necessary to draw attention to that?—Yes, we discovered that frequently.

20163. Then I see you go on to say, "The problem of the prevention of the contagious diseases of the sheep is a large one, and will most likely require years of patient observation and experiment before it will reach perfection. Those which are most destructive in this country are closely related, and hence there is good reason for believing that they may be combated upon the same principles as those which have proved so effectual in the case of louping-ill. It may turn out that the sheep can be immunised to several of them at the same time." Those are the experiments you were referring to just now, I suppose?—Yes.

20164. You say, "In the meantime, however, we would beg those interested to exert a little patience, and not to draw conclusions, at present, from what may seem to them, in certain instances, a disappointing result. The pathology and prevention of this class of diseases of the sheep is far more intricate than the ordinary layman may suppose, but we feel assured that we are on the path which will ultimately lead to a successful issue"?—Yes, that is so.

20165. Am I right in gathering from that that you regard the matter as still *sub judice*?—Certainly, the matter of treatment or prevention.

20166. I think you called attention in your second report to the curious bactericidal power of sheep's blood?—Yes, that is so.

20167. Which I think you say varies in different seasons of the year?—Yes.

20168. That, I suppose, would introduce a rather complicating factor in any preventive treatment?—Most complicating.

20169. You state, I see, in the second part of your report, on page 239, among your conclusions, "The blood of the sheep at certain seasons of the year is eminently bactericidal to certain disease microbes which are the causes of most of its contagious diseases, while at other seasons it loses this property, more or

Mr. D. J. Hamilton.

17 Dec. 1907.

less completely, and becomes an excellent medium for their propagation?—Yes.

20170. That must be rather a confusing factor?—It is a most confusing element; it vitiates experiments; experiments may be negative or positive, according to the season at which they are performed.

20171. Then I see on pages 201 and 202 of your second part you say, "This, however, seems fairly clear, namely, that animals in good condition are more liable to braxy than those poorly nourished. But even in this respect there are endless sources of fallacy. Is it, strictly speaking, braxy that these well-fed animals die from, or is it something else which has been mistaken for braxy? Is it so-called 'blackquarter,' for instance, or is it the disease known as 'struck' or, finally, is it a disease hitherto unrecognised? To commit one's self to such untested statements would be productive only of further confusion where confusion is already rife." Should I be right in thinking from that that it may turn out, after all, that blackquarter and braxy are the same?—No. The term "braxy" in the bucholic mind is one applied with a very wide margin; a shepherd will tell you that there are all kinds of braxies, red braxy, white braxy, water braxy, and so on, these all representing different diseases.

20172. I see you proceed on the same page to say, "All these crude and untutored notions seemed, in our estimation, quite inadequate to account for the seasonal character of the contagious diseases of the sheep. We felt there must be something deeper, probably something peculiar in the constitution of the sheep, in all likelihood something reaching far back in the animal's ancestral history which was at the foundation of this seasonal peculiarity"?—That is so.

20173. Some constitutional peculiarities, I apprehend, irrespective of any microbic invasion?—Yes, quite.

20174. Have you formed any opinion as to the method of communication of the disease from sheep to sheep, whether by tick or otherwise?—I have.

20175. Would you be so good as to state it?—We made a great many experiments with the tick to see whether we could communicate the disease through the bite of the tick.

20176. (*Chairman.*) Which disease are you speaking of?—Louping-ill. There was a prevalent notion that louping-ill might be conveyed by the bite of the tick, probably from the fact that the tick appears parasitically in the sheep at the same time as louping-ill, both in the spring months, and accordingly we had to see what truth there was in that opinion. I may say that in some of the most pronounced cases of louping-ill that we saw the sheep had not a single tick upon it, nor a single tick bite. Others were covered with ticks, but never did we see any evidence of the virus being inoculated from the point where the tick had bitten. We showed experimentally that if you tattooed the skin of the sheep with a little of the virus of louping-ill you could produce louping-ill, and you produced a local lesion, a lesion very much like that found in blackquarter sometimes; but never in any instance did we see the disease spread from a tick bite as in the case of this superficial scarification.

20177. (*Sir William Collins.*) You think the tick may be dismissed then as the medium of conveyance of the disease?—No, there is one method by which I think it may under rare circumstances (but so rare that it may almost be put out of account), become the means of conveyance, namely, when the tick is swallowed. The tick crawls all over the soiled parts of the fleece, and becomes smeared with the fæcal matter and so on, from the moist parts of the skin, and under the circumstances I can quite well conceive that it might convey the disease when it is swallowed by the sheep.

20178. Then the evidence points to the fact that the disease is communicated by ingestion rather than by inoculation?—Certainly.

20179. In your earlier observations did you find that the slaughter of the animal in the earlier stages of the disease was the best mode of finding the cause or by allowing the animal to die and examining the carcase?—By allowing the animal to die; but never in any instance when I examined the peritoneal liquid in an animal killed during the height of the disease, did I fail to recover from the peritoneal liquid by incubation the same bacillus as that which I found so constantly.

20180. I see on page 51 of the second part of your Report you say, "We discovered, however, as time went on, that the killing of the animal was an entirely mistaken procedure"?—Yes, if you want to investigate the disease.

20181. May I ask what was the earliest date of the administration of drenching?—I think there were some preliminary experiments which we made (I am open to correction) in the years 1903 and 1904. 1903, I think it would be, when we begun.

20182. When did you first try it on a large scale?—We went on increasing the number year by year up to the present time.

20183. Have you formed any idea as to the duration of the alleged immunity?—In braxy it seems to last the life-time in the majority of cases. As in the case of small-pox, you will find exceptions here and there; but in the case of braxy I think it will last the natural life, or the commercial life of the animal, at any rate—quite sufficiently long for commercial purposes. I am not so sure with louping-ill whether that is so. Two-year-old sheep take the disease, and it is said sometimes take it twice. I do not think, in the case of louping-ill, it is quite so lasting, although it tides the animal over the louping-ill season, and that is the great point.

20184. When you speak of the duration of a life-time, what period have you in your mind?—From two to two and a half years, that is to say, in the case of an animal for slaughter.

20185. Referring to the particular case of the 420, when the 400 were drenched and 20 were not drenched, has it been the subject of an official report?—Not yet; we are getting the report ready. It has been a most arduous matter to procure all the details of such a report, and we are trying to render it as accurate as possible, to sift out the kernel of truth from the many statements sent into us; it will be presented to the Board of Agriculture before many weeks. I have it nearly ready.

20186. I was wondering whether it was in a form in which you could favour the Commission with it?—I do not think so. I must present it to the Board of Agriculture first.

20187. I did not quite gather your evidence in regard to the 30 out of the 400 that died. I understood you to say that they died of various things, including accidents?—Yes, various things.

20188. In the case of how many of those 30 was the peritoneal fluid presented to you for examination?—I have not got my note-book with me bearing upon that particular subject; but I think I made up the number when I got the details returned to me to be eleven.

20189. Including those cases by drowning?—I do not know. If you take the total mortality you must always leave a margin for drowning—and all sorts of accidents.

20190. But I understood that the 30 included all these casualties?—Yes.

20191. I was wondering how many of the 30 were submitted to you for examination?—Eleven.

20192. Were there any casualties among the 30?—I cannot tell you definitely. I would not like to commit myself upon a matter of that kind. I cannot remember at present.

20193. Do you think that you examined one fourth, as I understood you to say to the noble Chairman, of the 30 that were undrenched and died?—I would not like to say. I could not commit myself to any figures definitely. I am only speaking from memory.

20194. You prefer not to commit yourself to any precise figures?—If you please. I must present them to the Board of Agriculture first. I would like to have my figures before me before I say anything further about it.

20195. (*Sir John McFadyean.*) These investigations of yours have been followed with great interest, I understand, by the agricultural community of Scotland?—They have.

20196. And so far as you know the line of investigation that has been pursued has had their approval?—Yes, it has had their approval with certain failures in certain districts.

20197. I was not referring to that. I mean that they do not disapprove of the fact that you have

attempted to solve the causation and method of prevention of these diseases by resorting to experiments?—Very far from it.

20198. Is there an Anti-Vivisection Society located in Scotland, do you know?—I think there are some ladies inclined that way.

20199. Have they formed themselves or been actually constituted into a society?—I do not think so.

20200. So that no opposition that you are aware of has been raised to your experiments?—No combined opposition. I think many persons hold very strong views upon the subject, and they may have individually complained. I do not think there is any society of that kind, so far as I know.

20201. It has been suggested here by various witnesses that experiments on animals with a view to extend knowledge with regard to human or animal disease ought to be absolutely prohibited by law. What do you think would be the general feeling of agriculturists in Scotland with regard to such a proposal?—I would not like to speak for the agricultural community, but from conversation and wide experience that I have had with intelligent farmers, I think it would be perfectly disastrous; it would raise a *furore* among the intelligent agricultural population were you to attempt anything of the kind. That is my impression.

20202. You are pretty well in touch with agriculturists?—Yes, I have seen a great deal of those interested in sheep farming at any rate.

20203. (*Sir Mackenzie Chalmers.*) Do I correctly understand that you in giving evidence to-day represent the University of Aberdeen or the Medical Faculty of Aberdeen?—Through the Medical Faculty you may say I represent the Aberdeen University. I do not think the matter came before the Senatus, but we had it up at the Faculty and discussed it there on two separate occasions.

20204. May I ask if the Faculty are unanimous or not on the subject that experiments on living animals are necessary?—Perfectly unanimous.

20205. I take it as regards these experiments that you performed that your licence enabled you to experiment on unspecified farms, that is to say, where the disease was, as well as in a laboratory?—Yes, what is called a travelling licence.

20206. Without a travelling licence could you have effectively experimented?—I could not; I should have been breaking the law had I done so.

20207. When you are dealing with animal diseases spread about over the country, is it essential that the experiments should be performed where the disease is found?—Absolutly essential. I would not trust to laboratory experiments exclusively on a matter of that kind. My experience is dead against that line of inquiry being final.

20208. Would there be this further danger that you would have to bring infected animals from a long distance to the laboratory, which would in itself be a danger?—We would not be allowed to transport the animal.

20209. I may take it that your opinion generally, and the opinion of your Faculty, is that animal experimentation is a necessity if any progress is to be made?—Most certainly; I think that is their unanimous opinion, so far as I am able to speak for the Faculty.

20210. Is there any opposition in Aberdeen itself to animal experimentation?—Very little.

20211. Is that within the University or outside?—Even outside.

20212. (*Mr. Ram.*) You have told us that you discovered the nature and the cause of these two diseases that you were experimenting for by administering to living animals a portion of the fluid from the intestinal tracts of diseased animals?—Yes, and from the abdominal cavity also.

20213. You had, before you tried that, been endeavouring for a considerable time, I believe, to ascertain the nature and cause of the diseases?—That is so.

20214. And so far as investigation of dead animals went, had you failed to discover them?—Certainly.

20215. In your opinion would it have been possible that you could have discovered what you have otherwise than by making use of living animals in the way you have described?—I do not think so.

20216. At any rate you had for years been endeavouring to ascertain the cause without success?—I will not say for years. Two sets of observations were going on relatively, observation of symptoms and *post-mortem* phenomena, and so on.

Mr. D. J. Hamilton.

17 Dec. 1907.

20217. And for how long have you been endeavouring to deal with the disease?—It is very hard to specify any time, but in the case of louping-ill you may say for three months—I do not know now I could express it to give you an idea. The two things were going on very much at the same time, although experimentation came on after we had discovered that there was something to work with.

20218. Then it was not, as I imagined your evidence to be, that you had been searching for years, but you had been searching for a considerable time?—I would not say for years.

20219. I think you told us that you were first put upon the idea of immunising the animal from finding in the case of braxy that a sheep which had survived the first year was practically free from the disease?—Yes.

20220. Therefore in seeking to immunise the animals you were following the law that nature gave you in that respect?—Yes, we were.

20221. Is there any official return of the number of sheep kept in Scotland year by year?—I really do not know; I do not think so.

20222. There is none that you know of?—No.

20223. Is there anything by which you can say that the disease has been diminished greatly, either louping-ill or braxy, throughout Scotland in the last year or so?—Nothing whatever, so far as I know, except mere local evidence—nothing on a general scale affecting the whole of Scotland.

20224. You gave us an account of 350 or 400 sheep, some of which were drenched and some were not. Were there other experiments made in other parts of the country besides that one that you told us of?—Yes.

20225. Have you had any result of such other experiments?—We have.

20226. Do they generally give the same result that you told us attended that 400?—With certain exceptions here and there on particular farms and in particular districts, the returns, so far as braxy is concerned, have shown that the mortality in the drenched is very considerably lower than in the undrenched.

20227. I gather, then, that you think you have yet much to learn?—We have a very great deal to learn, I consider.

20228. Do you think that what you have learned in consequence of your investigations has been on the right lines?—Yes.

20229. And you hope that you may yet learn so much more as to effectively combat the disease generally, and what I may call commercially?—I hope so. I am thoroughly confident that we will do so.

20230. Do you find that farmers generally willingly lend themselves to this attempt to immunise their sheep by drenching?—I have not had the slightest difficulty. I have had every encouragement from farmers. I say it to their credit that they behaved extremely well under the circumstances.

20231. Is the method of administering the immunising material by drenching a process which can be done by a less skilled person than would be necessary for inoculation?—Yes, a shepherd could do it perfectly well.

20232. A shepherd, of course, is continually practising drenching?—Yes.

20233. Lastly, may I ask you this: When you were carrying on your examination to test the nature of the disease, did all the animals that showed symptoms of being contaminated with the disease show precisely the symptoms of the disease that you expected to find from the toxin you administered?—Yes, with this qualification—that in the case of louping-ill if you inoculate subcutaneously, usually the virus is so active that it kills the animal before the chronic symptoms come on; but should the animal live over a matter of four or five days, then it presents a picture of the disease. And in the case of braxy all the points are brought out.

Mr. D. J. Hamilton.
17 Dec. 1907.

20234. What I particularly wish to arrive at is this: Was the disease the symptoms of which they exhibited the specific disease that you expected to find, and not an analogous disease or a disease that might be mistaken for it?—Not only was the disease the same, but we recovered the same organism out of the tissues.

20235. (*Dr. Gaskell.*) I should like to be quite clear about this matter. I understand that your method of immunisation is to put into the alimenary canal the spores that are cultivated artificially?—We have not worked with the spores yet—with the bacilli.

20236. Is that the same thing as putting into the alimentary canal the same bacillus as the animal itself would take by feeding?—That is so.

20237. There is no attenuation caused by the method of cultivation?—Not to any extent. In the natural disease exposure to weather may have the effect of attenuating the organism to a certain extent.

20238. Then your method, I presume, is to give a mild form of the disease?—Yes.

20239. And so to cause immunity to it?—To give it at the time of year at which the animal is not subject to it.

20240. That is the whole point, is it, to give it at a time of year when the animal is not naturally susceptible to the disease?—Yes.

20241. And so to cause immunity?—Yes.

20242. If you gave it at other times of the year it would not be efficacious?—You would kill them in great numbers.

20243. You say that you tried inoculation experiments?—Yes.

20244. And you tried the method of attenuating in those inoculation experiments?—Yes.

20245. Did you at that time know the difference of the times of the year?—We knew that the particular diseases occurred in the sheep at different times of the year, but we had none of the specific knowledge that we gained afterwards through further experimentation.

20246. May I gather that those inoculations were not given definitely at the time of year when the animal was less susceptible?—Some were and some were not.

20247. Can you say from any records that you have whether there was any difference at all?—I remember that the first inoculations made with louping-ill were administered at the end of the louping-ill season—let us say towards the middle of June; but always afterwards, so far as I remember, we endeavoured to make the experiments during the time that the animal was not subject to the disease, with this exception—that I remember one instance, now that you ask the question, in which we made a subcutaneous inoculation of braxy during the month of November—in the middle of November—with the result that we killed nearly half of the animals, I think, that were experimented on.

20248. Do you suppose, then, that the failure of the inoculation experiments and the success of the feeding experiments were due to the activity of the mucous membrane in the alimentary canal, or something of that kind?—That is one of the deepest questions, I think, in the whole of biology. How these particular organisms act is a matter so complex that I really prefer not to enter upon it.

20249. What I want to be clear about is—are we to understand that the failure of your inoculation experiments and the success of the feeding experiments tend in any way against the value of inoculation experiments in other diseases?—Oh, no. I think you quite mistake what I said about the failure of inoculation experiments. They confer undoubtedly a certain immunity—there is no doubt of that; we proved that; but the difficulty was in the administration of the system in unskilled hands. It means that you would have to provide a skilled person to make the inoculations, that you could not trust shepherds to do this, and in that respect (a very formidable respect, of course) the method of subcutaneous inoculation naturally fell into disuse.

20250. There is just one other question I should like to ask you with respect to your University. Are you authorised to say whether the University desire the existing Act to continue, or whether they would like to see it modified in any way?—I cannot answer for the University as a whole, but I can so far answer for the Medical Faculty. It is my opinion, and I think it is the opinion of the Medical Faculty, that they would desire the existing Act to continue. I think, so far as I know, we are satisfied with the existing Act. I would not like to speak specifically for my colleagues, but I know that those with whom I have talked are quite well satisfied with the present Act and its administration, and we would have no objection to go on under the same circumstances.

(After a short adjournment.)

20250A. (*Dr. Wilson.*) With regard to all these allied diseases, the diseases that you provisionally designate A and B, as well as braxy and louping-ill, you would call them, I suppose, all bacterial infectious diseases?—Contagious diseases.

20251. Would you call them acute febrile diseases? Have you taken the temperature?—Yes, they are acute febrile diseases.

20252. So that, as regards the febrile symptoms, braxy especially bears some resemblance to anthrax?—In some respects it does.

20253. As regards temperature?—Yes, the temperature goes up very high sometimes. It may go up to 105, 107, and 108 sometimes.

20254. And during life have you ever been able to discover what I call the braxy bacillus in the blood?—We found it immediately after death.

20255. But during life?—No.

20256. Then in that respect it differs very materially from anthrax?—Yes, entirely; it is not primarily a blood disease.

20257. With respect to anthrax, is it not very essential that a specimen of the blood should be taken immediately after death has taken place; because it is contended that other bacteria invade the carcase?—If you mean in the case of anthrax, in my opinion, the blood should be taken immediately after death, for several reasons.

20258. Otherwise you could not depend upon the bacteriological diagnosis of the case?—The organism is apt to disappear some time after death. I should not say very apt, but it sometimes vanishes from the blood.

20259. Now, with regard to this bacillus in the intraperitoneal fluid, I take it from your Report that you never find it when the fluid is clear?—You do not find it microscopically in the case of louping-ill; usually if you kill the animal you have great difficulty in identifying the bacillus by mere microscopical examination; but if you incubate the liquid, I have never failed to recover it within a few hours after the incubation has commenced.

20260. Whether the liquid has been taken from a living animal or from a dead animal?—Yes.

20261. But you state also, I think, that you always find it microscopically when the peritoneal fluid presents an opaque appearance?—I do not know that I have ever failed to find it in such cases; and that has been strengthened by later evidence during the last 18 months or so.

20262. But would you not say that even during life, when the intra peritoneal fluid assumes that milky or opaque appearance, pyæmic changes had set up?—No, there is no evidence of pyæmia in the slightest degree.

20263. But when you get the peritoneal fluid of a milky or opaque appearance in ordinary cases of disease, would you not say that pyæmic changes had set up?—Oh, no, not necessarily.

20264. Not if you had febrile symptoms along with the appearance of the disease?—Not necessarily. It might be so. If you had a case of septicœmia to deal with you would very likely find a septic organism growing in the peritoneal fluid after death.

20265. But during life?—Yes, and even during life—in septic peritonitis or peritonitis from any cause.

20266. Then you get a milky or opaque appearance?—Yes, but that of itself would not be sufficient to diagnose what the milky or opaque appearance was due to, it may be due to difference causes.

20267. May I ask what interval of time usually elapses before you receive any of these specimens?—It varies very much; we try to get them as soon after death as possible. A great many cases were received, as I have stated in the case of louping-ill, immediately after death, and, in the cases of braxy also, but with braxy it is more difficult. I think about the longest interval that I remember intervening between the death of the animal and our examination of the carcase was something like a couple of days; I do not think more than that. But I have received braxy cases just as they dropped down dead—within a few minutes after the animal had died.

20268. You admit that all these similar diseases from clinical symptoms or ordinary observations are more or less allied, and it is very difficult to distinguish them?—Sometimes it is extremely difficult. I have known experts in the veterinary profession and among farmers, who have been deceived in cases which they thought they were perfectly certain about.

20269. Does it not sometimes happen that in passing the virus from animal to animal, with the specific bacillus, say, the appearance of that bacillus is very much modified?—I do not think so—not in the case of any of these diseases, at any rate, that we are dealing with at present? It comes out exactly the same as you introduce it. You will find in the peritoneal liquid or in the serus liquid of the inoculated lamb, or in the blood, the same bacillus as that which you inoculated, giving all the reactions of the bacillus that you have inoculated, and more vigorous usually than it was previously.

20270. So that from the appearance of the bacillus, microscopically and culturally, you contend that these diseases are essentially distinct diseases, notwithstanding their similarity?—Yes, and by inoculation.

20271. But in inoculating you state that very often with braxy the animal dies very suddenly?—Yes, it dies very suddenly.

20272. In those cases of sudden death, supposing that a rabbit has been used, could you distinguish that from death caused by, for example, in testing for ptomaines?—I do not know that the two cases are exactly parallel. A ptomaine is a very different thing; it is not a living poison. I do not think you could exactly draw a comparison.

20273. Except that there might be a sudden death of the animal in both cases?—Both may kill the animal very rapidly; but you can introduce the pure spores of any of these diseases mentioned in our Report, and you get the same organism out again in the animal which you inoculate and in a pure condition.

20274. But I am referring to other symptoms. If you inoculate them with the organisms the tissues of the animal will make a cultivating medium always?—Not always, very far from it sometimes.

20275. I mean in dead animals?—Yes, but in louping-ill sometimes you will find the result is the very opposite to what you suppose.

20276. They vary from different conditions of the blood, and so on?—Yes.

20277. It all depends upon that?—Yes.

20278. But you do find, as a rule, that if you inoculate into the peritoneum the bacilli thrive as in a medium culture?—Not always, sometimes. It depends upon the nature of the experiment a great deal and the nature of the organism that you introduce. I will undertake to say that at certain times of the year you can introduce almost any of the organisms in question subcutaneously into sheep, and will hardly kill the animal in a single instance.

20279. Referring again to the instance of louping-ill, that is jumping-ill?—Yes, louping is an old Saxon word: *chorea paralytica ovis.*

20280. You state that so long as the lambs are being suckled as a rule they do not take the disease?—Sometimes they do, but as a rule they do not. I have seen both mother and lamb affected with the same disease.

20281. Does that apply more to braxy? Do lambs suffer from braxy in the suckling period?—Braxy occurs at the time of the year when they have ceased to be suckled.

20282. That would show that lambs are more or less immune, would it not?—Oh, no. Hogs become more or less immune, but the lambs are very far from being immune.

20283. But they do not take it, you mean to say?—They do take it.

20284. What, braxy?—Yes, they take braxy. Not while suckling; they are away from their mothers at that time, weaned.

20285. Would not that be the time to administer your prophylactic? Have you tried feeding lambs with your prophylactic to see what the result may be?—Yes, August is the best month. We have tried all the months of the year, but August we find the best.

20286. At that time, before the lambs are weaned?—Weaning time is most convenient for another reason, because you have to consider the convenience of the farmer. August is most suitable, because he is weaning them, and he then gets them together.

20287. With regard to that lamb to which you refer in your Report, in whose *post-mortem*, if I may say so, you first discovered the habitat of the bacillus, was that a weaned lamb?—No, it was not; it was at the time of year when it was still following the mother.

20288. After the louping-ill?—Yes.

20289. Was it in an emaciated condition?—No.

20290. So that you could not say that it was improperly fed in any way?—Not in the very slightest degree.

20291. Do you think that these diseases are influenced at all by the amount of food which the sheep may be able to obtain at times?—In the case of braxy the better fed they are the more liable they are to it. I do not think that is the case in louping-ill, but in the case of braxy it appears to be the case. It is always the best member of the flock that is affected.

20292. Is there any relation between outbreaks of the disease and very severe wintry weather, for example?—There appears to be a certain relationship, but I do not know whether it is a direct one. It is always said that on a frosty morning animals are more liable to die from braxy. I expect that is more from the deteriorating influence the frosty weather has upon the general condition of the animal. Any change in the weather is said to favour braxy. I have seen the very worst outbreaks, however, in the most beautiful weather; but I think it may be admitted that any sudden change in the weather increases the mortality.

20293. Have you any idea of the incubation period of the disease?—It is almost impossible to say in the case of braxy. From the fact that you very seldom see the animal before it is advanced in the disease, or, at any rate, for some hours after the disease has commenced. But in the case of inoculation experiments the usual period is something like 24 or 25 hours. I expect in natural braxy it may be a little longer.

20294. In the Western Highlands, the South of Scotland, and the North of England, where the disease is more or less prevalent, they have these old sheep-folds, have they not?—Yes.

20295. Do you think that they influence the spread of the disease at all?—Practically on an infected farm they have the disease everywhere.

20296. But these folds are never changed?—Very seldom.

20297. Most of them are made of stone walls?—Yes, they are.

20298. So that during very severe and stormy weather, when the sheep are huddled up together in these pens or folds, you would call those conditions more or less insanitary?—But I do not think they huddle them up in severe weather at all. That is the very time that they do not huddle them up.

20299. But sheep must take shelter in the course of a storm?—No, they do not.

20300. What are the folds for, then?—For gathering in dipping time, mostly.

20301. Not for shelter?—No, the sheep lives out in the open unless it is buried in the snow, and then they dig it out—it is only in dipping time that they are brought in, or for castration, or anything of that sort.

20302. You make some reference in your *précis* to the influence of the Gulf Stream, but are you still of opinion that it can have any influence in the spread of these diseases?—It is quite likely that it may be a fostering influence.

20303. But braxy is also very prevalent in Iceland?—Yes.

20304. And in Norway?—Yes.

Mr. D. J. Hamilton.

17 Dec. 1907.

20305. And in certain parts of New Zealand?—I believe so, although I have no direct evidence bearing on the allegation.

20306. So that the Gulf Stream influence is not of general application?—I do not know; it comes pretty close to it. The waters of the Gulf Stream, as I understand, pervade directly or indirectly all round these shores.

20307. Do you think it is felt as far north as Iceland and the coast of Norway?—Indirectly, at any rate.

20308. You also state, I think, that even although the bacilli of these diseases may be found in the intestines, yet when the sheep are moved down into the lowlands, to be fed, say, on turnips or pasture, they never fall with braxy or louping-ill?—I would not say never.

20309. Well, hardly ever, I was going to say?—Much less often.

20310. It is seldom that cases of braxy or louping-ill crop up amongst the sheep when they are being fed on turnips?—Comparatively seldom, but I have seen it.

20311. Of course, you have found that inoculating with the bacilli, the vaccine, in braxy or louping-ill is attended with a considerable amount of risk?—Yes, it is.

20312. On account of the mortality?—Yes.

20313. But that in administering these bacilli by their mouth there is little or no risk at all?—If it is done at the proper time of the year.

20314. Have you made extensive experiments, say, during and before weaning amongst lambs, to ascertain whether that would have any influence upon it then?—That is the very time when it ought to be done, any time up to weaning time. That is the time in which the sheep is immune from practically all these diseases.

20315. I am referring to lambs. Do you feed the lambs with the prophylactic before weaning?—No, we cannot; they are too young, and they cannot be gathered.

20316. Does this prophylactic that you call drenching, scour or produce diarrhœa?—I have seen it produce a little diarrhœa sometimes, but not as a rule.

20317. In the natural disease, in louping-ill, or in braxy, do the sheep suffer from diarrhœa?—Sometimes they do.

20318. Then you would expect a considerable increase of bacilli, such as the coli bacilli, in the intestines if the sheep was suffering from diarrhœa?—Quite likely. It would depend greatly upon what the diarrhœa was due to, of course. The sheep is remarkable in this respect, that its intestine contains so few bacteria of any kind.

20319. I have seen it stated that in the intestines of animals in the Arctic regions no bacilli are discoverable; is that your experience?—I have no experience of this. I do not know. I know from examination of healthy sheep that the amount of bacteria found in the intestine is comparatively slight.

20320. Is not this prophylactic mode of yours unique in the bacteriological treatment of disease. I mean you do not know any other bacteriological disease, or bacterial disease, for which a prophylactic is used in this way?—The old method of drenching is not a new one by any means. It has been applied in veterinary practice for long.

20321. I mean to drench with a preparation or culture of bacillus?—The drenching has usually been performed, so far as I know, with some of the liquids of the body of the animal suffering from the disease, as in pleuro-pneumonia, for instance.

20322. Such method has not been successful?—The method of drenching has been employed for the prevention of pleuro-pneumonia of cattle, for instance, but I do not know that it has been applied to these diseases of sheep, nor in the particular way in which we employed it, by the method that I have described.

20323. Is not this drenching method applied in similar diseases in other animals?—I will not say that drenching has not been a method in use, but it has been applied empirically.

20324. But specific drenching?—I do not think so, but I would not like to be positive on the matter. Of late the alimentary canal has been looked upon as the source from which one can treat several contagious diseases and produce immunity, and much more so than formerly.

20325. In cholera, as of course you have heard, the cholera bacilli can be swallowed with impunity, and have been swallowed with impunity?—Yes; but I would not like to try it.

20326. I think you make reference to the system of preventive treatment followed in bye-gone days of drenching with the dung of pigs fed on the manure of sheep?—No, fed on the same pasture as the sheep.

20327. But do you not state that pigs may feed on the manure?—No, the pasture.

20328. Does that mean pasture covered with the manure of sheep?—Yes.

20329. Was your treatment suggested by that, or was it an induction from your discovery of the habitat of the bacillus in the digestive tract?—We supposed that this pigs' manure treatment of these diseases (which is a thoroughly empirical one), had nothing in it at first; however, the farmers were so positive about its virtues, that we made further inquiry into it, and after we discovered the intestinal habitat of the organisms we were dealing with, the explanation was afforded of how the pigs' manure might act as a prophylactic.

20330. Just because it might contain the bacillus?—That is so; the pig is always put out to feed upon the grass over which the sheep are grazing, the manure is collected after it has been upon the grass. The manure is filled with spores of some kind, most likely the spores which are the cause of the disease in the sheep, and if you administer the manure to the sheep you confer an immunity upon the animal. It seemed quite rational after that explanation was available.

20331. Now the bacillus, you say, was first discovered by Professor Nielsen in Norway?—The bacillus of braxy.

20332. Did he discover it in the peritoneal fluid?—No, not in the peritoneal fluid.

20333. Where?—In other parts of the body. You find it in the blood in some cases.

20334. But according to your experience you find it very seldom in life in the blood of living animals?—You find it pretty often in the blood of the living animal immediately after death.

20335. Did Nielsen also find it in the intestines?—Yes, he did, in the stomach, not in the peritoneal liquid. I do not think he ever examined that.

20336. Have your experiments been repeated by any Norwegian bacteriologists?—I do not know whether they have been repeated, but the Norwegian Government sent a representative over here from their Agricultural Department to interview me, and learn about them. Professor Jensen, also, from Copenhagen, is very much interested in the matter, and I have had a good deal of correspondence with him about it.

20337. But you cannot say that your experiments have been yet confirmed by other investigators?—I do not know.

20338. Have they been disputed?—I have had no evidence of their being disputed or confirmed, either one or the other.

20339. Of course, your inquiry is incomplete still?—Yes.

20340. Now as to the results, I suppose the farmer would look upon what I may call the total general mortality as the index of the healthiness of his flock without differentiating?—Quite so, they take a general view of the total mortality.

20341. In your statistics I see, for example, with regard to braxy, in your first series of 34, you have no deaths at all?—Yes, I think so.

20342. But you have deaths from other diseases—3 or 9 per cent.?—Yes.

20343. These other diseases, including the allied diseases to which you refer as A and B, which you have provisionally so named?—Yes.

20344. As well as malignant œdema?—Yes.

20345. Then in your second series of experiments you drenched 1,545, I think?—I think that is so.

20346. And the deaths from braxy amongst those amounted to 9, or 0.6 per cent., but there were 144 deaths from the other allied diseases or 9.3 per cent.—Yes.

20347. So that there is, even excluding the braxy, still a considerable mortality amongst the flocks?—There was at that time. That was the second year we commenced our operations.

20348. So that from statistics it is sometimes very difficult to obtain what you might call reliable results?—I confess that is the case. One requires either one way or the other to examine the data upon which your statistics are made up with the utmost care, and to repeat the experiment over and over again in order to be perfectly certain.

20349. I think you have also stated that your experiments have not been equally successful on the various farms on which they have been tried; the results have not been equally satisfactory, on some farms they have been satisfactory, and on others they have failed?—On certain farms—on the majority of farms—they have succeeded wonderfully well; on other farms they have been a failure; the mortality has been fairly high—not exceptionlly high, but fairly high—and apparently for a very good reason. The sheep were treated for one disease and they died from something else. We did not know what disease was present on the farm. I now always try to get an inkling of what diseases they have to begin with. Rationally, of course, one would consider that sort of basis at the beginning of the treatment on the farm.

20350. Now, with regard to the prophylactic itself, is it prepared by the Highland Society or by the Board of Agriculture?—It is prepared by myself.

20351. Is it distributed to the farmers free?—We have usually distributed it free until this last year, and, I think, part of the foregoing year (1907 and part of 1906), when we had to make a small charge for it. The applications we had were so numerous that the preparation of it was attended with a fair amount of expense, and we made a small charge for it, which they willingly paid.

20352. Then, I think, you say that these braxy carcases are still eaten with impunity in Scotland?—Yes.

20353. Do you think there is any risk yourself in eating that food?—There is no other animal except the sheep that takes braxy. I do not know that I would like to eat braxy mutton myself, but other people do. They eat it and it does them no harm, apparently. Dogs and other animals eat the carcases with impunity.

20354. But you would not think that there would be the same immunity attaching to eating meat from a tuberculous animal?—I would not like to give an opinion on tht subject at all. That is a matter *sub judice* at present.

20355. It would depend upon the amount of the disease, I suppose?—I do not know. I really would not like to express an opinion upon the subject.

20356. But you yourself have carried out investigations with regard to tuberculosis?—I have.

20357. Do you believe in tuberculin, as a diagnostic agent, as a very reliable agent?—Which tuberculin do you refer to? There are so many nowadays.

20358. The tuberculin used by veterinary surgeons?—You mean in cattle, as a diagnostic in cattle?

20359. Yes?—Certainly.

20360. Did they not find at Aberdeen that when using this tuberculin on tuberculous cows there was no reaction?—There are several circumstances that influence it. If an animal is far advanced in tuberculosis there may be no reaction, whereas a single tubercular gland sometimes will give a marked reaction.

20361. Have you ever tried it on young calves?—In what respect do you mean?

20362. In testing?—I do not know that I have.

20363. Would you expect a young calf to react?—I would expect a young calf to react. Certainly with an animal just out of the calf stage it is done often enough, and it reacts there.

20364. But the calves are free from the disease; they are not, as a rule, tuberculous?—Usually.

20365. Would you expect tuberculin to have a reaction in stall-fed cattle, cattle ready for the butcher?—I do not know that stall-feeding has anything to do with reaction.

20366. But supposing it were tried?—I do not exactly see the point of the question.

20367. Tuberculin I mean to say is exploited as a test for the disease. We know that it cannot be used in fairs or on cattle landed from America at Birkenhead, because they are in an unstable condition, although they may have no tuberculosis, and yet they will react. I want to know whether the experiment has ever been tried of testing stall-fed cattle with tuberculin, which are presumed free from the disease, to see whether those will react?—It is used for stall-fed cattle; they are tested with tuberculin.

20368. I mean cattle fed up for the butcher?—Do you mean a milk cow?

20369. No, any sort of animal, any sort of cow or heifer fed up for the butcher which is presumed not to be tuberculous?—I think so. I do not know why it should not. I have known it react.

20370. Even if the animal is not tuberculous?—No.

20371. So that it is not a very reliable test?—One of the most important points, with American cattle at any rate, is to know whether they have not been tested with tuberculin before you got hold of them. That is a very important point.

20372. (*Sir John McFadyean.*) Dr. Wilson understood you to say that such an animal might react, although it was not tuberculous; is that so?—No. I understood the question to be whether a stall-fed tubercular animal tested with tuberculin would not react. I have seen cases that failed to react, but what the cause of it was I do not know. I have seen a milk cow very far advanced in disease that did not give any reaction at all, or only the very slightest reaction; nothing you could swear by.

20373. (*Dr. Wilson.*) Do you know anything about sheep-pox?—Very little. It is a disease I have not had any experience of.

20374. There has been no prophylactic discovered for that yet?—I do not know.

20375. I am going to read you a passage from the evidence submitted by the late Sir John Simon, who, you know, was Medical Officer to the Local Government Board. This evidence was submitted by him before the last Royal Commission in 1876. Referring to sheep-pox, he says:—"By these experiments on sheep it has been made quite clear that the contagion of sheep-pox is something of which the habits can be studied as the habits of a fern or a moss can be studied, and we look forward to opportunities of thus studying the contagion outside the body which it infects." Has any advance been made since that evidence was given?—Do you mean in relation to sheep-pox?

20376. Yes?—I cannot tell you. I would not like to commit myself to any statement in the matter.

20377. (*Sir William Collins.*) Is there any organism recognised as the cause of sheep-pox now?—I do not know. I do not think so.

20378. (*Dr. Wilson.*) No more than there is in small-pox?—No.

FORTY-FIFTH DAY.

Wednesday, 18th December 1907.

PRESENT:

The Right Hon. The Viscount SELBY (*Chairman*).

Sir W. S. CHURCH, Bart., K.C.B., M.D.
Sir W. J. COLLINS, M.P., M.D., F.R.C.S.
Sir J. MCFADYEAN, M.B.
Sir MACKENZIE CHALMERS, K.C.B., C.S.I.
Mr. A. J. RAM, K.C.
Mr. W. H. GASKELL, M.D., F.R.S.
Mr. G. WILSON, M.D., LL.D.

Captain C. BIGHAM, C.M.G. (*Secretary*).

Sir GEORGE KEKEWICH, K.C.B., M.P., called in; and Examined.

Sir G. Kekewich, K.C.B., M.P.
18 Dec. 1907.

20380. (*Chairman.*) I believe you are a Member of Parliament, and Honorary Secretary of the Parliamentary Association for the Abolition of Vivisection?—I am.

20381. And you come here to represent the views of that Association at their request?—I do.

20382. I believe you do not profess to have any expert knowledge of either medical or surgical matters?—I have only the knowledge that an ordinary man of common-sense, I suppose, can obtain from reading. I have no medical knowledge.

20383. That is what I meant to convey by the word expert?—Quite so.

20384. (*Chairman.*) I shall ask Sir William Collins to be good enough to ask you the questions which arise upon your *précis* which you have sent in; he has been good enough to say that he will do so.

20385. (*Sir William Collins.*) At the request of the noble Chairman, I propose to take you through the *précis* with which you have furnished the Commission. I am sure that I shall not do it so effectively as his Lordship, but I will endeavour to obey the direction of the Chair. May I ask what is the object of the Association on whose behalf you appear?—The object of the Association is the total abolition of vivisection.

20386. What is the name of the Association?—The Incorporated Parliamentary Association for the Abolition of Vivisection. It is called the Parliamentary Association because its vice-presidents consist exclusively of Members of Parliament of the two Houses, and they include a great number.

20387. On what ground do they advocate the abolition of experiments on animals?—They advocate it on the ground that, first of all, they regard them as inhuman, immoral, and degrading, and a disgrace to civilisation; and, further, they consider that the experiments which have been made under the present Act, and which have been carried out at the expense of so much torture and so much animal life, have been practically unproductive of any beneficial result to the human race.

20388. Would not the latter statement involve some medical knowledge?—From a certain point of view it will; but I think that any man of ordinary powers of observation and common-sense can judge what results have been obtained from the experiments and researches which have been carried out.

20389. Have you considered the mode in which the Cruelty to Animals Act, 1876, was passed?—Yes. Its motive power was the Report of the Royal Commission on Vivisection, which sat in 1875, and was appointed in consequence of a strong public agitation on the subject. Horrible cruelties were reported to have taken place on the Continent, and vivisection was also in a less degree in vogue in this country. The fact that M. Magnan, a French physiologist, had performed the experiment of injecting alcohol and absinthe into the veins of dogs before a medical congress at Norwich showed that there was danger that the medical profession in England might become generally permeated by the vivisection propaganda. M. Magnan was prosecuted under the then existing law, and left the country.

20390. What was the date of that prosecution?—I think it was 1874.

20391. And under what Act then was the prosecution?—Under the Prevention of Cruelty to Animals Act, an Act that was known as Martin's Act.

20392. What was the result of the prosecution?—The result of the prosecution was nothing, because he left the country, so that I believe no conviction was obtained, but I have not been able to find out exactly what happened.

20393. (*Mr. Ram.*) Did he stand his trial?—I think not.

20394. (*Sir William Collins.*) It was a threatened prosecution only?—I cannot quite make out from the records on the subject what happened, but, anyhow, he left the country, and so no decision was arrived at.

20395. Then as the result of the deliberations and Report of the Royal Commission of 1875, was a Bill introduced into Parliament?—A Bill (now the Cruelty to Animals Act, 1876) was introduced in 1876 by Lord Carnarvon into the House of Lords, and read a second time, after debate, on May 22nd. In the course of his speech he said that under the then existing law only domestic animals were protected, that as to vivisection the protection afforded to those animals was insufficient, and that for animals which were not domestic there was no protection at all. I wish to call the attention of the Commission to the fact that Lord Carnarvon introduced this Bill as a Bill to afford further protection to animals. He said further that the Bill was intended to prohibit in express terms and as a general principle the practice of vivisection, but it allowed exceptions, for certain purposes of teaching, with anæsthetics, and for purposes of research, even without anæsthetics, but only in the most rare cases. Those were his words.

20396. Were any representations made to the Government by the medical profession at that time?—Yes; the Committee stage of the Bill was deferred until June 20th, in consequence of the action taken by the medical profession. Some hundreds of medical men attended a deputation at the Home Office in order to present a memorial with some 3,000 signatures, and the consequence was that, so far as the Bill was amended in passing through Parliament, it was altered in accordance with their views. I have been unable to discover from Hansard, which I have looked at, at

what particular point in the Bill the amendments took place. There was one amendment that was introduced in the House of Commons, which, I think, was in the interests of the medical profession, to the effect that no prosecution should be instituted without the consent of the Secretary of State.

20397. The Bill was brought into the House of Commons in August, was it not?—Yes, the Bill was brought into the House on August 10th; it passed through all its stages by August 15th, on which day it received the Royal assent, and Parliament was prorogued. I wish to call the attention of the Commission to the fact that the whole consideration given to this Bill in the House of Commons was five days; it passed through all its stages in five days. And I think there is no Member of Parliament who will not tell the Commission that that was a totally inadequate consideration for a Bill of this importance and character.

20398. Did the discussion occupy any considerable portion of those five days?—No, it did not, so far as I remember. There was a debate on Second Reading; there was a little said on the Committee stage, and the last stage passed through without any discussion at all; the fact being, of course, that it was a wearied House at the end of the Session; and as you, Sir William, know very well, members are very glad to get rid of all these measures as fast as they can in order to get away for the prorogation. What I wanted to point out was that a measure so passed through the House of Commons has not really, although it has technically, the same authority as a measure which has received full consideration from the House, and has been fully debated throughout all its stages.

20399. Perhaps you will state the objections that your society entertains to the Act?—We object to it because the principle of the Act, namely, the prevention of pain and cruelty, which is contained, I think, in Section 1, is entirely nullified by the exceptions allowed on certificates given by the Home Secretary.

20400. Is the certificate given by the Home Secretary? We have been told, I think, by previous witnesses, that it is open to the Secretary of State to disallow a certificate, but the certificate is actually signed by other authorities?—I have no doubt that it is so. From my own experience in the Civil Service I know that that kind of routine work is always delegated by the Minister to other people.

20401. Is it a matter of delegation to those within his own office, or is it that he recognises the action of other persons, such as Royal Societies, in granting a certificate, and under the Act the power is reserved to the Home Secretary of disallowing that certificate if he sees reason?—I believe that is so.

20402. Will you proceed with your objections to the process of certification under the Act?—We think that the Act has been practically powerless to stop either pain or cruelty. The Act provides that the animal experimented on must be anæsthetised, and that it must be killed before recovering from the anæthetic. But if the Home Secretary gives a certificate anæsthetics need not be used, nor need the animal be killed before recovery. The "most rare cases" referred to by Lord Carnarvon (that was cases for purposes of research even without anæsthetics) developed into 379 certificates in 1906, and there were also issued 88 certificates for performing experiments on cats and dogs. It may be added that no less than 256 certificates were held by medical men, dispensing with the obligation to kill the animal before recovery, and 118 certificates dispensing with the obligation to kill cats and dogs before recovery.

20403. Are the 88 certificates for performing experiments on cats and dogs included in the 379 certificates?—I understand that they are not.

20404. They are in addition, are they?—Yes, in addition.

20405. Do you suggest that these were all painful experiments?—I do not quite understand how any experiment can be other than a painful experiment, either *in initio* or in its subsequent results.

20406. Would that remark apply to cases of experiments conducted under anæsthetics in which the animal is destroyed before it recovers from the anæsthetic?—I should answer to that that we have no guarantee that in all cases the anæsthesia is perfect. It may be that the animal is completely anæsthetised in many cases, and consequently the animal does not feel any pain during the experiment. On the other hand we have no guarantee that the process of anæsthetisation is complete.

20407. Possibly you may be asked questions upon that in cross-examination. Will you proceed to state your objections to the Act in the matter of experiments performed in illustration of lectures?—The Act lays down that experiments are not to be performed as an illustration of lectures, and then proceeds to nullify this provision by further provisos. I should like to say here that the form of the Act is what I should call absurd. It seems perfectly ridiculous first of all to insert a clause saying one thing, and then to nullify the whole of that clause by provisos; for I think that every one of the restrictions in Section 3 is practically nullified by the provisos attached to that section. I have never seen any other Act of Parliament in that form myself.

20408. I think you have already stated that you object to the provision whereby a prosecution against a licensed person shall not be instituted, except with the consent in writing of the Secretary of State?—We think that bears out our contention that this Act instead of being an Act for the protection of the animals, is an Act for the protection of the medical men who carry out the experiments.

20409. Did the subsequent passing of the Public Authorities Act, 1898, affect the question of prosecutions under the Act of 1876?—Yes, Section 1 (A) of the Public Authorities Act, 1898, renders it illegal for a prosecution to be instituted more than six months after the offence, and therefore prosecutions have become impossible. The only means of discovering illegal proceedings under the Act is the Report of the Home Office Inspector, and his reports are never issued until the matter reported on is at least six months old. No doubt the framers of the Public Authorities Act had not this result in view (I do not think they had this particular Act in view at all), but such is the effect of the provision. In answer to a question I asked the Home Secretary on the subject in the House of Commons on November 13th, 1906, he said that he could not issue the Report quarterly (it is now issued half-yearly) because of the immense mass of documents that had to be received and examined, and because it would very greatly increase the labour involved, with little or no advantage. He added that contraventions of the Act were reported to the Home Secretary as soon as they were discovered, so that the institution of proceedings for performance of illegal experiments was not dependent on the date of the Report. That would be well enough if the Home Secretary would institute prosecutions himself, or give to others the information enabling them to do so. But I am not aware of any case in which he has adopted either course.

20410. Do you think that the Act has operated in the direction of the restriction of vivisection?—No; I think it has acted as a great stimulus to vivisection. The proof of that is the number of experiments, which has risen from 481 in 1878, which was two years after the passing of the Act, to 43,287 in 1906.

20410A. Our attention has been called to the fact that a considerable number of such experiments are of the nature of inoculations, involving merely the prick of a needle. Have you anything to say in regard to that?—I am aware that that is the case, but I am not aware that inoculation does not lead to painful and undesirable consequences. I have often heard that if you inoculate with a bit of pus, say under the tongue, you may produce very great pain and a great deal of trouble. An instance, which I deal with later, is the inoculation for plague with Haffkine's serum.

20411. Have your Association embodied their views in a Bill?—They have, but I believe that Bill has not been furnished to the Commission.

20412. I think we have not had it?—No; you have not had it. The reason being because we find it extremely difficult to draft a Bill, and therefore I should like to eliminate that, if I may, from my *précis* altogether.

20413. Do you desire, on behalf of the Parliamentary Association for the Abolition of Vivisection, to give us any specific recommendation as to the form of a Bill for carrying out their object?—We could do that later. But we are rather of opinion that the time is premature for framing a Bill. We think we had

Sir G. Kekewich, K.C.B., M.P.

18 Dec. 1907.

better delay it until after this Commission has issued its final report, and then we shall introduce a Bill into Parliament expressing our own views on the subject.

20414. So that at the present moment the views of the Association are not embodied in any Bill?—We have not yet embodied them in any Bill.

20415. Do you desire to call attention to certain omissions and discrepancies which, in your opinion, demand the attention of the Commission?—Yes; to some which have characterised the evidence before the Royal Commission. I want to point out that such evidence, far from relieving the position, on the contrary greatly aggravates the widespread and daily-increasing disquietude in the public mind, as regards the suffering inflicted upon animals, and the hopeless confusion and anomalies of present-day medical science. The Commission will understand that I am representing experts although I am not an expert myself.

20416. Is that the opinion of the Parliamentary Association?—It is the opinion of the Parliamentary Association.

20417. (*Sir Mackenzie Chalmers.*) I do not quite understand, do you represent the experts in your Association?—So far as my *précis* goes I represent the opinions of persons who are experts in the sense that they belong to the medical profession. I do not say that they are experts in the sense that they have taken part in experimental research or vivisection, except, perhaps, in their student days in hospitals.

20418. (*Sir William Collins.*) You desire to suggest certain reasons for alleging this increasing public disquietude, I understand?—We wish to say that in consequence of the increasing public disquietude we have been enabled to add recently, since the publication of the Blue Books detailing the evidence supplied to this Commission, no less than 29 members of Parliament to the list of our vice-presidents, and we have received from a number of other members such expressions of interested sympathy as experience has shown are prefatory to their becoming staunch opponents of the practice of vivisection.

20419. Then while not volunteering medical opinions yourself, do you desire to make some statements in regard to medical science?—I wish to confine my remarks to the important subjects of the infliction of pain, anæsthesia and anæsthetics, vivisections and demonstrations before students. These, as I consider, being subjects with which any man of common intelligence is qualified to deal, and, moreover, subjects which are of the most vital interest to the members of the Association which I represent, and to the general public, bearing as they do upon the systematic infliction by men in high and responsible positions of pain and considerable suffering upon helpless creatures, and also (I think this is a most important point) upon the demoralisation of the young men and women who are the future physicians and surgeons at whose hands the community will presently benefit or suffer.

20420. Do you suggest that such practices have a detrimental effect upon the humane sense and morality?—Yes. I would remind the Commissioners that the development in man of the humane sense has been the slow growth and higher moral awakening of many millions of years of evolution, and that, should they favour or further facilitate such demonstrations before students they will, by rendering them callous to the sight of pain and mutilation inflicted upon living, intelligent creatures, incur serious risk of blighting that humane sense which is the very highest characteristic of civilised men, and is, beyond all others, the faculty most needed in those who will one day have the lives and welfare of their fellows in their trust.

20421. It has been suggested to the Commission that the practice of vivisection under the Act would have no more demoralising effect upon students than witnessing surgical operations under anæsthesia. What do you say with regard to that?—I think undoubtedly it would. I think the witnessing of a series of experiments by students upon living animals undoubtedly renders them more callous to suffering than if they witnessed an operation or operations which are done for the benefit of the person undergoing the operation.

20422. Would your objection and your fears in regard to the lowering of the moral sense be met if you could be assured that vivisection was conducted entirely painlessly?—No, I do not think it would. I think the whole sight is degrading and immoral—the sight of the animals strapped down and cut to pieces I do not know that I have anything more to say on that point.

20423. Do you suggest that the same advantageous results which have been claimed for vivisection could have been obtained by some other mode?—By clinical research.

20424. Do you desire to call attention to what you mention in your *précis* as to the barren state of medical knowledge?—Yes; I think that it is obvious that the present state of medical knowledge is barren. We see disease and degeneracy on all sides, against which it is equally obvious that medical art is powerless, or they would cease to exist. To take a single instance, since the year 1729 influenza in various forms and of varying degrees of severity has been an ever-recurring scourge. Now it is perennial, even endemic. Yet our medical scientists cannot give us one satisfactory explanation of its origin or of its prevention; nor, if we judge by its constitutional sequelæ and its mortality, can we suppose that they know much about its treatment. Yet they have been supplied with abundant material, not only animal, but also human, for observations with a view to the discovery of means to rid us of this scourge. We are, however, apparently no whit nearer ridding ourselves of it than we ever have been. Here is a practical, everyday test, and surely, also a convincing evidence of the barren state of present medical knowledge.

20425. Do you suggest that medical science has remained stationary during the last 30 years?—I should say that it has not made any great advance. I have seen it stated that we know little more than we did in the days of Galen and Hippocrates as regards medical science. I do not go so far as that.

20426. You say that you have seen it stated. May we take it that the view which you have put forward is that entertained by the Parliamentary Association?

20427. (*Sir Mackenzie Chalmers.*) And its experts?—Yes. I was going to say (I happen to know something about it from home knowledge) that I have heard medical men say that so far as remedies are concerned there are constantly new remedies, such as antipyrin and sulphonal, which were at one time ushered in with a great flourish of trumpets, but which, I think, are not any longer in general use; and, as a matter of fact, many medical men, I think, are really limiting themselves to a very small number of efficient remedies.

20428. (*Sir William Collins.*) I understand that you desire to call attention to certain points in the evidence which has been laid before the Commission. Of course the Commission has an opportunity of reading that evidence, but you may desire to direct attention to one or two particular points?—Yes. As regards the infliction of pain, inasmuch as obviously the opponents of the practice are not in a position to obtain experiences, it is necessary to rely upon the admissions and representations of vivisectors themselves. For this reason, their contradictions and admissions are most valuable, as warning the Commissioners and the public that the evidence as to the pain suffered by animals in process of mutilation is wholly untrustworthy and unreliable, either because of the inaccuracy of statement or the inaccuracy of observation of the operators, or because, under the Act as at present carried out one operator actually experiments without pain while another confesses that he has done painful experiments, and indeed, adds that he is not ashamed of the fact. Professor Starling (Question 3451, First Report) commits himself to the bold and sweeping statement: "Though I have been engaged in the experimental pursuit of physiology for the last 17 years, on no occasion have I ever seen pain inflicted in any experiment on a dog or cat; or, I might add, a rabbit, in a physiological laboratory in this country, and my testimony would be borne out by that of anyone engaged in experimental work in this country." Professor Cushney says (Question 4932, Second Report): "I am quite satisfied that no animal suffered pain under my experiments." (Question 4962) "I should say that the statement that cruelty occurs in laboratories in England at the present time is grounded on misconception, and is false."

20429. Have you any reason for disputing these statements?—As a mere question of pain I do not see that there is anything illegal in the causation of pain because the operator may hold a certificate enabling him to dispense with anæsthetics.

20430. (*Chairman.*) That is not the statement that you make. The statement that you object to of Professor Starling's I understand is that he has not caused pain to animals in his experiments?—Yes.

20431. I understood Sir William Collins to ask you whether you dispute that statement?—Yes.

20432. (*Sir William Collins.*) And that the testimony would be borne out by anyone engaged in experimental work in this country?—He says so.

20433. Do you desire to suggest any reason for doubting that?—I do not know enough about the persons engaged in experimental work, but I should rather doubt whether they could honestly say that. Dr. Thane, an inspector under the Act (Question 450, First Report), says: "I have not seen nor have I ever heard of any operation—a procedure that was seriously painful—being performed without anæsthesia." I do not know whether Dr. Thane's experience is large. He is an inspector under the Act, but I understand that last year he was only present at 15 experiments, and I understand that the whole of those experiments were in Sir Victor Horsley's laboratory; he did not go any further than that.

20434. Do you suggest that Dr. Thane did not inspect last year any vivisections under the Act except those performed by Sir Victor Horsley?—Yes, I understand that to be the case.

20435. What is the source of that information?—I understand that Dr. Thane said that he had inspected 15 experiments, and that Sir Victor Horsley stated that Dr. Thane had inspected his laboratory 15 times.

20436. (*Chairman.*) What question is that?—I have not the number, but I understand that in Dr. Thane's own evidence he said that he had only witnessed 15 experiments altogether, so that if he had inspected Sir Victor Horsley's laboratory 15 times and had only witnessed 15 experiments altogether it is obvious that all those 15 experiments were in Sir Victor Horsley's laboratory and nowhere else.

20437. (*Sir William Collins.*) Would it not be possible for an inspector to pay an inspection visit to a laboratory and not to witness an experiment in the course of his procedure?—That is so, of course, but I should have thought that those visits were of very little use.

20438. That is the ground for the statement you have made?—That is the ground.

20439. Is there any other point in Dr. Thane's evidence to which you desire to call attention?—Yes, he later admits that, on the other hand, "In some cases of this group (that is, experiments performed under Certificate A) the infection or injection is followed by great pain and suffering. I may mention the injection of tetanus toxin and the infection with plague; also the insertion of certain drugs." "The injection of tetanus toxin," he states, "will produce tetanus, which . . . is manifested by convulsions which are of a painful nature." "Injection with plague makes the animals very ill and makes them look miserable." "It is obviously impossible to say to what extent mice, in which such tumours (implanted cancer) are growing, are suffering pain, but observation of their behaviour and habits does not justify the assumption that, so long, at all events, as the tumour is of moderate size, they are suffering acutely or severely." Nevertheless, the facts and the Inspector's evasive way of stating them justify the assumption that these creatures may suffer acutely or severely according to their own humble powers of bearing pain, whether or not the tumour remain of moderate size, and we are not told of means taken to restrict the growth. When asked, may the result of the operation be painful, although the operation itself is performed under an anæsthetic? (that is in the case of renewed operations) "That comes on," he replies, "two paragraphs further on;" and later says, "When in operations under these certificates the operation has been performed and the wound has healed, it does not follow that the animal remains in a state of pain or suffering." Nobody, of course, would suppose that after the healing of the wound it necessarily follows that the animal remains in a state of pain or suffering. But he carefully ignores the truth that in extensive cutting operations with excision of organs there must necessarily, upon waking from anæsthesia, be very severe and prolonged pain, until, that is, the severed tissues heal. He reiterates that the operation is conducted aseptically, which may hasten the closing of the wound, but cannot certainly diminish sensation and the degree of suffering which is inseparable from extensive cutting operations. Then Professor Pembrey has made some admissions.

20440. Do you desire to call attention to them?—The freemasonry of reserve and evasion as to the fact and the amount of suffering inflicted is candidly broken by the very frank and damning admissions of Professor Pembrey, Professor of Physiology at Guy's Hospital. He says (Question 14084):—"I confess that I have done painful experiments, and I am not ashamed of admitting it. They are absolutely necessary. I want to show that pain is part of the scheme of nature, and that we must recognise its existence." He believes (Question 14093) "that a recognised physiologist should be given a licence to cover all experiments." He was asked whether that licence should be given for experiments without anæsthetics, and he said, "Without anæsthetics or with anæsthetics and without certificates." He believes that the Vivisection Act is entirely opposed to the advancement of physiology. Further, he expresses the opinion that the infliction of suffering is a meritorious act. Then, at Question 14147: "I consider," he says, "that it is perfectly right to inflict pain upon animals." Then there was a question asked: "Not unnecessarily?" and he said, "No." In answer to another question, he says: "I will be perfectly straightforward. I say that you should not inflict pain if you can obtain the knowledge in any other way, but I say that even where there is an operation the pain there is of a protective nature; it may produce syncope, and therefore less sensation of pain." I presume that a knock on the head will do the same thing. This suggests that such an extreme degree of suffering should be inflicted as to cause the unfortunate creature under operation to become insensible, in order that while it is in this condition of insensibility a further operation may be done. "Further," he continues, "I say that the introduction of an anæsthetic may produce complications, so that more experiments may be necessary than if the experiment were done on the animal in a condition of syncope. . . . If you give them anæsthetics you are introducing a complication which you could remove, and therefore without anæsthetics you actually save life and actually diminish the infliction of pain." That seemed to us to be a very extraordinary doctrine. By these admissions we get at the truth. Professor Pembrey has, at all events, the courage of his convictions. He has done "painful experiments, and is not ashamed to admit it." He considers it "perfectly right to inflict pain upon animals." "Painful experiments," he adds with conviction, "are absolutely necessary." "Pain is part of the scheme of nature." It is "protective" and "beneficent." He is right, no doubt, in that pain is protective when it calls the sufferer's attention to the presence of an injury, and also in rousing the reparative processes to make good that injury. But it is difficult to trace the protective character of pain inflicted under vivisection, as it will certainly not protect a creature, clamped powerless upon a board, from further investigations by an operator. And surely only the strangest perversion of mind can find anything "beneficent" in the infliction of suffering by intelligent man upon a helpless creature of lesser intelligence.

20441. If I remember rightly, some of the painful experiments admitted in this country by Professor Pembrey under licence had to deal with the destruction of rats by sulphur dioxide with a view to disinfect ships. Do you suggest that it is undesirable that experiments of that character upon rats should be performed with a view to prevent the propagation of plague?—I do not quite understand why painful experiments should be performed under those circumstances. I have not sufficient medical knowledge to know whether it is possible to carry out such an experiment as that without pain.

20442. I suppose that would be dealing with two different respirable gases, the anæsthetic on the one hand and the sulphur dioxide on the other?

20443. (*Chairman.*) If you are going to kill rats in a ship you could not first catch the rats and anæsthetise them, and then proceed to poison them with gas. You must do it at once?—This, I imagine, was a question of the suffocation of rats, was it not?

Sir G. Kekewich, K.C.B., M.P. 18 Dec. 1907.

20444. (*Sir William Collins.*) Yes. May I ask if the alleged fact that sulphur dioxide is a good mode of destroying rats with a view to prevent the propagation of plague had been discovered by other than vivisectional means, you would object to its use for that purpose?—I am met by the fact that I do not understand how suffocation comes within vivisection. I thought vivisection was cutting.

20445. You think that these experiments might be performed without being brought under the Act at all?—I should imagine so.

20446. The term vivisection is not, I think, defined in the Act?—I do not think it is, but I was speaking really of its obvious meaning—vivisection is the cutting of living animals.

20447. Does your Association distinguish between experiments upon living animals of a cutting character and painful experiments upon living animals such as the administration of suffocating gases?—I think we should oppose both, but, on the other hand, I do not know that anything except cutting experiments comes under this Act. The words of the Act are: "A person shall not perform on any living animal an experiment calculated to give pain." I do not know whether this particular experiment you speak of does give pain.

(*Sir Mackenzie Chalmers.*) Undoubtedly, if you have read his evidence.

20448. (*Sir William Collins.*) I thought you were alluding to Dr. Pembrey's evidence to show that he had conducted painful experiments?—I am not dealing with his experiments specifically; I am dealing with his general statements, where he says that painful experiments are absolutely necessary, that pain is part of the scheme of nature, that it is protective and beneficent, and all that kind of thing.

20449. I understand that you desire to draw attention to what you conceive to be a discrepancy between the evidence of Professor Pembrey and Professor Starling?—Professor Pembrey, in direct contradiction to Professor Starling and others, tells us that he does painful operations, and that, moreover, "they are absolutely necessary." Thereupon we are confronted by the question: Were those other gentlemen, then, imposing upon our credulity, or were they the victims of their own? Can extensive mutilations under anæsthesia administered, as Professor Starling confessed, by the laboratory boy, be wholly and invariably painless? Painful experiments, he says, are "absolutely necessary." This, then, is the candid truth of the matter. Vivisection is necessarily, that is, unavoidably, a painful—possibly a gruesomely painful—process. Some notion of the degree of that pain, and of the callousness of the operator, is indicated by Professor Pembrey's recommendation that anæsthetics should be dispensed with, and that the animal should be subjected to suffering so severe as to cause insensibility in order to avoid the "complications" attending the administration of an anæsthetic. That, as I understand, means that he advocates the infliction of pain of such severity as to make the animal collapse under the pain. That hardly seems consistent with the principle of the Act that anæsthetics should be administered. Professor J. N. Langley, F.R.S., says (Question 15251), "The degree of pain is, of course, always a relative thing. . . . I have indicated the difference, so far as I could, by saying that some of my experiments were clearly not painful, and some of them were of the nature of a severe operation in a hospital, and those I should think, possibly, at times do cause pain, as they do in a human being." I should have thought that they always did.

20450. We have frequently had our attention directed to Professor Klein's evidence before the last Commission?—No doubt. When he gave evidence before the last Royal Commission in 1875 he was asked at Question 3539, "Then for your own purposes you disregard entirely the question of the suffering of the animal in performing a painful experiment." His answer was, "I do," and he is still employed under the Local Government Board. Further indications of the blunting effects of vivisection upon the humanity of the operator are supplied by Professor Pembrey's observations upon the relief of human pain by anæsthetics. At Question 14119 he is asked, "Did I rightly gather that in your opinion anæsthetics are unnecessary," and he said, "Yes. I am convinced that they are often unnecessary, not only in the case of animals, but of men." And at Question 14120 he is asked, "For vivisection and for surgical operations?" and he answered, "For vivisection and for surgical operations, and I mentioned the case of midwifery." He condemns anæsthesia for women in childbirth (the suffering during which, it is acknowledged, is atrocious), and himself circumcises children without anæsthetics. "If they cry," he says, "it does not matter; it is much better that a child should cry and moan than that its life should be lost; the introduction of anæsthetics has done a considerable amount of harm." Professor Pembrey tells us that he has a class of 70 or 80 fresh students every year. We may judge for ourselves the moral effects upon these students of their professor's doctrines, and of the sight of the painful operations to which he confesses.

20451. Are you not rather ignoring the extent to which we are told that anæsthetics are employed in cases of experiments upon living animals?—As I understand, the point here is that you have a man in a very high position in a hospital who actually advocates the dispensing with anæsthetics altogether.

20452. I thought you were going to give us some reason why you doubted the assertion that anæsthetics are so largely employed in the case of experiments on living animals?—We have no absolute proof that anæsthetics are ever used, because no anti-vivisection doctor has ever been allowed to witness any experiment.

20453. (*Chairman.*) Then nobody is to be believed on his oath except an anti-vivisection doctor. We have had plenty of people, not speaking on their oath no doubt, but do you say that nobody's word is to be taken for a fact of that description unless he is an anti-vivisection doctor?—No.

20454. That is what you stated just now; "we have no absolute proof." That is to say that if 20 people came and said that they were present at an operation and that anæsthetics were used, and that the animal was perfectly quiet and still, and showed no sign of pain, and was not strapped down even, nevertheless you would disbelieve them because there was not an anti-vivisection doctor among them?—We should say that we want to send a competent witness from our own side.

20455. (*Mr. Ram.*) To be present on every occasion?—I do not know that on any occasion——

20456. On every occasion, I said?—But I do say that up to the present time, so far as I am aware, there has been no occasion on which any man of that kind has been allowed to be present—a person like Dr. Hadwen, for instance.

20457. (*Sir William Collins.*) Did not Professor Starling offer to admit other persons to his laboratory than those who are at present authorised to attend?—Yes, and I should like to say, partly in corroboration of what I have said, that anæsthetics are not always used in the case of painful operations when they might be, that I notice that in some of the evidence that I saw, given before this Commission, Colonel Lawrie said that he had seen the painful operation of dissecting the neck in order to establish cross circulation done without any anæsthetic whatever, but I observe that in his evidence he did not say where it was done, and he did not say whether the operator held a certificate enabling him to dispense with anæsthetics.

20458. (*Dr. Gaskell.*) Do you say that he saw it done without any anæsthetic whatever?—Yes.

20459. (*Mr. Ram.*) Can you give us the reference?—Yes, I have the reference here.

20460. (*Sir William Collins.*) Was not morphia administered in those cases?—Yes, but I understand that morphia is not an anæsthetic.

(*Chairman.*) It might have been worth mentioning that it was given.

20461. (*Dr. Gaskell.*) When you say without any anæsthetic whatever you mean with morphia, and that you do not consider morphia to be an anæsthetic. If that is what you mean, it is hardly the same thing as saying without any anæsthetic?—Yes, but Colonel Lawrie said that the operation was performed with a small dose of morphia only; he does not say with a fatal dose of morphia.

20462. What was the operation?—It was the operation of tracheotomy. He was asked, at Question 16816: "What was done; was tracheotomy performed without chloroform?—(A.) The whole dissection was performed without chloroform." Then he was asked: "Do you say it was performed without anything in

the way of an anæsthetic?" And he answered: "It was performed with a small dose of morphia." He was asked: "What was the operation?—(A.) What is called a cross-circulation experiment. The necks of two animals are dissected and the large blood vessels cross-connected." Then he was asked, What animals they were, and he said dogs. Then he was asked: "But it was under an anæsthetic?" And he answered: "I do not call morphia an anæsthetic." I think that has been supported by other evidence, I think by Professor Hobday, if I recollect rightly, of the Veterinary College.

20463. (*Sir William Collins.*) Do you desire on behalf of your Association to make any suggestions as to the admission of persons representing anti-vivisection views into physiological laboratories?—Dr. Starling said that he would admit any Member of Parliament or layman, but not "any" doctor.

20464. (*Mr. Ram.*) It was not that he would not admit "any" doctor, but not every doctor?—I understand that no doctor holding views opposed to vivisection has ever been admitted to witness these experiments. And then further on Professor Starling said that no person would be admitted to a physiology class who came merely from curiosity. I do not know whether he would admit me.

20465. (*Sir William Collins.*) Seeing that your Association advocates the entire abolition of the practice I suppose it is idle to ask you whether an increase of inspectors would in any way meet your objections?—No, I do not think that any increase of inspectors would meet our objections.

20466. Even anti-vivisection inspectors?—Even anti-vivisection inspectors, because we are opposed to the practice altogether. The only object, so far as I understand it, of the appointment of what you would and what we would call anti-vivisection inspectors would be to see that the operations were carried out in accordance with the certificates, that is to say, that under a certificate allowing experiments on animals with anæsthetics, the anæsthetics were used and that complete insensibility was effected; and, further, that if the holder of the certificate was enabled to dispense with anæsthetics altogether to see (I do not know what he would see then) that the experiment was carried out in accordance with the certificate. But we are opposed on the ground of its inhumanity and inutility to the whole practice of vivisection. That is our position.

20467. If the Act were not abolished but modifications were made would your Parliamentary Association desire that the number of inspectors should be increased, and that provision should be made for the representation of those who are sceptical on the subject of vivisection on the inspectorate?—I do not quite understand what you mean by their being sceptical on the subject of vivisection. The only object, as I said before, would be to see that the experiments were painless. Of course our Association would prefer that to the existing practice, but we hold that the Act should be repealed and another Act passed in its place, abolishing the whole practice of vivisection of animals.

20468. Does your Association think that the result of the entire abolition of the practice in this country would be to reduce the totality of animals submitted to vivisection. It has been suggested to us that if abolition were decreed either the practice might be carried on surreptitiously or that those who were desirous of practising it would be driven abroad where there would be no, or fewer, restrictions upon their conduct?—I do not say that I am not concerned with what takes place abroad. I view it with as great horror as the English practices, but, after all, what takes place abroad is not our business; we have to look after our own country. And as for a surreptitious performance of vivisection, under those circumstances I apprehend that, if the penalties were large enough, there would not be much surreptitious practice of vivisection.

20469. (*Sir Mackenzie Chalmers.*) You would prohibit it under penalty; you would not leave it to the ordinary law of cruelty?—No, I should not be satisfied, for the reasons that Lord Carnarvon gave in introducing this Bill, with a mere repeal of this Act. I would not be satisfied without the passing of a fresh measure prohibiting the practice of vivisection altogether.

20470. (*Sir William Collins.*) Would you put further restrictions upon the submission of living animals to experiment for scientific purposes than exist in regard to cruelty to animals arising from other than scientific investigations?—No, I think I would bring them all under one and the same Act. For instance, now, I believe that if a horse has lockjaw, and it is not killed immediately, that is punishable under the Cruelty to Animals Act, and is dealt with in the ordinary way by the magistrates, and the horse is directed to be killed. If an experimenter produced artificial lockjaw on a horse, I should inflict precisely the same penalty upon him, but if he, as they do now, produced artificial lockjaw in a horse, and kept that horse alive as long as he possibly could for observation, I should inflict a heavier penalty in proportion to the degree of cruelty. May I add that Miss Lind-af-Hageby, who is the only anti-vivisectionist who has actually attended advanced classes in England (so far as I am aware), affirms that "the most unsatisfactory and obviously unreliable methods of anæsthetising are in vogue in the vivisectional laboratories." She makes that statement on page 159 of a book she calls (not very complimentarily) "The Shambles of Science."

Sir G. Kekewich, K.C.B., M.P. 18 Dec. 1907.

20471. I understand that you desire to draw attention to experiments upon living animals, with a view to the prevention of plague?—In the examination of Mr. C. J. Martin, Director of the Lister Institute of Preventive Medicine, and a member of the Advisory Committee for the Investigation of Plague in India, he was asked by you whether he thought Haffkine's vaccine, or any other vaccine, in India is having a valuable influence in checking the spread of plague, and he replied, at Question 12300, "Very valuable." I should like, in passing, to call attention to the word "vaccine." I do not understand that the plague serum is vaccine at all; it does not come from the cow or calf. It is mere plague serum, and induces simply a modified attack of plague. You then asked him whether plague has ever been more prevalent in India in the memory of man than during the past year, and he answered, "Not that I am aware of." I wish to lay this matter somewhat more fully before you as a grave national responsibility. The point which brings the question of the plague in India under the consideration of the Parliamentary Association is the manner in which the serum used for the inoculations is prepared and tested; that is to say, the fact that it is prepared by inoculation of animals. W. Symners, of Cairo, gives a record of experiments made to determine the therapeutic efficacy of plague serum (Central b.f. Bakt., April 15th, 1899) carried out at the Serum Institute of Abbasieh, in Egypt. Cultures were made from the bacilli of bubonic plague obtained from Bombay, and experiments (that is to say, inocculations) tried on guinea-pigs, white rats and mice, and horses. Cultures on agar or on bouillon were found to possess little virulence, and it was necessary to pass the bacilli through white mice—in other words, to inoculate them with plague—before sufficient virulence could be obtained; the bacilli obtained from these mice were then used to make cultures in bouillon, and the new bacilli thus obtained were injected into horses, generally under the skin of the neck. Local swelling, and inflammation of the glands, and slight fever followed these injections. Sometimes these injections were repeated as many as fifteen times on the same horse; then the jugular vein was opened, and from the blood thus withdrawn the serum was obtained, which was then injected into the abdominal cavity of white rats. As the plague serum thus obtained was not very virulent, it was suggested that more virulent bacilli should be employed, and that the injections should be carried out in large quantities, and for longer times on horses. The details of the preparation of plague serum, no doubt, vary very much; each manufacturer will have his own process; but in all there is the same system of injecting these filthy products of disease into healthy animals, so as to give them the plague, of finally injecting horses with the disease, and, when they do not die of it, bleeding them to obtain the serum, which is to be used for human inoculations. Monkeys have been used in the preparation of the testing of plague serum, as well as cats, guinea-pigs, mice, and rats. Dogs, we are told, are most refractory to the infection. "Lawson could not infect pigs, either by alimentation or by subcutaneous injection. Experimenting on sucking pigs he succeeded in causing tumefaction and œdema at the site of the inoculation, but could not discover the bacillus in the ganglia." That is out of "Bubonic Plague," page 16, by Montenegro, who wrote on plague

Sir G. Kekewich, K.C.B., M.P.

18 Dec. 1907.

at Oporto. The same author, on page 13 of his book, gives this case: "Batzaroff received some broth, the virulence of which had decreased so much that a large dose inoculated in a rat did not kill it. . . . Depositing a certain quantity of the cultivation in the nostril of another guinea-pig he succeeded in producing plague pneumonia, and killed the animal, but in eight days." "Simond (page 20) made a monkey breathe infected flour, but did not succeed in producing the pneumonia of plague." "Simond made a rat eat pieces of diseased spleen without any result" (page 21). Plague pneumonia is described (page 59) by the same author: "At the end of thirty hours fever begins, which rises very high; the animal appears to be miserable, depressed, breathes with difficulty, coughs up a foamy liquid. From its nose there flows a serosity which irritates the mucous covering of the snout; the inflammation . . . causes serious mischief in the eye. Meanwhile the exhaustion of the animal increases, respiration becomes strident, there is a distinct wheezing . . . and finally in twenty-four or thirty-six hours the animal succumbs." Thousands of animals have been used for these inoculations, and an enormous amount of suffering caused in the preparation and testing of the various serums. When Mr. C. J. Martin speaks of the "very valuable" influence of inoculations on the plague in India, he is probably not aware that the present epidemic has lasted eleven years, increasing in violence with every year, whereas the normal duration of an epidemic of plague is seven months; nor is he aware that during those eleven years (or, to be exact, ten years and seven months, from September, 1896, to the end of April, 1907) there have been 5,326,000 deaths from plague in India. Will he dare to say that without Haffkine's and Yersin's serums there would have been a greater number of deaths than five and a quarter millions? It is, to say the least of it, a significant coincidence that never within the memory of man has an epidemic of plague been of such immensely long duration, and never within the memory of man has plague been treated by inoculations of plague serum. When the plague broke out in Bombay in the end of 1896, all the experts were unanimous in declaring that the ordinary duration of the epidemic was seven months. In the "British Medical Journal" of February 6th, 1897, it is said: "As regards the epidemic, no better news is forthcoming, nor, we fear, is any great abatement of the disease in Bombay, or wherever else it may appear, to be anticipated with any confidence until six or seven months after the commencement of the outbreak. Bombay, it may be hoped, will be free of the epidemic in the month of April, that is seven months after its appearance in September, 1896." On February 13th, 1897, the same authority repeats: "We do not hope to hear that Bombay is free from plague before April, but we do rely on a distinct improvement by the end of that month." On February 27th, 1897, "the six or seven months of its wonted period of activity are over." On this same date occurs this ominous note: "Dr. Yersin is on his way to Bombay with a stock of serum." With the arrival of Dr. Yersin's serum, and other serums, all hope of the epidemic keeping to "its wonted period of activity" was at an end. A manufactory of plague was established, which has been hard at work ever since, producing its five and a quarter million deaths. These figures, 5,326,000 deaths from plague from September, 1896, to the end of April, 1907, were given by Mr. Morley in the House of Commons on June 6th, 1907, on the occasion of a debate on this subject, when Dr. Rutherford said that the plague was one of the chief causes of the unrest in India, that it was a preventible disease, that it had been brought under in most countries, and that only in India had it such awful effects ("British Medical Journal," June 15th, 1907). In the months of January, February, and March of this year the deaths from plague in India reached the enormous number of 58,438, 98,397, and 171,522 respectively.

20472. Do I correctly understand you to suggest that the use of these sera of Haffkine and Yersin has been the means of propagating the plague?—I do.

20473. Or that the use of them has diverted attention from other means in regard to plague prevention?—I do.

20474. Do you make both those suggestions, or which?—I suggest both. I suggest that in the first place the use of these sera was an actual propagation of the plague. These sera are not at all analogous to vaccine which is used for the prevention of small-pox. They are plague itself, and they give the plague. I think there is no proof whatever that a man who is inoculated with Yersin's or Haffkine's serum is not just as much a centre of plague as a man who has caught the plague in the ordinary way.

20475. (*Chairman.*) Are you speaking now from your own knowledge or from something that you have read?—I am speaking from my reading, not of my own knowledge. I have fortunately not been in these centres of plague, so I cannot speak from personal knowledge, but it seems to me that the inoculation with these sera for plague is very analogous to the old system of inoculation for small-pox, which is not only discredited, but is actually forbidden by law, I believe, at present.

20476. (*Sir William Collins.*) Are you not aware that it is claimed by some investigators that vaccine can be made out of small-pox virus?—I have heard so, but most assuredly if you inoculate a person from the cow pox virus you do not get a case of small-pox. I have heard it, but I find it extremely difficult to believe.

20477. Have you not also heard that it is claimed that by the use of small-pox virus the vaccine may be obtained by inoculating a calf or cow with human small pox?—No, I do not know that. I do not know whether it is proved or not.

20478. (*Sir John McFadyean.*) Might I ask why the material from this cow disease, cow-pox, is not regarded as "filthy materials" by your Association?—Our Association is not prepared to offer any evidence as regards the question of vaccination, because vaccination is a subject of special Acts of Parliament, one of which was passed as lately as last year, and we did not understand, and we do not understand, that it comes within the function of this Commission to inquire into it.

20479. That was not my question. I did not wish you to express an opinion as to the efficacy of ordinary vaccination, but you class sera and other products of disease as "filthy materials" when used with the object of curing or immunising human beings. I want to know, do you place the so-called cow-pox lymph in the same class, and, if not, why not?—I have already said that I do not come here prepared to give any evidence on the subject; as representing the Association, I offer no evidence whatever on the subject of cow pox. If the Commission would like to know my personal views on the subject of vaccination I shall be delighted to give them.

20480. (*Sir William Collins.*) Have you ever seen a case of natural cow-pox in a cow?—Natural cow-pox in a calf?

20481. In a cow?—No, I have never seen it.

20482. (*Sir John McFadyean.*) But I understood that it was you yourself that introduced the subject of cow-pox vaccination and contrasted the material used there, or the benefit of the operation with the use of serum?—I introduced the subject of inoculation.

20483. Of human beings?—The inoculation of small pox.

20484. I beg your pardon.

20485. (*Sir William Collins.*) Will you proceed to state the grounds on which you think that the practice of the use of sera has diverted attention from other means which you regard as more satisfactory?—As the counter proof that this treatment of the plague by serum inoculations has aggravated instead of "stamping out" the epidemic of plague, I will give the history of the outbreak in Alexandria in 1899. Before that time a Commission was sent by the Egyptian Government to inquire into the treatment of plague in Bombay. The "British Medical Journal" for August 14th, 1897, gives the report of this Commission formed by Dr. J. G. Rogers, Director General of the Sanitary Department, Egypt, Dr. Bitter, and Dr. Ibrahim Pasha Hassan. "The Commission agreed that improved sanitation is the only method of staying the inroads of the disease. The members declare that prophylactic inoculation is a method, the efficacy of which is not yet established, and contend that to render a whole nation immune on the outbreak of an epidemic is a practical impossibility." In May, 1899, the Commissioners had an opportunity of proving the truth of their report, when plague broke out in Alexandria. It was "dealt with on lines directly opposed to Mr. Haffkine's views," as Dr. J. G. Rogers reports in the following letter to the "Times" of August 4th, 1899: "Sir,—M. Haffkine's address on

the subject of preventive inoculations against plague delivered before the Royal Society, and the leading article in the 'Times' on the same subject, will excite considerable interest amongst practical sanitarians all over the world, and nowhere possibly more so than in Egypt, where plague is now being dealt with on lines directly opposed to M. Haffkine's views. In considering those views it must be remembered that M. Haffkine is not a medical man, and that therefore in all probability he looks on disease from the laboratory point of view. It is otherwise difficult to explain his persistent attitude of opposition to the work of the practical sanitarian, opposition which, in the opinion of many, has had a dangerous, if not a pernicious, influence in India. It must never be forgotten that, at a moment when, though somewhat late, practical proposals were put forward by a committee of practical medical men of long Indian experience for checking the spread of plague in Bombay, M. Haffkine alone dissented, and by throwing the full weight of his reputation into the scales against any really useful sanitary measures being applied, was mainly instrumental in these measures being rejected. Plague has been known to exist in Egypt since May 4th, and no doubt the infection was introduced before that date. By applying the sanitary measures so despised by M. Haffkine and denounced by him before the Royal Society as useless in the prevention of the saprophytic forms of disease such as plague, results not altogether unsatisfactory have been attained, and the disease has at least been kept well under control. The total number of cases has never risen above 13 in the week. In the weeks ending June 28th, July 5th, 12th, and 19th, they were respectively 12, 11, 9, and 6 cases of the disease. In 100 houses in which plague cases or suspicious cases occurred, and which were efficiently disinfected, in not one instance has a second case been noted. Had practical measures been abandoned and protective inoculations substituted, would these results have been attained? I venture to think not.—I am, Sir, yours truly, J. G. Rogers, Director-General, Sanitary Department, Egypt."

20486. Did Dr. Haffkine reply to that letter?—I have no reply. I do not know.

20487. Did he not on August the 12th in the "Times" decline to discuss details with Sir J. G. Rogers?—I do not know; but the consequence was that the plague was stamped out in Alexandria within seven months.

20488. Has Dr. Haffkine not recently returned to India to resume work under the Government?—I believe he has. At all events this epidemic at Alexandria in consequence of the application of sanitary measures without plague serum lasted only seven months.

20489. (*Chairman.*) In consequence of what do you say?—Apparently in consequence of complete sanitary measures having been adopted, and no plague serum having been used, the epidemic was stamped out or ceased in seven months, which is the usual time for the duration of an epidemic of plague in any particular place. And on the 22nd October, 1899, the Minister for Foreign Affairs received a telegram from Lord Cromer stating that it was then three weeks since a case of plague had occurred at Alexandria. The "British Medical Journal" congratulated Sir John Rogers and Dr. Ruffer, "on the success which has attended their carefully devised scheme for stamping out the disease in Alexandria."

20490. (*Sir William Collins.*) Did not they employ sera in any form?—I understand not. I understand that no serum was employed; on the contrary, they declined to employ it.

20491. (*Chairman.*) When you say you understand so I do not always follow the source of the information. Do you mean from newspapers or books?—No, I understand from persons with whom I have conversed who are qualified to speak about it.

20492. Conversation?—Yes. But we have the testimony of Mr. Rogers to that effect.

20493. That you have read, I think?—Yes, who was Director-General. He at all events was of opinion that the sanitary measures were the cause of the cessation of plague.

20494. (*Sir William Collins.*) Is there any further question to which you wish to direct attention?—I now wish to call attention to the commercial aspect of the present system of sera and the present system of vivisection. Dr. George Wilson, in his Presidential address in the section of State medicine at the annual meeting of the British Medical Association in August, 1899, used these words: "The whole bacteriological theory and practice is steeped in commercial interests." This is at the back of all the arguments in favour of experimenting upon animals; that it constitutes in itself a well paid occupation.

Sir G. Kekewich, K.C.B., M.P.

18 Dec. 1907.

20495. (*Dr. Wilson.*) You are not quoting now from me?—No, only those few words. This is mine. The inventors of sera and antitoxins receives royalties upon the sales; the manufacturers of sera and antitoxins charge for them as for any other manufactured article is charged for. Mr. Power, the Medical Officer of the Local Government Board, explained in his evidence (Question 4885) that the vivisectors who do their pathological work receive a sum which pays for the animals used, pays for laboratory expenses, and includes their own personal remuneration.

20496. (*Chairman.*) What question do you say that is?—Question 4885.

20497. You must have got a wrong reference?—That is the reference that was given to me.

20498. You have not looked at it yourself?—No; you can easily imagine that I cannot verify every reference.

20499. Mr. Power's evidence begins at Question 4281.

20500. (*Sir Mackenzie Chalmers.*) You said you could not quite verify every reference, but this evidence is your own evidence?—Yes, only the remark in inverted commas is Dr. George Wilson's statement.

20501. (*Chairman.*) When you gave us just now the statement about payment to inventors and the manufacturers of sera, was that your own statement, or was it from some other source? Were you quoting?—Yes, that was quoted from Mr. Power's evidence.

20502. That is the point. I dare say it is quite correct, but we have not got the reference?—I can get the proper reference and insert it in the proof.* Then there is a quotation from Dr. Luteand to Dr. Bantock, stating that the Pasteur Institute is the property of a limited company——

(*After some discussion.*)

(*Chairman.*) I do not think we can have evidence of one doctor on matters of medical skill, simply through a letter written to another doctor.

20503. (*Sir William Collins.*) You desire, I understand, to draw attention to Messrs. Burroughs and Wellcome's price list?—I do. It is very evident that it would not be worth their while to keep up large laboratories and horse farms for the production of sera if the sale was not profitable. I desire to put their price list in simply to show that these are expensive sera; it shows the commercial aspect and the commercial value of these things.

20504. (*Chairman.*) I do not see what the distinction is between selling serum at a price and selling medicine at a price. Chemists do not sell medicine at a price that does not pay them. Is there anything immoral in selling serum at a price that pays any more than in selling castor oil or anything else?—There is nothing immoral about it any more than there is in any tradesman pushing the sale of his goods, but all I want to prove here is that there must be a motive in pushing the sale of these goods. I imagine that they are pushed just the same as the sale of any other article is pushed.

20505. Do you think that, in the case of a general practitioner in the country who made up his own medicines and sold them, it would be a reflection on his evidence about the value of the serum which you put to him in cross-examination to show that he was probably not speaking the truth?—I do not say that he is not speaking the truth.

20506. Or doing anything discreditable. I do not quite see what the discredit is. If people invent a serum which costs money to make I do not see why they should not sell it, and sell it at a profit?—I do not say that they should not sell it, and sell it at a profit. All I say is that when you sell things at a profit, and the profit comes to you, there is always an inducement to push the sale.

20507. (*Sir William Collins.*) Have you suggested that there is anything immoral in the sale of these

* *The reference is in Mr. Power's evidence—Questions* 4409 *and* 4411.—G. K.

Sir G. Kekewich, K.C.B., M.P.

18 Dec. 1907.

sera?—I have not suggested that there is anything immoral in it.

20508. (*Chairman.*) Anything to discredit?—What I suggest is that there is an inducement to push the sale.

20509. (*Sir William Collins.*) May it be that the sale of these goods is so extensive because they supply a felt want?—I do not say that it is not possible.

20510. (*Sir John McFadyean.*) I should like to put another question to you. Do you wish to put that list in as evidence, that the inventor in this country of any serum shares in the profits of Messrs. Burroughs and Wellcome?—That I have no means of knowing.

20511. What is the motive of putting in Messrs. Burroughs and Wellcome's price list if you do not suggest that any British inventor of a serum or any medical man who recommends it is getting any of the profits?—I suggest that the inventors of sera receive royalties on the sale.

20512. What is your source of information with regard to that?—At this moment I cannot tell you, but I will furnish the Commission with the information.

20513. Might I ask that you will furnish the Commission, in the proof of your evidence, with evidence that some British inventor of a serum is sharing in the profits obtained by the sale of it?—Yes, I will.

20514. (*Chairman.*) I think we should not admit any evidence of a personal kind of that nature unless it is really first-hand evidence; it must be something that would be really evidence in a court of justice?—I quite agree, My Lord. I think there ought to be something to support that statement that the inventors of sera and antitoxins received royalties upon the sales.*

20515. (*Sir John McFadyean.*) It is particularly British inventors that I wish you to notice?—The whole object of what I suggest here is not to prove that anybody has done anything disgraceful, but merely that there is an ordinary commercial aspect of the question and a monetary stimulus to pushing the sale as in any other case.

20516. My impression is that you have not produced any evidence to show that the inventors are commercially interested. That is what prompted my question?—I will endeavour to do so when I get proof.

20517. (*Sir William Collins.*) Do you desire to call attention to the question of vivisection as a means of training medical students?—The Parliamentary Association does not consider that there is any evidence to show that vivisection is necessary for the training of medical students. We consider that there is strong evidence to the contrary. Mr. Morris, the President of the Royal College of Surgeons, has reached that eminent position, according to his evidence before the Commission, without ever having performed an experiment on an animal. He also stated that there are many other practising surgeons who have never practised vivisection (Question 7786). Sir H. R. Swanzey, F.R.C.S., President of the Royal College of Physicians of Ireland, speaking of operations on the eye, declares (Question 9896-7) that he does not consider it necessary for a student to operate on an anæsthetised animal in order to acquire skill in such operations, but that he might obtain that skill by operating on the eyes of dead persons (I think his expression was dead persons). Mr. H. Morris, F.R.C.S., President of the Royal College of Surgeons, England (Questions 7751 and 7752) approves of some demonstrations before students for teaching, but not for operative purposes, and he gives the following evidence: (Question 7783) "You made your name, I think, which is a very good one, by experiments on the kidney, was it not? (A.) I never made an experiment in my life." (Question 7786) "Were those operations, which you have conducted so skillfully and fortunately, discovered, and were you made to do them by experiments on living animals? (A.) Personally, not at all. The operation that I did in the first place, and was the first to do, was done quite irrespective of any experiment on animals; that is, the cutting of a stone out of a kidney." (Question 7828) "I gathered from one answer . . . that you rather objected to the use of vivisection for the purpose of obtaining manual skill? (A.) Those are my feelings, I do not think it is necessary." (Question 7831) "Shall I be right in thinking that there are many practising surgeons who have never practised vivisection? (A.) Surely yes."

20518. Of course, all this evidence is before the Commission. Is there any special point that you desire to make upon it?—Merely this, that if the President of the Royal College of Surgeons, England, can obtain such eminence without having ever made an experiment in his life, that seems to be a refutation of the claim that operations on living animals are necessary for the training of students in manual skill.

20519. You also desire to refer to certain answers given to questions by Sir H. R. Swanzey. Perhaps if you cite the number of the questions it will be sufficient?—Questions 9896 and 9897. I think I have already stated the effect of those questions. Then there is Sir W. Thornley Stoker, Inspector for Ireland, who says (Question 761): 'I believe that such demonstrations during lectures are used more for the purpose of interesting and attracting a class than for any direct teaching value they possess. I am strongly of opinion that in any legislation which may be undertaken with a view to the revision of the Act 39 and 40 Vict. c. 77, experiments on living animals should be forbidden in illustration of lectures, on the ground of their uselessness, and perhaps cruelty also. . . . Such demonstrations cannot but be demoralising to the young men and women who witness their performance. They seem to me to be an offence against humanity." Then he was asked at Question 904: "But the fact that the experiment can be carried out without pain would not modify your attitude in the least?" and he said "It would not." That is the end of what I should suggest as to the evidence. I have been asked by the Committee of the Parliamentary Association to make an explanation with regard to an oversight in Mrs. Cook's evidence if the Commission will hear it.

20520. (*Chairman.*) I do not see how, when we have had a witness before us who has given evidence and been examined, we can ask another witness to give an explanation of what she said. It must stand for what it is worth?—She also represented the Committee of the Parliamentary Association.

20521. But I do not think that makes any difference?—Then that will be all I have to say.

20522. (*Sir William Collins.*) Does that conclude all that you desire to say in examination-in-chief?—That concludes all I desire to say if the Commission rule this explanation inadmissible.

20523. (*Chairman.*) There are just a few questions that I should like to ask you. I observe that you say on page 2 of your *précis*, at the bottom of the third paragraph, that the Government of the day were no doubt glad to get rid of so unsavoury and controversial a subject so speedily and so easily. The reference is to getting that Bill through in the last four days of the sittings of the House?—Yes.

20524. You say that it was a controversial subject; but is it not the very strongest possible evidence that it was not controversial that it was allowed to pass through the House in all its stages in the last four days? Could you have stronger evidence that the Bill was not a controversial Bill?—I think that a Bill, for the purposes of the House of Commons, if it is being pushed through in the last four days loses a great deal of its controversial character for practical purposes.

20525. Do you not know very well that the Government are always asked towards the end of a Session what Bills they propose to press, and they say: "We propose to press such-and-such Bills, but not if they are controversial"? Unless they are really absolutely essential Bills they do not at that stage bring in a new Bill and pass it through unless both sides of the House are prepared to let it go?—It is a controversial subject. I am not prepared to say whether in those days it was regarded as a controversial Bill. Of course, as you know yourself, there are many degrees of the controversiality of Bills.

20526. When you spoke of it as controversial, and at the same time as having passed through the House in the last four or five days of the Session in all its stages, it struck me as a very strong piece of evidence that it was not a controversial Bill, but was generally

* "*Behring has patented his diphtheria anti-toxin serum on the Continent; Koch for years has made a princely royalty out of his tuberculin.*" *From the Presidential Address in the section of State Medicine, at the Annual Meeting of the B.M.A., August*, 1899. *By George Wilson, M.A., M.D., LL.D.*

assented to?—What I rather referred to was that it was, at all events, controversial in the country, if it was not controversial at that time in Parliament. Of course at that time, between the 10th and the 15th of August (and particularly in 1876, I think it was), I do not suppose the attendance of members was as it is now. They had mostly gone away for the grouse shooting, and so forth, before the 15th.

20527. I should have thought, after some experience of the House of Commons, that it was very strong evidence that it was not considered controversial?—I bow to your greater experience.

20528. You speak of there being 43,000 experiments in 1906. Do you know at all how many of those were inoculations?—No, I do not.

20529. The vast majority?—I do not know whether there is any means of discovering that.

20530. Are you aware that a large number of the 43,000 were experiments ordered and conducted on behalf of the Board of Agriculture, the Board of Trade, and the Local Government Board?—Yes, I believe that a great many of them were.

20531. I am told that about 6,000 were operations under that head, and about 20,000 in cancer research?—Those 20,000 in cancer research were inoculations.

20532. They were for what we may call a semi-public inquiry; it was not on the same footing as a Government inquiry?—No.

20533. Then I see you rather suggest that Dr. Starling's evidence on the question of pain is inconsistent with the views of other physiologists; I am leaving out Dr. Pembrey for the moment, but inconsistent with other statements. You say, for example, in the middle of page 7 of your *précis*, that he has said, and you seem disposed to doubt whether it is true, that he had on no occasion ever seen pain inflicted in any experiment on a dog or cat?—Yes.

20534. If you read the whole context I think you will see that it is quite plain that Dr. Starling is speaking about experiments under anæsthetics. He says that he always administers anæsthetics and that he administers them efficiently, and it is with reference to that that he is speaking when he says that he has never seen any pain inflicted in any experiment. You speak afterwards as if he was guilty of want of candour in saying that, because it is admitted that after animals have recovered (in cases where they are allowed to recover), they feel pain from the consequences of the operation. You observe that Professor Starling has never said the contrary of that. He says that in an experiment he has never inflicted pain, because he always used anæsthetics. He says that there may be pain afterwards in cases where the animal afterwards recovers. There is surely no want of candour there. You accuse him very strongly of want of candour. Is there any want of candour in those two statements?—I cannot find the second statement.

20535. You say on page 10 of your *précis*: "Professor Pembrey, in direct contradiction to Professor Starling and others, tells us that he does painful operations, and that, moreover, 'they are absolutely necessary.' Thereupon we are confronted by the question: Were those other gentlemen then imposing upon our credulity, or were they the victims of their own? Can extensive mutilations under anæsthesia administered, as Professor Starling confessed, by the laboratory boy, be wholly and invariably painless? Painful experiments, he says, are 'absolutely necessary.' This, then, is the candid truth of the matter." Are you aware that Dr. Starling's evidence on that point, as to pain not being suffered under anæsthesia, and as to a certain amount of pain being suffered afterwards, is the evidence of, I may say, a dozen of the most eminent physiologists and representatives of universities who have come here to give evidence before us?—I am perfectly well aware of that, but, as I understand, the anæsthetic, which I suppose was chloroform, was administered in the case of Dr. Starling's experiments by the laboratory boy. I think somewhere in his evidence, if I am not mistaken, there is some statement that when the animal began to move the boy increased the dose of chloroform.

20536. I do not know whether he said "boy"?—The laboratory boy.

20537. But that is hardly the point. The question here is that you are contrasting Professor Pembrey, who says that he does painful experiments, and that they are absolutely necessary, with the evidence of Professor Starling and others; and you speak of it as a question of candour, because you say that Professor Pembrey is a man who speaks the candid truth in the matter, implying that the others are not candid?—We certainly do imply that; and it seems to me obvious that if the anæsthetic is administered by the laboratory boy, and if the laboratory boy is entrusted with the duty of putting on more chloroform if the animal moves, those experiments cannot be absolutely painless.

20538. You will see that many questions have been asked on that subject, of how it is administered and by whom, and so forth, throughout the evidence, which I cannot take you through; but what I am pointing out now is this. I understand you to say that, although these 12 gentlemen practically agree in their statements about anæsthesia and its being complete, and about there being no pain suffered at the time by the animal, but that some pain is suffered afterwards, they are not candid witnesses, because they say that and because Dr. Pembrey says the reverse. You accept him as a candid witness, and the other 12 you do not?—He certainly was candid. He said "painful experiments are absolutely necessary."

20539. But you contrast him with their evidence. Do you suggest that these other 12 gentlemen were uncandid witnesses in what they said?—They have——

20540. I should have thought it would not be difficult to answer that with yes or no?—I always presume that these gentlemen have a different idea of pain from the idea that we ordinary laymen have.

20541. Then it was not so much a want of candour, as that they were under a delusion?—You may put it in that way if you like.

20542. Which do you prefer to put it as: that it was delusion or want of candour?—My Association think it is want of candour. I am somewhat doubtful whether it was from want of candour or a mistaken idea—whether it came really from a certain callousness imbued in them by their profession.

20543. Your society's suggestion then is, that all these very eminent members of their profession have come here and, as you say, have been "imposing upon our credulity"?—Well, we are told by another of them that pain is caused—that is "absolutely necessary."

20544. But do you say so. Never mind about the evidence of others at present. You say, "Were those gentlemen imposing upon our credulity or were they the victims of their own"? You say that your society (whatever you may think) do not think that they were the victims of their own credulity. Then we must adopt the other alternative, that they were imposing on our credulity. Is that your society's view?—I said: "Were these gentlemen imposing on our credulity?" In that case it would make them out as making an immoral statement. "Or were they the victims of their own?" That means, were they under a delusion? We ask the question.

20545. But you said that your society's view was that they were not under a delusion?—I should say that that is the view of the society.

20546. Then it is a want of candour?—Yes.

20547. Then we are to understand that these 12 gentlemen came here for the purpose of deceiving us, and Dr. Pembrey is the one honest man?—I do not say that he is the one honest man, but he seems to have been honest.

20548. You are aware that Dr. Pembrey's views on the whole subject differ very largely from those of his confrères?—Yes, I know they do.

20549. His view seems to have been that pain is a blessing and that anæsthetics are a curse?—Yes.

20550. (*Mr. Ram.*) To human creatures and to animals?—Yes.

20551. (*Chairman.*) And that the Vivisection Act is entirely opposed to the advancement of physiology in every part?—Yes.

20552. You are aware probably, if you have read the evidence, or have had it read for you, that I think I might say almost all the witnesses who have been called as physiologists are not opposed at all to the present restrictions as to anæsthesia; they are content with the restrictions imposed, with the obligation to use anæsthetics?—I believe those exceptions and restrictions in the original Act were really concessions

Sir G. Kekewich, K.C.B., M.P.

18 Dec. 1907.

to the medical profession, and therefore it is to be supposed that they are satisfied with them.

20553. I am putting the question, not for the purpose of arguing whether they were right in saying so, but as showing that their views and Dr. Pembrey's views are quite different on the main points in dispute, that they take quite a different view?—I was going to say that on the Second Reading in the House of Commons, Dr. Ward, one of the representatives of the medical profession, moved the rejection of the Bill, and after explanations from the Government, who professed great sympathy with the medical profession, he withdrew his opposition to the Bill.

20554. What Bill was that?—That was this Bill that is at present operative, the Cruelty to Animals Act, 1876; thereby admitting that the Bill was in conformity with the views and desires of the medical profession.

20555. There are such things as compromises, but I am putting it that it was in conformity with the present views as regards anæsthesia?—I may say that the society would not admit that there was any compromise about the Cruelty to Animals Bill.

20556. I do not know how the fact was in the least. I am merely suggesting that the mere fact that a person withdraws his opposition to a second reading does not mean that he agrees with everything in the Bill always?—No, that is so.

20557. (*Sir William Church.*) Referring to the bottom of the fifth page of your *précis*, do you think that the community suffers at the present moment from a want of humanity in the medical profession?—I think it does to a certain extent. Of course, you are asking me a question which I can only answer from my personal experience, and from what I have heard, and so forth. I think that there are a certain number of uncommonly rough physicians and surgeons in the profession.

20558. And you think that that number has increased since 1876?—In consequence you mean of what?

20559. I do not say what it is in consequence of; I ask you whether you think that the number of rough physicians and surgeons now existing is proportionately greater than it was before the Act of 1876?—That I cannot tell; it is impossible to tell. I was not acquainted with the circumstances before the Act.

20560. Then you have no evidence whatever that the introduction of the Act and the working of the Act have led to the demoralisation of those who enter the medical profession?—I think the medical student is a good deal rougher than he used to be.

20561. Is that the generally received opinion?—That is the general view, I should think.

20562. Do you mean to tell the Commission that it is the generally received opinion now in the world that the medical student is a more uproarious and rougher individual than he is described in books written some 50, 60, or 70 years ago?—I am not prepared to say that, but I think he is rough enough, at all events.

20563. That is not my point. I wish to know what evidence you can give us of the statement that the medical profession is rougher now, and I suppose you mean by that is less regardful of the feelings of those who come under their treatment, than the profession was 30 or 40 years ago?—The only evidence that one can give of that is hearsay. I do not for a moment suggest that the great mass of the medical profession are not exceedingly humane. I think they are. Personally I have never come across a doctor who has not been humane. But at the same time I can only imagine, speaking for oneself, that seeing these experiments carried out day by day all the horrors of it would have the effect of blunting one's sense of sympathy.

20564. Therefore if I might so say, it is only what you imagine to be the case. You have not any evidence to bring before us that it is the case, but it is what you imagine might be the case?—It is just the same thing, or it is very much the same thing as that a man who shoots a great deal is utterly insensible to the sufferings of the animals that he wounds, and the more he shoots the more insensible he becomes to it. I cannot think that it is improving the humane sense in them.

20565. So that we are all degenerating—our sportsmen have degenerated, too, because they kill more pheasants in a day now than they used to do 60 or 70 years ago?—I do not know that our sportsmen have degenerated, but I know that I myself gave up shooting because of the horrors of it. I used to shoot a great deal, and in consequence of the horrors that I saw I gave it up altogether..

20566. (*Mr. Ram.*) Then it did not have the normal effect upon you, Sir George?—What do you mean?

20567. You are putting it that the effect of much shooting is to inhumanise a man. It had the opposite effect upon you, I gather?—As a general rule I mean, but sometimes it turns the mind in the other direction, and it did so with me.

20568. (*Sir William Church.*) Then with regard to what you say on page 6, has clinical research been neglected, do you think since demonstrations have been shown in teaching medical students?—Of course, I am not an expert, and I am not qualified to answer these questions thoroughly, but I have heard from certain doctors whom I have come across in my position as honorary secretary of this Association, and whom you would call anti-vivisection doctors, that clinical research is to a great extent subordinated in these days to experimental research.

20569. Have you any knowledge of the present curriculum which is required of a medical student?—No.

20570. Then you have no knowledge, I suppose, of the medical curriculum that was required before; say 40 or 50 years ago?—No.

20571. You are not aware that now it is incumbent upon a medical student to attend for a fixed number of months upon clinical teaching and clinical observation?—I am not acquainted with the course of study of medical students.

20572. But you stated in your evidence that there are other means, that medical scientists are not driven to use experiments only, and you said, in answer to Sir William Collins, I think, that you meant by that that clinical research might be carried further?—Those are the views of my Association, and I think they are the views of a certain portion of the medical profession.

20573. But I rather gathered, I may, of course, have misinterpreted you, that you considered that the barren state of our knowledge was because clinical investigation and clinical research were not carried out, and were neglected for experimental research?—No, I have not said so. What we have said is that in all these years during which vivisection has been practised it has not had any great effect in either curing disease or preventing disease.

20574. Have the other means of research which have been in use for ages had any great effect?—I think at all events it produced all the knowledge that we have.

20575. Is it not the case that the great incentive for scientific research in physiology and in pathology is in the hope of supplementing the knowledge that we get from mere observation of disease?—I presume that that was the reason of the introduction of vivisection, but it does not seem to have had any result up to the present time. That is what we contend.

20576. I would beg leave to differ from you, because surely the foundations almost of medical knowledge arise from experiments made upon animals two thousand years ago, when the first cases that we have information of began. Do you think that no knowledge was obtained by the experiments of Galen?—I am not acquainted with the experiments on animals at so distant a date; but all that we affirm is that no real knowledge has been obtained as to curing disease or preventing disease from the vivisection experiments under the Cruelty to Animals Act. That is what my Association are prepared to contend.

20577. You mean that your Association are unable to find any direct practical application of any group of experiments since the Act of 1876 was passed?—I do not mean any practical application, because there has been plenty of practical application, but no beneficial application.

20578. Therefore you do not consider that any benefit whatever has been derived from the use of any what I will call sera, in the treatment of disease?—No, on the contrary, we should be inclined to hold that more lives have been sacrified by the introduction of sera than if they had not been used. We have an instance that such is the case in Koch's tuberculin, which I believe led to the loss of a considerable number of lives, and has now been exploded.

20579. I beg to differ from you there altogether, it has not been exploded. But that is your position, that really no benefit has been proved yet to have resulted either to men or animals from the use of sera?—We should go further and say that harm has resulted, as in the case of plague.

20580. But you say you have no medical knowledge, and therefore I will not go into any actual specific cases in which I think you would find a difficulty in maintaining your view?—You quite understand that I am not a medical expert. I am merely dealing with this question as an outsider, with it is to be hoped a certain amount of common intelligence and sense; that is all.

20581. I think you told us that you are in the habit of reading books on medical subjects?—I read some that are germane to this particular subject.

20582. I suppose your reading is chiefly directed to works which are written by those who hold the same views as yourself?—No, I do not say that. One question which I have been greatly interested in, on public grounds of course, is the question that I have dealt with in my evidence at some length, namely, the question of bubonic plague in India. That is a question on which I have read.

20583. I should like to ask you a few questions on that point. You gave us as an instance of a disease in which no increase of knowledge had taken place, influenza. What makes you take 1729 as the year that you start from; is there any reason for taking it?—That is our first record of the invasion of influenza, so far as I know.

20584. I think if you look you will find that influenza epidemics were described long before that time. The first one that is described goes back to the fifteenth century. I should have thought that the argument that you make use of with regard to influenza is just an argument the other way. Perhaps you are not aware that experimentation in bacteriology has rendered it probable that we are acquainted now with the organism with which is always associated, if it is not the one which causes influenza; so that we have advanced somewhat in our knowledge?—I did not know that a particular bacillus had been discovered; but, of course, I am aware of the theory that the bacillus is not the *causa causans* of zymotic diseases generally.

20585. You do not think that the bacillus that is stated to be at all events always found with influenza is the *causa causans*?—Of course, I am always obliged to guard myself by saying that I am not a medical expert; but as I understand the two theories, one is that the bacillus is the cause, and the other is that there is a poison surrounding the bacillus on which really the bacillus feeds.

20586. If the bacillus produces the poison?—I did not say that. I said on which the bacillus actually feeds, in which it lives, and that the bacillus is really a cleansing and curative agent.

20587. Then I will not pursue that any further?—But all I say is that I am aware of those two theories. I am not medical expert enough to be able to adopt one side or the other.

20588. I will not pursue that any further: but I think that, in answer to a question by Sir William Collins, you mentioned the drugs of antipyrin and sulphonal, which you said had had great repute, and were now exploded or were not in favour. What leads you to say that?—They are not used now.

20589. Would you think I am wrong if I tell you that these two drugs and several others which are similar in composition are used daily, and I might say hourly, throughout certainly this country—I should think almost throughout the world?—I am informed that antipyrin is very seldom prescribed now because of its effect on the heart, and that sulphonal is also not prescribed generally because of its cumulative effects.

20590. May I ask you who was your informant? Where did you get that information?—I got it from a member of the medical profession.

20591. Did he tell you that he did not use them, but that he probably used bodies closely resembling them, which have also been introduced of late years?—That I do not know; but I do know also that in my domestic pharmacopœia sulphonal and antipyrin once played a very considerable part, and now they are not prescribed.

Sir G. Kekewich, K.C.B., M.P.

18 Dec. 1907.

20592. I will not say the contrary?—That is all.

20593. Then on page 7 you say that "the evidence as to the pain suffered by animals in process of mutilation is wholly untrustworthy and unreliable, either because of the inaccuracy of statement or the inaccuracy of observation of the operators, or because under the Act as at present carried out one operator actually experiments without pain, while another confesses that he has done painful experiments." I should wish to ask you whether you are alluding to experiments carried out with the same object. Do you mean to say that when two experimenters carry out the same object, in one case the experiments are done with pain and in another without?—Do you mean similar experiments?

20594. I do not mean similar; I mean the same experiment done by two experimenters—an experiment directed to the same end?—That it may be carried out with pain in one case and not in the other.

20595. Yes?—I imagine that that is quite so, according to whether the anæsthesia is complete or not. Of course we do not presume to say that complete anæsthesia does not prevent pain. Of course it does.

20596. I did not gather that. What you mean, then, is that the difference in the result may be due to one experimenter having his animal under an anæsthetic and the other having his not under an anæsthetic?—Or, rather, one having the animal completely anæsthetised and the other having it imperfectly anæsthetised.

20597. You do not give the experimenter (who is a man whose whole attention has been directed to these subjects) the credit of being able to know whether he is performing experiments under one condition or the other?—In many cases, as I understand, for the practical purposes of the experiment the anæsthesia is kept as light as possible. I do not mean that it is not complete, but it is not very heavy anæsthesia.

20598. (*Mr. Ram.*) Do you mean that it admits of suffering?—I mean that in that case there may be intervals of waking, and therefore intervals of consciousness, during which pain is caused.

20599. (*Sir William Church.*) Then I gather from that that you would not grant that any experiments are valuable for the acquirement of knowledge, but that, if they were, you think they ought to be done without any anæsthetics at all?—No. I say that they ought not to be done at all, with or without anæsthetics—at least, that is the view of our Association.

20600. Then you rather complain on page 8 with regard to the mice that have tumours. You say: "We are not told of means taken to restrict the growth." Have you ever made any inquiries as to what is done with mice when the tumours become large? Has your society ever asked for any particulars?—I do not know, but I confess that as a mere ordinary layman I do not understand the advantage of implanting a piece of cancer in a mouse, and making it a tumour, because that is not the way in which cancer comes in a human body.

20601. I will not go into that; but, as a matter of fact, your Association has never either written or asked the Cancer Research Fund anything about the mice, and never asked to be allowed to see them, or anything of that sort?—I do not know that they have.

20602. They are not aware that if a tumour is likely to be produced, say in a mouse, which in any way produces symptoms of pain, that mouse is killed, the object having been probably obtained?—I have no doubt that it is killed. I take it from you that it is. But of course I do not know that we have made any inquiries as to what happens. I suppose it is killed.

20603. Of course, no method is taken to restrict the growth, because the growth is what is required. It is the only way by which material for experimentation can be obtained, by keeping up the growth in a succession of animals; but no questions have ever been asked as to whether the animals are kept in pain or not?—I should imagine that during the growth of the tumour they must feel pain, judging from the analogy of human beings, at all events. I am not prepared to say more.

Sir G. Kekewich, K.C.B., M.P.

18 Dec. 1907.

20604. It is a very natural thing to imagine, but I merely mean that your Parliamentary Association has not made any inquiries into the subject?—That I cannot say.

20605. What is the reason that leads you to state on the same page, "There must necessarily, upon waking up from anæsthesia," (that is after operations on man) "be very severe and prolonged pain until the severed tissues heal"? Is that the result of your reading or your information?—That is in the extensive cutting operations, with excision of organs. I should have thought that any ordinary layman would know that.

20606. Then that is not the result of any inquiries that you have made of persons who have undergone severe operations which have healed by first intention?—This *précis* has been prepared by members of the medical profession, and I imagine that they, at all events, know from experience that such is the case, although I have no experience of the kind.

20607. Might I ask by whom this *précis* has been prepared?—It was prepared by the Parliamentary Association generally and their executive, and there are in it members of the medical profession.

20608. Mr. Stephen Smith?—There are several. I do not wish to mention their names.

20609. Is he one?—He is not one.

20610. Miss Arabella Kenealy?—Yes, she is one.

20611. (*Mr. Ram.*) You told us that you represented experts?—Yes, to a certain extent. There are a certain number of experts connected with our Association. When I say experts, I mean fully qualified medical experts.

20612. Who assisted in the preparation of your *précis*?—Yes.

20613. Will you give us the names of any of those who assisted in the preparation of your *précis*?—I have already said Miss Kenealy.

20614. Any other?—Dr. Bourchier, and, I think, some others.

20615. (*Sir William Church.*) Your Association has not inquired into that question, I gather then, from those associated with the large general hospitals, and who perform many operations both in hospitals and in private?—I understand that the drift of the question is to show that with extensive operations with excision of organs, after the operation has taken place and the anæsthesia is over, there is no pain. That is what you would suggest?

20616. Not severe and prolonged pain. I suggest certainly that it is not necessary that that should take place?—I have not had many operations performed upon myself. I have had some little ones, and I have always found that any cutting out of anything, even the cutting of a fishhook out of a finger, is followed by pain. I have had a salmon-fly through my finger, and had to have it cut out. I have always found that that is followed by considerable pain, even that small operation. I cannot for a moment imagine it possible that after an operation such as the excision of organs there can be no pain until the tissues heal.

20617. First of all you say that it is in accordance with what you think yourself would be the case, without inquiry, and it is founded upon information that you have received from those people whom you call experts, whom the Parliamentary Association have consulted?—That is to say, it is a statement with which I, simply as an outside observer and an ordinary layman of some experience and a little intelligence, agree; that is all.

20618. Would you tell me where Dr. Pembrey says that he himself circumcises children without anæsthetics; I do not read his answer quite in that way?—The reference is not given.

20619. What he states is that circumcision when performed as a religious rite is not done under anæsthetics, and he does not say that he always does it himself without anæsthetics. What he states at Question 14,161 is: "I have circumcised children without anæsthetics." He does not say that he habitually does it. "If they cry it does not matter; it is much better that a child should cry and moan than that its life should be lost. That circumcision is not such a serious operation is shown by the fact that the ordinary medical man does circumcision under anæsthetics and the Jewish non-medical man does it without anæsthetics." And he himself, apparently having seen a death in a child from anæsthetics during the operation of circumcision, does not always use it for circumcision. But he does not state that he never uses anæsthetics.

20620. (*Sir Mackenzie Chalmers.*) I understand that he says that Jews never use it, and they circumcise largely?—He says that he has done it without anæsthetics, but he does not say that he habitually does it. That is the point, is it not?

(*Sir William Church.*) Yes.

20621. (*Sir William Church.*) I should like if I might to ask you a few questions about the plague in India. I gather from what you have said in answer to questions, and also from what you say on page 15 of your *précis*, where you say "A manufactory of plague was established," that was by the use of serum, "which has been hard at work ever since producing its five and a quarter million deaths," that the view of your Association is that the use of Haffkine's prophylactic has actually caused a spread of the disease?—The view that we hold is that the use of Haffkine's so-called prophylactic has not only not acted as a prophylactic and not reduced the number of cases, but that it has actually increased them; that it has created centres of plague where none existed before, and that it has as a matter of fact kept up the epidemic. I do not know whether it is all due to Haffkine. I think Yersin's serum is also answerable for some.

20622. But at all events the use of sera has caused an actual spread of the disease directly by its use?—Yes, that is our view.

20622A. Not because that has caused the Government to cease taking other precautions; that is what I want to get at?—I understand that the sanitary method of combating the disease is not taken to a very large extent in India.

20623. That I gather. You contrasted the sanitary steps which have been taken in India with those which were taken in Egypt?—I understand that sanitary steps have not been taken to the extent, at all events, that they have been taken in Egypt.

20624. In your opinion, therefore, the Government of India has been rather remiss in not taking more active sanitary steps in India in combating the plague?—I think so, and I think also that the Government is very much to blame, with all these facts before it, for not having taken active steps to ascertain whether Haffkine's serum did actually propagate plague or not.

20625. I will go to that in a short time. Are the circumstances of Egypt and India quite comparable. I mean with regard to taking what are called ordinary sanitary precautions?—I take it that it is a great deal more difficult to effect complete sanitation in India than it is in a country like Egypt, which is what I may call more closely governed.

20626. Therefore there would be greater difficulties in carrying out in India measures such as were adopted in Egypt?—No doubt.

20627. You allude, I see, to the state of unrest in India, and you say that the plague was one of the chief causes of unrest in India?—So we read—that plague, famine, and so forth, are the chief causes of unrest in India, or among the chief causes.

20628. In what way did this unrest in India arise in connection with the plague?—I think the people, whatever the Government may think, are gradually becoming converted to the same view as I am taking to-day, that the inoculation is actually causing plague amongst them.

20629. You think that it was the introduction of inoculation that caused the unrest?—I will not say the introduction of inoculation, but the continuance of the inoculation, and the fact that the plague has not diminished at all by the inoculation, but rather increased.

20630. You do not think that it is the attempt to put the rules of sanitation in force that has caused the unrest?—I have not heard so.

20631. And you would prefer not to give any opinion, I suppose, whether you think it is probable that that is the cause of the unrest?—Of course, if we were to go into the causes of unrest in India, we should be getting into quite political matters, if we deal with that very much. But the causes of unrest are of various kinds.

(*Chairman.*) Do not let us go into that question.

20632. (*Sir William Church.*) But, as a matter of fact, are there not reasons why it is very much more difficult for the Government to put laws of sanitation in force in India, than it is in Egypt?—There are reasons, of course, connected with the religious creeds of the people.

20633. In fact, you cannot move the population about, you cannot move the population from a village to another spot without making arrangements for the different castes being separate, can you?—That is so. But I was not arguing merely that if they had taken measures of sanitation in India to the same extent that they have in Alexandria they would have stamped out the plague. I was rather arguing that if they had left things alone without the introduction of Haffkine's serum, the plague would, so to speak, have burnt itself out.

20634. That is to say the actual use of Haffkine's and Yersin's sera have disseminated the plague?—That is our view.

20635. And how have you arrived at that view?—No epidemic of plague, I believe, before this one has ever lasted more than about seven months, and the only condition in which this epidemic of plague differs from others is in the introduction of these sera. That is one reason.

20636. Has the present epidemic of plague that is going on in India been equally severe over all parts of the country?—That I cannot answer you.

20637. India is a very large country?—Certainly.

20638. You are not aware at all of the way in which the mortality has varied in different parts of India, according to the Government Returns?—No, but I can well understand that from natural causes it would vary in that way.

20639. I have the returns before me for five years, from 1901 to 1906. Your Association have not looked at those to see how the mortality has varied in different spots at different times during those five years?—Probably not.

20640. Have your Association read any of the reports of what I might call the experimental use of Haffkine's or Yersin's sera?—I myself have a book here which is very interesting on the subject of these sera, by Professor Montenegro.

20641. That was before the present epidemic, was it not? Was not his book prior to the present epidemic in India?—This book was written in 1900, during the epidemic.

20642. At the commencement of it?—Yes, and it gives sundry particulars about Haffkine's lymph and Yersin's lymph and Luslig's vaccine. I observe that one of your witnesses before the Commission, who was an Indian medical man, Colonel Lawrie, said that when Haffkine's serum came to him, as a general rule it was putrid.

20643. Do you know the results of the use of the serum at the Byculla gaol?—No.

20644. Would you accept it as correct that of the prisoners living exactly under the same conditions so far as regards lodging and food and possible communication with the outside, 172 were not inoculated, and among those there were twelve cases of plague, six of which proved fatal, and on the other side of the jail, where there were 147 inoculated, there were two cases and no deaths. If the serum spreads the disease, how was it that there were not more cases on the inoculated side of the jail than on the uninoculated side?—As I understand, the whole of one side of the jail was inoculated.

20645. 172 were not inoculated, and 147 were?—Were they all mixing together?

20646. No, they were not?—I thought you said that they were on different sides of the jail?

20647. We will leave that out, as I am not positive about it. But it is the case that 172 were non-inoculated and there were twelve cases of plague and six deaths, and of the 147 cases inoculated there were two cases and no deaths?—But everyone of the inoculated cases had plague.

20648. No, this was for prophylactic purposes?—With Haffkine's serum?

20649. Yes?—But I read here that Haffkine's serum whenever it is given always induces a mild attack of plague.

20650. I beg your pardon. This was for a prophylaxis purpose against the plague?—I quite understand that, but the prophylaxis consists in the inoculated persons having a mild attack of plague.

20651. I will not go into that question, but they were healthy persons. It was not done for cure; it was done for prevention?—Yes, I understand that; but my point was that inasmuch as all these persons who were inoculated had a mild attack of plague, they could not possibly disseminate it—they all had plague, although it was mild. The two cases, I suppose, that died were cases of virulent plague.

(*Sir Mackenzie Chalmers.*) The two cases did not die.

20652. (*Sir William Church.*) Two cases had it?—Yes, then they were cases of virulent plague.

20653. Two cases apparently, according to you, had a second attack, one when they were inoculated and subsequently another attack?—Or had it virulently. But it is admitted, as I understand, that Haffkine's serum causes a mild attack of plague.

20654. (*Sir John McFadyean.*) Do you mean admitted here before the Commission?—I understand that it is admitted by the medical profession, and by Haffkine himself.

20655. (*Sir William Church.*) At all events, you are not prepared to contest those figures that I gave you?—No, only I should distinctly contest the deductions from them.

20656. I only wanted to know whether your Association have really taken the trouble to have any of the returns, which could easily be got now, before them and investigated them?—That I cannot tell you. But I do not think I should judge on such a return as that. There is no reliance whatever to be placed upon it, because although the return may be perfectly correct, it is vitiated by the fact that all cases inoculated with Haffkine's serum have a mild attack of plague; that is, they have a mild attack of plague, and they are centres of infection themselves wherever they go, and, as I understand, also they are only immune for a very short time, I forget how long.

20657. I quite appreciate your position now, and I will not ask you anything further about it, as it is a scientific and medical question. You say the action of the serum so far as plague goes is similar to that of inoculation in small-pox formerly?—Yes.

20658. I did not understand that that was your position before. Does that also apply to the use of other sera besides plague sera, that when you make use of sera you give either the animal or men the disease that you are trying to give it immunity from?—I take it that it does in some cases. I presume that you give it a modified form of the disease, otherwise no immunity would be conferred.

20659. Have your Association taken any trouble to inform themselves on that question?—I have no doubt that they have.

20660. But surely you must know whether they have; you come to represent them?—Of course, I cannot possibly tell everything that my Association have done.

20661. It is one of the most important and most difficult subjects, and one that you seem to have had a great deal of advice upon?—I cannot tell exactly what my Association have read. There are a good many members of it.

20662. So that really I may take it, I do not wish to say anything offensive, that personally you have brought forward the plague in India as an instance before us without having any personal knowledge of the subject, and apparently without the Association having taken very great pains or labour to investigate the subject?—I do not admit that at all. I admit that I have not had any experience from the point of view of a medical expert. I have not been in India, and I have not seen the plague; but I do say that I have read a good deal about it, and that I know as much (as I have indicated originally in offering my evidence to the Commission) as any ordinary intelligent educated man would know about such a subject, and I think I am entitled as one of the general public to draw my deductions from the facts that are reported to me.

20663. But your deductions were a most serious charge against the Government. It comes to this, that not only have they neglected enforcing what are called the ordinary sanitary laws, but that they actually spread plague by the means they have taken?—

Sir C. Kekewich, K.C.B., M.P.

18 Dec. 1907.

It is a very serious charge, but undoubtedly it is a charge that the natives of India are beginning to make, as well as some people at home.

20664. I will not pursue it?—If I might supplement my answer to one question as regards the effects of Haffkine's serum, I will read a passage from Montenegro, at page 73: "The inoculation causes a mild attack of plague. In six hours the patient suffers from malaise, headache, depression, and fever, and this condition continues a couple of days, at the end of which there is usually vomiting and diarrhœa. The symptoms disappear slowly. The site of the inoculation is much congested, the skin desquamates, sometimes eruptions appear." That is suggested here by this Professor Jose Verdes Montenegro, a distinguished medical man in Spain.

20665. (*Chairman.*) Do you know that he is a distinguished physician?—He is ex-Interne of the Central University of Medicine, Associate Physician of the Hospital de la Princesa, and Professor at the Municipal Micographical Laboratory, Madrid. He is a distinguished man.

20666. If this is to show that the fever which is given by inoculation is of a serious kind, I think that we are all agreed that the plague is a very serious disease?—It is to show that the inoculation actually causes plague.

20667. That is the question I asked you. Is this a description of the disease which is imparted by inoculation?—Yes.

20668. (*Sir Mackenzie Chalmers.*) Did you read Dr. Martin's evidence, who came here, who had inoculated himself twice or three times?—No.

20669. He gave us his personal experience of inoculation, which does not quite accord with Professor Montenegro's.

20670. (*Sir William Church.*) I think I can throw light upon it. I think I am right in stating that Dr. Montenegro's work was published in the last century; that is to say, about 1899, or some such date as that?—1900.

20671. And is it possible that knowledge with regard to these bodies has advanced since then?—I am not prepared to say. I do not know whether the lymph is differently obtained now, or what happens.

(*Dr. Wilson.*) But your contention is, I think, that immunity cannot be conferred in the case of any of these diseases for which vaccines or sera are used as preventives unless a mild attack of the disease is induced.

(*Chairman.*) Is not that a medical criticism? I do not think the witness really professes to lay down general rules about medical effects.

(*Witness.*) No; only that immunity is stated to be conferred by Haffkine's lymph, and it continues for six months, but it does not continue for longer.

20672. I understand your view to be in this case that Haffkine's remedy given as a prophylactic gives the disease itself in a mild form?—That is so.

20673. And that the disease in a mild form is capable of being communicated to others in a virulent form?—Yes.

20674. And therefore it spreads it?—Yes.

20675. But, of course, you are here speaking from information that you have gathered from books and conversations, and not from your own personal knowledge?—Of course.

20676. (*Sir John McFadyean.*) I think you said that you were so impressed with the pain caused to animals in shooting that you had given it up?—Yes, that is so.

20677. Could you tell us how long it is since you gave it up?—About 15 years.

20678. I understood you to say that, while disclaiming any expert medical knowledge, you felt quite competent to give evidence before this Commission on such questions as anæsthesia, and the results of experimentation on animals, in virtue of the fact that you were a person endowed with ordinary powers of observation and common sense?—Quite so.

20679. To what extent have you exercised your power of observation in judging as to the possibility of anæsthetising animals sufficiently? One of the questions you have given evidence on is anæsthetics?—Yes.

20680. To what extent have you exercised your powers of observation with regard to the controversial matters relating to that?—I am afraid that I do not understand the purport of the question.

20681. I do not want to misquote you, but I think you said that ordinary powers of observation and common sense would enable one to judge with regard to such questions as anæsthesia, and the value of the results obtained by experimentation on animals?—I do not mean observation in the sense that I have witnessed experiments on animals, for I have not.

20682. Then what did you mean by observation, may I ask?—I was rather referring to observations that one had of pain in animals; and you yourself referred to one thing, one's observation in the shooting field.

20683. But it was no question of anæsthesia that came in there?—No, it does not come in.

20684. I think the question with regard to which you made the statement was whether experimentation on animals had advanced medical knowledge or not, and I took it down that you said that ordinary powers of observation and common sense enabled one to judge with regard to that question?—Observation in that sense means that one observes that the results, at all events of medical knowledge, are no greater than they used to be so far as one can see.

20685. But can you really claim that your observations with regard to that point ought to be allowed to have any great value with this Commission?—That is for the Commission to judge.

20686. Would you not admit that, in so far as your evidence has any value on that and other subjects, it is derived mainly from the fact that you have weighed the evidence bearing on the question?—To a certain extent, yes.

20687. Is it not mainly that as regards the question of anæsthesia, for instance?—I suppose that most men get their knowledge from reading unless they are engaged in actual experiments, and I admit that I have not been so engaged, and therefore my knowledge must come from reading.

20688. And, as we are all aware, many of the points are controversial, and therefore when you formed your opinion as the result of your reading it must have been because you weighed the evidence; is that not so?—You know how one forms opinions. One considers the credibility of the evidence.

20689. That is weighing the evidence?—I suppose that is weighing it, after a fashion.

20690. Now I want to put this to you. We have had here the President of the Royal College of Surgeons and the President of the Royal College of Physicians, and we have had representatives of most of the Universities, and a great many other men who are medical men, and I think I may say that they have been almost unanimous in their opinion that great advances have been made in medicine within the last 55 years?—In medicine, did you say?

20691. In medicine and surgery; and most of them hold that a great deal of that advance is due to experimentation on animals. Now the Commission has to weigh against that your evidence and the evidence of a smaller number of persons, most of them non-medical, and do you think that we would be violating the principles of common sense if we accepted the opinion of the majority in this case?—I think I may divide it into two things. First of all, I think that one distinguished surgeon who was examined before you said that he had rejected remedy after remedy until his remedies had been reduced to a number that he could count on the fingers of his two hands.

20692. Who was that?—Dr. Bantock.

20693. He is one of the minority?—I have no doubt he is one of the minority. And another answer that I might make to you is that the fact that the majority is in favour of a thing is absolutely no proof that their opinion is right. That has been shown in medicine more than in almost any other line—more even than in politics.

20694. (*Chairman.*) I do not think you need argue that to us; if I thought that that was the meaning of Sir John McFadyean's question I think we should all of us say we are not to be bound by the mere counting of heads of witnesses?—But Sir John spoke of the majority—would I put my opinion and that minority against the opinion of the majority.

20695. (*Sir John McFadyean.*) No, I beg your

pardon, the important part of my statement was that the majority was made up of men of great eminence in medicine, and presumably men qualified to form an opinion, as well qualified as the minority; and I therefore asked you whether you thought we should be violating the principles of common sense if we accept the opinion of the majority, not because they were the majority?—It is entirely for you to consider whether you will accept the opinion of the majority or of the minority, it seems to me; but what I was going to point out was that there was just as much common consensus of opinion in the medical profession years ago in favour of Lord Lister's antiseptic treatment of wounds; it was thousands to one in favour of it, I suppose; and as I understand at the present day Lord Lister himself has given up his antiseptic treatment.

20696. Have you taken the trouble to read the evidence which has been given to the Commission on that point?—Yes, I have. And I understand that he has given up his antiseptic treatment, and its place has been taken by the aseptic treatment.

20697. I might put the same question to you with regard to that. We have had evidence from distinguished surgeons here, who have scouted the view that you have just put before us, and we have really had no respectable evidence to show that what you have said is true.

20698. (*Chairman.*) If you only read the evidence on one side, that would be the conclusion that you would come to; but if you read the evidence on both sides, I cannot help thinking that you would come to the conclusion that it was not so?—But the evidence that I read was that of Lord Lister himself, I believe, in some speech that he made at Edinburgh.

(*Sir John McFadyean.*) Is that something that appears in the proceedings of this Commission?

(*Chairman.*) Yes, it has been referred to, and used on one side and explained on the other. There has been a good deal of evidence about it.

(*Witness.*) I think I could give some other instances if I may be permitted.

20699. (*Sir John McFadyean.*) Surely?—In former days the medical profession was uniformly in favour of blood-letting and strong purgative treatment by calomel. All that is gone. Inoculation for smallpox is another instance, and all that is gone, and yet it was supported by the great majority of the medical profession. My only point is that the majority are not always right, neither are they often right.

20700. I never suggested that they were, but may I ask whether that is the strongest reason that you can urge why in this case the Commission should accept the opinion of the minority rather than that of the majority?—As I said before, I have nothing to say as to the Commission accepting one view or the other. All my business is to place before the Commission our views, and the Commission will adopt which view they think the most consistent with common sense.

(*At this point Sir William Church took the Chair.*)

20701. (*Sir John McFadyean.*) On page 1 of your *précis*, in the second paragraph, you say that "The Association desires the total abolition of experiments on animals, believing the existing law which permits them, to be inhumane, immoral, and degrading, and a disgrace to civilisation. Further, the Association considers that the experiments which have been made under the present Act and which have been carried out at the expense of so much torture and so much animal life, have been practically unproductive of any beneficial results to the human race." When you spoke about experimentation upon animals as being degrading, I understood that you had in view principally the effect that it had on students. Is that so?—Yes, partly.

20702. Are you aware that under the Act, it is illegal to experiment on animals for the instruction of students, unless anæsthetics are used efficiently?—I think that anæsthetics must be used.

20703. And that the animal must not be allowed to recover; that in fact the experiment must be painless under the Act. (*The witness referred to the Act.*) I should have thought with regard to such an important point as that that you would not have had to refer to the Act?—There are six clauses and there are five provisos, I think. What the Act says is: "An experiment shall not be performed as an illustration of lectures in medical schools, hospitals, colleges, or elsewhere"; but then it goes on to modify that by saying: "Experiments may be performed under the foregoing provisions as to the use of anæsthetics by a person giving illustrations of lectures in medical schools, hospitals, or colleges, or elsewhere, on such certificate being given as in this Act mentioned," and so forth. There is nothing laid down as to the animal being killed.

20704. Do you suggest that it is possible under the existing law and under the Act to experiment on animals for the purpose of instructing students without the use of anæsthetics, throughout the whole course of the experiment and without killing the animal at the end of the experiment?—Without killing the animal at the end of the experiment. I do not see in this Act any provision of that kind.

20705. Will you take it from me that that is the state of the law; that this Commission is, I think, satisfied that that is the state of the law?—I am afraid I am not satisfied myself.

20706. Assuming that to be the state of the law, would you explain to the Commission wherein the experiments are calculated to demoralise and degrade the students?—I think that any body of young men witnessing a series of experiments involving horrible cuttings of animals, and practices of that kind would become degraded. I cannot conceive it to be otherwise. I should not like to put one of my own boys through it; that is all I can tell you.

20707. And you would say that, even if you were satisfied that the experiments involved absolutely no pain?—But as regards the killing of the animals afterwards——

20708. Would you please answer the question. I ask would you say the same if you were satisfied that the experiments involved absolutely no pain?—You mean if the animal continued under the anæsthetic the whole time and was killed at the end of it?

20709. I mean if the Act is complied with?—I am not prepared to say that the Act lays down that the animals under those circumstances should be killed.

20710. I did not ask you to give evidence on that; I think I may say that the Commission is entirely satisfied on that point. I ask you to assume that it is possible to experiment on animals for instruction without causing them any pain, and I ask you then whether you would give the same answer, namely, that such experimentation is calculated to degrade and demoralise the students?—Yes, I should.

20711. Would you explain why?—I have already explained why. I cannot imagine these horrible cruelties——

20712. Did you say cruelties?—You may say it is not cruelty because it does not give pain, but I do not at all agree. I think that if a number of surgeons were to tie me on a table, a perfectly healthy body, and to proceed to cut me up under the influence of anæsthetics, I should consider that was cruelty. And I consider that it is equally cruelty in the case of animals.

20713. Equally?—Yes.

20714. Observe that your argument seems to imply that man has no right to kill one of the lower animals?—I have very great doubts whether man has the right to kill one of the lower animals.

20715. I am quite content with that. I understand that another point about which you are in doubt is whether it is really possible to efficiently anæsthetise an animal under an experiment?—No, I do not say that it is not possible to anæsthetise an animal. I know perfectly well that it is possible to anæsthetise an animal under experiment. What I am in doubt about is whether as a uniform practice complete anæsthesia is obtained. I think there is a great deal of evidence that one has read in different places to the effect that complete anæsthesia is not obtained in these cases; that the animal wakes up, and so forth. I remember seeing a series of lectures by a man called Professor Crile, I think, in the course of which it was shown by his own admissions that the animal did wake up and move its legs and its body, and so forth.

20716. It has been given in evidence before this Commission that in most cases the experimenter has absolutely no motive for not anæsthetising the animal efficiently; that, on the contrary, it is greatly to his advantage as a demonstrator that the animal should be efficiently anæsthetised. What do you say to that

Sir G. Kekewich, K.C.B., M.P.

8 Dec. 1907.

argument?—I have no doubt that in a good many cases the animal is completely anæsthetised. But all I say is that there is evidence in a very considerable number of cases that the animals are not fully anæsthetised, and, more than that, that the anæsthetising is left to very incompetent hands.

20717. Does that mean that there is some difficulty in causing continuous efficient anæsthesia to animals like dogs, or is it that there is a deliberate evasion of the Act?—I take it that there are cases of both kinds. I take it that there are cases where there is a deliberate evasion of the Act. I am not prepared to say that 43,000 experiments take place without some cases of deliberate evasion of the Act. Surgeons are only human after all.

20718. Do you want to give any evidence on that, other than hearsay or supposition? You said that there were many cases you believed in which the animal was not sufficiently anæsthetised. Will you cite a case in point or half a dozen, let us say. You said many?—I cannot carry these cases in my mind, but I certainly have read of a good many cases in which the anæsthesia was not complete. The sort of evidence that I would put before the Commission is what I have put in my *précis*.

20719. Which *précis* is singularly lacking in detail. I was trying to help you to supplement it. Perhaps it is unfair to ask you for these cases?—I did not care to inflict all the cases upon the Commission.

20720. Will you kindly add six cases to your evidence when you revise the proof?—I know that this lady is not a lady who carries much weight with vivisectors, but Miss Lind-af-Hageby affirms that "the most unsatisfactory and obviously unreliable methods of anæsthetising are in vogue in the vivisectional laboratories." That is the kind of evidence.

The following cases were subsequently forwarded:—

1. *In the "British Medical Journal" for November 10, 1906, Dr. W. G. McCullum, recalling previous experiments, writes:—"It will suffice to recall to your memory the fact that in dogs, cats, rabbits, monkeys, and many other animals, complete parathyroidectomy is followed within a few days by the condition commonly described as tetany, in which convulsions, spasms, and rigidity of the muscles of all parts of the body render the animal almost helpless. Respiration becomes exceedingly rapid and laboured, profuse salivation occurs, and death supervenes in the attack, although occasionally the violent symptoms gradually give place to a stuporous condition which may last several days, terminating in death.*

2. *In Kiske's (Halliburton's) Physiology, 15th edition, p. 287, it is stated:—"Another experiment, originally performed by Salathe, can be demonstrated on a 'hutch rabbit.' If the animal is held by its ears with its legs hanging down it soon becomes unconscious; and, if left in that position for about half an hour, it will die."*

3. *In Dr. Crile's experiments upon "shock" the foot of a fox-terrier was crushed under "incomplete anæsthesia." Dr. Crile states also in his book that when he applied flame to a dog's paw "the animal struggled on the application of the flame."*

4. *Professor Schäfer experimented in drowning and resuscitating 36 dogs (2 without anæsthetics at all).*

5. *In a paper read at a meeting of the British Medical Association, at Toronto, Professor Cushney described a number of severe abdominal sections which he had performed upon dogs, cats, and rabbits, to which no anæsthetic, but merely morphia, urethane and paraldehyd, had been given.*

6. *In "The Journal of Physiology" for August, 1906, in a paper on "The Functions of the Thyroid and Parathyroid Glands," Professor Swale Vincent and Mr. W. A. Jolly, Assistant to the Professor of Physiology in the University of Edinburgh, record a number of experiments on monkeys, cats, dogs, prairie-wolves, badgers and rats from which the thyroid and parathyroid glands had been completely removed. They state: "Dogs, cats, foxes, and prairie-wolves frequently suffer severely and die."*

20721. That is the kind of evidence that weighs with you?—But I am not for a moment saying that the absence of anæsthetics is against the law.

20722. I have not asked any questions about that. I understood you to contend that the Act is being violated in many cases, inasmuch as animals are being experimented upon for the instruction of students without being under the influence of an anæsthetic all the time?—I did not speak of experiments for the instruction of students. I spoke of the general experiments.

20723. You will forgive me for saying that my question was limited to that?—I have not the smallest doubt that the same thing applies to the case of animals which are experimented upon for the instruction of students.

20724. Then it need not be qualified?—I have not the smallest doubt that there are many cases in which the anæsthesia is not complete.

20725. With regard to the ease with which animals may be anæsthetised with certainty, might I ask whether you have read the evidence given before this Commission by Mr. Hobday?—No, I just looked at it.

20726. You quoted his opinion, and with approval, I noticed, with regard to morphia?—I just looked at it.

20727. But you do think that he is a man whose opinion is entitled to a good deal of weight?—I do.

20728. Perhaps when you have time you would refer to his evidence given before this Commission, in which he told us that he had himself anæsthetised 1,200 consecutive cases, and that when he was asked whether he thought there was any difficulty in keeping an animal under complete anæsthesia for a long period he said no. He was also asked whether he thought there was any difficulty in deciding whether the anæsthesia was sufficient or not, and he also said no. And finally he was asked whether he administers the anæsthetic himself, and he said no, that his dog nurse does it—the attendant at the laboratory. I would like also to call your attention to the evidence which he gave with regard to the use of morphia. What was the source of your information with regard to his opinion concerning morphia?—He said that morphia was not an anæsthetic, I think.

20729. Where did he say that?—I understand that he said so.

20730. Have you read his evidence here?—I have looked at it. I have not read it. I cannot say that I have read it carefully.

20731. Then you must have seen the part that I have just been giving you the substance of with regard to anæsthetics. Do you attach much importance to that?—With regard to morphia not being an anæsthetic do you mean?

20732. No, to the evidence which I have just summarised with regard to the ease with which animals may be anæsthetised and kept under anæsthetics for a long period?—Yes, I am bound to believe what he says, that they can be.

20733. At Question 16462 he was asked: "Would you consider that morphia is a narcotic to a dog? (A.) Yes, I do consider it a narcotic. (Q.) Do you use it in your practice in the same way as medical men do in their practice with human beings for allaying pain? (A.) I use it largely for stopping pain. (Q.) And you find no difficulty? (A.) I find no difficulty in the dosage." Does that modify the opinion that you had when you came here with regard to the value of morphia for stopping pain?—I believe that morphia deadens pain. I am not sufficiently an expert to be able to understand the exact effects of morphia and the exact effects of anæsthetics generally, but I have always understood that morphia is used to deaden pain, but that it does not act as an absolute anæsthetic or stop pain unless indeed it is given in an excessive dose so as to induce insensibility.

20734. I point out to you it was you yourself who introduced Mr. Hobday's name to convince us that morphia was not of any use?—I do not know whether there is anything more in his evidence.

20735. Oh, there is a great deal more; but I think that you will find it very difficult to discover anything that seriously qualifies that?—If you will allow me I will make a search and see what I can find.

20736. In one or two places in your *précis* you speak about "hideous cruelties" being caused under the Act and "the torture of animals." Were you referring to any particular experiments that you know to have been performed in this country under the Act?—Setting aside the cases where anæsthesia is obtained, there are large numbers of certificates issued for experiments without anæsthetics.

20737. That is not the question. My question was, Do you know of any instances in which hideous torture has been caused under the Act?—Surely where

experiments are performed without any anæsthesia there must be hideous torture.

20738. You mean that if they are performed without anæsthesia they must cause hideous torture?—Yes.

20739. Does that sound logical? May they not be performed without anæsthetics because they are not calculated to cause torture? I should have thought that was logical?—The certificates, I believe, are not limited in that way.

20740. That is not my question. My question was do you know of any case in which hideous torture has been caused by any experimenter in this country under the Act?—I answer that by saying that it is impossible under the conditions specified, that hideous torture should not be caused.

20741. (*Mr. Ram.*) But I understand that you are not prepared to give any case. Is that the result?—It is very difficult to give any case of hideous torture, because, after all, the only fair witness as to hideous torture is the animal itself, and you cannot examine the animal.

20742. That is your answer?—You cannot possibly tell except from inference that the animal is suffering hideous torture.

20743. You assert that there is hideous torture, but you say that there is no means of proving it?—That would be so.

20744. (*Sir John McFadyean.*) Then what would be the use of inspection in such a case? I understand that you deprecate inspection; you do not think that inspection would be of any value. You would not rely upon inspection, at any rate?—For what purpose?

20745. For preventing cruelty?—No, because our view is that vivisection should be put an end to altogether, and therefore there would be no necessity for inspectors.

20746. On page 6 of your *précis* you select the ignorance of the medical profession with regard to influenza as evidence, I understand, of the fact that nothing is to be gained by experimentation on animals?—What I say is that in 150 years the medical profession has not discovered either the cause of influenza or how to cure it.

20747. That is a fact which I think is very much open to dispute; but assuming it to be true, I want to know why you set it forth, what influence did you expect it would have upon the minds of the Commissioners?—As an instance of the failure of the medical profession; and they have equally failed in the case of nearly all other diseases.

20748. Failure in what respect; failure to discover something by experimentation, was that it?—Well, they have not made their position any better.

20749. Did you want to prove to this Commission that it is impossible to learn anything by observation either?—No, I think you can learn more by observation; that, in fact, it is the only reliable source of information.

20750. Then would you explain how it is that this fact discredits experimentation but does not discredit observation? The disease has been open to investigation by observation and clinical research, as you say, since 1729. If you are correct in maintaining that nothing has been discovered in that interval, that seems to me to be seriously to the discredit of observation?—The medical profession, as I understand it, have discovered nothing about influenza, as to either its cause or its cure by observation; but since they adopted experimental methods they have not succeeded in discovering anything more.

20751. Might I ask was this put in your *précis* by your medical experts or is it something within your own knowledge?—Partly one and partly the other.

20752. Which is it, is it your part or the medical experts' part which assumes that you can experiment with human influenza on animals? Did you ever hear tell of human influenza, which is the disease you are referring to, affecting any animal other than man?—No, I never did, but I should have thought it could be communicated to animals.

20753. You "should have thought." That is not a thing about which you can ask us to accept your evidence.

20754. (*Sir Mackenzie Chalmers.*) You have no intuitive knowledge with regard to it. Have you inquired into it?—I have no knowledge that influenza has been communicated to animals.

Sir G. Kekewich, K.C.B., M.P

18 Dec. 1907

20755. (*Sir John McFadyean.*) I suggest to you that you have been singularly unfortunate in your selection of an illustration, because you have taken the one disease regarding which it is admitted that there is much ignorance, largely because we cannot experiment upon animals with it. But, if the facts were as you state them, they seem to me to throw no discredit whatever upon experimentation, but to throw great discredit upon what you call clinical research and observation?—These paragraphs are to show how little medical knowledge has advanced. So far as I personally am concerned, I give other instances. The only zymotic disease which I know that is materially less than it was in the days of my childhood, so far as I can see round me, is typhus fever, and typhus fever has been entirely got rid of apparently by sanitation.

20756. (*Mr. Ram.*) What about small-pox? Is that less or more?—If you are asking my personal view, in my opinion small-pox has been stamped out by sanitation also.

20757. Is there less or more than when you were a boy?—A great deal less; it has been stamped out by sanitation.

20758. It is not only typhus, then, that is less in degree since you were a boy?—I say it has almost disappeared.

20759. But not only typhus fever, but small-pox has also disappeared?—That is quite true; I think they have been both stamped out by sanitation.

20760. (*Sir William Collins.*) Was there a greater epidemic of small-pox in living memory than there was in 1871 and 1872?—I am afraid that my memory does not carry me back to that.

20761: (*Sir John McFadyean.*) At any rate, will you admit that, if it is a fact that human influenza is not transmissible to the lower animals, there is no force in your illustration as showing the futility of experimentation with a view to advancing knowledge with regard to human diseases?—I think that, so far as my illustration concerns the barrenness of our present medical knowledge, there is force in the illustration, but if influenza cannot be communicated to the lower animals, and therefore cannot be made the subject of experiments, I admit that under those circumstances one may be wrong in saying or implying in any way that the failure to discover the cause or the cure of influenza is in any way due to the failure of experiments on animals.

20762. What line of research would you suggest as probably being more fruitful?—That is a question that I am not competent to answer.

20763. I can understand that in that answer you hesitate to say observation. You have recommended it before, and clinical research. Would you say that here?—Generally so, but as to the exact methods I am not competent to answer.

20764. I do not mean the exact methods; but does not your argument seem seriously to discredit research observation?—It has shown that research observation, at all events, has never produced any effect as regards a knowledge of the cause and cure of influenza.

20765. Would you turn, please, to page 8 of your *précis*. In the fourth paragraph you say: "Nobody, of course, would suppose that, after the healing of the wound, it necessarily follows that the animal remains in a state of pain or suffering. But he" (that is Dr. Thane) "carefully ignores the truth that in extensive cutting operations, with excision of organs, there must necessarily, upon waking from anæsthesia, be very severe and prolonged pain until, that is, the severed tissues heal." That appears to me to almost amount to a charge of untruthfulness against the witness whose evidence you are quoting, and I want to put it to you that the subject is controversial. There is evidence on both sides, is there not? Do you think that there is evidence on both sides?—I have no doubt there is evidence on both sides.

20766. Why did you accuse the witness who espoused one side of carefully ignoring the truth?—Because he said, as I understand——

20767. He took the opposite view from the one you

approve of?—Not at all. He said that "when the wound has healed it does not follow that the animal remains in a state of pain or suffering." Everybody knows that when a wound is healed the animal does not remain in a state of pain or suffering; but what he ignores is the condition of the animal between the operation and the period of the healing of the wound.

20768. Is this expert evidence that you are giving?—I am simply reading.

20769. But you are criticising the evidence of this expert?—I am simply reading what he has said. He said: "When, in operations under these certificates, the operation has been performed and the wound has healed, it does not follow that the animal remains in a state of pain or suffering." There is no doubt that it does not when the wound is healed.

20770. You are assuming that it is an obvious falsehood to say that a considerable operation may be performed on an animal under anæsthetics without that animal suffering any pain when it comes out of the anæsthesia?—No. I make the charge that he carefully ignores the truth that in extensive cutting operations, with excision of organs, there must necessarily, upon waking from anæsthesia, be very severe and prolonged pain until the severed tissues heal. What he has ignored is the period, I understand, between the cutting and the healing.

20771. That is the period that I refer to. You want us to believe that a person who contends that in that period the animal may be free from pain is telling an obvious untruth. Will you allow me to read the evidence of Mr. Hobday, of whose opinion you express approval. Just please listen to this question and answer. It is Question 16352. "It has also been represented to us that extensive surgical wounds inflicted in physiological experiments on the lower animals must necessarily be painful when the animal comes out of the anæsthesia. Have you any evidence bearing on that question?—(*A.*) I have no experience of a physiological laboratory; I never worked in one; but my own experience is that the statement is absolutely untrue. I argue in this way: The wounds are the same, whether the human surgeon makes them with the scalpel or I make them. If they are done antiseptically they are the same in principle. . . . By far the greater majority of my wounds heal by primary union." You would perhaps think that that refers to operations which did not involve the cutting out of organs, but elsewhere in his evidence he told us that it applied to extensive operations in which he opened the abdomen and cut out organs. Does that not lead you to suppose that you have rather severely criticised this witness when you charge him with carefully ignoring the truth?—No, I do not think so, I am sorry to say. You asked me just now whether I believed that that was the case. I simply say that I do not believe that the animal does not feel pain between the time when it comes out of anæsthesia and the healing of the wound.

20772. That is not the question. It is a question of whether, when the opinion is not unanimous on a point like this, you are entitled to charge a person who adopts an opinion opposite to yours of carefully ignoring the truth?—I am absolutely justified in saying that the answer I have quoted above carefully ignores the period between the waking from anæsthesia and the healing of the tissues. As I understand in the evidence that you read to me, Mr. Hobday maintains that under certain circumstances, in certain operations and under certain conditions, there is no pain during that period. So far as that is concerned, I simply say that I could not bring myself to believe it.

20773. It is not a case of asking you to believe it. Can you contest the truth of it? You do not pretend that you have any first hand experience as to the result of healing of large wounds after an operation?—I do not understand what you mean by contesting the truth of it. I do not contest that that is his opinion.

20744. But I ask you, have you any experience of your own to show whether things are as you hold they are?—But there are a certain number of things that one regards as practically self-evident to oneself which one has no experience of.

20775. Would you mind answering the question—have you such experience?—You asked me whether I have operated——

20776. No, I did not?—That is experience.

20777. I asked you whether you had had any opportunity of forming an opinion from observation as to whether this is true or not true?—I really do not understand the purport of the question, but what I have felt always when I have cut myself severely is that I have always had pain between the time of the cut and the healing of the wound. Neither can I conceive that it is possible that it should not be so.

20778. Were these wounds of yours treated aseptically and sutured?—Aseptically, certainly, yes, but not antiseptically.

20779. But the point is that you hold one opinion and the witness whom you criticise holds another opinion, and his opinion is supported by that of a man of great experience, Mr. Hobday. I suggest that when that is so you should not accuse the witness of having carefully ignored the truth?—I really do not know that I am quite responsible for the verbiage.

20780. (*Sir Mackenzie Chalmers.*) I am afraid that I have a few questions that I must ask you, because we naturally attach considerable importance to your evidence, and there are some points that I should like to clear up that I do not quite understand. Your society wishes totally to abolish vivisection?—Yes.

20781. You have given us two definitions of vivisection. When your society is anxious to abolish vivisection, do you mean cutting operations, or do you mean any animal experiments?—When you say animal experiments, that was one of the grave difficulties we had in mind when we tried to draft a Bill. The difficulty as to experiments is that there may be experiments in feeding or other innocuous experiments.

20782. Taking the temperature is an experiment?—Yes, an innocuous experiment. But we wish to abolish all experiments, cutting or inoculation.

20783. Inoculation with any disease?—Yes.

20784. Would that include, for instance, the use of animals which are used for the preparation of vaccine, and the use of animals which are used for preparing antitoxin?—Yes.

20785. You would prohibit those by law?—Yes.

20786. For instance, calf vaccine?—With regard to calf vaccine, I wish to say, as I said before, that I do not consider that vaccination is a subject on which I am prepared to give any evidence, unless the Commission wish to hear my own personal opinion. For my Association I give no evidence.

20787. Your personal opinion would, I think, be of interest and importance. Do you object personally to using calves for the preparation of vaccine?—I object to vaccination altogether.

20788. And also to antitoxin for diphtheria?—Yes, I do so far as my knowledge goes, and so far as my reading goes.

20789. You have seen diphtheria cases; I suppose we all have?—I have seen one or two in my own family, and the patients recovered.

20790. Have you seen any where antitoxin has been used?—No.

20791. I may take it, then, that the main object of your Association, apart from drafting considerations, is to abolish every experiment with an animal, whether by vivisection, inoculation, or otherwise, which causes pain?—Yes.

20792. Would you carry that principle so far as to prohibit mutilations of animals for commercial purposes?—I do not know what mutilations you refer to.

20793. For instance, every horse in England which is not used for stud purposes is gelded, usually without anæsthetics. Would you draw any distinction between an operation for the purpose of increasing knowledge and an operation for commercial purposes?—Yes, I should. Besides, the one is not an experiment, the others are experiments. I should draw a distinction between them.

20794. You would draw a distinction between an experiment for the purpose of increasing knowledge or alleviating suffering and an operation for commercial purposes; would you interfere with the commercial purposes or not—for instance, gelding a horse?—I should not interfere with that. That is not an experiment.

20795. Therefore, it being for a commercial purpose and not for a humanitarian purpose, you would allow

it?—I am hardly prepared to admit the word "humanitarian."

20796. An experiment is for a humanitarian object, is it not—for the purpose of alleviating suffering in the future?—It is supposed to be.

20797. And gelding a horse is for purely commercial purposes—to make it a more saleable animal. You would admit that, but not the other?—I should admit that. It is not an experiment. It is a matter of long custom. I should not, for instance, put down circumcision among the Jews.

20798. Or require it to be done under an anæsthetic?—I really do not know that it is a sufficiently serious operation. I am afraid Moses did not use anæsthetics.

20799. I may have misunderstood you, but I thought that you rather complained of Dr. Pembrey doing circumcision without an anæsthetic?—I did not say anything about that; it was merely mentioned casually. I do not complain of circumcision being done without anæsthetics; it is not a sufficiently serious operation, and it is not an experiment.

20800. Take the case of spaying sows. A great many animals are spayed; you would leave that; that is outside?—That would be on the same footing as gelding horses.

20801. Outside altogether?—Besides, it is not an experiment, neither is circumcision, and it is not an experiment on animals either.

20802. Still, I take it that you would not allow purposeless mutilation of an animal, even if it was not experimental?—That, of course, comes under different legislation, and it comes under a different category; it comes under the Prevention of Cruelty to Animals Act; it is quite a different thing, and it is amenable to the ordinary law of the land.

20803. As regards an increase in the number of experiments, I have no doubt that you have looked at the last Return?—I have not seen anything after that 43,000.

20804. The Return ordered by the House of Commons to be printed on the 13th of May, 1907; you have seen it, no doubt?—I thought that was the last; it is for 1906. 43,000 is the last, is it not?

20805. Yes. You are aware that what is called vivisection proper only accounts for about 2,700 of the experiments, and the rest are under Certificate A, which is for inoculation experiments?—I thought there were 21,000 inoculations only, and 6,000 for Government Departments.

20806. No; under Certificate A 43,287 inoculations is the exact number. What I was going to ask you is this. Do you accept Dr. Thane's statement in the report: "In no case has a cutting operation more severe than a superficial venesection been allowed to be performed without anæsthetics"?—I am bound to accept it if Dr. Thane says so.

20807. Does that relieve your mind in any way? Is that any relief to you?—If that is the case, how did it come that Colonel Lawrie saw a dissection of the neck without any anæsthetic?

20808. I am afraid I cannot give evidence; I can only suggest it to you in a question?—Whatever Dr. Thane says, there is a very serious and very painful operation which a witness says is done without any anæsthetic.

20809. I can suggest the answer to you, but only that; we called a witness before us, Dr. Shore, who performed the operation, and if you read his evidence I suggest that you will see the explanation which (whether you accept it or not) was laid before us. You have not seen it, perhaps. He performed the actual experiment that Colonel Lawrie saw. It would take you some time to read it. I can only suggest to you that the Commission at once investigated that statement made by Colonel Lawrie, and we called a witness who gave the explanation. You will judge of that explanation when you read it?—Yes.

20810. As it is late, I will leave out some things that I should have liked to have asked. In your *précis* you speak about certificates given by the Home Secretary. Are you aware that the Home Secretary does not give certificates?—Yes, I know he does not; that is a mistake.

20811. May I put it to you in this way: Those certificates are given by certain eminent authorities?—Yes.

20812. They go through a considerable routine before they are allowed to come into operation, and the Home Secretary has the power of disallowance?—The section says: "The Secretary of State may at any time disallow or suspend any certificate given under this section."

Sir G. Kekewich, K.C.B., M.P. 18 Dec. 1907.

20813. You agree that a power of disallowance is not the same as the power of making?—A power of disallowing would only be exercised in the event of serious complaint being made against the experimenter.

20814. I must ask you on that, have you made any inquiries as to the process which is gone through with regard to these certificates?—As to whether they are ever disallowed, do you mean?

20815. No, I mean as to what happens before they are allowed to come into operation. Have you made any inquiry as to that?—I thought that had been placed before the Commission in sufficient detail by Mr. Coleridge, so that I did not think it necessary.

20816. Do you know, at any rate, that five pairs of eyes have to examine a certificate before anything is allowed to be done under it?—Yes, I know that a considerable number have, but as I say I did not take up the question of certificates in this evidence because I agreed with the evidence given by Mr. Coleridge on this part of the question, and so I thought that would be sufficient testimony.

20817. Do you know what inquiry he made upon the subject?—I believe he is very familiar with it.

20818. With certain aspects of it perhaps. You referred to the Public Authorities Protection Act, 1898. Why do you say that that affects the case of experiments under the 1876 Act; what is your ground for saying that?—I believe that the persons holding these certificates are for the purposes of the Act decided to be public authorities.

20819. I never heard of it. I should like some authority for it. What is the authority for it?—I do not know; but you will observe that in answer to my question in Parliament the Home Secretary did not canvass that at all.

20820. Did he not?—I referred in my question to the Public Authorities Act.

20821. What was his answer; have you got his answer?—I have got it all down here. I have read it to you.

20822. It is news to me, certainly, that that Act applies?—It does, though.

20823. May I suggest to you that a publican has to have a licence, but he does not come under the Public Authorities Protection Act, although he is called a publican?—It does, though. The Home Secretary added that contraventions of the Act were reported to the Home Secretary as soon as they were discovered, so that the institution of proceedings for performance of illegal experiments was not dependent on the date of the Report. He did not for a moment say that the Public Authorities Act did not apply. I asked him the question, and my question distinctly referred to the Public Authorities Act.

20824. I should like to have the words of that answer because I rather think I am responsible for it?—I can give you the whole question and answer out of Hansard, and then you will see.

20825. Of course, he replied to it at the time, but I do not think he referred to that Act. A street hawker you see has to take out a licence, and a gamekeeper has to take out a licence, but you would not say that they come under the Public Authorities Protection Act, would you?—No, but I understand that the definition of public authorities in the Act covers the holders of licences.

20826. Not so far as I read it, but we need not discuss that?—Is it not so?

20827. No, I think not?—The Home Secretary had his attention drawn in the question to the Public Authorities Act, and he did not in his answer say anything about it, or whoever drafted the answer for him.

20828. What I was going to suggest to you is this: You are a magistrate, are you not?—Yes.

20829. Do you know Section 11 of the Summary Jurisdiction Act?—No, I do not know it.

20830. That is the section which provides that all summary proceedings, in the absence of special statutory direction, must be begun in six months before the

Sir G. Kekewich, K.C.B., M.P.
18 Dec. 1907.

magistrates. Is not that the enactment which protects the public generally?—I understood that it was the other. I referred to that in the question to Mr. Herbert Gladstone, and he did not seem to question it. It does not much matter which it is if it has the same effect.

20831. Assuming for the moment that the Public Authorities Act does apply, the repeal of it would not help you, would it, having regard to Section 11 of the Summary Jurisdiction Act?—Not if Section 11 of the Summary Jurisdiction Act has the same effect. You do not want to repeal the section in either case; all you want to do is to take the particular offence out of the section.

20832. That is to say, to put licensees under the Act in a worse position than the rest of the population as regards summary offences?—How is that?

20833. You have to prosecute an ordinary person who commits an offence within six months; but in this case you would take away that protection?—You might put it in that way; but you have also to put it in this way, that the method in which the Act is administered makes it impossible for prosecutions to be instituted in consequence of the block put upon them by either the Public Authorities Act or the Summary Jurisdiction Act, whichever it is, as the case may be, and therefore practically when you say in the Act of Parliament, the Cruelty to Animals Act, 1876, that no prosecution can be instituted except with the consent of the Secretary of State, as a matter of fact no prosecution can be instituted at all, whether the Secretary of State consents or not, under the existing law. That is what we argue.

20834. You argue that until the returns are published the Secretary of State knows nothing about what has happened?—Quite so. Our only source of information is in those reports.

20835. Do not you think that the Secretary of State occasionally has information before it is able to be collected and published?—Yes, I know it is a very heavy business.

20836. I am rather puzzled by your evidence generally. I am not quite sure how far your evidence represents what I may call a brief given you by experts. Where does your own evidence end, and where are you speaking to your brief?—I should be puzzled to tell you myself.

20837. (*Mr. Ram.*) Is the *précis* your own creation?—Some of it is.

20838. (*Sir Mackenzie Chalmers.*) I will tell you why I ask the question. I attach great importance to anything that you tell us yourself, but I do not attach much importance to anything that your experts tell you, unless I know who they are and what their means of information is. You cannot, I am afraid, separate for me what is yours and what is, so to speak, your brief?—It is all my brief, but of course the part with which I am specially familiar is the question of plague. I know something about the whole question, but the part I am specially familiar with is the passage of the Act through the House of Lords and the House of Commons, and the strong point which I made as to the hurry with which it was passed through the House of Commons.

20839. As you appear on behalf of the Association, may I ask you this. I understand that there were experts who helped you to prepare this statement?—I believe several, but I do not know them all.

20840. But who were the two you had communication with?—I had communication with Miss Kenealy.

20841. Who has given evidence here herself?—Yes.

20842. And who was the other?—Dr. Bourchier, I think.

20843. Who is Dr. Bourchier?—Miss Bourchier.

20844. Is she a practising medical woman?—Yes; she has been.

20845. Miss Kenealy has retired from practice, I think; she told us she was now a journalist and not a practising doctor?—I believe she is not in active practice.

20846. Miss Hageby, I suppose, you have not consulted with?—I do not know her even.

20847. But it is Dr. Bourchier and Dr. Kenealy?—Yes, and the members of the executive of the Association.

20848. Do you know at all what scientific qualifications they have?—No, I do not know.

20849. I just want to ask you one or two questions about plague. You have taken great interest in plague?—Yes, I have taken some.

20850. Have you read the reports by the Scientific Commission appointed by the Government of India, which have just been published; Dr. Martin's reports?—I have not seen them yet. I do not know whether they are issued as Parliamentary Papers.

20851. They are not issued as Parliamentary Papers, but they have been out for some months, some of them?—You see, my information comes largely from Parliamentary Papers. I get those.

20852. I am afraid those are often rather out of date, are they not?—And anything I get furnished with by others who are interested in the question.

20853. Have you read Dr. Martin's evidence to us. He was Chairman of the Plague Commission?—No, I have not.

20854. It bears a great deal on the statements that you have made to us to day, but if you have not read it it is hardly possible to discuss it with you, I am afraid?—Is it issued?

20855. It is in our Third Report?—Then I am sure to have it.

20856. Because these statements of yours—I do not know if I am putting it too strongly—are in every direct opposition to some of the statements contained in that report?—As I understand, they are in opposition.

20857. But you know that that Commission was a very important Commission, consisting of very eminent men?—Yes.

20858. Do you think that no weight is to be attached to their findings?—I do not say that no weight is to be attached to their findings, but I do say, as it appears to me, there is an exceptional case of an epidemic of plague, an epidemic which certainly has become endemic. And in what way does this epidemic differ from previous epidemics? It differs in the fact of the use of these sera, that is all; otherwise the conditions are better.

20859. Might you not apply the same line of reasoning to different earthquakes? You have the same conditions, but one earthquake is more severe than another?—I do not admit the analogy.

20860. Then may I put this as an analogy to you: A lifebelt will save you from drowning; but you read in a particular year, say this year, that more people have been drowned than last year. That would be no argument against lifebelts unless more lifebelts were used, would it?—No.

20861. Your argument would rather come to this, would it not: A greater number of deaths from drowning have occurred this year than last, therefore lifebelts are of no use. What you have got to take is the number of people inoculated by Haffkine and the number of deaths among the people so inoculated?—I know that, and I should have thought from what I could see that those statistics were quite valueless. I should have thought they were of very little value, because you see you take a certain number of people and you know the number of people who are inoculated, but you do not know the number of people who are not inoculated, not absolutely.

20862. In the jail case there was, of course, a comparison?—Yes, we know.

20863. How do you account for the very small propagation of plague among Europeans in India who are freely inoculated?—Has that anything to do with it? A good many Europeans are said to be inoculated. Have you considered why it spreads so much more among the native population?—I should be inclined to attribute it to cleanliness, as a non-expert.

20864. Are you aware that the Plague Commission who were mingling with plague night and day, were all inoculated themselves and all escaped?—I do not know that. They escaped a serious attack of plague, but I presume that they had plague in some shape.

20865. But still, if a very mild attack of plague will save you from a fatal disease, is it not worth while?—Yes, I do not deny for a moment that inoculation may give a mild attack of plague and give immunity for a certain time. All that I desire to try to enforce is that these people who are inoculated

are just as infectious as other people, and may give the plague to others.

20866. But do you say that plague is infectious. There is no danger in going through a plague hospital?—That is one of those points, I believe, which is not yet cleared up.

20867. There is one form of it, the pneumonic form, which is supposed to be infectious; but have you considered how far plague is infectious or contagious, or not?—Of course I have generally never observed cases of plague, but so far as one's reading goes, one is in very great doubt as to what the means of communication of plague are. What between rats and fleas, and all the rest of it, one does not know any more than one does with many other diseases.

20868. There is only one question more that I wish to ask you. How do you account for it (it is a point that presses upon us), that all the heads of the medical profession are unanimous in favour of the necessity of animal experimentation. We have had the President of the Royal College of Physicians, the President of the Royal College of Surgeons, representatives of the Royal Society, and representatives of the great universities, and the whole, what I may call heads of the profession, unanimous. How do you account for that?—The head of the Royal College of Surgeons himself was not, was he?

20869. If you read his evidence you will see that he was?—I was under the impression that he said that he did not consider it necessary.

20870. He only said that it was not necessary for students to perform experiments, but if you look at his evidence you will see that I am right in saying that the Royal College of Physicians, the Royal College of Surgeons, the Royal Society and the great universities are unanimous in favour of the necessity of experimentation. How do you account for that?—Because I think they look at it through coloured spectacles. They look at it through medically coloured spectacles. I do not mean to say that they are not honestly biased by considerations of so-called humanity.

20871. But are they not the people who are in daily personal contact with disease, and therefore have more means of judging than the rest of us?—Decidedly.

20872. (*Mr. Ram.*) Following up what Sir Mackenzie Chalmers has just asked you, can you suggest any reason why the heads of the profession and those who represent the universities and Royal bodies, should wear, as you expressed it, glasses of one colour, and that those who wear glasses of another colour should be few and not distinguished?—I was not drawing a distinction as regards glasses.

20873. I want to draw it rather?—I was not drawing a distinction as regards glasses between those medical men who are in favour of experiments upon animals and those medical men who are not. I was drawing a distinction between the medical profession generally and the general public.

20874. But I am rather drawing a distinction, if I might for the moment, between these two classes of people who have come here and given evidence before us, either directly, as the heads of the profession have done, or indirectly, as some others have done, and are doing now through you. How do you account for the fact that all that are eminent are on one side and those that are not eminent and few in number are on the other side?—They are not undistinguished on the other side. Surely Dr. Bantock is a very distinguished and very successful surgeon.

20875. Dr. Bantock gave evidence in favour of the necessity of vivisection?—No, he gave evidence practically opposed to it.

20876. No. I will read you the passage?—I know that there is a passage or two at the end of his evidence in which he made certain concessions, but the general tenor of his evidence was against it.

20877. Have you read Dr. Bantock's evidence all through?—Yes.

20878. Then you know the passage that I am alluding to?—Yes, you are alluding to a passage towards the end of his evidence. I could not tell you *viva voce* without referring to it.

20879. It justifies me in citing him also as an eminent man in favour of the necessity of experiments on animals?—I should not read it so.

20880. I will refer you to it if you like, but can you give me any answer to the other point that I put to you: Why is it that all the most eminent men advocate the necessity of experiments, if it is a fact, as your Association thinks, that experiments are useless?—I really could not say why they all do. I imagine that they are perfectly honest in their view, but I imagine that the general public, which we represent, and the Parliamentary feeling, which we represent very largely, have a right to our opinion. We look round us and we do not see any great advantage having been gained by these experiments, and we do not see that disease is less or that the population is becoming less degenerate.

20881. But on what ground do you ask the Commission to set aside the evidence of the most eminent persons who have made this subject a study, in favour of the evidence of inexpert persons who have not made this subject a study?—I have not asked the Commission to set aside that evidence. I have asked the Commission to consider the evidence that we give.

20882. We certainly shall do that with the utmost care. You say in your *précis*, on page 6:—"Our medical scientists are by no means driven to use experiments as their only means of research. They have other (and confessedly superior) methods of investigation." What is a confessedly superior method?—The clinical method; that is our view.

20883. By whom is it regarded as confessedly superior?—I presume at all events that they are confessedly superior in the sense that those methods of investigation are open to every medical man (the others, I understand, are not), they are part of the daily practice of every medical man.

20884. Is that the meaning of the words "confessedly superior"?—I cannot tell how those words got there exactly.

20885. Is that the meaning that you put upon them?—At all events, you would imagine that they were equally good, since all such knowledge as we have seems to have come from clinical research, and not from experimental research.

20886. In the next sentence you say:—"The present barren state of medical knowledge compels us to conclude that long years of vivisection have added perhaps not one assured and certain weapon to their armament. To any man of common intelligence this barren state of medical knowledge is obvious." You think that that is a true description of the present state of medical knowledge?—I am inclined to think—if I may say so, with all respect—that it is a true description.

20887. May I point out that, except so far as in comparatively recent years, medical science has been helped by experiment, it was wholly dependent on clinical observation?—Yes.

20888. It does not look, then, as if it had benefited very much by clinical observation if that on which it relied for all those years has left us in the present barren state of medical knowledge that exists to-day?—For many years before vivisection had been in vogue, long before the Cruelty to Animals' Act, 1876, and we at all events (I am speaking for the Association) do not find that any advance has been made beyond the small amount that has been gained by clinical research in all these years during which vivisection has been practised.

20889. Do you think that medical science is no more skilled in combating disease now than it was, say, 50 years ago?—It depends how many years ago you refer to.

20890. I said 50 years ago?—I do not know whether that was in the days when doctors used to hang the rooms in which there were scarlet fever patients with scarlet curtains as a means of keeping away the disease.

20891. Seriously, I should like your opinion as an answer to my question. Do you mean that medical science in your opinion is really in no degree more advanced to-day in combating disease than it was 50 years ago?—I do not think that medical science, so far as my recollection goes, or my observation goes,

Sir G. Kekewich, K.C.B., M.P.

18 Dec. 1907.

has much advanced since the time when I was a boy. I think sanitary science has improved enormously.

20892. Do you think that Lord Lister has done nothing for us to ameliorate pain and to assist in overcoming disease?—Whatever advantageous changes may have resulted in that way, what I rather meant was that the causes of diseases have not been ascertained so as to get rid of the causes; nor have the cures of diseases been ascertained. If you could only find out what the cure of a disease was you would get rid of the disease.

20893. If the causes of disease are still not ascertained, does it not seem reasonable that experiments should be made to endeavour to find out what the causes are?—Experiments are made with the object of finding out what the causes are, but they never have discovered from the experiments what the causes are so as to be able to prevent them.

20894. That is your opinion, from reading the state of science up to to-day?—That is my view, because the prevalence of disease appears to be very much the same as it always has been.

20895. Do you suggest that operations which to-day are performed, I may say daily, with a very small percentage of deaths—take one that we hear so much about, for instance, the operation for appendicitis—could have been done 50 years ago with any hope of success of saving the life of the patient?—I think that great advances have been made in surgery, but I believe those advances to have been made by operating on the dead body and observation of the dead body, not on animals. One gets rather confused between the medical art and surgery.

20896. (*Sir William Church.*) Might I be allowed to interpose one question? What makes you think that that improvement is due to operations upon the dead body now? How do operations on the dead body differ now from what they were 50 years ago? Are they more frequent, do you mean?—No, I did not mean that. I meant that our knowledge had come from operations on the dead bodies of human creatures rather than upon the living bodies of animals.

20897. That would not tell us anything as to the treatment of the wounds afterwards?—No, I admit that a great advance has been made in the treatment of wounds afterwards.

20898. I did not understand what you meant by operations. I thought you meant operations in teaching students and surgeons how to operate. You did not mean that?—No, because any improvements in dealing with wounds are surely sanitary improvements rather than medical.

20899. May we take it from you that you disbelieve wholly and entirely in the germ theory of disease; that you say is a myth?—I do not say that. I say that it is not proveable.

20900. You would not go so far as to say that it is altogether a myth?—No, I would not.

20901. (*Mr. Ram.*) Then you said that you objected to any kind of experiment on a living animal because it is demoralising to the operator?—Yes.

20902. Do you think it is demoralising to a man to dissect a dead animal?—No.

20903. Take the case of an animal under an anæsthetic from which it can never recover, which is wholly unconscious under that anæsthetic. Why is it more demoralising to a man to examine that animal than to examine an animal which is dead, which you have just told me is not demoralising?—Because the whole process of examining living animals, to a layman, the cutting and wounding and mutilation of living animals is at all events the most sickening process one can possibly imagine. It would be most sickening to me. I feel it would be most demoralising to me. If I could get myself into a condition so as to view without any pang or any feeling of disgust a long series of experiments on a number of animals one after another, day by day, week by week, month by month, tied upon a table and cut to pieces, by the time that I was at the end of the series of experiments I should feel that I was one of the most callous, demoralised brutes in the whole scale of creation. I am putting the instance of what I should feel myself.

20904. That is what I may call an *à priori* idea of what you would feel yourself?—Certainly.

20905. Have you any instance that you can give us of any person who to your knowledge has been demoralised or adversely affected morally after having performed experiments on living animals under anæsthetics?—I do not know exactly what you mean by being adversely affected morally.

20906. I mean in your own word demoralised?—Their sense of humanity with regard to animals and so forth, I should think, would be very strongly affected.

20907. Can you give me a concrete instance of any man in whom you know that that has been the effect?—I do not think that I could give you any specific instance of any man who by indulging in experiments on animals has become a thief or a murderer.

20908. I am not suggesting that?—Or even in other senses immoral.

20908A. I suggest in your own words callous or inhumane?—I answer that, from the analogy of my own feelings. I cannot imagine that any man can go through all those experiments without becoming demoralised.

20909. The question was, can you tell me of any man who, to your knowledge, has been so adversely affected?—Of course I cannot. You know very well that I cannot pick out any man, and more than that, if I did know of a man I should not be able to tell you.

20910. I hope you would. I take it that the answer is that you do not know any concrete case of that kind?—Certainly.

20911. What would you say to this case: Supposing that the Commissioners, after hearing all the evidence—a great deal of it on both sides—and after weighing it all very carefully, came to the conclusion that experiments have been of very great use to humanity, should you still urge them to advise that there should be no experiments at all allowed merely on the ground of possible suffering in a certain number of small cases in those experiments to some animal?—Your premise is that the Commissioners have come to the conclusion that such and such is the case. I should not urge the Commissioners to put in their Report anything which, after due deliberation, they concluded to be wrong.

20912. I am not suggesting that. I say supposing that the Commissioners, after weighing the evidence on both sides find that experiments on animals have been and are productive of great good as a means of the amelioration of pain to human creatures, should you still say on the other grounds that you have urged—grounds of morality and humanity, and so forth—that all experiments ought to be made illegal?—If, as you say, the Commissioners have concluded that such is the case, it is no use my offering any evidence.

20913. You may take it from me that they have not concluded that yet. I want the assistance of your mind in the matter?—But my duty is to place before you this evidence, and for you to weigh and consider and see how far it leads you to modify any views that you hold already.

20914. You said that you objected to all experiments on the ground that they were inhuman and useless—unproductive was your word. I am supposing that the Commission are bound to find as a matter of evidence that they are not unproductive, but are useful and have been of great good to mankind in alleviating suffering. Should you still say that although useful, they ought to be made illegal on the ground of inhumanity or immorality, of which you have been telling us?—I can only place my own view before the Commission. My view is that they are useless, unproductive, and inhuman. But you ask me, supposing that the Commissioners conclude one thing, would I advise them to modify their conclusion? That has nothing to do with me. All I have to do is to place my views before the Commission for them to consider.

20915. I want to go as far as I can with you to get the benefit of your assistance. You put it on the three grounds that it is immoral, inhuman, and useless. Supposing that the Commissioners come to the conclusion that it is not unproductive, but on the contrary is useful, ought they still, in your opinion, to endeavour to make it illegal on the ground that it is immoral or inhuman? It is a very plain question?—I could not say: that would be for the Commissioners to judge. I do not pretend to be the *arbiter pugnæ*.

20916. Reference was made just now by you to Mr. Morris; you quoted him as saying that in his opinion

students ought not to be allowed to do experiments, and that you were also under the impression that he had said that experiments generally were unnecessary. I will refer you to his answers on page 41 of our Report, on the 18th day, beginning at Question 7658:—"Experiments on animals in relation to aseptic surgery and the healing of wounds have been of material advantage, in your opinion? (A.) Most material. I quote Lord Lister. We could not have arrived at the knowledge we possess at the present day had it not been for experiments on animals. (Q.) You do not say that that knowledge has arisen from experiments on animals alone? (A.) No. (Q.) But there are other modes of investigation which have been going on in research? (A.) Certainly. (Q.) Chemical investigation, for instance? (A.) Yes, each of the forms of investigation has been essential, but experiments on animals have been equally, if not more, essential or important than the other forms of investigation. (Q.) And it is not easy, in your opinion, to separate the advantages which have been derived from each particular source? (A.) It is impossible. (Q.) It is your decided opinion, as an experienced surgeon, that vivisection has been essential? (A.) I have no hesitation in expressing that opinion." I wanted to bring that to your mind, because I think you are under the impression that Mr. Morris, whose opinion, of course, everybody greatly values, had said that experiments were unnecessary?—As a matter of fact, he himself has never performed an experiment.

20917. He never has. I think there is only one other matter that I need trouble you with, and it is this. You spoke about experiments which would come under Certificate C, that is, experiments for the instruction of students?—Yes.

20918. I want to draw your mind to this because it was not present to your mind, I think, when you were giving evidence before. Certificate C has to be signed by one or more eminent persons such as the Prsident of the Royal Society, the Presidents of the Royal Colleges of Physicians, and so forth, who state:—"We hereby certify that in our opinion the proposed experiments are absolutely necessary for the due instruction of the persons to whom such lectures are to be given with a view to their acquiring physiological knowledge, or knowledge which will be useful to them for saving or prolonging life or alleviating suffering." Then the note to that certificate is this:—"The animal must during the whole of the experiment be under the influence of some anæsthetic of sufficient power to prevent the animal feeling pain; and the animal must, if the pain is likely to continue after the effect of the anæsthetic has ceased, or if any serious injury has been inflicted on the animal, be killed before it recovers from the influence of the anæsthetic which has been administered"; and reference is made to Section 3 of the Act, sub-sections (3) and (4). I want to point out that that can only take place under what are termed the operative sections of the Act, and not under the exceptions. Those words that I have just read are quoted from the Act, and are not included in the savings which subsequently come in the Act, which have been termed relaxations of the Act?—You mean the provisos.

20919. You see this is the operative part of the Act?—Are you speaking of Section 3, sub-section (4)?

20920. I am speaking of Section 3, sub-sections (3) and (4)?—Sub-sections (3) and (4) can be nullified by proviso 3.

20921. But as a matter of fact, under the certificate of which I was speaking they are not only not nullified but the certificate is granted only under sub-sections (3) and (4), and admits of no nullification. Do you follow?—Yes, I see; but there is also sub-section (5).

20922. No, I am speaking of sub-sections (3) and (4), because that is the matter to which Certificate C relates.—Of course, and both those sub-sections (3) and (4) can be nullified by provisos 2 and 3.

20923. But the operation can only be done, if at all, under Certificate C, and Certificate C, as I have just pointed out, is limited to those two sub-sections which I have just quoted?—That certificate combines those two points.

20924. (*Dr. Gaskell.*) Do I rightly understand you that this *précis* of yours was partly drawn up by you and partly by others?—It is a united effort.

20925. You make a good deal of Dr. Pembrey's evidence, I see?—Yes. *Sir G. Kekewich, K.C.B., M.P.* 18 Dec. 1907.

20926. Is that your part?—Partly.

20927. But you put it in your *précis*. Are you responsible for it?—I should not like to disclaim the responsibility.

20928. Are you responsible for the correctness of it?—I do not wish to evade my responsibility for all of it. All I say is that I cannot be supposed as a non-expert to have put together the medical part.

20929. I am simply asking you, are you responsible for the accuracy of the statements that you have given us?—I do not wish not to be.

20930. Then you are responsible?—I take the responsibility.

20931. Then, in the first instance, you say, on page 9 of your *précis*, that Dr. Pembrey "expresses the opinion that the infliction of suffering is a meritorious act"?—Yes, he expresses the opinion that it is a meritorious act.

20932. I have read through Dr. Pembrey's evidence, and I have not been able to find that statement. I have not seen that he has expressed that opinion?—If I cannot find it, I imagine that "expresses the opinion" is a bit of loose writing; "he apparently believes," I should have thought would have been better.

20933. Quite so; it is a piece of loose writing in the part for which you have just accepted the responsibility?—Yes.

20934. But which does not necessarily give the actual opinion of Dr. Pembrey?—No.

20935. I am sorry that you accepted the responsibility?—I am quite ready to accept the responsibility.

20936. I will go a little further, please, to the next thing, which is at Question 14149. That is a statement of Dr. Pembrey's of which you have made a good deal. I will read it to you. Dr. Pembrey says:—"I will be perfectly straightforward. I say that you should not inflict pain if you can obtain the knowledge in any other way; but I say that even where there is an operation the pain there is of a protective nature; it may produce syncope, and therefore less sensation of pain. Further, I say that the introduction of an anæsthetic may produce complications, so that more experiments may be necessary than if the experiment were done on the animal in a condition of syncope. . . . . If you give them anæsthetics you are introducing a complication which you could remove, and therefore without anæsthetics you actually save life and actually diminish the infliction of pain." For the accuracy of that you are ready to vouch?—I head this as an except from Dr. Pembrey's evidence. I did not actually write it out myself.

20937. Your comment was that this was an extraordinary doctrine?—Yes.

20938. And one that filled you with sensations of horror, more or less?—It fills me with horror.

20939. Now, may I read what Dr. Pembrey did say?—Yes.

20940. "I will be perfectly straightforward. I say that you should not inflict pain if you can obtain the knowledge in any other way; but I say that even where there is an operation, the pain there is of a protective nature; it may produce syncope, and therefore less sensation of pain. Further, I say that the introduction of an anæsthetic may produce complications, so that more experiments may be necessary than if the experiment were done on the animal in a condition of hypnotism, which I offered to show to the Commissioners. That, I think, is one very important point. These animals pass into a condition, so far as one can see, comparable to hypnotism. If you give them anæsthetics you are introducing a complication which you could remove, and therefore without anæsthetics you actually save life and actually diminish the infliction of pain." Your *précis* has taken out the word "hypnotism" apparently, and put in the word "syncope"?—I thought that syncope was there as well as hypnotism.

20941. No, you say "than if the experiment were

Sir G. Kekewich, K.C.B., M.P.

18 Dec. 1907.

done on the animal in a condition of syncope"?—Yes. What does he say?

20942. He says:—"On the animal in a condition of hypnotism"; and then where you have put in those dots he explains the condition of hypnotism as I have read it to you?—Yes, I understand that, but that, of course, does not remove——

20943. It removes the whole of Dr. Pembrey's statement there?—I do not think it does.

20944. He is referring there simply to the condition of hypnotism. He is advocating hypnotism instead of an anæsthetic, and for that reason he says "therefore without anæsthetics," that is to say, if you give hypnotism without an anæsthetic "you actually save life, and actually diminish the infliction of pain"?—Surely you are incorrect in that. He says at the beginning:—"I say that even where there is an operation the pain there is of a protective nature; it may produce syncope." I presume that "syncope" is right there?

20945. Yes.—Yes, "and therefore less sensation of pain." The horror to me is in inflicting pain, without any anæsthetic, which shall be so terrible that it produces insensibility. That is what it comes to.

20946. Where in that do you find that Dr. Pembrey says that he was going to inflict pain without anæsthetics? He does not say so?—But he says that the pain in the operation there is of a protective nature. Obviously that must be where there is no anæsthetic given. "It may produce syncope, and therefore less sensation of pain." I presume that when a person is absolutely insensible, in a state of syncope, he does not feel any pain at all, but the horror to me is that pain should be of such a terrible character that it should produce syncope.

20947. Is Dr. Pembrey there giving anything more than an illustration of the protective mechanism?—I should not read it so.

20948. Is he not there giving simply an illustration of the protective mechanism, and is he not, in a subsequent part of the answer, advocating hypnotism instead of an anæsthetic; and have you not put down before us that he is advocating that the animal should be put in a condition of syncope instead of an anæsthetic?—No, I do not agree with that interpretation. As I understand his answer, which begins "Further," immediately after the words "sensation of pain," there is nothing about hypnotism in the early part of the answer. All he says is:—"Further, I say that the introduction of an anæsthetic may produce complications, so that more experiments may be necessary than if the experiment were done on the animal in a condition of hypnotism." But what does he mean by hypnotism? Does he mean the syncope which is produced by a terrible pain?

20949. May I ask whether you have read his evidence, because he explains what he means by hypnotism before. You have not read it?—I have read some of it.

20950. You cannot explain then why the word syncope is used here instead of hypnotism; how that unfortunate mistake got into your *précis*?—No, I do not know how it got there; but what I do say is that if pain produces syncope it is a perfectly horrible thing. If you inflict sufficient pain to produce syncope it must be horrible torture.

20951. Do you mean to say that Dr. Pembrey has ever advocated that? He advocates hypnotism. He is simply illustrating the protective mechanism in the shape of syncope. Is not that true? When you get severe pain you faint?—It may not be so, but I should be inclined to read it as if he advocated it.

20952. It would read so naturally if you substitute syncope for hypnotism, as has been done in your *précis*; but if you put in the words which Dr. Pembrey used, it cannot be read so?—I am very glad to find that he is not quite so bad as I have painted him.

20953. There is one more question that I should like to ask you, and that is, you and your society are desirous of getting at the truth of this matter, are you not, with regard to experiments on animals?—I hope we are all of us desirous of getting at the truth of the matter.

20954. And you have been especially doubtful with respect to the anæsthesia and the condition of the animals when they have been kept alive after an experiment?—Yes.

20955. And you have suggested a want of candour on Dr. Starling's part in other cases with respect to this very question?—Yes.

20956. Dr. Starling gave his evidence here, I think, on the 12th December, 1906?—Yes.

20957. That is a year ago, is it not?—Yes.

20958. In that evidence Dr. Starling requested that those responsible persons belonging to anti-vivisection societies, who were desirous to see what happened in the laboratories themselves should come to him and see what happened. Was that not so?—No, I do not read it so.

20959. He suggested it, I mean?—He said that he would admit any Member of Parliament or layman, but not any doctor.

20960. That is all I meant?—I should be no use if I went there. I am a Member of Parliament, but I should be of no use there.

20961. Has your Association, or have you, during the whole of that year made any attempt whatsoever to accept Dr. Starling's invitation?—No, because we should be of no use. Do you suppose that I should be of any use witnessing an experiment?

20962. But you have just told us that a man of common-sense and intelligence, as you consider yourself, would be able to judge on the subject as to whether a dog was properly anæsthetised or not?—Yes, but in order to do that, what I should like to do would be to be able to see through a hole in the door without it being known that I was there. I do not say that there would be anything underhand or wrong about it, but I do say that if an observer was present special care would be taken.

20963. But even supposing that special care was taken, would it not be better, if you really were desirous of finding out what was going on, to accept an invitation of that kind? What I want to understand is, why no member of your Association has attempted to accept that invitation of Dr. Starling's given in that way?—Because we do not think it would be of any practical use if we did. If we could get admission for a doctor whose views were in accordance with our own to see these experiments, we should be very glad. For instance, there is a Dr. Hadwen, who is very prominent in anti-vivisection societies. If we could get admission for him we should be very glad. If we could get admission for Miss Lind-af-Hageby I daresay it would be very useful to us; but for a mere Member of Parliament or layman as he suggests to go and witness experiments would be of uncommonly little use.

20964. Then the reason why you have not done it is simply that you, as a Member of Parliament or layman, consider that you would get no advantage whatever by so doing?—We think it would be a waste of time.

20965. (*Dr. Wilson.*) There is only one question that I want to put to you. Apart altogether from advantages which may be gained either in the prevention or the cure of disease or for the relief of human suffering, do I correctly understand that your Association takes up the position that on ethical grounds alone you press for the total abolition of vivisection?—I think that is so. At all events I should take that ground myself. If you put it on ethical grounds alone I should press for total abolition.

APPENDIX A.

I.—DRAFT FORM OF APPLICATION FOR LICENCE SUGGESTED BY SIR V. HORSLEY, F.R.S., F.R.C.S

39 and 40 Vict., c. 77.

APPLICATION FOR LICENCE.

Address_____

Date_____

To the Right Honourable the Secretary of State for the Home Department.

Sir,

I, _____

_____

_____

beg to apply under the above-mentioned Act for a Licence for the performance of experiments on animals, and hereby append particulars of my proposed investigation.

1. General purpose and object of the investigation _____

_____

_____

2. Nature of experiments to be performed on anæsthetised animals which are killed before recovery from the anæsthetic _____

_____

_____

3. Nature of experiments to be performed with aseptic or antiseptic precautions on anæsthetised animals which are subsequently allowed to recover from the anæsthetic_____

_____

_____

_____

4. Nature of inoculation experiments to be performed on anæsthetised or non-anæsthetised animals

5. Class of animals to be employed in the investigation

6. Place in which the experiments are to be performed

This application is supported by the recommendations appearing below.

I am,

Sir,

Your obedient Servant,

* Here applicant to sign his name. *

We recommend that the above application be granted.

* Here the person recommending is to sign his name. 1. *

† Here specify statutory qualification (see Sec. II.). †

2. *

II.—DRAFT FORM OF RETURN OF EXPERIMENTS PERFORMED DURING A YEAR BY A LICENSEE

SUGGESTED BY SIR V. HORSLEY, F.R.S., F.R.C.S.

Form No. RETURN OF EXPERIMENTS PERFORMED DURING THE YEAR 190 .

No. of Licence .

Total Number of Experiments performed.	Number of Experiments in which the animal was killed before recovery from the anæsthetic.	Number of Experiments in which the animal was allowed to recover from the anæsthetic.	Number of Inoculation Experiments.	Number of Experiments in which pain was definitely observed.	General Remarks.

Reference to journal or periodical in which the results of experimental research have been published during 190 .

Date 190 Signature of Licensee.

ROYAL COMMISSION ON VIVISECTION.

FIFTH REPORT

OF

THE COMMISSIONERS.

Presented to both Houses of Parliament by Command of His Majesty.

LONDON
PRINTED FOR HIS MAJESTY'S STATIONERY OFFICE.
By WYMAN and SONS, Limited, 109, Fetter Lane, E.C.

And to be purchased, either directly or through any Bookseller, from

ROYAL COMMISSION.

WHITEHALL, 17TH SEPTEMBER 1906.

The KING has been pleased to issue a Commission under His Majesty's Royal Sign Manual to the following effect :—

EDWARD, *R. & I.*

EDWARD THE SEVENTH, by the Grace of God, of the United Kingdom of Great Britain and Ireland and of the British Dominions beyond the Seas King, Defender of the Faith, to

Our right trusty and well-beloved Cousin and Councillor WILLIAM COURT, VISCOUNT SELBY ;

Our right trusty and well-beloved Councillor AMELIUS MARK LOCKWOOD, Commander of Our Royal Victorian Order, Honorary Colonel of the 4th Battalion of the Essex Regiment ; and

Our trusty and well-beloved :—

SIR WILLIAM SELBY CHURCH, Baronet, Knight Commander of Our Most Honourable Order of the Bath, Doctor of Medicine ;

SIR WILLIAM JOB COLLINS, Knight, Doctor of Medicine ;

SIR JOHN MCFADYEAN, Knight ;

MACKENZIE DALZELL CHALMERS, Esquire, Companion of Our Most Honourable Order of the Bath, Companion of Our Most Exalted Order of the Star of India, one of the Under-Secretaries of State to Our Principal Secretary of State for the Home Department ;

ABEL JOHN RAM, Esquire, one of Our Counsel learned in the Law ;

WALTER HOLBROOK GASKELL, Esquire, Doctor of Medicine ;

JAMES TOMKINSON, Esquire ; and

GEORGE WILSON, Esquire, Doctor of Medicine ;

GREETING !

Whereas We have deemed it expedient that a Commission should forthwith issue to inquire into and report upon the practice of subjecting live animals to experiments, whether by vivisection or otherwise ; and also to inquire into the law relating to that practice, and its administration ; and to report whether any, and if so what, changes are desirable ;

Now know ye that We, reposing great trust and confidence in your knowledge and abililty, have authorized and appointed, and do by these Presents authorize and appoint you, the said William Court, Viscount Selby (Chairman) ; Amelius Mark Lockwood ; Sir William Selby Church ; Sir William Job Collins ; Sir John McFadyean ; Mackenzie Dalzell Chalmers ; Abel John Ram ; Walter Holbrook Gaskell ; James Tomkinson ; and George Wilson to be Our Commissioners for the purposes of the said inquiry

351. 2,500.—Wt. T.L. 306.—6/08. Wy & S.

And for the better effecting the purposes of this Our Commission, We do by these Presents give and grant unto you, or any five or more of you, full power to call before you such persons as you shall judge likely to afford you any information upon the subject of this Our Commission ; and also to call for, have access to and examine all such books, documents, registers and records as may afford you the fullest information on the subject, and to inquire of and concerning the premises by all other lawful ways and means whatsoever.

And We do by these Presents authorize and empower you, or any five or more of you, to visit and personally inspect such places as you may deem it expedient so to inspect for the more effectual carrying out of the purposes aforesaid.

And We do by these Presents will and ordain that this, Our Commission shall continue in full force and virtue, and that you, Our said Commissioners, or any five or more of you, may from time to time proceed in the execution thereof, and of every matter and thing therein contained, although the same be not continued from time to time by adjournment.

And We do further ordain that you, or any five or more of you, have liberty to report your proceedings under this Our Commission from time to time, if you shall judge it expedient so to do.

And Our further will and pleasure is that you do, with as little delay as possible, report to Us under your hands and seals, or under the hands and seals of any five or more of you, your opinion upon the matters herein submitted for your consideration.

And for the purpose of aiding you in your inquiries We hereby appoint Our trusty and well-beloved Charles Clive Bigham, Esquire, Companion of Our Most Distinguished Order of Saint Michael and Saint George, Captain in Our Army, to be Secretary to this Our Commission.

Given at Our Court at *St. James's*, the 17th day of September 1906, in the sixth year of Our Reign.

By His Majesty's Command.

H. J. GLADSTONE.

Note.—His Majesty was subsequently pleased to create Mr. Chalmers a Knight Commander of the Most Honourable Order of the Bath.

ROYAL COMMISSION ON VIVISECTION.

FIFTH REPORT.

TO THE KING'S MOST EXCELLENT MAJESTY.

MAY IT PLEASE YOUR MAJESTY,

Availing ourselves of Your Majesty's permission to report our proceedings from time to time, we beg to submit to Your Majesty, as an Appendix to this our Fifth Report, Minutes of the Evidence taken in the month of March, 1908, with Appendices and an Index of all the evidence we have heard, as we think the present publication of these documents is desirable.

ALL WHICH WE HUMBLY SUBMIT FOR YOUR MAJESTY'S MOST GRACIOUS CONSIDERATION.

SELBY (*Chairman*).

M. LOCKWOOD.

W. S. CHURCH.

M. D. CHALMERS.

A. J. RAM.

CLIVE BIGHAM (*Secretary*).

MINUTES OF EVIDENCE

TAKEN BEFORE THE

ROYAL COMMISSION ON VIVISECTION.

Wednesday, 25th March 1908.

FORTY-SIXTH DAY.

PRESENT:

The Right Hon. The Viscount SELBY (*Chairman*).

Colonel The Right Hon. A. M. LOCKWOOD, C.V.O., M.P.
Sir W. S. CHURCH, Bart., K.C.B., M.D.
Sir W. J. COLLINS, M.P., M.D., F.R.C.S.
Sir J. McFADYEAN, M.B.
Sir M. D. CHALMERS, K.C.B., C.S.I.
Mr. A. J. RAM, K.C.
Mr. W. H. GASKELL, M.D., F.R.S.
Mr. J. TOMKINSON, M.P.
Mr. G. WILSON, M.D., LL.D.
Captain C. BIGHAM, C.M.G. (*Secretary*).

Lieut.-Colonel E. LAWRIE, M.B., I.M.S., recalled; and further Examined.

Lt.-Col. E. Lawrie, M.B., I.M.S.
25 Mar. 1908.

20966. (*Chairman.*) You have sent us a printed statement?—Yes.

20967. There is only one page in it on which we desire to hear you, and that is page 10A, in which you speak of an operation on two dogs, and give some details, those details involving a charge of a distinct breach of the law, and, in the language you use, a wilful breach of the law on the part of Dr. Gaskell and of those who were assisting him; therefore we think it is material that we should examine you upon it. The rest of your statement is matter of comment, and on matter not very material to our inquiry; but this is distinctly and directly material to our inquiry, and therefore we shall confine ourselves to the one matter about which we wish to ask you, which, as I have already said, deals with what was done and said with reference to anæsthetics on the 7th of July, 1894?—Yes.

20968. You visited Dr. Gaskell's laboratory at Cambridge on that day?—Yes.

20969. That was for the purpose, I understand, of watching some experiments upon two dogs?—Yes.

20970. They were experiments in cross circulation?—Yes.

20971. Involving opening the throat of each dog and placing a tube in it and connecting it with the other dog?—Connecting the vessels in the two dogs' necks.

20972. You say that you arrived there before luncheon?—Yes.

20973. You saw two dogs on the table in the laboratory?—Yes.

20974. Were those the same two dogs that you watched the experiments on after luncheon?—Yes.

20975. How long were you in the laboratory before luncheon?—That I cannot recollect. I was not there very long.

20976. Was any work done then?—No, not that I remember.

20977. Did all of you examine the dogs, or did you merely see that they were there?—I was just taken in to see them.

20978. You did not stop to examine them or watch them?—No, there was nothing doing then. They were ready for the experiment.

20979. Then you did not, in fact, do anything before luncheon?—No.

20980. Were their throats open at that time?—Yes.

20981. Were the tubes in their throats?—Yes, so far as I recollect the tubes were in both dogs' throats.

20982. Are you quite sure?—That is the best of my recollection.

20983. I must ask you when you do not remember a thing distinctly to say so?—I have stated in the statement which I sent to you exactly what I recollect.

20984. I do not want you to read it from the paper, because there are other gentlemen who were present at this experiment, and there will be a good deal of dispute probably about it. I do not know what they are going to say, but they are here at any rate, and there may be considerable dispute, so I will ask you to speak from your memory, and when you feel that your memory does not establish a fact, to let us know?—Yes. I have stated exactly what I recollect in my statement.

20985. I want you to give it orally, please, *viva voce*, and not to read it from the paper, because I want to have your recollection?—I have stated all that I recollect there. I have nothing to add to it.

20986. You will follow what I tell you, please, is the proper method of giving evidence—that is, to answer questions. There are some matters that we have allowed to be read when they are matters of opinion and criticism, but when it is a simple matter of fact that is being spoken of, I would rather that you spoke from your memory if we are to have other witnesses who are to speak from their memories. Was anything said about anæsthetics?—Dr. Gaskell told me that the dogs had had no anæsthetic except morphin.

20987. What was it that he said?—He said they had had no anæsthetic; but they had had some morphin; and he led me to understand that they had had it so as to be able to report that the dogs had had an anæsthetic so as to hoodwink the Inspector.

20988. I want to know what he said?—That they had had no anæsthetic at all except a small dose of morphin.

20989. And at that time you say their throats had been opened?—Yes.

Lt.-Col. E. Lawrie, M.B., I.M.S.

25 Mar. 1908.

20990. Did he say that they had had none at all—no anæsthetic at all?—He said that they had had nothing but the morphin solution.

20991. Did he say how much morphin he had had?—He said ten drops of morphin solution.

20992. Would that in your opinion have produced anæsthesia?—No anæsthesia at all.

20993. Would three grains of morphin produce anæsthesia?—No, three grains does not anæsthetise a dog.

20994. Have you experimented on dogs yourself?—Yes, I have.

20995. With anæsthetics?—With anæsthetics and with morphin.

20996. And that is the result of your experiments?—That is the result of the experiments of the Hyderabad Commission on 600 animals.

20997. You mean as to how much anæsthetic should be given?—They were principally as regards the effect of chloroform; and the effects of certain other anæsthetics were inquired into incidentally.

20998. What I asked you was, have you experimented with morphin on dogs?—Yes, we have.

20999. You did?—Yes, repeatedly.

21000. Did Dr. Gaskell say anything as to why they had not had anæsthetics?—He said they were going to experiment with the chloroform afterwards, and that they did not give them any chloroform before the experiment began because they wanted to have the primary effects of the chloroform in the experiment.

21001. And that was the reason they used morphin?—He did not say that was the reason they had used morphin. He led me to suppose that they used morphin simply to comply with the Act, and to be able to say that they had used an anæsthetic.

21002. Can you remember Dr. Gaskell's words?—No, I cannot remember the words; but that is their exact meaning.

21003. You have sent me in a statement here that uses certain language. You do not say now that Dr. Gaskell said it was done to hoodwink the Inspector. Did he use any such words?—He used words that had that precise meaning.

21004. Did he use any such words?—I cannot remember the exact words, but that is the precise meaning of what he said to me.

21005. You must see that it is material to try and remember it. You have printed this document and circulated it among us with the word "hoodwink"?—That is the precise meaning of what he said to me.

21006. I think you must really know enough about evidence to understand why we want to know the exact words that Dr. Gaskell used?—I cannot remember the precise words that he used.

21007. Then you will not undertake to say that he did use the words "hoodwink the Inspector"?—No, I will not undertake to say he did use those words; but what he said had that precise meaning.

21008. It is rather odd that you should have circulated that if you are not sure that he said it, "and satisfy the Act"; he did say that apparently?—Those were the precise words he used so far as I recollect; but the meaning he gave me was that he meant to evade the Act. That was the impression he gave me.

21009. To satisfy the Act?—Yes.

21010. That was the first account you gave me just now when I asked you the question, that what he said was that it was to satisfy the Act?—Exactly.

21011. He would not have satisfied the Act without producing anæsthesia, would he?—What I understood was that if he was able to say that he had used an anæsthetic (and he called morphin, I suppose, an anæsthetic for that purpose) that would satisfy the Act.

21012. That is an inference you can draw from what he said?—That is what I understood from what he said.

21013. Did Dr. Shore say anything?—I do not remember his saying anything.

21014. Who was present at the time that these words were said?—There was no one present but myself

21015. I suppose Dr. Gaskell was present?—Of course; he said it to me.

21016. Who else was present?—I do not think anybody else was present besides Dr. Gaskell.

21017. Are you sure that nobody else was present?—I do not think anybody was.

21018. Did you then go in to luncheon?—Yes, we went in to luncheon then.

21019. Were these words said in the laboratory?—They were said in the laboratory.

21020. Then you went in to luncheon?—Yes.

21021. How long were you there?—I cannot tell you. We were there 20 minutes or half an hour.

21022. And you came back into the laboratory?—Yes, and then the experiment was done.

21023. Was chloroform used then?—Chloroform was used for the experiment.

21024. Was chloroform used in such a quantity as to produce anæsthesia?—Well, it killed the animal.

21025. (*Mr. Tomkinson.*) Was it given to both dogs?—No, it was given to one.

21026. (*Chairman.*) Was anæsthesia produced?—Apart from that there was no anæsthesia. It was given until the animal died, for the purpose of testing its effect upon the heart.

21027. I should have thought it was a simple question to answer. Were the animals anæsthetised when you came back from luncheon?—No, they were not.

21028. Were they operated on, or only watched?—Nothing was done except the administration of chloroform for the purpose of testing its action in the experiment, that is all.

21029. Did the dogs make any sign or sound?—They only appeared to be in pain.

21030. How did they show that?—By shivering.

21031. But they made no sound?—They had tubes in their throats.

21032. That would prevent it?—That would prevent it. Still, dogs do not always make sounds when they are in very severe pain if they are terribly frightened.

21033. I do not say that they did. I only wanted to know whether the dogs did. Was anything said as to the time the dogs had been under operation?—I was told that they had been under operation for four or five hours.

21034. By whom?—By Dr. Gaskell.

21035. It was before luncheon that you were told that?—Yes.

21036. (*Sir Mackenzie Chalmers.*) What time of the day would it be when you were told that?—It was between one and two o'clock in the day.

21037. (*Chairman.*) I think that is all I want to ask you.

21038. (*Sir William Collins.*) You have seen the evidence given by Dr. Shore as to the strength of the solution of morphia that was used?—Yes.

21039. Are you prepared to accept that statement?—Well, no, I am not; I prefer to believe what Dr. Gaskell told me at the time.

21040. But at the time had you reason to believe that the solution of morphia was of the pharmacopœial strength or not?—I understand it was the pharmacopœial strength; because when a medical man tells you that solution of morphia is used you understand that.

21041. I see Dr. Shore stated in answer to Question 19458: "Of the two dogs, one dog received ten cubic centimetres of a 2 per cent. solution of hydrochloride of morphia, and the other dog six cubic centimetres of the same solution." You think that is not correct?—If that is correct, then of course what Dr. Gaskell told me misled me; it may be from the way I took it.

21042. If what Dr. Shore says is correct, would the dogs then have been in a condition free from pain?—No, certainly not.

21043. Do you say that a dose of 3 grains of morphia will not render a dog anæsthetised?—No, I do not think it would have any anæsthetising effect.

21044. Did you see the bottle out of which the morphia that was used was taken?—No, I did not.

21045. (*Sir John McFadyean.*) Did you make any notes of the facts that you have just been telling the Commission at the time?—No, I did not. I did of the second experiment.

21046. Did it strike you at the time that whoever was responsible for the experiment was guilty not only of breaking the Act, but of absolute brutality?—I

thought at the time it was excessively cruel—the cruellest thing I had ever seen.

21047. Did you make any observation to that effect?—I said that we had given all our dogs chloroform for the cross-circulation experiments.

21048. Did you say anything by way of protest against the brutality of the operation?—No.

21049. Between that date and the time you appeared as a witness here have you ever given expression to the feelings of revolt that you must have felt?—I have repeatedly said it was cruel.

21050. To whom?—To various people.

21051. You did not formulate a charge like that when you gave evidence here before?—No, I tried to avoid saying anything about it.

21052. Then why are you so anxious to convince the Commission of it now?—Because of my evidence being contradicted by Dr. Shore. I am given the lie direct about several things that I said.

21053. Therefore you want ——?—I want to vindicate myself. Besides, I want to see the truth established about chloroform.

21054. This has hardly anything to do with the truth about chloroform, has it?—Yes, it has a great deal, because it is on these experiments that the present anomalous position of chloroform largely rests.

21055. With regard to this question of hoodwinking the Inspector; what Inspector was it?—I do not know; I cannot tell you anything about that.

21056. But you have admitted that you cannot vouch for the absolute words that Dr. Gaskell used, and one may therefore test the reliability of your memory by finding out whether there was any probability of there being an Inspector to hoodwink at the time?—You see, I knew nothing about the Vivisection Act. I had been in India many years then, and everything about this was new to me.

21057. You know something about the Act now?—I do not know very much about it now; I have never seen the Act.

21058. Are you aware that no Inspector under the Act has ever resided in Cambridge?—I am not aware of that fact.

21059. You will take it as a fact?—Yes.

21060. Does it not seem extraordinary that Dr. Gaskell should have said that he did this to hoodwink the Inspector when there was not one chance in a hundred, let us say, that the Inspector would turn up at that moment? It seems peculiar, does it not, that he should have used that expression?—I do not say that the word was "Inspector."

21061. No, but that he should have held the opinion that it was necessary to hoodwink the Inspector. If he said that he desired to hoodwink the Inspector he must have thought it necessary to hoodwink the Inspector?—I can only tell you what he told me.

21062. You are equally clear that he said that he desired to satisfy the Act?—Yes.

21063. To satisfy the Act he was bound to have the dogs free from pain?—No, I did not understand that at all.

21064. You did not understand it. But why do you refuse to accept that interpretation of his words. Assuming that he did use those words, why are you anxious to have the Commission believe that it was merely satisfying the letter and not the spirit of the Act?—Because he had used morphin.

21065. (*Chairman.*) You knew enough of the Act, did you not, to know that it was necessary to anæsthetise a dog before operating upon it?—No. I understood that if you said you had used morphin as an anæsthetic that would satisfy the Act.

21066. You had been in the medical service for some years before 1894, had you not?—Yes.

21067. How many years?—From 1872.

21068. And from 1872 onwards were you in England at all?—I was at home on leave in 1886.

21069. Your speciality was examining into the operation of anæsthetics, was it not?—No; I had to use anæsthetics a great deal in surgery, and in a great many experiments for the Hyderabad Commission.

21070. (*Sir Mackenzie Chalmers.*) On animals?—On animals.

Lt.-Col. E. Lawrie, M.B., I.M.S.

25 Mar. 1908.

21071. (*Chairman.*) Do you mean that you really did not know in 1894 that the Act of 1876 required that an operation of this sort on an animal should be under anæsthetics?—Well, morphia was mentioned to me as an anæsthetic.

21072. No. I am speaking about what satisfies the Act. Did you know in 1894 that in order to satisfy the Act you must anæsthetise a dog under an operation of that sort?—No, I did not.

21073. You really did not know that in 1894, after having had twenty-two years of medical service?—The Act did not apply to India at all.

21074. (*Sir John McFadyean.*) It seems to me that your view as to a legal obligation is rather remarkable, because I understand it to be with regard to any requirement of the law, that when an individual says he has satisfied a requirement of the law, that requirement is thereby fulfilled. Is that your position?—I know nothing about the law or your interpretation of it. I am simply telling you what Dr. Gaskell told me, and led me to understand.

21075. But the point is that the language that he used may be capable of two interpretations?—I am only giving you mine; I cannot give you any other.

21076. But I want to know why you refuse to accept the other interpretation?—Because I have always held to the first. I formed that opinion at the time, and still have it, and I cannot alter it.

21077. You think it absolutely incredible that Dr. Gaskell, when he said that he desired to satisfy the Act, may have intended to say that he desired to have the dogs free from pain?—I am sure that he had not that meaning.

21078. Why?—From the way he said it to me.

21079. That is a new item of evidence; it is not on what he said, but the manner in which he said it?—Exactly.

21080. Was it said scoffingly?—No, it was said intentionally to lead me to suppose that he should report the administration of morphin, and meant whoever was responsible, the Inspector or whoever it was, to understand that it was an anæsthetic.

21081. (*Chairman.*) That he should report it?—That is the opinion I formed.

21082. (*Sir John McFadyean.*) You say that it was done with the intention to lead you to suppose that?—Yes.

21083. But then that is a mere interpretation placed upon the manner in which the thing was said, is it not?—It is the way he said it, and the words he used which had the meaning I have given here.

21084. You would not admit the slightest possibility of your having misunderstood him?—Not about that, most surely.

21085. Then with regard to the state of the dogs, you wish us to believe that they were subjected to dissection for four hours before you saw them?—That is what I was told.

21086. You believe it?—I believe it, certainly.

21087. And you say that the dogs were "in frightful agony"; those are your own words?—Yes, they appeared to be in frightful agony.

21088. You were asked a minute ago as to what was the evidence of that, and you said shivering?—Shivering and appearing to be in pain.

21089. Let us hear what the other symptoms were?—As I have given you—they were shivering, and appeared to be in pain.

21090. But when you say that they appeared to be in pain, that is not sufficient evidence for the members of the Commission?—They were tightly tied down; they could not do anything.

21091. In case you may have misinterpreted the signs you saw exhibited by the dogs, I want you to be good enough to tell the Commission all the evidence on which you found this statement that the dogs were in frightful agony?—The dogs were both tied down, and could not show any other signs of pain except what I have told you.

21092. I may say that I am a person practically acquainted with the tying down of dogs. Can you tell me how you tie a dog down so that it cannot show evidence of pain?—They had their fore feet and hind feet tied down and their heads tied down.

Lt.-Col. E. Laurie, M.B., I.M.S.

25 Mar. 1908.

21093. Have you ever seen dogs struggle when so tied down?—Yes, I have seen them attempt to struggle very often indeed.

21094. You have seen them attempt to struggle?—Yes, I have seen them.

21095. I want to put it to you in this way and see whether you agree with me or not: that however firmly you tie a dog down by its fore and hind paws, and by its head, if you proceed to cause it pain it will succeed in executing quite extensive movements with its body. I ask you to agree to that as being what I have myself observed?—Yes, they sometimes do.

21096. No—as a rule. I want you to assent to that statement, as a rule?—I cannot say more than that they sometimes do, and, of course, generally they would.

21097. What I should regard as signs of frightful agony in a dog would be violent contortions of the body and great disturbance of the respiration in an attempt to howl. Was anything of that sort exhibited by these dogs?—When dogs are in the last extremity of pain, they are in such a fright of getting something more that they lie generally as quiet as they can; and the shivering I saw that day was a sign to me of terrific pain.

21098. But still they were lying quiet?—I could not say actually they were lying quietly. They were shaking with fright.

21099. It is hardly right in answer to my question, which is directed to finding out whether they were suffering agony or not, to say that they were shivering with agony. All it seems to me that you are entitled to say is that they were shivering?—Not at all. I am entitled to say what I saw—that they were shivering with agony; which they certainly were.

21100. (*Chairman.*) Shivering was the only outward symptom that you saw?—Shivering, and the general state of the dogs.

21101. Was there any other outward symptom—leave out the question of what you infer. What was the outward symptom? You told me shivering, and you did not mention any other when I asked you?—Shivering, and the way in which they breathed through the tubes.

21102. (*Sir John McFadyean.*) Did the behaviour become markedly different when the anæsthetic was administered?—The anæsthetic was administered to one dog and that dog died.

21103. Did the behaviour of that dog become markedly different?—I was watching the fall of blood pressure during the time the experiment was being done.

21104. You cannot say anything about it?—I cannot give any further evidence about what they suffered after that, because my time was taken up in looking after the fall of the blood pressure on the drum.

21105. How was the chloroform administered?—I do not remember how it was administered—whether it was administered through a bottle or with a motor—I do not know; it was administered through the tracheal tubes. I do not know how it was given on the other side.

21106. How were the tubes secured in the throat?—I cannot tell you.

21107. Do not you think that if these dogs had been left quite unanæsthetised they would have been very likely to have torn and disturbed the apparatus?—I do not see how they could have done that.

21108. You do not assent to the view that a dog, although it is tied down by the extremities and by its head, can execute very extensive wriggling movements?—I did not see them do anything of that sort.

21109. To that extent then that, as a symptom of agony, was not present?—No.

21110. (*Sir Mackenzie Chalmers.*) I want to ask you one or two questions. You have experimented a good deal with anæsthetics on animals?—Yes.

21111. Can you tell us at all how many animal experiments you have made or been present at?—I was present at the 600 experiments done by the Hyderabad Commission.

21112. They were done under your supervision?—Well, I was present at them.

21113. You have experimented yourself?—Yes.

21114. On animals?—Yes.

21115. How many; can you give us roughly the number?—I cannot tell you. I have done a great many, and, of course, I took part in a good many experiments at the Commission. I was President of the Commission.

21116. Have you yourself experimented with morphia on animals?—There were many experiments made by the Hyderabad Commission with morphia.

21117. What in your opinion, as an expert, is a sufficient dose of morphia to produce anæsthesia in a dog of this size?—I cannot tell you the amount that would be necessary, but it must be a lethal dose. I do not know what the lethal dose for a dog is.

21118. If Dr. Shore was correct in saying that, owing to some misapprehension as to the strength of the mixture, he gave 36 times as much morphia as you thought, would that be a lethal dose or not?—No, it certainly was not a lethal dose.

21119. In your opinion nothing short of a lethal dose can produce anæsthesia in a dog?—I should think not, that is my opinion.

21120. Have you made any experiments for the purpose of testing it at all?—No, I have not.

21121. If a sufficient dose of morphia is given to a dog to produce anæsthesia, how long would the dog remain alive under it?—I do not know.

21122. Does the effect of morphia in your experience last for any considerable time?—Are you talking about animals now?

21123. Yes?—I cannot give you an opinion about that, because I have not had sufficient experience of the effects of morphia on animals. I can tell you about the human subject.

21124. A human subject must not have what you call a lethal dose?—No, a dose to relieve ordinary pain.

21125. May I take it that in your opinion morphia, even in a non-lethal dose, deadens pain, and in a lethal dose abolishes pain. Is that what you say?—It would deaden certain kinds of pain.

21126. Only certain kinds?—Yes, it would not deaden the pain of a cutting operation—an ordinary medicinal dose.

21127. With a larger dose?—I should not like to give any patient more than a medicinal dose.

21128. Now, I want to understand a little more about this particular experiment. You went into the laboratory before luncheon?—Yes.

21129. And there you saw the two dogs which had already been operated on?—Yes. They were prepared for the experiment.

21130. Will you tell us exactly what had been done to those dogs?—I cannot tell you precisely, any more than that their vessels had been cross connected, and that they had got tracheotomy tubes in their throats. I cannot tell you what had been done precisely, because I was not even told that. They had been prepared for the cross circulation experiments, and complete dissection of the neck had been done in both dogs.

21131. The operative procedure consisted in putting in a tracheotomy tube, and what else?—Cross connecting the vessels.

21132. At the time when you saw the animals there was common circulation then, was there?—That I cannot tell you—whether the clamps had been opened or not.

21133. Who went into the laboratory with you, do you remember?—Dr. Gaskell.

21134. Was Dr. Shore there?—I do not remember. I remember seeing him about. I do not remember that he was there at that moment.

21135. Was Sir Clifford Allbutt there?—No, he was not.

21136. Was anyone else there?—At the first experiment I do not recollect anybody else being there at all except assistants.

21137. I do not quite understand. Were there two experiments on that day?—There were two experiments, one on the 7th of July and the other on the 11th. At the first experiment there was nobody present except the laboratory people, so far as I recollect. On the second occasion Sir Clifford Allbutt and Dr. Langley

and somebody else were there; there were three or four people present on the second occasion.

21138. (*Chairman.*) This is the 7th of July that you are speaking of?—On the 7th of July I do not think that anyone was there except the laboratory assistants.

21139. That is the occasion you are speaking about?—Yes.

21140. (*Sir Mackenzie Chalmers.*) You saw one experiment on the 7th of July and another on the 11th?—Yes.

21141. Were both those experiments of the same kind?—Yes.

21142. On both occasions you say that the animals had been prepared before the experiment?—Yes, before I got there both animals were prepared, on both occasions.

21143. Then you spoke about going to luncheon after that?—That is on the first occasion.

21144. Who was at luncheon on that occasion then?—I do not recollect anybody except Dr. Gaskell and Dr. Shore. There may have been somebody else, but I do not remember.

21145. It was on the second occasion that Sir Clifford Allbutt and Dr. Langley were present.

21146. At the laboratory? When you went into the laboratory and you saw the dogs prepared for the experiment, was the laboratory attendant there?—I cannot recollect; I fancy he was, but I cannot recollect anybody specifically.

21147. Was Dr. Shore there?—Dr. Shore was about the laboratory.

21148. You said nothing at the time, may I take it, of the inhumanity which you witnessed, or thought you witnessed going on at the time?—I thought it was frightfully cruel.

21149. And yet you said nothing?—What was I to say? I could not possibly say anything in another man's laboratory.

21150. But surely! is that so?—It is so certainly. I could not go into Dr. Gaskell's laboratory and criticise his way of doing his experiments. I should never dream of doing such a thing, and I cannot imagine that any other man could either.

21151. I should not have thought so myself. When did you first mention to anybody that you had seen what you call a cruel experiment?—I have always mentioned it, and I talked about it on that day. I told Dr. Gaskell that we had given all our animals choloroform, and I could not understand why he would not give chloroform to his. We never dreamt of doing any operation like this without chloroform.

21152. Would giving chloroform in the initial stage (that is for the purpose of putting in the tracheotomy tube and connecting the arteries) have in any way vitiated the experiment?—In my opinion not in the least.

21153. Chloroform could have been given as well as morphia?—Certainly.

21154. There was absolutely no object in giving morphia instead of chloroform?—Not that I know of.

21155. Was there any scientific object to be attained by not giving a sufficient anæsthetic?—I am quite prepared to believe that Dr. Gaskell thought that if he gave the chloroform it might vitiate the experiment. But that is not my opinion, of course.

21156. But he did not say so?—He said as much as that, that they did not want to give chloroform before it was given for the experiment.

21157. Was there any object in preparing those dogs as you say, three or four hours before, and leaving them?—It takes a long time to cross-connect the circulation; it takes a very long time to dissect the vessels out and connect them one with another.

21158. Have you seen it done yourself?—I have seen it done very often.

21159. It was done in your own laboratory?—In my own school.

21160. As a demonstration?—No; we were obliged to repeat these experiments when they gave us results diametrically opposed to the results we had obtained; we were, therefore, obliged to repeat the cross-circulation experiments that we had made them do.

21161. Did you do those under anæsthetics?—We did them under chloroform always so far as it was possible.

21162. When is it not possible?—Just before the experiment is begun, you must let the animals out of the chloroform so as to see what the effect of the chloroform is from the beginning, from the time that the blood pressure first begins to fall under the influence of the anæsthetic.

21163. It would vitiate the experiment, you mean, otherwise?—You cannot mix up the experiment with what you were doing before; you must begin the experiment, as it were, afresh.

21164. Then, assuming morphia to be a sufficient anæsthetic, that would be a good reason for giving it?—If morphia was an anæsthetic.

21165. In fact, you do not believe in morphia as an anæsthetic?—I know that it is not.

21166. (*Chairman.*) Except in a lethal dose, you mean?—Precisely.

21167. (*Sir Mackenzie Chalmers.*) By a lethal dose you do not mean a dose that kills at once, but kills in some hours, ultimately?—Yes.

21168. In your experiments, when you had to intromit the chloroform, did you give any anæsthetic?—No.

21169. The animals for that short period were without anæsthetics?—They were out of the anæsthetic.

21170. Did they show any signs of pain in an operation of this kind?—They did for a time, very often, not always.

21171. After tracheotomy in the human subject is there usually much pain?—Pain where?

21172. Anywhere?—Do you mean to say after the operation?

21173. Yes?—No, I should not think there is any pain at all, except the mere smarting of the wound—nothing else.

21174. You mean that the pain consists in the making of the cut, and the smart, and that soon passes away?—Yes.

21175. Then in the case of these dogs, which you told us were suffering pain, what were they suffering from exactly?—The whole of their necks were dissected, and opened up; all their vessels were exposed.

21176. That is to say, there was a large wound?—An enormous wound, the whole of the necks were dissected in both dogs, so as to cross-connect the vessels.

21177. Would there be many sensitive nerves there?—Yes.

21178. There would be considerably more pain than that following upon ordinary tracheotomy?—After tracheotomy there is no pain at all to speak of—nothing that would require any medicine.

21179. But after cross-connection dissection there would be?—There would be a great deal of pain, of course, but not as much pain as during the cutting.

21180. You told us that dogs in very great pain often do not growl, or make any sign?—Yes.

21181. What sort of experiments would you judge that from?—I am speaking generally. I cannot recollect any specific ones without the reports of the cases.

21182. Some of those were experiments you have made yourself?—Yes.

21183. In what kind of experiment have you had to cause a dog such pain?—In experiments on the action of chloroform, when we are obliged to let them out before we begin giving them chloroform in any particular observation.

21184. You have had yourself to perform very painful operations on animals?—No cutting operations.

21185. I want to know what operations you were referring to when you told us that dogs under great pain show very little sign except shivering?—Yes. I do not say that they always do.

21186. I want to know what operations you are referring to?—In the experiments of the Hyderabad Commission an enormous number of experiments were done to try and produce shock, by Sir Lauder Brunton, and those are the operations that I refer to. Sometimes they tried to produce shock in every stage of anæsthesia—in every stage of chloroform.

Lt.-Col. E. Lawrie, M.B., I.M.S

25 Mar. 1908.

21187. Those are experiments under anæsthesia?—Yes, but by that time they were allowed to come round again before the cross-connection.

21188. (*Mr. Ram.*) By Sir Lauder Brunton?—Yes, and the Hyderabad Commission; they were done by the whole Commission.

21189. (*Sir Mackenzie Chalmers.*) Who else?—The man who is now Surgeon-General of the Government of India, Dr. Bomford, and Dr. Rustomji.

21190. And yourself?—And myself.

21191. When did you first publish any account showing that these animals were, as you think, put to unnecessary suffering?—I have never published any account of it.

21192. When did you first put it in writing?—Here, for this Commission.

21193. Before you had given evidence here?—Yes.

21194. That is after fourteen years?—Yes.

21195. You did not think it your duty to inform any public authority about it?—No, certainly not.

21196. And you thought that, as it was in somebody else's laboratory, you were not even entitled to remonstrate with the people in charge of the laboratory?—No, I never should have dreamed of doing such a thing.

21197. Had you formed any opinion at the time whether the law was being broken or complied with?—I did not know.

21198. (*Mr. Tomkinson.*) In what capacity were you there, do you consider?—I was there as a mere spectator.

21199. As a guest?—As a guest.

21200. As an invited guest?—Yes.

21201. Not as a professional coadjutor?—Well, it hardly amounted to that. They wanted to show me what the results of their experiments were.

21202. You were there by invitation to see the effect of certain experiments?—Yes, they said they would produce certain effects by experiments which were the exact counterpart of those which formed the subject of report to the Nizam's Government.

21203. I think you say that you consider that your position there rather debarred you from making any protest against anything you saw that you might disapprove of?—Yes.

21204. You felt debarred from entering a protest against what you thought an act of cruelty?—Yes; it never would have entered into my head to do so at all.

21205. You say that Dr. Gaskell told you that the preparation for that experiment that you were to see had taken four hours?—Yes, about that.

21206. And you found these dogs so prepared, strapped down very firmly?—Yes.

21207. Without the possibility of more than shivering.

(*Chairman.*) He did not say that.

(*Witness.*) No, I did say that.

21208. (*Mr. Tomkinson.*) But you said I think that they showed no movement except that of shivering?—They could not do anything very much in the way of movement.

21209. Did you examine their eyes?—No.

21210. But you are tolerably satisfied that they were not unconscious?—I am sure they were not unconscious. They were not getting any anæsthetic.

21211. But, of course, there is a conflict about the quantity of the anæsthetic, at least the morphia?—I am only giving my own view, of course.

21212. Had that morphia been administered through the mouth?—I cannot tell. I understood it was administered subcutaneously.

21213. We have had it stated to this Commission that it is only when morphia is administered subcutaneously, that it is claimed to be an anæsthetic?—I see.

21214. The tubes in their throats would make the dogs voiceless, would they?—I should think so.

21215. You are not quite sure about it?—That is my opinion, that it would practically make them voiceless.

21216. If the dogs had been in that condition for some hours would not the struggling or demonstration of pain naturally die down rather; you would not expect them to show such active signs of pain as they would at the beginning of the operation, naturally?—No, certainly not.

21217. Then you do not think that being there and disapproving, as you did, of what you saw, you ought to have made a protest?—I could not have made a protest to a man in that position.

21218. You do not think that you in any way made yourself a party to the approval of the operation?—Not in the least, in no way certainly.

21219. You considered yourself bound by professional etiquette or by your position as an invited guest from making any protest?—These were two great physiologists, and it was not my business to speak to them about their own work and the way in which they did it.

21220. (*Mr. Ram.*) Will you tell me, please, is the operation of putting a tube into a dog's throat, as you describe it, a delicate one?—Do you mean difficult?

21221. Yes?—If you have had a little practice at it it is not difficult at all.

21222. Do you not require the dog to be immovable, or nearly so?—Well, you would have to have it fairly quiet.

21223. Do I rightly gather that in your opinion these dogs had been prepared for hours before, as you expressed it, for fully four hours before, and that the dogs were not under anæsthetics when their throats were being dissected and these tubes inserted?—Do you mean to say that during the whole time they were dissected from the commencement of the dissection until the time I saw them they had had no anæsthetics?

21224. That is what you say?—That is what I say.

21225. In your opinion would it be a possible thing to get the tubes into those dogs' throats in the way you saw them if dogs had been under no anæsthetics at all?—Certainly it would.

21226. Would it have been a difficult operation?—No, not particularly.

21227. Would it have been more difficult than if they had had chloroform?—Yes, I should think it might be a little more difficult.

21228. More difficult than if they had had a full dose of morphia?—I do not think morphia would make any difference one way or the other.

21229. (*Chairman.*) Does that apply not only to the operation of inserting the tube, but to the preparing of the arteries?—Does what apply?

21230. What you said about its making no difficulty or very little difficulty in performing the operation?—In many ways it adds to the difficulty to have to give chloroform to two dogs which are being prepared for a cross-connection experiment; it is extremely difficult to give a dose of chloroform so as to keep them anæsthetised without having accidental death.

21231. I did not say chloroform; I said an anæsthetic, or anything that would quieten them?—I am talking about chloroform, of course.

21232. (*Mr. Ram.*) Only chloroform?—Yes, or any anæsthetics of that kind that is given by inhalation.

21233. Does your opinion of the state of these dogs as to whether they suffered or not depend upon whether in fact morphia had been given to them to a sufficient extent to make them insensible?—No, it did not depend upon that at all.

21234. Do you then, in forming your opinion as to the state of those dogs, disregard whether they had been given morphia or had not?—I disregard it entirely.

21235. When you saw this operation performed, you saw the animals before you went to luncheon?—Yes

21236. You were of opinion that they were in great pain?—Yes, I was of opinion that they were in great pain.

21237. Did the statement that you have just made as to the suffering of the dogs and as to your belief that they were prepared for the operation without any anæsthetics, apply to the operations both on the 7th July and on the 11th July?—That was only spoken about on the first occasion, on the 7th July.

21238. But as to the state of suffering of the dogs, does it, in your opinion, apply to the feelings of the dogs on both occasions?—Yes, I should think it would.

21239. Now just revert to the occasion on which you went to luncheon; who were present at luncheon besides yourself?—I only remember Dr. Gaskell and Dr. Shore.

21240. Are you aware that both of those gentlemen have told us that in their opinion the dogs were under no suffering whatever?—Well, that may be their opinion.

21241. On the occasion of the luncheon, there were you three gentlemen there, so far as you recollect?—Yes.

21242. Those two gentlemen, as they told you, believed that the dogs were wholly free from suffering?—They have told you that.

21243. You, on the other hand, tell us you were sure the dogs were in a state of suffering?—I say so.

21244. How long did lunch last?—I cannot tell you precisely; it lasted probably 20 minutes or half an hour, but I do not recollect how long it lasted.

21245. In your last answer to Sir Mackenzie Chalmers, you stated that you did not know whether a breach of the law was being committed or not?—No.

21246. You did not know then?—No.

21247. Do you know now?—I have been told so.

21248. When did you first learn that a breach of the law had been committed?—I was told quite recently that a breach of the law had been committed.

21249. Have you read the Act?—No.

21250. All the evidence you have given us here without ever having read the Act under which we are proceeding; is that so?—Yes.

21251. When did you first learn that there had been a breach of the Act—when you were here the other day?—No, I cannot remember when it was. It was before that.

21252. I understand that, not knowing whether a breach of the Act was committed or not, and believing that those dogs were suffering torture the whole time of the lunch, you made no protest?—Yes.

21253. If you now became acquainted with a distinct breach of the law in any laboratory, should you consider it your duty to report it to the Home Secretary or not?—Certainly not.

21254. You say that in the operations that you performed yourself you have frequently allowed dogs to come out from under the influence from chloroform, and that they have suffered very much in consequence of your doing so?—They have suffered to a certain extent, yes.

21255. Where were those operations performed?—At Hyderabad. So far as possible, the animals were always kept under the influence of the anæsthetics.

21256. When you gave your evidence before, you made no reference before us to many of these important statements that have appeared in your comments here to-day?—No.

21257. Why did you not, if those facts were present to your mind then, bring them before our notice at that time?—Well, I did not wish to say anything about Dr. Gaskell, at that time especially.

21258. What caused you to change?—I did not wish to mention anybody by name.

21259. What caused you to change?—The fact that my evidence was contradicted.

21260. Had you between this date, fourteen years ago, and your giving evidence here, made no memorandum of what occurred on those occasions?—We have got the notes of the second experiment—our own notes.

21261. (*Chairman.*) Of the 11th you mean?—Yes, on the 11th.

21262. (*Mr. Ram.*) Nothing with regard to what took place on the 7th?—We did not take any notes on the 7th.

21263. If you did not know that there had been any breach of the law, or did not know (as I understand you to say) what the law was, what meaning do you attach to what you say that Dr. Gaskell stated "in order to hoodwink the Inspector and satisfy the Act"?—I did not attach any more meaning than what I state.

21264. What do you state?—I state that he told me that he gave the morphin in order to comply with the Act; that he was obliged to give some anæsthetic, and he gave the morphin and called it an anæsthetic.

21265. Then it was present to your mind that there was an Act?—Yes.

21266. And an Act that had been complied with?—Yes.

21267. And an Act that specified that you must have anæsthetics?—That I did not think of.

21268. What do you mean, then, by his giving morphin and calling it an anæsthetic in order to satisfy the Act?—I understood only what he himself said, that is all; that that was why he had given it.

21269. Have you ever in the fourteen years till a month ago repeated that statement of his to anybody?—Repeatedly.

21270. Can you name anybody to whom you have repeated it?—I have mentioned it to hundreds of people in India, Dr. Bomford, Sir Lauder Brunton, and everybody, of course.

21271. To Sir Lauder Brunton?—Yes.

21272. Did you name it as indicating that Dr. Gaskell had disregarded the Act?—I do not remember.

21273. What was your motive? How came you to mention it?—I just mentioned it as a matter of interest. It was in comparing it with our own experiments.

21274. Was it a matter that filled you with horror?—I cannot say that it filled me with horror. I thought it was horribly cruel.

21275. (*Chairman.*) I understand from what you said last that what you mentioned to those gentlemen was not the cruelty, but the fact of the experiments having been a failure in your view?—That has been mentioned also.

21276. I thought you said that was what you spoke about to Sir Lauder Brunton?—I have spoken about the whole of the reports.

21277. (*Colonel Lockwood.*) About its being cruel, as well as the other thing?—Yes.

21278. (*Mr. Ram.*) About the intention of hoodwinking the Inspector?—I do not remember saying anything special about that to Sir Lauder Brunton.

21279. (*Dr. Wilson.*) Do I correctly understand that all your cross-circulation experiments out in Hyderabad were painful experiments necessarily?—In parts they were, just before the experiment was begun.

21280. That is to say, the animal had always to come out of chloroform for the second part?—Before the experiment was begun.

21281. And were those experiments to which you referred as regards shock also painful experiments?—Well, I should think there was in some experiments a certain amount of pain, but they were always done more or less under the influence of an anæsthetic. One of the members of the Commission wanted to repeat the whole of the experiments as regards shock without any anæsthetic at all, but that the Nizam's Government would not allow.

21282. Was that request formally made in writing?—No, it was not made in writing.

21283. May I ask who made it?—I would rather not mention his name.

21284. You did not satisfy yourself at the time that those animals were suffering pain; it was merely an impression?—Merely what I saw.

21285. It was merely an impression?—It was rather more than an impression; in my own mind it was a certainty.

21286. But supposing, for example, that they did receive a large dose, what is called a lethal dose, of morphia, as Dr. Shore stated, do not you think it is possible that your impression might have been wrong?—But they had not had a lethal dose.

21287. How do you know?—Because they would have died of it.

21288. I think you admitted in answer to a question of mine, that they might have survived four or five

Lt.-Col. E. Lawrie, M.B., I.M.S.

25 Mar. 1908.

hours with a lethal dose?—Yes, then they would have shown signs of having had a lethal dose if they had had a lethal dose.

21289. (*Sir William Church.*) In answer to Sir Mackenzie Chalmers's question you said that your dogs did show evidence of pain when they came out of the chloroform, when you waited for a short time before giving it again. What were the symptoms of their being in pain then?—Merely struggling and whining.

21290. Then how was it that these dogs at Cambridge, if they were in such agony, did not struggle too?—They did not struggle. They were fastened down.

21291. I suppose your dogs were fastened down?—Our dogs were not fastened down in the same way that those were.

21292. And therefore the dogs that have received chloroform and are allowed to come out struggled, and the other dogs did not?—I do not say that. I do not remember very much about our dogs' struggles; it was not very much; but they were not fastened down as these dogs were.

21293. Do you mean that they were not fastened down at all?—They were fastened down just sufficiently to enable us to do what we wanted.

21294. But I am speaking of dogs which you subsequently used for your cross-circulation experiments?—Yes.

21295. They were fastened down I suppose in the same way?—They were not fastened down in the same way as these were.

21296. Do you mean that they were not fastened down so tightly?—No, not nearly so tightly; and most of our operations were done with students holding them to a certain extent.

21297. Students holding them when the connections were made between the vessels?—While the chloroform was given, while they were in the struggling stages of the chloroform.

21298. I am not speaking of while the chloroform was given; I am speaking of after the chloroform had been given and when you were waiting to give it again to see the effect of the chloroform on the blood-pressure?—We did not wait more than was absolutely necesary; there was no unnecessary waiting at all. The blood-pressure was allowed to get up to its normal level and then the experiment commenced.

21299. But I presume that you chloroformed your dogs first and then you connected the vessels?—While under chloroform.

21300. And whilst you were connecting the vessels were the dogs only held by two students?—They were held by whatever number was necessary—two, or three, or four; it did not matter how many there were. I never said only two.

21301. Do you mean that this delicate operation of uniting the vessels was done with the dogs loosely held by students and not fastened in any way?—They were fastened, but not fastened particularly tightly; and of course they only struggled when they were out of the chloroform.

21302. But they did struggle when they were out of the chloroform?—When they were partially out. They were unconscious, but they were very often partially out of the chloroform.

21303. In the case of the dogs at Cambridge, the only indication of pain they gave was shivering?—That was the only indication that I noticed particularly.

21304. Is there any difference between the narcosis of morphia and that of opium?—Not that I know of.

21305. Have you ever seen a person poisoned with opium?—Yes.

21306. A lethal dose?—Yes.

21307. Have you ever seen cases in which people have taken opium or morphia and have recovered?—In what dose do you mean?

21308. Apparently in a fatal dose, or nearly so, so that great difficulty has been found in recovering them?—Yes.

21309. Have you ever asked those persons any questions afterwards?—What about?

21310. I ask you whether you had ever asked those persons any questions at all afterwards?—Not that I recollect.

21311. You have never asked them whether they have been conscious at all of what has happened to them during their period of narcosis?—No.

21312. Do you know what happens to a person who is narcotised with morphia or opium?—Is this part of the proceedings of the Commission—to ask me my opinion about opium poisoning.

21313. Yes, it bears upon the question in this way: that you have said most distinctly that morphia is not a narcotic for dogs.

21314. (*Chairman.*) You said that you were told by Dr. Gaskell that a certain amount of morphia had been given, and there seems to be some dispute as to what effect three grains of morphia on a dog may be. It is material to ask you what your experience is about the effects of morphia?—In my opinion a three-grain dose of morphin to a dog is not an anæsthetic dose.

21315. (*Sir William Church.*) But I ask you first of all, if you would not mind giving me an answer, whether you know the condition of a man who has been narcotised by morphia or opium to a severe degree?—You mean poisoned?

21316. Not to die?—Yes, I understand—poisoned and recovering.

21317. Yes?—Yes, certainly I have.

21318. What is his condition?—His condition is a condition of coma, as everybody knows.

21319. Is he conscious of what is done to him?—Not when he is comatose, he certainly is not.

21320. Therefore you would not deny that probably another animal than man can be in the same unconscious condition?—Quite so.

21321. I only wanted to get at what you meant when you say that a three-grain dose of morphia it is impossible should in any given degree narcotise a dog?—Yes, that is my opinion, from the experiments that we did in Hyderabad.

21322. (*Chairman.*) What is a lethal dose for a dog?—I could not tell you; I do not know.

21323. You have never tested up to that?—No.

21324. (*Sir William Collins.*) Were these dogs at Cambridge not comatose?—I should not think they were.

21325. (*Sir John McFadyean.*) Are you sure that were not?—I should not think they were. I never thought about it.

21326. (*Sir William Church.*) The fact that they did not struggle like the dogs you experimented with might be due to the fact that they were narcotised?—I should not think so.

21327. Do you know whether morphia or opium administered at the same time as chloroform has greater or less effects upon the animal to which it is given?—You mean, does it deepen the anæsthesia?

21328. Yes?—I do not believe it does, unless it is given in such a dose as to produce its own effects. It would not influence the anæsthesia.

21329. And the anæsthetic would not in any way influence the action of the morphia?—The anæsthesia might be a little bit deepened, but not much.

21330. (*Sir John McFadyean.*) I think in answer to a previous question you said that you did not think four hours was an unreasonable time to be expended in preparing a laboratory dissection?—Did I say that?

21331. You were asked as to why there should have been a period of four hours during which the dogs were not under anæsthetics? You will correct me if I am wrong:; perhaps you have not stated that?—I do not quite understand what you mean.

21332. I will put it in this way: How long do you think it would take to prepare the dogs for the cross-circulation experiment by a person who had done it two or three times before?—I cannot give an opinion about that.

21333. Please let me have it as near as you can?—I should not be surprised if it took four hours.

21334. That is not owing to the great extent of the cutting that has to be done, because, after all, it is only a small slit in the dog's neck, is it not? Is it owing to the delicacy of the operation?—It is extremely extensive and difficult.

21335. It is an extremely difficult operation?—I should think so.

21336. That is what I should have thought; but unless I misunderstood, you said, in answer to Mr. Ram, that the difficulty would not be very greatly increased owing to the fact that the animal was conscious?—No; I should think it would be much more.

21337. Do you desire to correct that answer?—I said that I should think it would be much more difficult to prepare two animals for cross-circulation experiments under chloroform than if they were not under chloroform.

21338. I thought you said a minute ago that it was a very difficult operation?—Yes. I am talking of the dissection.

21339. I am talking of dissection even under an anæsthetic. Is that so?—Yes.

21340. Do you really ask the Commission to believe that anyone, even an experienced surgeon, would be able to perform such a delicate dissection as this insertion of these tubes in dogs that were not under an anæsthetic?—Certainly they could.

21341. Have you ever seen it done?—No, I have not.

21342. You would not admit that it would add enormously to the difficulty of the operation if the dog were conscious?—I do not see that it would add enormously to it; it would make it more difficult, that is all, so far as the actual dissection is concerned.

21343. So that you do not think it would have been a great advantage to have the dogs unconscious?—As regards the mere dissection, I do not think it would.

21344. (*Sir William Collins.*) How did the condition of the Cambridge dogs differ from the condition of dogs in a state of coma from morphia poisoning?—I cannot tell you.

21345. Was there any difference?—I cannot give you an opinion of my own as to dogs in a state of coma, because I do not think I have ever seen one.

21346. Then you are not prepared to say that the condition of the dogs at Cambridge was not that of coma from the morphia?—I should not think it was, most decidedly.

21347. But the dose, if Dr. Shore is right, was a much larger one than you previously apprehended?—Yes.

21348. (*Chairman.*) There are one or two questions I ought to ask you as there may be some evidence about it. You said that the animals were tightly secured?—Yes.

21349. So as not to allow of much movement, is that so?—Yes.

21350. I must ask you: would it be right to say that the bands were not used to prevent movements of the animals, and that considerable voluntary movement of the limbs would have been possible if the animals had been conscious?—No.

21351. That would not be true?—No.

21352. Supposing that either chloroform or a narcotising dose of morphia had been used, it would not have been necessary to bind them together?—While they were in a state of anæsthesia they would be quite still, of course.

21353. It would not be necessary to bind them together in that case?—No.

Lt.-Col. E. Lawrie, M.B., I.M.S.

25 Mar. 1908.

21354. Then did you examine the binding particularly?—No, not at all.

21355. It is your impression about their being tightly bound?—Yes.

21356. Then as regards the administration of chloroform, do you say that at no time whilst you were there did you see any chloroform administered except the concentrated dose that killed the dog?—Yes.

21357. And that was how long before the end of the experiment; how long did it take the dog to die under it?—I cannot tell you; I have not got the notes; it was only a few minutes.

21358. And up to those few minutes before the matter ended in the dog's death, there was no chloroform administered in your presence?—No.

21359. And your belief that there was no chloroform administered is derived entirely, I understand, from what Dr. Gaskell told you?—Certainly.

21360. If he had not told you so, you would not have undertaken to say that there was no chloroform administered?—I should have assumed that chloroform had been given if he had not told me so.

21361. (*Mr. Tomkinson.*) You say on page 11A that "when the two animals are ready for the experiment to begin, chloroform can only be given to the feeder"?—Yes.

21362. "As it is useless to give it to the fed"?—Yes.

21363. Do you mean that only one of the dogs had chloroform administered to it?—Yes, only the fed had chloroform given to it.

21364. Would it not affect the other?—No, not at all. The fed is the second dog.

21365. Then as regards the anæsthetic, for the latter part of the operation, the experiment, only one dog was being anæsthetised?—Yes, and that dog would not be anæsthetised if the experiment is properly done; it would not have any effect upon it.

21366. I say that only one of the two was being anæsthetised?—But I say that would not produce any anæsthesia in the fed dog if the experiment was properly done.

21367. In neither dog?—In neither dog if you give it to the fed; that is to say, it does not get to its brain if the experiment is properly performed.

21368. Then in your opinion was one of those two dogs absolutely without anæsthetics during the whole of the operation?—Yes, except the morphia.

21369. (*Sir Mackenzie Chalmers.*) How was that dog killed then?—So far as I recollect its artery was cut, I suppose; it is generally done in that way.

21370. Then after luncheon, when the experiment began, how long did it last in your presence?—It lasted a few minutes. I can tell you about the second experiment, because I have the notes; but I cannot tell you about the first, because I have not the notes.

21371. In either case the experiment that you yourself actually saw done only lasted a few minutes?—Yes.

21372. And that consisted in giving chloroform to one of the dogs?—To the fed.

Mr. L. E. Shore, M.D., recalled; and further Examined.

21373. (*Chairman.*) You have given evidence before us, as you will remember?—Yes.

21374. And to a certain extent upon this question of what happened on the 7th July, 1894?—Yes.

21375. You have been shown, I believe, a statement which has been made by Colonel Lawrie with reference to what took place on the 7th July?—Yes, Dr. Gaskell read to me a statement which is a criticism of my evidence.

21376. It is with reference to what took place on that 7th July with respect to these two dogs that I want to ask you some questions. Do you remember Colonel Lawrie arriving at Cambridge on that day?—Yes.

21377. When did you see him first?—I do not remember the time.

Mr. L. E. Shore, M.D.

21378. I will begin in another way. Perhaps you remember the dogs being prepared to be operated upon?—Yes.

21379. Did you take part in that preparation?—I prepared them myself.

21380. And who else was there whilst they were being prepared?—One laboratory assistant was there certainly all the time.

21381. Is he here today?—Yes, he is here; and generally another assistant was helping.

21382. And was there any other skilled person, any

Mr. L. E. Shore, M.D.

25 Mar. 1908.

other physiologist?—Not until Dr. Gaskell himself arrived.

21383. When did he arrive—before luncheon?—Oh, certainly before luncheon. I do not remember the hour.

21384. Did he arrive before the preparation was over?—Certainly.

21385. Was the preparation over before Colonel Lawrie arrived, do you remember?—I do not remember the hour at which he arrived.

21386. Now will you just tell us exactly what happened. You had these two dogs in the laboratory; what did you first do with them?—They were first given an injection hypodermically of hydrochlorate of morphia; that was between half-past eight and nine o'clock in the morning.

21387. What strength was that?—One dog was given 10 cubic centimetres of a 2 per cent. solution, and the other dog was given 6 cubic centimetres of the same solution.

21388. Why was there that difference?—One dog was somewhat smaller than the other.

21389. Was it proportionate to their size?—Not quite proportionate; there was rather less given to the smaller dog than was proportionate to its size.

21390. It was given less than its full proportion?—Rather less compared with the dose given to the bigger one.

21391. Were the dogs put on the table when you gave them that injection?—They were standing on the floor.

21392. How was it administered?—A dog is just patted and the syringe is put under its skin, and it is injected without any difficulty at all.

21393. And when that had been administered, did you put them on the table at once, or did you leave them for a time?—They were left for half an hour until they became drowsy and laid down.

21394. And then what happened?—Chloroform was then applied to the nostril.

21395. Were they then put on the table?—No, they were on the floor. The chloroform was put to the nostril of the animals until they were unconscious; they were then lifted on to the table.

21396. Was that done on this 7th July, when they had the chloroform after they became drowsy?—Certainly.

21397. Are you quite sure of that?—Perfectly certain.

21398. Did you watch the effect of the chloroform on them?—Certainly.

21399. Did it render them insensible?—Absolutely.

21400. You say that then they were put on the table; and what was done to them then? Were they bound in any way?—Their limbs were gently restricted by bands to the table and their heads fixed by a holder.

21401. What was the nature of the binding; was it tight or loose?—Just one narrow band to each limb, just sufficient to keep them in the required position for the operation, but not enough to prevent the dog from moving its limbs quite freely if it had wished to do so—that is to say, if it had been conscious.

21402. Were these dogs laid on their backs?—Yes, on their backs.

21403. You mean they were just sufficiently fastened to prevent their rolling over and to keep them on their backs?—Quite so.

21404. But not to prevent a good deal of motion?—No.

21405. Is that the usual way in the case of such an experiment?—Yes.

21406. Then did you proceed to operate upon them?—A tube was then put into the trachea.

21407. You opened the trachea first?—Yes.

21408. And then you put a tube in?—Yes.

21409. Did you perform any other cutting operation or any other operation?—After the tube was put in the tracheal tube was then connected to the bottle containing the A.C.E. mixture before any further cutting operation was done.

21410. When you had done that did you go on with the rest of the operation?—I went straight on with the preparation of the arteries and veins necessary for the experiment.

21411. And how long did the whole thing take you?—About two hours, I think—perhaps rather more.

21412. Were these dogs kept under chloroform all the time?—They were kept under A.C.E. all the time.

21413. The first thing that you administered after the morphia was chloroform?—Yes.

21414. And by inhaling, I suppose?—Yes.

21415. And the A.C.E.?—The A.C.E. through the tracheal tube.

21416. Is that the usual way in which you would deal with an operation of this kind?—Yes, that is the usual way.

21417. And you are quite sure that you followed it?—Certainly.

21418. Was there any reason whatever for departing from that process?—None whatever.

21419. Do you remember Dr. Gaskell coming in?—I do not remember the exact hour at which he appeared.

21420. You are speaking about a long time ago, but you remember that he did come in?—Yes, he came.

21421. Before you had finished?—Oh, yes.

21422. Was he there part of the time while you were keeping the dogs under chloroform?—He was there during the latter part of the preparation of the animal when the animal was still under the A.C.E. mixture.

21423. You cannot speak more definitely than that?—No, I cannot.

21424. Then was the laboratory attendant administering the A.C.E. under your supervision or did you do it?—The tracheal tube was in the bottle of the A.C.E. practically all the time, and it was being looked after both by me and the laboratory attendant.

21425. You were both there?—Yes.

21426. Did the dog struggle or show any sign of pain?—None whatever.

21427. Are you quite sure of that?—Quite sure.

21428. And the animals were kept unconscious throughout?—Yes, they were kept quiet.

21429. Do you remember Colonel Lawrie coming into the laboratory?—Yes, I remember him coming, but I cannot say at what hour he arrived.

21430. He says it was a little before luncheon, and that it was after you had finished the preparatory operations?—Yes.

21431. Did any conversation take place about what had been done to the dogs?—We doubtless told him what preparations we had made in the animals, but I do not remember the conversation.

21432. At any rate, I can ask you this: Did Dr. Gaskell say to him that they had not had any anæsthetic?—I heard him say no such thing.

21433. As it might interfere with or spoil the subsequent experiment with chloroform?—I am certain that he would say no such thing.

21434. Did he say that each dog had been given a 10-drop dose of morphin solution?—It is absurd to suppose that he would say any such thing.

21435. He did not say that he gave a 10-drop dose?—I did not hear him say any such thing.

21436. It would not have been true, I understand you to say, if he had said it?—No.

21437. He had given a much stronger dose?—A much stronger dose was given.

21438. But the dog had been given a much stronger dose than a 10-drop dose?—Yes, much stronger.

21439. Did Dr. Gaskell say he had given them a dose of morphin not to prevent pain, but in order to hoodwink the Inspector and satisfy the Act?—He certainly said no such thing.

21440. Or anything to that effect?—Certainly not.

21441. While Colonel Lawrie was there did the dogs show any sign of pain?—They gave no sign of pain whatever.

21442. Do you remember Colonel Lawrie and Dr. Gaskell going to luncheon?—Yes, I remember the luncheon.

21443. And after luncheon they came back into the laboratory, I understand?—Yes.

(*Dr. Gaskell.*) The luncheon was in the laboratory.

(*Chairman.*) I did not know that the luncheon took place in the laboratory in the presence of these dogs.

(*Dr. Gaskell.*) No, we have a private room at the laboratory—the professors' room.

21444. (*Chairman.*) That is what I supposed. The laboratory being the operating room, they had left the operating room to go into another room in the laboratory for luncheon?—Yes.

21445. And you lunched there, too, I suppose?—Yes.

21446. Then did you all come back into the room?—We all came back, having been absent, I think, about a quarter of an hour.

21447. When you came back just tell us what the condition of the dogs was and what was done?—While we were at luncheon the laboratory attendant never left the room, having had instructions to see that the animals were kept quiet and, if necessary, given further A.C.E. mixture. When I came back they were still perfectly quiet, and no A.C.E. mixture had been necessary. They were quite unconscious, and there was absolutely no movement.

21448. Was anything said by Colonel Lawrie either then or before or at any time to the effect that these dogs had not been anæsthetised and that they were in agony or anything of that kind?—I do not remember his making any such remark.

21449. Surely you would remember it if he had said it?—Yes, I think I should.

21450. According to your account it would not have been true?—It would have been quite untrue.

21451. After you came back what was done?—Strong chloroform was given to one of the dogs in order to perform the object of the experiment, namely, to see the effect of chloroform upon the heart, and when the object of the experiment was reached both dogs were then killed by concentrated chloroform.

21452. The object being to watch by what process and method the dogs died under the chloroform?—No. The object of the experiment was to show that chloroform depresses the heart's action and ultimately makes it stop.

21453. Is not that the same thing?—No, my Lord, it is not the same thing. In this case, although the animal's heart stopped, the animal remained breathing and had to be killed by an administration of chloroform to its brain.

21454. I am not going into the merits of the experiment, or whether it was successful or unsuccessful, but at any rate the experiment was completed—it came to its end?—The crucial experiment was completed, and then the dogs were killed by chloroform, both of them.

21455. Did they ever come back from anæsthesia?—They never regained consciousness.

21456. They suffered no pain?—They suffered no pain.

21457. (*Colonel Lockwood.*) You were present the whole time during this operation and you must have heard any conversation which ensued between Dr. Gaskell and Colonel Lawrie, and you have no hesitation in saying that the whole of Colonel Lawrie's story as to Dr. Gaskell stating that he had operated with this solution only to hoodwink the inspector is a fabrication from beginning to end?—That is so.

21458. (*Sir William Church.*) Could you tell the Commission what is a fatal dose of morphia in a dog?—No, I cannot answer that question. I have never attempted to kill a dog by morphia alone.

21459. Could you give the Commission any idea as to what is the usual dose to cause complete narcosis in a dog?—That, of course, varies with the size of the dog.

21460-1. Exactly, but could you tell us at all?—The doses that were given in these experiments were just the ordinary doses which it has been the habit in the laboratory for many years to give in all similar cases. There was no special exception made in this case.

21462. But would three grains, in your opinion, be sufficient to produce unconsciousness in a dog of a given weight?—Three grains is a large dose for a dog, except a very large dog. Much less is sufficient.

Mr. L. E. Shore, M.D. 25 Mar. 1908.

21463. For a dog of nine pounds would three grains be a dose,—or perhaps you do not wish to say?—

(*Chairman.*) That really is not very material, is it now, because we understand that the morphia was not relied upon as the anæsthetic. Chloroform was given.

(*Sir William Church.*) But it was relied upon to keep the dog unconscious, which is really the same thing as being in a state of anæsthesia, during the time that they were remaining on the table.

(*Chairman.*) I thought that chloroform and A.C.E. mixture were given.

(*Sir William Church.*) The A.C.E. mixture was not given continuously.

(*Witness.*) May I answer that point? The A.C.E. mixture was given until the defibrination of the blood was complete. As that went on it was wanted less and less, so that it was given more and more diluted; and so far as I remember the administration of the A.C.E. was discontinued altogether just before the cross-circulation was established.

21464. Then it was continued during the time you were at luncheon?—No, it was discontinued just before we went to luncheon, and in spite of that the animals remained perfectly unconscious.

21465. That unconsciousness was due to the influence of morphia?—It was due to the profound influence of the large dose of morphia that they had had, and no doubt also to the fact that they had not yet recovered from the chloroform and the A.C.E. which had been given to them for some three or four hours.

21466. Is not the effect of giving morphia at the time that you give or just before you give either chloroform or the A.C.E. mixture to intensify the action of the anæsthetic?—Very much indeed; only a very small amount of A.C.E. is required if there has been a large dose of morphia already. But I think that in these experiments it must not be forgotten that a long administration of A.C.E. induces an unconscious condition for a considerable time after the administration of A.C.E. is discontinued; for we know, from operations on man, that very often unconsciousness in a patient continues it may be for two or three hours after the administration of the anæsthetic is stopped.

21467. What I wanted to get, and I think I have got it, is that during the time when you were at luncheon and until you began the actual experiment no A.C.E. mixture was being used?—Certainly; it had then been discontinued.

21468. (*Sir William Collins.*) On the occasion of the experiment on July 7th I understand that you were present and Dr. Gaskell, Colonel Lawrie, and a laboratory assistant?—Yes, those were certainly present.

21469. Was anyone else present on the 7th?—I do not remember that anyone else was present except perhaps another laboratory assistant.

21470. And on July 11th who were present?—On July 11th at the latter end of the experiment Dr. Anderson and Sir Clifford Allbutt were also present besides ourselves. I believe there were two of Colonel Lawrie's students, I think I may call them, present on the 7th; I had forgotten them.

21471. Was there any time on July 7th when Dr. Gaskell and Colonel Lawrie were present in the laboratory and you were not present?—No.

21472. Are you quite clear about that?—I am quite certain. They might not have been in the same room, of course.

21473. Would it have been possible for a conversation to have taken place between Dr. Gaskell and Colonel Lawrie without your hearing it?—They might have gone into another room.

21474. Then it would have been possible for a conversation to have taken place between Dr. Gaskell and Colonel Lawrie without your hearing it?—In another room, but not in the same room.

21475. I do not know the relationship of the rooms; therefore it is for you to tell me whether it would have been possible for a conversation to have taken place between Dr. Gaskell and Colonel Lawrie on the 7th July and you not to hear it?—If they had left the

Mr. L. E. Shore, M.D.

25 Mar. 1908.

room they might have carried on a conversation which I did not hear.

21476. Was the A.C.E. mixture being given during the whole time that Colonel Lawrie was present?—No, not during the latter part of the experiment.

21477. Was the A.C.E. mixture or chloroform being given prior to the experiment with the chloroform, during any of the time when Colonel Lawrie was present?—I cannot remember, as I have forgotten the exact moment when Colonel Lawrie arrived on the scene?

21478. Would it have been possible prior to the crucial experiment with chloroform during the period when Colonel Lawrie was present, for the dogs not to have been receiving either chloroform or A.C.E. mixture?—May I ask you to repeat the question?

21479. Would it have been possible on the 7th July prior to the crucial experiment with chloroform during the period when Colonel Lawrie was present, for the two dogs to be without the obvious administration of any other anæsthetic than the morphia?—Yes, it would have been possible.

21480. (*Dr. Gaskell.*) If perchance Colonel Lawrie came into the laboratory just before lunchtime, it would have been possible then?—Yes, if he came just after the defibrination was completed and before the crucial experiment was made, in which there was an interval of first of all a quarter of an hour while we had luncheon, and perhaps another ten minutes or a quarter of an hour while we were getting ready the cross-circulation experiment. During that period there may not have been any A.C.E. administered, and Colonel Lawrie may have noticed that.

21481. (*Sir William Collins.*) Can you say from memory whether during the time when Colonel Lawrie was present A.C.E. was administered or not?—I cannot say positively that it was administered while he was there; and I can say certainly that there was a considerable period when it was not administered.

21482. What was the total length of time from start to finish of this experiment with these dogs?—On July 7th we began giving chloroform about half-past eight to nine o'clock in the morning, and we finished about 2.30 in the afternoon.

21483. That would be about from five to six hours?—Yes.

21484. During how many of those hours do you think that the A.C.E. mixture was being administered?—Right up until lunch time, which was about half-past one.

21485. Was it necessary for the purposes of the crucial experiment with choloform to secure that the blood of the dogs was relatively free from chloroform or A.C.E. mixture before the experiment began?—It was necessary that they should not be deeply under a large dose of chloroform at the time, and that was the reason why a large dose of morphia was given to the dogs; but a very small quantity only of A.C.E. mixture would be necessary to supplement the action of the morphia, if it was required at all, and such a little would not have vitiated the crucial experiment that we had in view.

21486. You say if the morphia was required at all?—If the A.C.E. mixture was required at all to supplement the morphia.

21487. I wanted to ask you whether the morphia was required at all. Would these dogs have been in a painless condition from start to finish if morphia had not been administered at all?—No. It is true that one could have performed the experiment so far as the defibrination under chloroform or A.C.E.; but after that, after that had to be discontinued, it would not have been safe, I think, unless the animals had received a large dose of morphia.

21488. Then after the cessation of administration of the A.C.E. mixture until the time of the commencement of the crucial experiment, to what do you attribute the anæsthesia of the dogs?—To the morphia that they had received, and also, as I have just explained, perhaps partly to the lasting effect of the unconsciousness after a long administration of the A.C.E.

21489. Would it be more advantageous for the experiment that the anæsthesia should be due in the main to the morphia, or to the A.C.E.?—It would be better that the anæsthesia should be due to the morphia.

21490. Was that partly the reason why morphia was administered?—No, the morphia was administered in the ordinary routine way in which experiments on dogs are made.

21491. If nothing but the morphia had been administered up to the time of the crucial experiment, would the dogs have been free from pain?—No. In the early part of the day the cutting operations could not have been done under morphia alone without the animals feeling pain.

21492. Was that because the morphia had not reached the maximum of its influence?—Yes, morphia does not reach the maximum of its influence until later. It is often not until after two or three hours after it is administered that it is at its maximum.

21493. At what time on July 7th would you say that the dogs would have been free from pain from the morphia only?—The earliest moment, you mean?

21494. Yes?—I do not like to answer that question. I did not test it. They were under A.C.E. at the time, and I should not like to say when unconsciousness would have come on under morphia alone; perhaps in about two hours; but I only suggest that. I cannot say; it was not tested.

21495. But if you are using morphia and chloroform conjointly as an anæsthetic for the purpose of an experiment, can you say when it would be safe to abandon the chloroform and rely upon the morphia exclusively for the purpose of securing freedom from pain?—Of course it would depend upon the dose of morphia that was given; but I should think, as I have just said, that after two hours or so you might abandon the chloroform administration and rely on the morphia alone provided that one was not doing any severe operation. Of course, whether you could do a severe operation or not would depend upon the dose of morphia that you had given.

21496. With any dose of morphia would it be possible to do a severe operation with perfect satisfaction as to freedom from pain?—I think with a large dose of morphia it would be possible.

21497. With such a dose as you gave to those dogs?—With that dose I do not think it would be possible to do a severe operation within the first two hours, and that is why the A.C.E. mixture was given.

21498. What would you regard as the minimum dose of morphia that should be given to such a dog as that which was experimented with on July the 7th, in order to be able to perform a considerable operation with complete satisfaction that there would be no pain?—Under morphia alone?

21499. Yes?—I cannot answer that question. I have never done such an experiment. I have never experimented on a dog under morphia alone.

21500. Do you think it possible to predicate what dose could be employed if morphia alone was administered to secure complete anæsthesia during a considerable operation?—I have no doubt that a large dose of morphia would in a dog produce it, provided that you waited a sufficient time for that dose to produce its full effect.

21501. Would it only be near the period of death that that condition would be achieved?—Oh, no; long before the period of death.

21502. Is three grains of morphia a lethal dose for a dog?—I have never watched a dog die under morphia. I cannot say whether it would kill it or not.

21503. (*Sir John McFadyean.*) What was about the size of the dogs operated on. There was a large one and a smaller one; do you remember what breed they were, or comparable with what breed in point of size?—I do not remember very accurately. I think the larger dog was a greyhound. I do not remember what the smaller one was.

21504. With regard to the way in which they were fixed down, I suppose there was nothing special with regard to the method of fixing these two particular dogs?—No; they were just kept on their backs on the table.

21505. How many pieces of apparatus or cords or bandages were applied to each limb?—One to each; one narrow cord to each limb.

21506. Where is it fastened? Is it above or below the carpus, the knee?—It is generally at the foot with

the hind leg, and with the front leg it is generally round the upper part of the elbow.

21507. I want now to ask you whether you know of any method of rigidly fixing a dog, using only one strap or bandage to each limb?—No; it would be quite impossible to fix a dog rigidly with only one band.

21508. If you allow an animal sufficient freedom for its respiratory movements, then there must be room for it to exhibit signs of pain by struggling?—Certainly; in the method that I use they could quite freely move their limbs and bodies.

21509. Then I wanted to get your opinion as to what you think about the feasibility of performing the dissection that you did on these dogs on an animal that is fully conscious?—It would have been totally impossible to perform so delicate operations as I have performed on animals conscious.

21510. (*Sir Mackenzie Chalmers.*) If I have understood you aright, at the time when Colonel Lawrie came it was just before luncheon probably?—Yes.

21511. At that time you had disconnected the A.C.E. tube from the tracheotomy tube?—Yes.

21512. So far as you remember, did Colonel Lawrie make any inquiry as to the anæsthetic that was being used or otherwise?—I do not remember his asking me that point.

21513. And you heard no conversation between him and Dr. Gaskell with reference to the use of anæsthetics?—No, I did not hear any conversation.

21514. Had you been operating for any time in that laboratory when you made these experiments? Had you worked with Dr. Gaskell for any time?—I had been experimenting in physiology for several years, from 1887.

21515. In that laboratory?—In that laboratory.

21516. Have you ever known in that laboratory a cutting experiment of any sort performed on any dog or other animal with morphia alone?—No, I have not seen it done in that laboratory under morphia alone.

21517. If it had been the practice in that laboratory to experiment with morphia alone without any other anæsthetic, would you have known about it?—Oh, yes, I should have known all about it.

21518. Would it be incorrect to say that ever in that laboratory, so far as you know, an illusory dose of morphia has been given for the sake of a nominal compliance with the Act?—No such thing is ever done in that laboratory.

21519. From anything you know, could there be any possible reason for Dr. Gaskell, as the head of the laboratory, making such a statement?—It is quite impossible that Dr. Gaskell could have ever made such a statement.

21520. If he had made it, may I take it that, from your own personal knowledge, that statement would have been absolutely incorrect?—Absolutely.

21521. In this case do I correctly understand that you performed the necessary operations before the crucial experiment both on the 7th and on the 11th?—Yes.

21522. Were the conditions in both cases the same?—Yes.

21523. Was morphia first administered, and was it followed by the A.C.E. in both cases?—Precisely the same.

21524. If a dose of morphia has been given, and that is followed up with the A.C.E. mixture for a considerable time, how long does it take after the discontinuance of the A.C.E. before its effects would wear off? When would you expect the animal to again become conscious to pain?—Of course, it depends upon the dose of morphia that one has given and the length of time.

21525. In these two operations, I mean, with the doses that you gave them?—If those animals had been left alone they would never have regained consciousness, in my opinion, but I have never left them until death. But I believe that they would never have regained consciousness.

21526. You believe that if you had never come back after luncheon on those occasions those animals would never have recovered consciousness?—I do not like to answer that question positively, because I have never left animals under those conditions; but I should think that very likely they would not.

Mr. L. E. Shore, M.D.

25 Mar. 1908.

21527. Did you from time to time after the discontinuance of the A.C.E. examine the dogs yourself to see whether there were any signs of consciousness or returning consciousness?—We were examining them continuously.

21528. With that object?—Certainly; we had got our eye on it the whole time. It was most important for the experiment that no consciousness should come back to the animals. If it had, and they had moved the least bit, all our labour would have been in vain, and the whole experiment would have been wrecked.

21529. I want to ask you about the statement of Colonel Lawrie, whether you agree with it. Colonel Lawrie says: "From personal observation I can state positively that before lunch on the 7th of July the two dogs had been lying with unconnected tracheotomy tubes in their throats" (that means unconnected, I suppose, with the A.C.E. mixture), "which in itself is presumptive evidence that they had not up to that time had chloroform or A.C.E. mixture." Do you agree with that statement?—No; I should have thought it was evident that one had got the tracheotomy tube ready for the very purpose of giving the A.C.E. mixture, which was the fact.

21530. For what purpose in this experiment did you perform tracheotomy?—For the easy administration of the A.C.E.

21531. That was the reason the animals were tracheotomised and why you put in the tracheotomy tube?—Yes.

21532. That was wholly independent of connecting the veins for cross-circulation?—Certainly.

21533. You said that you did it for the purpose of facilitating the long-continued administration of the A.C.E. mixture?—Certainly, that is its object.

21534. If you had intended to rely on morphia alone, without the A.C.E., would tracheotomy have been necessary?—It would not have been necessary.

21535. It would have been merely superfluous trouble?—Yes.

21536. Colonel Lawrie is correct in this when he goes on to say, "During the whole of that time the animals had no anæsthetic"; he is correct in that?—I was not present in the room at that moment, but so far as I remember the A.C.E. mixture had by that time been discontinued as unnecessary.

21537. Then you came back from luncheon. Are you perfectly positive that the animals, when you came back, were unconscious and free from pain?—Yes, absolutely.

21538. Colonel Lawrie says: "When I saw the dogs they appeared to be in a condition of frightful agony, and I believe that they were fastened on the dog boards, which must in itself be most exquisite torture, for five hours, and that their necks were dissected, without any anæsthetic." Is that an absolute misapprehension?—Yes.

21539. We asked him what signs of agony he saw, and he told us that he saw shivering in the dogs. Did you notice anything of that sort yourself?—No, I did not notice any shivering, but there may have been some.

21540. Would it be possible that there should be shivering without consciousness under the anæsthetics which you administered?—There might have been movement without consciousness.

21541. With anything like convulsive movements?—No, not with convulsive movements.

21542. Would there be shivering movement?—I suppose it is possible that some movement of that sort might have occurred in an unconscious state, but it is very easy to see the difference between a conscious movement, a voluntary movement, and an unconscious movement.

21543. By a voluntary movement you mean a movement caused by conscious pain?—Yes.

21544. Were the dogs so fastened that any conscious movement of pain must have been observed?—It could have been observed at once.

21545. When you are operating upon a dog under those conditions do you apply any test of conscious-

Mr. L. E. Shore M.D. 25 Mar. 1908.

ness, such as touching the eye?—We are watching carefully the breathing of the animal, and we are watching carefully to see that there is no voluntary movement, and we occasionally test the conjunctival reflex.

21546. Do you remember whether you tested it in this case?—Yes, we tested it.

21547. At what periods?—Off and on throughout the whole experiment; from time to time throughout the whole experiment.

21548. By the whole experiment you mean beginning in the morning, not merely the actual administration of the chloroform, but the whole time from the first tracheotomy?—Yes.

21549. The first thing you did, of course, was tracheotomy?—Yes.

21550. That was the first cutting incision that you made, I suppose?—Yes.

21551. And then after that you applied the A.C.E. tube and then the necessary incisions for the purpose of cross-circulation were made under the A.C.E., plus morphia?—Yes.

21552. *(Mr. Tomkinson.)* Do I correctly understand that the tracheotomy had nothing to do with the main experiment?—Tracheotomy was necessary to give the anæsthetic.

21553. The anæsthetic could not have been administered through the nostrils?—It could, but it could not be controlled so readily.

21554. Then the tracheotomy had nothing to do with the experiment of cross-circulation?—No, it was simply to facilitate the means of giving the A.C.E. mixture to keep the animals unconscious.

21555. Then I suppose that the long time occupied was the preparation for the great experiment?—Yes, quite so.

21556. The tracheotomy, I suppose, took but a short time?—It is done in a few moments.

21557. Then the two things are quite separate?—Yes.

21558. I did not understand that. During the whole time that Colonel Lawrie was there, did you or did you not gather from him any expression whatever of disapproval?—I did not hear him make any remark of disapproval of what was being done.

21559. He certainly made no protest to you?—None whatever.

21560. And he did not call attention to the fact that in his opinion the dogs were suffering?—No, he did not.

21561. Nor make any allusion to it?—I heard him make no allusion to anything of the kind.

21562. And no impression of a feeling of that kind on his part was conveyed to your mind?—None whatever.

21563. Therefore I suppose you were very much surprised to hear what he said about it afterwards?—Naturally, I was very much surprised.

21564. You spoke of the continuing effects of the anæsthesia after the operation. Is that more than the somnolency caused by anæsthesia. To illustrate what I mean, my experience is that a person after an operation, on the anæsthetic being removed and recovery of consciousness, says something: "I have not felt it; I am told it is all over," and then goes to sleep for a couple of hours or three hours. Did you mean more than that?—Of course you often get that condition of continued unconsciousness, whether we call it sleep or not.

21565. You would not call it insensibility to pain, would you?—During the time that the patient is asleep the pain of the operation is not felt certainly.

21566. But if the operation were continued, the patient would wake up—like operating on a person in a sound sleep. I think your contention in this case is that the effect of a subcutaneous infusion of morphia had a long continuing effect?—Yes, the dose of morphia was producing its narcotic effect for many hours.

21567. And was sufficient to continue the anæsthesia after the A.C.E. had been discontinued?—Yes, that is my opinion.

21568. *(Dr. Wilson.)* Did Dr. Gaskell give you any instructions as to the amount of morphia that should be administered to these dogs?—No, I decided it myself.

21569. So that he could not even say what was the dose that was given?—No, he left it to me.

21570. And he was not present when the dose was given?—No.

21571. So that he could not have made that statement from actual knowledge which Colonel Lawrie stated that he made?—No, it was impossible, but I doubtless told Dr. Gaskell the dose I had given.

21572. I think you also said that the assistant was in the room during the time when you were at luncheon?—Yes.

21573. And that he had received instructions if there were any signs that the dog was suffering pain to give another dose of the A.C.E. mixture?—Yes.

21574. *(Sir Mackenzie Chalmers.)* Were exactly the same conditions repeated on the 11th that took place on the 7th?—Yes, the conditions used for anæsthetising the animals were precisely the same, and were carried out in precisely the same way.

21575. Was Colonel Lawrie present only at the final experiment on both occasions?—On the second day Colonel Lawrie appeared in the afternoon, if I remember rightly, and saw only the termination of the experiment. I do not remember exactly when he came.

21576. When did you first hear that Colonel Lawrie thought that he had seen a cruel experiment?—It was when Dr. Gaskall read to me this document that has been circulated.

21577. The other day?—Yes.

21578. But during these fourteen years you never heard a word to the effect that Colonel Lawrie thought he had seen a cruel experiment?—There was some letter, I believe, that passed between Colonel Lawrie and Dr. Gaskell which Dr. Gaskell mentioned to me, which seemed to imply that Colonel Lawrie had thought our experiments cruel.

21579. When was that?—I do not remember how many years ago that was.

21580. *(Dr. Gaskell.)* Was there the slightest difference, so far as you remember, of course, between the conditions of the animals on July 7th and July 11th?—No, there was no difference between the conditions on the two days.

Mr. William Hall, called in; and Examined.

Mr. W. Hall

21581. *(Chairman.)* You were assisting in the laboratory, were you not, on the 7th July, 1894?—Yes. I could not be sure of the date.

21582. But you remember those cross-circulation experiments which took place in July, 1894?—Yes, quite well.

21583. There was one on one day and another four days afterwards?—Yes.

21584. I am taking you to the first day?—I recollect more about the day when Professor Allbutt was there.

21585. That is the second day?—Yes, I remember more about that date.

21586. I will ask you first in a general way, were the operations done in the same way as regards preparing the dogs on both occasions?—Exactly.

21587. You assisted at both?—Yes.

21588. Will you just describe the way in which the dogs were treated. There were two dogs on the first day and there were two other dogs on the next day?—Yes.

21589. Take the case of each pair of dogs. Were they treated in the same way?—Exactly.

21590. What was done?—In the morning with the help of another laboratory assistant, and Dr. Shore being about, I injected the dogs with morphia—both dogs with a 2 per cent. solution under the skin on the back.

21591. You injected them both with morphia?—Yes, I did.

21592. Do you remember what quantity you injected?—Yes, the first dog was a medium sized dog, that would be with 6 to 8 cubic centimetres. I was not particular to a cubic centimetre.

21593. And the larger dog?—The larger dog I injected with nine or ten; I could not say to a cubic centimetre.

21594. Proportionately?—Yes, in proportion.

21595. Then after they had been injected with morphia, were they left for a time?—Quite half an hour.

21596. And then?—Then, with some help, I laid the dog on its side, with Dr. Shore present, and I held a cloth over the nose of the dog with chloroform upon it, and the dog did struggle a little, but nothing to speak of.

21597. When you put the chloroform over its nose?—Yes.

21598. And then?—Being pretty well under morphia, it did not struggle much, but it did a little till it got really under the influence of the chloroform.

21599. Did it get thoroughly under the influence of chloroform?—Yes, on the floor, quite.

21600. Then what did you do?—I lifted it up with some help on to the operating table.

21601. Did you fasten it?—The legs were fixed with string, just round each leg. The head was fixed in a sort of clamp.

21602. Was it laid on its back?—Yes.

21603. Was that all the fastening it had—what you have described?—Yes.

21604. Do you remember Dr. Shore cutting the trachea?—Yes, quite well.

21605. And putting in the tube in the trachea?—Yes.

21606. That I understand was for the A.C.E. to be administered?—Yes, it is much easier that way than any other way to be done.

21607. When that was done did you give it any A.C.E.?—Immediately the tube was in, yes, the A.C.E. was put in. As a rule, it is always done.

21608. At that time was the dog insensible when you began to administer the A.C.E.?—Quite; it kept well under the chloroform all the time the duster was kept round the nose.

21609. Did you put the chloroform over its nose at intervals, or was it there all the time?—I kept it on until the trachea tube was in.

21610. Then did Dr. Shore proceed to operate on the dog?—Yes.

21611. That would be making fresh incisions altogether in the dog for the purpose of laying open the arteries?—Yes.

21612. And he made those?—Yes.

21613. The tracheotomy tube remaining in the slit in the trachea?—Yes, all the time.

21614. Did you keep on administering the A.C.E.?—I took the tube in and out of the bottle very likely, but when I did that I should say to Dr. Shore, "I have taken the tube out, sir," or, "I have put it in again, sir," so as to give warning. *Mr. W. Hall.* 25 Mar. 1908.

21615. But it was continually applied?—Yes, put in and out of the bottle in case of necessity.

21616. Then was the cross-circulation established in the glass tube?—Yes, when it was ready to be done.

21617. You mean after luncheon, just before the end of the operation, that was the last thing?—Yes, getting towards the last thing to be done.

21618. You do not remember, I suppose, about the luncheon, the times and the hours particularly?—I know I should not have gone at all, because it would be over at about three or half-past. I often stay until the thing is over, and then go to lunch afterwards. I could not be relieved in those particular cases.

21619. You never left the room then?—No.

21620. During the whole time, from the time that you administered the injection of morphia until the dogs were dead, you were in the operating room the whole time?—Yes.

21621. At any time during that period after you had administered the chloroform for the first time up to the death were the dogs sensible; had they any consciousness of pain?—I did not see anything of consciousness.

21622. Were they under the influence of these narcotics or anæsthetics?—Yes, one or other of them.

21623. Did you see any struggling?—No, I did not.

21624. And did you hear, or do you remember, at any rate, any conversation between Dr. Gaskell and Colonel Lawrie?—I cannot say I did. I should not take any notice. I should be too busy.

21625. You have no recollection after this lapse of time?—No.

21626. But you are quite sure that that was the process of treatment of the dogs that you have described to us?—Yes, I am quite sure.

21627. And that applies also to the 11th, I understand?—Yes, it was all the same.

21628. (*Mr. Tomkinson.*) Then the dogs were under your special eye the whole time, were they?—I and Dr. Shore, yes. I stopped all the time; I stayed in the room all the time.

21629. Was the anæsthetic connected with them from another room?—In the same room. A Woulff's bottle stood beside them against the head.

21630. It did not come from another room?—No; there was no need.

21631. Was it under your superintendence as well?—Yes. I had to help anyhow.

21632. (*Dr. Gaskell.*) Just one word, William. Dr. Shore and myself had done a number of other experiments previous to those two?—Yes.

21633. Of exactly the same character?—Yes.

21634. And you had assisted in those?—In every one, I think.

21635. They were precisely the same character in every case?—Exactly the same.

Mr. H. K. Anderson, M.D., F.R.S., called in; and Examined.

21636. (*Chairman.*) You were present, I believe, at the cross-circulation operation which took place on the 11th July, 1894, in the Cambridge Laboratory?—Yes.

21637. Are you yourself experienced as a physiologist and experimenter?—I have had seventeen years' experience, because I was a medical man to begin with. In 1894 I had had three years' experience as an experimenter. I became a Demonstrator of Physiology in 1891, and since that time have been experimenting with Professor Langley.

21638. Did you go to the laboratory at Dr. Gaskell's request?—Yes.

21639. To watch the operation?—Distinctly; that was why I was there. *Mr. H. K. Anderson.* M.D., F.R.S.

21640. As to its success?—And to answer for what exactly happened.

21641. You mean with a view to seeing what was ascertained by the experiment?—Yes.

21642. I am not going at all into the success or want of success or anything of that kind—it is merely on a very small point that I want to ask you, and I should not have asked it you if Colonel Lawrie had not said that what took place on the 7th and 11th was precisely the same, and that he observed the

Mr. H. K. Anderson, M.D., F.R.S.

25 Mar. 1908.

same things. You saw the experiment on the 11th?—Yes.

21643. And you did not see that on the 7th?—No.

21644. Were you there when the dogs were prepared?—No.

21645. You were only there on the 11th after the trachea had been cut and the chest laid open for the experiment?—Yes, I went in and out of the room; my recollection is that I went in and out while Dr. Shore was whipping the blood, but I was not in the room continuously till the real experiment began.

21646. But do you remember enough of what you saw to say whether the dogs were under chloroform or not?—Clearly.

21647. Or under an anæsthetic, I should say, because the A.C.E. was used as well as chloroform?—Yes.

21648. But during the period when Dr. Shore was operating, were the animals under anæsthetics?—Certainly, I should say they were anæsthetised.

21649. Have you any doubt about it?—None.

21650. Then you watched the experiment afterwards?—Yes, closely.

21651. How long would that watching period of the experiment take?—My recollection is that I had luncheon with Dr. Gaskell and Colonel Lawrie's two assistants, and that the experiment lasted, I should say, three hours—from two to three hours.

21652. After luncheon?—Yes.

21653. Watching the process?—Yes.

21654. Watching the action of the blood vessels?—Watching the effect on the heart and the respiration.

21655. During that time were the animals under anæsthetics or not?—Yes, they were under morphia.

21656. Were they conscious of pain?—I should say distinctly not.

21657. If there had been any struggling, would it have interfered with the observation?—As an experimenter myself I cannot imagine the experiment being performed in that case. I should expect that either the small glass tubes would break or the blood-vessels, especially the veins, would give way. I had never seen a cross-circulation before, and I was quite surprised at the delicacy of the operation.

21658. Stillness on the part of the dogs was essential to its success?—Yes.

21659. Is it an operation that you would think of performing unless the absence from pain was secured first?—No.

21660. (*Colonel Lockwood.*) You say that you did not closely observe the dogs when you went into the room. What reason have you, then, for stating that you believe the dogs to have been thoroughly anæsthetised?—I did not mean that. I meant that I was working in the laboratory and went in and out of the room to begin with but when I came in to watch the actual experiment, I observed the dogs most closely.

21661. Anyhow, you noticed that the dogs took sufficient of the anæsthetic to be absolutely certain that they were totally unconscious of pain?—I am quite convinced of that.

21662. (*Sir Mackenzie Chalmers.*) I do not think we have your scientific qualifications. You are a Fellow of the Royal Society?—Yes, and Doctor of Medicine and Fellow of Gonville and Caius College.

21663. And what is your appointment?—I am now Lecturer in Physiology. I was then Demonstrator.

21664. We may take it, then, that you are continually seeing experiments on animals and are familiar with all the procedure?—I have performed a very great number of experiments with Dr. Langley and by myself since I went to Cambridge in 1891. I was then performing experiments almost daily.

21665. This was in 1894?—Yes.

21666. At that time you were an experienced physiologist?—Yes.

21667. You were able to form an opinion, and a skilled opinion, as to whether the animals were suffering or not?—I think so, quite.

21668. Do you know anything whatever about the experiment on the 7th of July; were you in the laboratory then?—No, I had nothing to do with that experiment; I heard of it.

21669. Were you in the laboratory—in and out?—I was usually there daily. It is most probable that I was there.

21670. Do you think that if the animals under experiment then had been in great pain you would have noticed it and perceived it?—Well, I was not in the room.

21671. You were not in the room in which the experiment on the 7th was performed?—No, not on the 7th; I do not think I was in the room on the 7th at any time.

21672. Can you give us any opinion on this point? Colonel Lawrie said that he observed shivering in these animals; would that be a sign of pain or not?—No, I think not. When an animal is under anæsthetics, unless great care is taken to keep it warm, the animal may shiver. Mere cold may excite slight twitching of the skin in a dog.

21673. But any skilled person observing that animal and operating upon that animal, would know whether or not the animal was suffering from pain?—Certainly.

21674. When an animal has been originally under an anæsthetic, and is tied down, when the anæsthetic passes off is there any difficulty in knowing when consciousness of pain begins?—I do not think I have ever seen consciousness of pain in an animal during an experiment under the licence alone. I have experimented also on animals as I would on human beings. In such cases the animals as they come round from the anæsthesia, like human beings, exhibit uneasiness; but I do not think I have ever witnessed anything that I could call consciousness of pain, except the discomfort of a surgical wound after an operation.

21675. I take it that as soon as you observe any uneasiness the anæsthetic is again applied?—Yes, as soon as the animal began to move—and any movement at once calls attention to the anæsthesia—I should try the corneal reflex. In most experiments if the animal moved it would destroy the success of the experiment. and I should notice that the anæsthesia was passing off by the change in the respiration even before the animal moved.

21676. You have seen several cross-circulation experiments?—No.

21677. Only one?—Only one.

21678. Can you tell us what is the object of performing tracheotomy on the animal in connection with these cross-circulation experiments?—The greater ease of giving the anæsthetic. By means of the slit in the tracheal tube the amount of anæsthetic necessary to keep the animal evenly under anæsthetics can be adjusted to a nicety. That is my object in inserting a tracheal tube.

21679. That is the reason why tracheotomy would be performed in addition to the necessary incisions for the cross-circulation?—Yes.

21680. (*Mr. Ram.*) Do you think it is possible that the dogs could have been prepared for this operation, and have tracheotomy tubes inserted, without having an anæsthetic when they were so inserted?—It would be quite impossible except by using sheer force.

21681. You told us that the operation is an exceedingly delicate one?—Most delicate.

21682. In your opinion, would it be, in the first place, reasonably feasible to insert these tubes at all unless the animal were insensible under an anæsthetic?—I should say it would be impossible.

21683. You said, in answer to Lord Selby, that you would not think of doing such an operation as this without the animal being thoroughly under anæsthetics?—Yes.

21684. That is the reason why you would not do it; do you mean either on humanitarian grounds or on the ground of getting a successful operation, or both?—For both reasons.

21685. But, quite apart from humanitarian desire, would it be possible, in your opinion, to hope for a successful operation unless the animal were properly anæsthetised during the whole time?—It would be impossible unless it was curarised.

21686. (*Colonel Lockwood.*) Made immovable?—Yes. Made immovable.

21687. (*Dr. Gaskell.*) Would this operation be pos-

sible under curare?—No, because the whole point of the experiment depended on watching the respiration.

21688. (*Mr. Ram.*) Apart from that, this particular operation, I understand, could not have been done under curare?—No.

21689. It would have neutralised the effect that you desired to secure?—Yes.

21690. (*Mr. Tomkinson.*) Could these dogs, if they had been in great pain, have evinced it to you?—Yes.

21691. If they had been suffering the agonies which they have been represented to have been suffering, what signs could they have shown to you?—In the first place, it is quite a misrepresentation to say that the dogs were tied tightly to the stand. The stand used in the laboratory allows quite free movement of the dog. Any dog would begin to move its body and wriggle its head if it was in pain.

21692. And there were no such signs?—None whatever.

21693. Would the tracheotomy prevent the emission of a cry on the part of the dog?—Certainly.

21694. Then the dog could not cry?—No.

21695. Does tracheotomy stop the voice?—It must.

21696. Then you could not depend upon a sound from a dog upon which tracheotomy had been performed as an indication of pain?—No, of course not.

21697. But other signs they could have given in the way of movement or restlessness if they had been suffering?—Yes. *Mr. H. K. Anderson, M.B., I.M.S.* 25 Mar. 1908.

21698. And you did not see any?—No.

21699. You are quite satisfied of that?—Yes, quite satisfied.

21700. (*Dr. Wilson.*) As regards the shivering to which reference has been made, I think you said that there might be some possibility of that having been witnessed?—Yes.

21701. From cold?—Yes, and also if the muscles are bared in the neck there may be twitching of the muscles. The mere exposure of the muscles may excite twitching.

21702. But shivering from cold would not be because the dog felt the cold; it would be reflex action?—Yes, and be due to the depressing effect of the morphia and the anæsthetic on the dog's temperature.

21703. Not because any cold was felt, of course?—No.

21704. May I ask whether at all times in the Cambridge Laboratory every possible care is taken to carry out the intentions of the Act—that is to say, that all experiments shall be carried out painlessly?—Every attention.

Mr. W. H. Gaskell, M.D., F.R.S., a member of the Commission, Examined.

21705. (*Chairman.*) You were not examined on this particular point, I think. Your name was not mentioned by Colonel Lawrie when he gave his evidence, although you were rather pointed to as the physiologist who had performed certain experiments?—No, in the original evidence certainly my name was not mentioned, and I was wondering in my own mind when he said it whom he meant when he spoke of one-twelfth of a grain of morphia. I did not conceive for a single moment that he could mean me.

21706. Colonel Lawrie came down by appointment to Cambridge, I believe?—Yes, he came down at his own suggestion, not by any suggestion of mine, but because he desired to show us that his experimentations in cross-circulation were right and that ours were wrong. We said, We will show both if you like; so he brought two Indians over with him for that purpose.

21707. He suggested that he came as your guest. He was not coming merely as your guest, but as a business matter in physiology?—He was coming there on a business matter for that purpose. The reason why he did not show us anything was because I had written over to India to explain to him that he must get a licence first before he could make those experiments in Cambridge, and he did not get that licence.

21708. He came over on the 7th of July. You have heard the evidence of Dr. Shore as to what I will call the preparation of the dogs for the final experiment that you were to make—the experiment of observation?—Yes.

21709. What did you see of that part of the business?—I have endeavoured to carry back my memory to remember when I came into the laboratory, but I cannot tell you. All I know is that I did come before luncheon in order to receive Colonel Lawrie. You must understand that we had made many of these experiments before; the research was finished, the whole thing was done, and there were simply two extra ones to please Colonel Lawrie.

21710. You had made this very experiment frequently before at the request of Colonel Lawrie?—At the request of the Nizam's Government; and we had sent our report over, and it was all finished and done with. That was two years before or more.

21711. Then I want to know this. This was not the first time that you had had this experiment in your laboratory by any means?—No, not by any means; but what I want to point out in respect of that is that I was not in hardly any case or very seldom present right through, because I was not doing the experiment myself. It was Dr. Shore, with the assistance of the laboratory boy, who was doing it, and could do it much better than if I tried to put my oar in. *Mr. W. H. Gaskell, M.D. F.R.S.*

21712. In all these experiments that you have had, have you gone in and seen what was going on from time to time?—Yes. The experiments were of my devising.

21713. What was the regular course as regards morphia and anæsthetics?—The course was exactly what Dr. Shore and William Hall have described to you.

21714. And that had been followed in all previous experiments?—Yes.

21715. Was there any reason on earth why it should not have been followed in this one experiment?—Absolutely none. There is every reason against it.

21716. I suppose you find it difficult to recall your exact observation on that particular morning?—I have not the very faintest conception what I talked to Colonel Lawrie about. I only know what happened, but as to what the conversation was when he first came and I received him, and Dr. Shore was in the operating theatre, I have not the slightest notion.

21717. Can you tell me this? Can you say whether you told him that you had given a 10 drop dose of morphin solution not to prevent pain, but in order to hoodwink the Inspector and satisfy the Act?—I can only say with respect to the first statement that he probably did ask me what dose was given, and I told him the dose, for the simple reason that the actual dose that was given is on the record or the protocol written in my own handwriting, and that was written on that very day. I looked it up the other day in Dr. Shore's rooms; it was covered with dust, old and shabby, but there it was, the exact amount given. That was done, I know, on that very day. It was 10 cubic centimetres of a 2 per cent. solution, that is what I wrote, and that is what I told Colonel Lawrie If Colonel Lawrie manufactures it into 10 drops of morphin, that has nothing to do with me.

21718. If it was only that memories might be mistaken about whether you said 10 drops or 10 grains, that would be a very different matter; but he goes on to say what is more important. Did you say to him that the morphia had been given not to prevent pain, but in order to hoodwink the Inspector?—I have told you I have not the faintest remembrance of what I did say, but I am absolutely certain that I never said that. I should never have dreamed of saying it; and it is such a silly thing to say.

21719. How often does the Inspector come and visit your laboratory?—There are no regular times; he turns up at odd times.

Mr. W. H. Gaskell, M.D., F.R.S.

25 Mar. 1908.

21720. I do not quite see what the suggestion is how it could have hoodwinked him?—Not in the least; it could not have been done.

21721. You did not say it?—I am certain. I never could have said it.

21722. Do you remember watching the experiment after luncheon?—I remember perfectly well watching the experiment, and I remember also perfectly well watching the second experiment, and asking Sir Thomas Clifford Allbutt and Dr. Anderson to come in because I was dissatisfied. I wanted the evidence of witnesses, I mean to say, after the first experiment.

21723. I will ask you this: Did Colonel Lawrie say anything to you about the dogs being not sufficiently anæsthetised or in pain or anything of the kind?—I am absolutely certain that he never mentioned that, for that is a sort of remark that I should have remembered. When I came in—I cannot say whether it was just before Colonel Lawrie came in or not—the dogs all the time I saw them were absolutely quiescent. There was not a movement or a sign of movement, and in addition to that the record shows that the blood-pressure tracing was perfectly steady, and the respiration was perfectly steady, too. So that those two things which would have shown any indication of pain in the dog as well as movement were absolutely absent. I am as convinced as I am of anything in my life that those two dogs were fast asleep.

21724. If dogs when undergoing an experiment of that sort were without anæsthetics and in a condition of frightful agony—which is the phrase Colonel Lawrie used—would the operation have been possible?—As a member of this Commission, and also as a person of a certain amount of common sense, I say it stands to reason that it is utterly impossible. You have got here two dogs fastened together simply by stitches in the skin. Upon that flap of skin you have those delicate tubes connecting their two jugulars and delicate tubes connecting their arteries. If those dogs were not anæsthetised—as Colonel Lawrie tries to make out from what I said to him—those dogs were not under anæsthetics at all. There was, according to him, only 1-12th of a grain of morphia given, and that was nothing, and there were no anæsthetics of any kind.

21725. And his statement is that you said so?—I say that is the evidence he has put in. I absolutely defy any person whatever of any kind to make that experiment under those conditions. It is absolutely and utterly impossible. The very smallest amount of struggling must break through that connection and must damage the experiment. There is one essential condition of success—that is, absolute quiescence of these animals, and that is why I say that the charge brought against me—at least, the reminiscence of what I said to Colonel Lawrie—is silly.

21726. If there had been any struggling you could hardly have forgotten it—it would have affected the success of the experiment immediately, and the thing would have failed?—The thing is in my memory perfectly well, seeing the animals absolutely quiescent. There was not a movement, and as I ventured to suggest, Sir Thomas Clifford Allbutt would tell you the same. He was a person, mind you, not accustomed to laboratory experiments, and who would, therefore, naturally notice anything of the kind rapidly.

21727. Thank you. I only wished to put to you the exact statement Colonel Lawrie put into your mouth?—Quite so.

21728. (*Sir William Church.*) Have you got any tracing or record of the circulation or respiration of these dogs that you could put in?—I have got it absolutely.

21729. (*Sir Mackenzie Chalmers.*) On the 7th as well as the 11th?—Yes, both of them, perfect from beginning to end.

21730. (*Sir William Church.*) Would you wish to put in a tracing recording the pulse and circulation of these dogs?—I should like it very much.

21731. (*Sir Mackenzie Chalmers.*) It is quite possible that you had some conversation with Colonel Lawrie about the administration of morphia?—I think it is very likely.

21732. But, as a fact, in these experiments, you did not rely on morphia alone, but A.C.E. was given in addition?—Absolutely.

21733. (*Chairman.*) And chloroform to start with?—Chloroform to start with.

21734. (*Sir Mackenzie Chalmers.*) Chloroform followed by A.C.E.?—Yes.

21735. In your opinion, would the morphia alone given in this case have been sufficient to produce complete anæsthesia?—I have no experience of morphin, you must understand, but from all I have ever read or heard I should have said that 3 grains of morphin would have produced complete unconsciousness to pain after an interval of time. That is what I should have said, without the slightest doubt.

21736. You are certain that these dogs throughout the whole time you saw them were absolutely free from pain?—The whole time I saw them they were lying absolutely quiet. There was no movement, and they were breathing regularly and quietly. That was, to my mind, conclusive evidence that they were not suffering pain.

21737. I want to get this clear. You saw them during the whole time that Colonel Lawrie saw them?—I saw them during the whole time that Colonel Lawrie saw them.

21738. Is it absolutely incorrect to say that in the laboratory either on this experiment or any other morphia has been given by itself to hoodwink the Inspector or for any similar purpose?—It is absolutely ridiculous.

21739. If Colonel Lawrie understood you to say that it is an absolute misapprehension?—An absolute misapprehension.

21740. If he had asked you how these animals were anæsthetised you must have told him it was not only morphia, but A.C.E. mixture as well?—Most certainly.

21741. The A.C.E. mixture, I suppose, always gives a smell, does it not; it must have been perfectly obvious coming into the room where these dogs were that A.C.E. had been used?—I think that would be a little difficult to say, because a physiological laboratory rather smells of different smells, you see, among which you distantly have A.C.E. and chloroform, and that kind of thing. I mean that I do not think my nose would detect that it was freshly used.

21742. (*Mr. Ram.*) There are one or two statements that I want to put to you, if I may, other than those which Lord Selby put to you. The first is this. Colonel Lawrie said: "The two dogs were lying ready for the commencement of the experiment with unconnected tracheotomy tubes in their throats. Dr. Gaskell said they had not had any anæsthetic because it might interfere with or spoil the subsequent experiment with chloroform." We have been told to-day by the laboratory assistant that he gave them morphia, but, after leaving them for half an hour, he then gave them chloroform, and that before the throats were opened at all. Is it a fact that any anæsthetic might interfere or spoil the subsequent experiment with chloroform?—Only, as Dr. Shore and Colonel Lawrie himself have pointed out, at the stage when you desire to test the action of chloroform. At the preliminary stage, of course not.

21743. Following that up is a second statement that he made that "the two dogs had been lying with unconnected tracheotomy tubes in their throats, which in itself is presumptive evidence that they had not up to that time had chloroform or A.C.E. mixture." What is your comment upon that?—That sentence conveys no meaning to me whatever—absolutely none. I do not know what he means by unconnected tracheotomy tubes; what he expected them to be connected with. I asked someone to ask him that question to see whether he knew how chloroform was given in the laboratory, and he clearly did not know how it was given. He had no conception that all that was required was to dip the end of the tube into the Woulff's bottle containing the A.C.E. mixture. The tube itself, the metal tube, with that little piece of india-rubber at the end of it, you put in and out of the bottle as you like. He had no conception apparently of that. He talks about the absence of any evidence of chloroform being taken when the bottle was on the table all the while.

21744. (*Chairman.*) That bottle did not contain chloroform?—A.C.E. There were two bottles, one with chloroform and one with A.C.E.

21745. (*Mr. Ram.*) May I take it, therefore, that what Colonel Lawrie says he saw here is not presump-

tive evidence or any other evidence that the animals had not had at that time chloroform or A.C.E. mixture?—Absolutely.

21746. Did you, in fact, say that the dogs had not had any anæsthetic?—As I have already said before, I have not the faintest notion what I said or did not say, but I am absolutely certain that I could not have said that.

21747. The fact is that they had to your knowledge had it?—Yes.

21748. I have only one other matter to trouble you with. Colonel Lawrie says, and he has elaborated it to-day: "A certain amount of cruelty is inseparable from any cross-circulation experiment"—and he stated that in his own experiments he allowed the animal at a certain moment to recover from the chloroform, and that it suffered?—That it struggled.

21749. And in his opinion suffered?—Yes.

21750. In your opinion is that a necessary accompaniment of any cross-circulation experiment?—No, if he had given a sufficient dose of morphia, as we did, that would not have been the case. It would not have interfered with the experiment.

21751. At the moment the chloroform was removed the morphia would have prevented the animal suffering any pain?—Absolutely. I am sure the animal was fast asleep. His animals distinctly show pain by struggling. In our case not even he was able to say that there was any movement.

21752. *(Dr. Wilson.)* During the crucial experiment, of course, only one dog was under the influence of chloroform?—It was not a question of the influence of chloroform. It was a question of proving the action of chloroform; that was all. The chloroform was not given as an anæsthetic then; it was given to test the action of chloroform.

21753. And, of course, complete narcosis was induced in both animals during the crucial operation by the amount of morphia that had been given?—And, as Dr. Shore has explained to you also, by the previous administration of A.C.E. and chloroform.

21754. And these two experiments on the 7th and 11th were really only repeat experiments of a considerable number that had been performed previously?—I will not say a considerable number, because it is a long, laborious, and difficult operation, and it was not necessary to make many.

21755. The same course was pursued?—Yes; the number is published. I do not remember now how many.

21756. And the same amount of morphia given?—The same procedure absolutely.

21757. *(Sir Mackenzie Chalmers.)* Did I rightly understand you to say that the very object of the tracheotomy was to enable a respirable anæsthetic to be administered and regulated?—Yes.

21758. *(Mr. Ram.)* Accurately?—Accurately.

21759. *(Chairman.)* I will just ask you this. Sir Thomas Clifford Allbutt was present on the 11th, but not on the 7th?—Yes.

21760. He is ill, and not able to be here?—Yes.

21761. He has sent a letter and a certificate?—Yes.

(Chairman.) I think we had better not have the letter read in the absence of the writer.

APPENDIX I.

HOME OFFICE FORMS

IN USE UNDER THE

VIVISECTION ACT, 1876.

(Put in by Home Office.)

Form 1.

APPLICATION FOR LICENCE.

39 & 40 Vict., c. 77.

Address

Date

To the Right Honourable the Secretary of State for the Home Department.

SIR,

I* beg to apply under the above-mentioned Act for a Licence for the performance of experiments on animals.

The object which I have in view in applying for a Licence is†

The experiments which I propose to perform are‡

The place in which it is proposed that the experiments are to be performed is§

* Here insert name and profession (see Sec. 11 of Act) of Applicant.

† Here state for what purpose the Applicant desires to obtain a licence to perform experiments on living animals.

‡ Here indicate the general nature of the experiments which it is intended to perform; also state, if that is the case, the intention of Applicant to send in a certificate or certificates (describing each certificate by its appropriate letter) with reference to the same experiments, or any other circumstances that may be material. See also Note at the end of the application.

§ Here insert registered place. If the place is not registered it will be necessary for the person having authority over the building to apply to the Secretary of State for its registration.

Form 1 (*cont.*).

This application is supported by the recommendations appearing below.

I am,

SIR,

Your obedient Servant.

* _____

* Here Applicant to sign his name.

We recommend that the above application be granted.

1. _____

† Here the person recommending is to sign his name.

‡ _____

‡ Here specify statutory qualification (see Sec. 11).

2. † _____

‡ _____

N.B.—If the Licence is held alone without Certificate, the animal must be kept in anæsthesia throughout the whole of the experiment, and if the pain is likely to continue after the effect of the anæsthetic has ceased, or if any serious injury has been inflicted on the animal, it must be killed before the anæsthesia has passed off.

Certificate A dispenses altogether from the obligation to use an anæsthetic. It will be necessary in cases of simple inoculation calculated to give pain but not involving any surgical operation.

„ B dispenses from the obligation to kill the animal before the anæsthesia has passed off; it is necessary therefore whenever the initial operation is to be done under anæsthetics but the animal is to be allowed to survive.

„ C is necessary for Experiments illustrating Lectures.

„ E is never held alone, but is necessary whenever any experiment is to be performed on a Dog or Cat under Certificate A.

„ E E is never held alone, but it is necessary whenever any experiment is to be performed on a Dog or Cat under Certificate B.

„ F is necessary whenever any experiment is to be performed on a Horse, Ass, or Mule.

P T.O

Form 1 (*cont.*)

39 & 40 Vict., c. 77, Sec. 11.

11. Any application for a licence under this Act and a certificate given as in this Act mentioned must be signed by one or more of the following persons; that is to say,

The President of the Royal Society;

The President of the Royal Society of Edinburgh;

The President of the Royal Irish Academy;

The Presidents of the Royal Colleges of Surgeons in London, Edinburgh, or Dublin;

The Presidents of the Royal Colleges of Physicians in London, Edinburgh, or Dublin;

The President of the General Medical Council;

The President of the Faculty of Physicians and Surgeons of Glasgow;

The President of the Royal College of Veterinary Surgeons, or the President of the Royal Veterinary College, London, but in the case only of an experiment to be performed under anæsthetics with a view to the advancement by new discovery of veterinary science;

and also (unless the applicant be a professor of physiology, medicine, anatomy, medical jurisprudence, materia medica, or surgery in a university in Great Britain or Ireland, or in University College, London, or in a college in Great Britain or Ireland, incorporated by royal charter) by a professor of physiology, medicine, anatomy, medical jurisprudence, materia medica, or surgery in a university in Great Britain or Ireland, or in University College, London, or in a college in Great Britain or Ireland, incorporated by royal charter.

Provided that where any person applying for a certificate under this Act is himself one of the persons authorised to sign such certificate, the signature of some other of such persons shall be substituted for the signature of the applicant.

A certificate under this section may be given for such time or for such series of experiments as the person or persons signing the certificate may think expedient.

A copy of any certificate under this section shall be forwarded by the applicant to the Secretary of State, but shall not be available until one week after a copy has been so forwarded.

The Secretary of State may at any time disallow or suspend any certificate given under this section.

Form 2

CERTIFICATE A.

Official Copy.

39 & 40 Vict., c. 77.

WHEREAS*

* Here insert name, address, and profession of person to whom Certificate is to be given. (Sec. 11 of Act.)

has represented to us†

† Here insert name, address, and statutory qualification of each person certifying. (Sec. 11 of Act.)

that he proposes, if duly authorised under the above-mentioned Act, to perform on living animals certain experiments described below: We hereby certify that, in our opinion, insensibility in the animal on which any such experiment may be performed cannot be produced by anæsthetics without necessarily frustrating the object of such experiment.

‡ This Certificate is given for_____experiments.

‡ This Certificate shall be in force until the_____day of_____19____

‡ A certificate may be given for such time, **OR** for such series of experiments as the person signing may think expedient; and it is desirable that such limitation should be here inserted. If a Certificate is unlimited, or limited *by time* only, the Secretary of State usually imposes a limit on the number of experiments to be performed.

Experiments are not to be performed under this Certificate until the Licensee has been informed that it has not been disallowed by the Secretary of State. The Certificate, even if given for a longer period, ceases to have effect on the expiration of the Licence.

§ Description of proposed experiments

§ *At the end of the Description the animals are to be named, and it is necessary to submit, in addition, if dogs or cats are used, Certificate E, or if horses, asses or mules are used, Certificate F.*

‖ Object of these experiments:—

Here state in what manner the experiments will be of service in advancing by new discovery physiological knowledge, or knowledge which will be useful for saving or prolonging life or alleviating suffering.

N.B.—This Certificate is subject to any conditions that may be assigned in the Licence, and it will be the duty of the holder to refer to his Licence and ascertain whether any of the conditions attached to the Licence limit the number of Experiments authorised by this Certificate or in any other way place restrictions on what may be done under this Certificate.

Form 2 (cont.).

39 & 40 Vict., c. 77, Sec. 11.

11. Any application for a licence under this Act and a certificate given as in this Act mentioned must be signed by one or more of the following persons; that is to say,

The President of the Royal Society;

The President of the Royal Society of Edinburgh;

The President of the Royal Irish Academy;

The Presidents of the Royal Colleges of Surgeons in London, Edinburgh, or Dublin;

The Presidents of the Royal Colleges of Physicians in London, Edinburgh, or Dublin;

The President of the General Medical Council;

The President of the Faculty of Physicians and Surgeons of Glasgow;

The President of the Royal College of Veterinary Surgeons, or the President of the Royal Veterinary College, London, but in the case only of an experiment to be performed under anæsthetics with a view to the advancement by new discovery of veterinary science;

and also (unless the applicant be a professor of physiology, medicine, anatomy, medical jurisprudence, materia medica, or surgery in a university in Great Britain or Ireland, or in University College, London, or in a college in Great Britain or Ireland, incorporated by royal charter) by a professor of physiology, medicine, anatomy, medical jurisprudence, materia medica, or surgery in a university in Great Britain or Ireland, or in University College, London, or in a college in Great Britain or Ireland, incorporated by royal charter.

Provided that where any person applying for a certificate under this Act is himself one of the persons authorised to sign such certificate, the signature of some other of such persons shall be substituted for the signature of the applicant.

A certificate under this section may be given for such time or for such series of experiments as the person or persons signing the certificate may think expedient.

A copy of any certificate under this section shall be forwarded by the applicant to the Secretary of State, but shall not be available until one week after a copy has been so forwarded.

The Secretary of State may at any time disallow or suspend any certificate given under this section.

Form 3.

CERTIFICATE B.

Official Copy.

The President of the Royal Irish Academy;

The Presidents of the Royal Colleges of Surgeons in London, Edinburgh, or Dublin;

The Presidents of the Royal Colleges of Physicians in London, Edinburgh, or Dublin;

The President of the General Medical Council;

The President of the Faculty of Physicians and Surgeons of Glasgow;

The President of the Royal College of Veterinary Surgeons, or the President of the Royal Veterinary College, London, but in the case only of an experiment to be performed under anæsthetics with a view to the advancement by new discovery of veterinary science;

and also (unless the applicant be a professor of physiology, medicine, anatomy, medical jurisprudence, materia medica, or surgery in a university in Great Britain or Ireland, or in University College, London, or in a college in Great Britain or Ireland, incorporated by royal charter) by a professor of physiology, medicine, anatomy, medical jurisprudence, materia medica, or surgery in a university in Great Britain or Ireland, or in University College, London, or in a college in Great Britain or Ireland, incorporated by royal charter.

Provided that where any person applying for a certificate under this Act is himself one of the persons authorised to sign such certificate, the signature of some other of such persons shall be substituted for the signature of the applicant.

A certificate under this section may be given for such time or for such series of experiments as the person or persons signing the certificate may think expedient.

A copy of any certificate under this section shall be forwarded by the applicant to the Secretary of State, but shall not be available until one week after a copy has been so forwarded.

The Secretary of State may at any time disallow or suspend any certificate given under this section.

41.

Home Office,

Whitehall,

15th December, 1905.

It is requested that you will state on the annexed form, 1st, the Number of Experiments on living Animals performed by you in the year 1905, under your Licence, or any Special Certificate you may have held during the year; 2nd, the general purpose of the Experiments; and 3rd, the number of those Experiments in which there was reason to believe that any appreciable pain was inflicted, specifying the kind of animal that suffered, and stating in general terms the nature of the Experiment that occasioned pain. I shall be obliged if you will also inform me whether any of the experiments were performed on behalf of any Public or Official Body.

You are also requested to furnish a complete list (on the enclosed form) of any writings, based upon experimental work, which you may have published during the year 1905, giving the full title of each paper with an exact reference to any periodical in which it may have appeared, and the name of any Society to which it may have been communicated.

You are reminded that the furnishing of copies of such papers is made a condition of your Licence, and are requested, if you have not already done so, to forward copies to the Secretary of State without delay.

G. D. Thane,

Inspector

Form 11.

(*Pro Formâ* Copy of a Licence endorsed with all "Conditions" which are in general use).

39 & 40 Vict., c. 77.

No. of Licence *100.* .. 100,000.

LICENCE.

In pursuance of the powers vested in me by the above-mentioned Act, I, the Right Hon. *Herbert John Gladstone*, one of His Majesty's Principal Secretaries of State, hereby grant to *John Smith, Esq.*, of *1, Blank Street, London, W.*, this Licence to perform experiments subject to the restrictions and provisions contained in the said Act.

This Licence will not authorize the holder to perform any of the experiments for the performance of which a Certificate is required by the Act, unless he also holds the necessary Certificate or Certificates

This Licence, unless earlier revoked, shall be in force up to the *28th day of February, 1907*, or for such longer period as may from time to time be hereafter authorized by a Secretary of State in writing, and is given subject to the conditions annexed hereto.

Home Office, Whitehall,

25th day of *June, 1906.*

CONDITIONS.

1. Attached to all licences.

1. This Licence authorises the holder to perform experiments at the following place only, viz.:—[*The Medical and Scientific Departments, University College, London.*]

2. Attached to licences granted to Students of Medicine.

2. That all experiments carried out under this Licence shall be performed under the supervision [*Professor A. B., F.R.S., of University College, London.*]]

3. Attached to all licences.

3. The holder must keep a written record of his experiments. Such record shall be open to examination at any time by the Inspector, and a report of all experiments performed shall be furnished to the Inspector on the 31st day of December, and at any other time when required.

4. Attached to licences of all holders of Certificates A. or B. where Secretary of State does not limit the number of experiments to be performed.

4. That after the completion of the experiments detailed in Certificates (*A. No. 1., A. No. 2, E. No. 1., A. No. 3, and F. No. 1*) or on the 31st day of December, at latest, in each year in which the said Certificates are in force, and at any time when required by the Inspector, the holder of this Licence is to report to the Inspector, on the prescribed form, the number and nature of the experiments performed.

5. Used in cases where a Certificate A. would permit of experiments more severe than simple inoculations, etc.

5. That no operative procedure more severe than simple inoculation or superficial venesection may be adopted in any of the experiments under Certificates (*A. No. 1, A. No. 2, E. No. 1, A. No. 3, and F. No. 1*).

6. Used in all Certificate A. cases; and in some Certificate B. cases where antiseptics would not be applicable.

6. That if an animal, after and by reason of any of the said experiments under the said Certificates (*A. No. 1, A. No. 2, E. No. 1, A. No. 3, and F. No. 1*), is found to be in pain, which is either considerable in amount or is likely to endure, and if the main result of the experiment has been attained, the animal shall be immediately killed under anæsthetics.

7. Used in all Certificate A. or Certificate B. cases where Secretary of State limits the number of experiments to be performed.

7. That not more than (*20*) of the experiments detailed in Certificate (*B. No. 1*) may be performed and of these, not more than (*10*) may be on cats or dogs under Certificate (*EE. No. 1*), and after the completion of the said (*20*) experiments, or on the 31st day of December, at latest, in each year in which the said Certificates are in force, and at any time when required by the Inspector, the holder of this Licence is to report to the Inspector, on the prescribed form, the number and nature of the experiments.

8. Used in Certificate B. cases where two operations may be performed in the course of the experiment.

8. That all operative procedures in connection with the Certificates (*B. No. 1 and EE. No. 1*) be carried out under anæsthetics of sufficient power to prevent the animal from feeling pain.

9. Used in Certificate B. cases wherever there is a wound to which antiseptics could be applied.

9. That the animals experimented on under Certificates (*B. No. 1 and EE. No. 1.*) be treated with strict antiseptic precautions, and if these fail and pain results, that the animals be immediately killed under anæsthetics.

10. Used in all Certificate C. cases.

10. On the completion of any experiment under Certificate (*C. No. 1*) the animal shall be killed forthwith by or in the presence of the experimenter.

11 Attached to all licences.

11. That in the event of descriptions of any experiment performed by the said Licensee and requiring a Licence under the said Act appearing in any medical, scientific, or other journal or magazine, or in a report of any lecture delivered by the said Licensee, printed for publication or for private circulation, the said Licensee shall transmit to the Secretary of State the said journal or magazine, or the fullest of such printed publications or reports of lectures, accompanied by a letter drawing attention to the publication.

12. Attached to all licences.

12. Such conditions as the Secretary of State may think fit to prescribe.

Whitehall, 25th June, 1906.

Form 11 (*cont.*).

Extracts from 39 *and* 40 *Vict.*, *c* 77,

2. A person shall not perform on a living animal any experiment calculated to give pain, except subject to the restrictions imposed by this Act. * * * *

2. The following restrictions are imposed by this Act with respect to the performance on any living animal of an experiment calculated to give pain; that is to say,

(1.) The experiment must be performed with a view to the advancement by new discovery of physiological knowledge or of knowledge which will be useful for saving or prolonging life or alleviating suffering; and

(2.) The experiment must be performed by a person holding such licence from one of Her Majesty's Principal Secretaries of State, in this Act referred to as the Secretary of State, as is in this Act mentioned, and in the case of a person holding such conditional licence as is hereinafter mentioned, or of experiments performed for the purpose of instruction in a registered place; and

(3.) The animal must during the whole of the experiment be under the influence of some anæsthetic of sufficient power to prevent the animal feeling pain; and

(4.) The animal must, if the pain is likely to continue after the effect of the anæsthetic has ceased, or if any serious injury has been inflicted on the animal, be killed before it recovers from the influence of the anæsthetic which has been administered; and

(5.) The experiment shall not be performed as an illustration of lectures in medical schools hospitals, colleges, or elsewhere; and

(6.) The experiment shall not be performed for the purpose of attaining manual skill.

Provided as follows; that is to say,

(1.) Experiments may be performed under the foregoing provisions as to the use of anæsthetics by a person giving illustrations of lectures in medical schools, hospitals, or colleges, or elsewhere, on such certificate being given as in this Act mentioned, that the proposed experiments are absolutely necessary for the due instruction of the persons to whom such lectures are given with a view to their acquiring physiological knowledge or knowledge which will be useful to them for saving or prolonging life or alleviating suffering; and

(2.) Experiments may be performed without anæsthetics on such certificate being given as in this Act mentioned that insensibility cannot be produced without necessarily frustrating the object of such experiments; and

(3.) Experiments may be performed without the person who performed such experiments being under an obligation to cause the animal on which any such experiment is performed to be killed before it recovers from the influence of the anæsthetic on such certificate being given as in this Act mentioned, that the so killing the animal would necessarily frustrate the object of the experiment, and provided that the animal be killed as soon as such object has been attained; and

(4.) Experiments may be performed not directly for the advancement by new discovery of physiological knowledge, or of knowledge which will be useful for saving or prolonging life or alleviating suffering, but for the purpose of testing a particular former discovery alleged to have been made for the advancement of such knowledge as last aforesaid, on such certificate being given as is in this Act mentioned that such testing is absolutely necessary for the effectual advancement of such knowledge.

4. The substance known as urari or curare shall not for the purposes of this Act be deemed to be an anæsthetic.

5. Notwithstanding anything in this Act contained, an experiment calculated to give pain shall not be performed without anæsthetics on a dog or cat, except on such certificate being given as in this Act mentioned, stating, in addition to the statements herein-before required to be made in such certificate, that for reasons specified in the certificate the object of the experiment will be necessarily frustrated unless it is performed on an animal similar in constitution and habits to a cat or dog, and no other animal is available for such experiment; and an experiment calculated to give pain shall not be performed on any horse, ass, or mule except on such certificate being given as in this Act mentioned that the object of the experiment will be necessarily frustrated unless it is performed on a horse, ass, or mule, and that no other animal is available for such experiment.

6. Any exhibition to the general public, whether admitted on payment of money or gratuitously, of experiments on living animals calculated to give pain shall be illegal. * * * *

7. The Secretary of State may insert, as a condition of granting any licence, a provision in such licence that the place in which any experiment is to be performed by the licensee is to be registered in such manner as the Secretary of State may from time to time by any general or special order direct; provided that every place for the performance of experiments for the purpose of instruction under this Act shall be approved by the Secretary of State, and shall be registered in such manner as he may from time to time by any general or special order direct.

8. The Secretary of State may license any person whom he may think qualified to hold a licence perform experiments under this Act. A licence granted by him may be for such time as he may think fit, and may be revoked by him on his being satisfied that such licence ought to be revoked. There may be annexed to such licence any conditions which the Secretary of State may think expedient for the purpose of better carrying into effect the objects of this Act, but not inconsistent with the provisions thereof.

9. The Secretary of State may direct any person performing experiments under this Act from time to time to make such reports to him of the result of such experiments, in such form and with such details as he may require

Form 11 (*cont.*).

11. Any application for a licence under this Act and a certificate given as in this Act mentioned must *be signed by* one or more of the following persons ; that is to say,

The President of the Royal Society ;

The President of the Royal Society of Edinburgh ;

The President of Royal Irish Academy ;

The Presidents of the Royal Colleges of Surgeons in London, Edinburgh, or Dublin ;

The Presidents of the Royal Colleges of Physicians in London, Edinburgh, or Dublin ;

The President of the General Medical Council ;

The President of the Faculty of Physicians and Surgeons of Glasgow ;

The President of the Royal College of Veterinary Surgeons, or the President of the Royal Veterinary College, London, but in the case only of an experiment to be performed under anæsthetics with a view to the advancement by new discovery of veterinary science ;

and *also* (unless the applicant be a professor of physiology, medicine, anatomy, medical jurisprudence, materia medica, or surgery in a university in Great Britain or Ireland, or in University College, London, or in a college in Great Britain or Ireland, incorporated by royal charter) by a professor of physiology, medicine, anatomy, medical jurisprudence, materia medica, or surgery in a university in Great Britain or Ireland, or in University College, London, or in a college, in Great Britain or Ireland, incorporated by royal charter.

Provided that where any person applying for a certificate under this Act is himself one of the persons authorised to sign such certificate, the signature of some other of such persons shall be substituted for the signature of the applicant.

A certificate under this section may be given for such time or for such series of experiments as the person or persons signing the certificate may think expedient.

A copy of any certificate under this section shall be forwarded by the applicant to the Secretary of State, but shall not be available until one week after a copy has been so forwarded.

The Secretary of State may at any time disallow or suspend any certificate given under this section.

22. This Act shall not apply to invertebrate animals.

APPENDIX II.

(Put in by Home Office.)

SUMMARY OF REPORTS ON THE LAWS RESTRICTING THE PRACTICE OF VIVISECTION IN BRITISH INDIA, BRITISH COLONIES AND FOREIGN COUNTRIES

NOTE.—These reports were received in 1904 from H.M. Representatives abroad in reply to enquiries initiated by the Home Office.

(i.) BRITISH INDIA.

There is no legislation restricting vivisection in British India. A Bill drafted in 1892 was allowed to drop as unnecessary. In scientific institutions over which the Government has any control the lines of the English Act 39 and 40 Vict., c. 77, are followed.

(ii.) BRITISH COLONIES.

Apart from the general law as to cruelty to animals, there is no legislation dealing with vivisection in Canada, Cape of Good Hope, Natal, New Zealand, Jamaica, or Barbadoes. In the Australian Colonies the only enactments dealing directly with this question are those of Victoria and Queensland.

In Victoria, sections 12 and 13 of the Animals Protection Act, 1890, exempt persons practising vivisection from the penalties of that Act, and provide for the registration of practitioners and for the making of regulations.

In Queensland, section 12 of the Animals Protection Act of 1901 is in similar terms.

(iii.) FOREIGN COUNTRIES.

There are no special enactments or regulations restricting the practice of vivisection in Belgium, Bulgaria, France, Greece, Hesse, Hungary, Portugal, Roumania, Russia, Servia, Spain, Sweden, and Norway, Turkey, or the United States of America.

In two countries there is definite legislation, viz. :—Denmark and Switzerland (cantons of Geneva and Zurich).

In the following countries the practice is regulated by Government instruction issued to universities, schools, and other institutions :—Austria, Baden, Bavaria, Germany, Holland, Italy, and Saxony.

In Bavaria, Belgium, Germany, and Russia, there is, however, general legislation providing penalties for those guilty of cruelty to animals, which might presumably be applicable to those who practise vivisection ; but in France the general law relating to cruelty to animals only applies to such experiments held in public as are attended with excessive cruelty, not to those conducted in private ; in Holland the law as to cruelty to animals does not apply to ill-treatment with a scientific object ; in Sweden the general law would not seem to affect cases of cruelty to animals occurring in a laboratory, while in Norway an Act coming into force this year (1905) as to cruelty to animals specially provides that the Sovereign or anyone to whom the Royal Authority may be delegated shall not be restricted from granting special permission to special persons for conducting experiments on animals which may entail suffering ; in the United States of America, the law as to cruelty to animals specially excepts from the provisions of the Statute scientific experiments conducted under the authority of the faculty of some regularly incorporated college, university, or scientific society.

As to other foreign countries, it is not stated whether or not there is legislation as to cruelty to animals which might be applicable to those who perform experiments on living animals.

APPENDIX III.

MEMORANDUM BY MR. G. D. THANE.

(Inspector under the Act.)

(*a*) Inspection of Unregistered Places.

Mr. S. Coleridge stated (qu. 10262 and 10645) that by giving a licensee permission to vivisect in private places he is thereby placed beyond the possibility of legal inspection, because by Clause 10 of the Act of 1876 the inspector has no right of entry into, or inspection of, any unregistered place.

Experiments performed in unregistered places fall into two groups.

In the first the experiments are performed in order to investigate outbreaks of disease in animals, such as "braxy," "Louping ill," and "struck," in sheep. It is impossible to say where an outbreak will occur; it may affect a wide area, the place may be remote, and it is often necessary to inoculate a considerable number of animals in the open country. It is evident that registration is not practicable in these cases; but the licensee is required, when he reports the experiments to the inspector, to state the name of the place or places in which such experiments have been performed.

In the second group are included cases in which, owing to special circumstances, it is not possible to perform the experiments in a registered laboratory.

In the few instances, within my experience, in which permission has been granted to perform certain experiments in a specified place, not registered for the performance of experiments generally, it has been for a limited period, a condition has been added to the licence that the place shall be open to inspection by the inspector, and they have all been indicated in the annual reports. Thus, in the report for 1903, it is stated :—

> "... two licensees, who were permitted to perform certain experiments dealing with the effects of increased atmospheric pressure, and requiring the employment of apparatus which was not available at a laboratory, at a place which was not registered; this place was open to inspection, and has been frequently visited."

During the year 1907 a similar permission was granted in one case, and the place was visited while the experiments (inoculations) were in progress.

(*b*) Certificate A, and the "Pain" or "Inoculation" Condition.

This condition was introduced in 1887 in the following form :—

> "That if severe pain has been induced in an animal after any of the said experiments has been performed under the said Certificate A, No. , and if the main result of the experiment has been attained, it is a condition of this licence that the animal be immediately killed under anæsthetics."

In 1899 it was slightly modified, thus :—

> "That if an animal, after and by reason of any of the said experiments under the said Certificate , is found to be in pain which is either considerable in amount or is likely to endure, and if the main result of the experiment has been attained, the animal shall be immediately killed under anæsthetics."

Since 1887 the condition, substantially unaltered, has been invariably used with Certificate A, except in cases when it was obvious that pain could not ensue from the procedures contemplated and that it was consequently unnecessary. I am not able to recall a case in which Certificate A has been allowed to come into operation without this condition. The suggestion that the condition has been from time to time abandoned, or materially modified (see Questions 10272–10275) is unfounded.

I may be allowed to call attention to the following extract from the first Annual Report which I made, viz., that for the year 1899 :—

> "No experiments requiring anything of the nature of a surgical operation, or that would cause the infliction of an appreciable amount of pain, are allowed to be performed without an anæsthetic."

A similar statement is contained in every Annual Report which I have presented, and since 1901 it has been in the following form :—

> "In no case has a cutting operation more severe than a superficial venesection been allowed to be performed without anæsthetics."

It is further stated, from 1900 onwards :—

> "In no instance has a certificate dispensing with the use of anæsthetics been allowed for an experiment involving a serious operation."

It will therefore be seen that, during the time as to which I can speak from personal knowledge, Certificate A, which dispenses with the use of anæsthetics, has not been allowed for any operative procedure more severe than the opening of a subcutaneous vein, for which no one would think of using an anæsthetic in man; that is, in other words, that vivisection of an animal, in the proper sense of the term, without anæsthetics, has not in any case been allowed by the Secretary of State.

In reply to Question 12918 reference is made by a witness to Certificate A2. The numeral here means that this is the second Certificate A which has been submitted by the holder. There is only one form of Certificate A, or of any other certificate; although of course when the wording of a certificate has been altered there have been for a time both the old and the new forms in operation until the former expired or was disallowed.

(*c*) Certificate B.

In reply to question 10560, Mr. Coleridge stated—"that that certificate admits of a very large amount of extreme pain and awful suffering, because under that certificate the animal may be kept disembowelled alive without anæsthetics as long as actual cutting operations are not being performed upon it."

The change in the wording of Certificate B from "during the whole of the experiments" to "during the whole of the initial operation of such experiments" was made in 1892 because the experiment continues during the whole of the time following the operation while the effects of the operation are being developed, and only terminates when the animal is finally killed.

The "initial operation" covers all proceedings until the wound is closed and dressed. It has never been regarded otherwise, either in the Home Office or by licensees, and in no case within my experience have procedures calculated to cause pain been carried out on an animal during or after the operation without the animal being anæsthetised. I never heard the suggestion that such a thing was permissible until it was made by Mr. Coleridge. In my report for 1906 I state that "no observations or stimulations of a character to cause pain are allowed to be made without the animals being anæsthetised."

No certificate B, which would permit of painful procedures without anæsthetics, has in my experience been allowed to come into operation by the Secretary of State

G. D. Thane.

March 7th, 1908.

I N D E X.

ABERDEEN:

Experiments on animals meet with small opposition in, *D. J. Hamilton*, 20210-11.
Municipal laboratory at, *G. D. Thane*, 339.

University of:

Demonstration experiments at, *A. R. Cushny*, 5159.
Evidence on behalf of, *see* HAMILTON, D. J., 19984-20378.

ABERNETHY, DR, reference *Rev. J. P. Hopps*, 8329.

ABRATH, DR., prosecution of, for abuse of Vivisection Act, Section VI., and conviction *A. G. Scott*, 19568-75, 19681-5.

ACTINOMYCOSIS, *see under* PARASITIC DISEASES.

ACTS OF PARLIAMENT, *see under* PARLIAMENT.

ADDISON, clinical observations of, as to functions of suprarenal glands, *Miss A. Kenealy*, 6637, 6642.

ADVISORY COMMITTEE ON PLAGUE IN INDIA, work of, and Commission emanating from, *C. J. Martin*, 12286-91.

AFRICAN COAST FEVER:

Failure of Koch's experiments and present accurate knowledge of cause of, *S. Stockman*, 3403-8.
Koch's preventive inoculation for, not successful in Rhodesia *S. Stockman*, 3331-50.
Transmitted by agency of blood-sucking ticks *S. Stockman*, 3410-14.

AGRAMONTE, DR., member of United States Commission to investigate cause of yellow fever in Havannah, *W. Osler*, 16531.

ALCOCK, DR., assisted in experiment described in *Shambles of Science*, Chapter XI., *Miss Lind-af-Hageby*, 7448-50.

ALDENHAM, laboratory at, held by Lister Institute of Preventive Medicine *G. D. Thane*, 344.

ALEXANDRIA, plague outbreak in, and successful treatment by application of sanitary methods *Sir G. Kekewich*, 20485-90.

ALLBUTT, SIR T. CLIFFORD, present at Dr. Gaskell's cross circulation experiments *L. E. Shore*, *W. H. Gaskell*, 19465, 21470, 21726.

ALLINGHAM, WILLIAM, M.D., letter to, *re* "incomplete anæsthesia" *Hon. S. Coleridge*, 10993.

ANÆSTHESIA:

Analgesia not necessarily coincident with, *A. R. Cushny*, *F. Gotch*, 5270-4, 13898-900.

"Complete":

Can be always obtained in experiments, *Sir R. D. Powell*, *H. Morris*, *E. A. Schäfer*, *F. Gotch*, *Sir J. F. Moulton*, 5771-3, 8020, 10047-53, 12809-11, 13586-7.
Can occur without abolition of corneal reflex *D. W. Buxton*, 12523-4.
Definition *D. W. Buxton*, 12544-56.
First movements which return after, are not indicative of consciousness *J. N. Langley*, 15274-5.
Must be capable of preventing all shock *D. W. Buxton*, 12662-6.
Narcotics can induce, *D. W. Buxton*, 12681.
No difficulty in maintaining, throughout experiments *D. W. Buxton*, 12679-80.
No difficulty in securing, for length of time *Sir J. Russell*, 695.
Present guarantees of, unsatisfactory *J. H. Levy*, 18477-83.

ANÆSTHESIA—*cont.*

"Complete"—*cont.*

Same precautions taken to ensure, in experiments on animals as in operations on human beings *D. W. Buxton*, 12461-6, 12684-7.
Secures against all pain *E. A. Schäfer*, 10069-71A.
Skilled anæsthetist has no difficulty in ascertaining, *D. W. Buxton*, 12419-20.
Symptoms indicating, vary slightly with nature of anæsthetic used *D. W. Buxton*, 12421-7.
Vivisection only justifiable if there is guarantee of, and animal is not allowed to survive *J. H. Levy*, 18477-83.

Consciousness, and reasons for supposing sharp dividing line exists between *S. F. Smith*, 13082-3.
Consciousness disappears long before movement, and power of motion returns before sensation *H. Morris*, *E. A. Schäfer*, 7937-52, 10222-4.

Deaths from:

No inquest or public inquiry held in Scotland as to, *Sir V. Horsley*, 15861-2.
Possible difficulty in differentiating between death from shock or, *Sir V. Horsley*, 15863-4.

Different degrees of, *E. H. Starling*, *D. W. Buxton*, 3889-90, 4062, 12510-22.
General, for human beings sometimes prohibited by patient's condition *H. Snow*, 2399-400.
Hypnotism an unreliable substitute for, *J. N. Langley*, 15270.
Imperfect, implied by use of curare *H. Snow*, 2357-75.

"Incomplete":

Alleged deception in letters to surgeons with regard to meaning of, unfounded *Hon. S. Coleridge*, 19930-2, 19967-74.
Correspondence with surgeons and Home Office as to use of, in human operations *Hon. S. Coleridge*, 10991-11043.
Definition *D. W. Buxton*, 12544-56.
Experiments described in *Shambles of Science* were performed under, *Miss Lind-af-Hageby*, 9130-1, 9157-97.
Explanation of term as used in connection with Dr. Crile's experiments, *Sir V. Horsley*, 15721-8.
Frequently advised in physiological text books *Miss Lind-af-Hageby*, 7223-97.
Movement of animals on operating table indicate, *Miss Lind-af-Hageby*, 9661-4.
No possibility of, during experiments *A. R. Cushny*, 5175-8.
Signifies patient is not necessarily free from pain *D. W. Buxton*, 12437-8.
Suggested use of term by Dr. Crile in reference to his experiments in different sense *D. W. Buxton*, 12578-82.
Surgeons' statements as to, *Hon. S. Coleridge*, 10305-14.

"Light":

Nature of certain experiments frequently demands, *Miss Lind-af-Hageby*, 7438-41.
Meaning of term, *Miss Lind-af-Hageby*, *D. W. Buxton*, 9546-62, 9658-61, 12431-5, 12544-56.
Movement and cries possible without sensation of pain under, *H. Morris*, 7996-8002.
Pain may be felt under, *Miss Lind-af-Hageby*, 9137-40, 9486 96.
Use of, does not indicate any degree of pain *A. D. Waller*, 18081-5.

Maintenance of, during experiments tested by inspector *Sir J. Russell*, 547-8.

ANÆSTHESIA—*cont.*

Maintenance of, in surgical operations on men *H. Snow*, 2379-91.
Maintenance of, possible for long periods *E. H. Starling, Sir L. Brunton, J. N. Langley*, 3627-34, 7012-13, 15114-18.
Maintained throughout all cutting experiments, and no cruelty ever witnessed, *Sir V. Horsley, Lorrain Smith*, 16188-98, 18280-3.
Maintained throughout all demonstration experiments *J. N. Langley*, 15387, 15102-8.
Marked by progressive effects divided into degrees of narcosis and definition of such degrees *D. W. Buxton*, 12389-96, 12575-6.
Meaning of term, and use of term "slight anæsthesia" by vivisectors *Hon. S. Coleridge*, 10385-411.
Meaning of term varied, but usually denotes absence of pain *J. N. Langley*, 15411-16.
Measures taken to resuscitate animal if anæsthesia is pushed too far, *E. A. Schäfer*, 10072-82.
Narcotics initially produce sleep, and large dose produce, *A. R. Cushny*, 5181-2.
Object of modern research on, is to know how to paralyse higher centres of brain *Sir V. Horsley*, 15900.
Painful sensation is first to be abolished concluded from personal experience, *L. E. Shore*, 19479-81.
Profound, condition of patient under, *E. H. Starling*, 3755-7.

Reflex movements under:

Occur in all degrees and indicate no sensation of pain, *D. W. Buxton*, 12525-31.
Skill required to distinguish between movements due to sensation of pain and, *D. W. Buxton*, 12612-19.
Some, persist in third degree but no sensation of pain *D. W. Buxton*, 12400-10.

Slight, meaning of term, *Hon. S. Coleridge*, 11548-61.
Small doses necessary for continuation of, when once produced *W. E. Dixon*, 18668.

Tests:

Absence of purposive movement is criterion of unconsciousness to pain *Sir V. Horsley*, 15929-35.

Blood pressure:

Effective *E. H. Starling, W. E. Dixon* 4053-4, 18737-9.
Not used in operations on human being *W. B. Dixon* 18789-92.
Conjunctival reflex is most practical, *D. W. Buxton, A. D. Waller*, 12414-18, 18144-9.
Corneal reflex, *W. E. Dixon*, 18669, 18787-9.

ANÆSTHETICS:

A. C. E. mixture:

Chloroform preferable to, for dogs *F. Hobday*, 16322-6, 16473-5, 16497-500.
Gradual action of, *J. N. Langley*, 15311-313.
Preferable to chloroform, for animals *Sir T. Stoker*, 1023, 1025-7.
Use of, *D. W. Buxton*, 12451.

Action:

Established by experiments on animals *D. W. Buxton, Sir V. Horsley* 12457-60, 15652-3.
Differences in, upon different nerve centres *J. N. Langley*, 15120-9.
Sensory cells paralysed before motor cells *W. E. Dixon*, 18672.
Similar upon men and animals *D. W. Buxton*, 12439-46.
Upon whole central nervous system *D. W. Buxton*, 12599-604.

Actual discovery of, not due to experiments, but knowledge of their precise nature entirely due thereto, *D. W. Buxton*, 12539-40.

Administration:

Consistent and efficient in experiments *Sir J. Russell, G. D. Thane, E. H. Starling, E. A. Schäfer*, 637-9, 700-1, 1765-8, 3470, 3603-6, 3639-56, 10213-21, 4154-9, 4242-52.

ANÆSTHETICS—*cont.*

Administration—*cont.*

Discomfort arising from, *M. S. Pembrey* 14160-1.
Discomfort following, may be greater than slight pain involved in performing operation without, *J. N. Langley*, 15325-8.
Discomfort and fear not caused to animals by methods employed in India *Col. E. Lawrie*, 17039-42.

to Dogs:

Method and apparatus used *G. D. Thane, E. H. Starling, D. W. Buxton, W. E. Dixon* 1230-1, 3585-8, 12488-500, 18677-9.
More difficult, than to human beings *E. H. Starling, S. F. Smith*, 3481-7, 13082
Not difficult *D. W. Buxton*, 12488-500.
Used to be frequently attended by fatal results *F. Hobday*, 16294, 16378-80.

Dose renewed during experiment if necessary *W. E. Dixon*, 18679-85.
Experiments should not be performed under present system of, *Col. E. Lawrie*, 16798, 16808.
Gradual diminution of sensitiveness to pain during, *Sir V. Horsley*, 16012-14.
Great improvement since 1875 in, *Sir J. Russell*, 729.
Invariable, in all experiments more extensive than simple inoculation *E. H. Starling*, 3445.
Knowledge of, should be acquired by practice on animals *Sir V. Horsley*, 15644.
Knowledge of, to animals would be of advantage in human practice, *J. N. Langley*, 15268.
Methods adopted in laboratories, *E. H. Starling, W. E. Dixon*, 3828-35, 3878-80, 4242-52, 18677-9.
in Midwifery cases *G. D. Thane, Sir V. Horsley*, 1720-22, 16015.
Necessity of teaching, by experiments *Sir V. Horsley*, 15651-2.
Nerve stimulating, efficient during *E. H. Starling*, 3657-8.

Overdoses:

Frequent, *Sir J. Russell*, 549.
Occasional, *E. H. Starling*, 3601-2.

Present system of, necessitates preliminary operation of tracheotomy *Col. E. Lawrie*, 16801-7, 16838-53.
Regulations as to, strictly conformed with in all laboratories, *G. D. Thane*, 450, 1588-96.
Skilled anæsthetist unnecessary, to assist during experiments *W. E. Dixon*, 18687.
Special branch of medical practice *G. D. Thane*, 1718-9.
Students are taught methods of, *E. H. Starling*, 3750-2.
Students learn wrong methods of, *Col. E. Lawrie*, 16905-9.
Students should learn, by a course of experiments on animals *Sir V. Horsley*, 16112-114.
Tracheotomy never performed on animals previous to, and such procedure would be illegal *A. D. Waller, J. Lorrain Smith* 18115-19, 18460-1.
Unreliable methods of, in vogue *Sir G. Kekewich*, 20470.
Woulff's bottle used for, *G. D. Thane*, 1615-16.

After effects of, on animals *Sir J. Russell, F. Hobday*, 731-2, 16441-6.
All severely painful experiments should be carried out while animal is completely under, *A. G. Scott*, 19507-8.
Alcohol, mixture of chloroform, and, used *D. W. Buxton*, 12451.
Animals always fully under, in operation and nature of those, employed *A. R. Cushny*, 5039-57.
Animals recover rapidly from effects of, *Sir J. Russell*, 540.
Anti-vivisectionists' persistent misstatements regarding neglect of, *Sir V. Horsley*, 15728-9.

ANÆSTHETICS—*cont.*

Castration should be performed under, *J. W. Graham*, 5928-31, 6111-13.
Cases of second operations for testing purposes, all conducted under *G. D Thane*, 1216-8.
Certain experiments for pharmacological research cannot be satisfactorily performed under, *A. R. Cushny*, 4847-8.
Certificates disallowing use of, imply torture of animals *Sir G. Kekewich*, 20736-43.
Certificate dispensing with, never allowed for severe operations *W. P. Byrne, G. D. Thane*, 160, 440.
Certificates go to release conditions as to *W. P. Byrne, Mrs. K. Cook*, 221-3, 2000-7.
Certificates do not necessarily prescribe particular forms of, *H. Morris*, 7964-7.
Certificate B requires, *Sir J. Russell*, 557.

Chloral:

Doses of, necessary to anæsthetise rabbits and man *W. E. Dixon*, 18654-9.
Efficiency of, *G. D. Thane, F. Gotch*, 1635-8, 13890-2.
Insensibility produced by use of, *Sir L. Brunton*, 6902-6.
Not often used, but method of administering, when employed *W. E. Dixon*, 18682.
Overdose of, has complete narcotic effect, and experiments in connection with, *Sir T. L. Brunton* 6785-98.
Rarely used as an anæsthetic for man, *W. E. Dixon* 18654-7.
Used generally as an anæsthetic for animals *W. E. Dixon* 18658.

Chloroform:

Action of, diminished blood pressure apart from any connection with respiration *A. D. Waller*, 18087A-90.

Administration:

Can be given with perfect safety, so long as regular respiration is maintained *Col. E. Lawrie*, 16952-6.
Clinical experience rather than laboratory experiments have been truer guide in, *Col. E. Lawrie*, 16975-86.
Danger is at beginning of procedure *F. Hobday*, 16455-60.
by Means of a mask *F. Hobday*, 16382.

to Dogs:

Evidence before previous Commission as to, *Sir J. Russell*, 697.
Series of experiments in connection with, and small percentage of deaths *F. Hobday*, 16434-5.

Hyderabad method, is the only safe method *Col. E. Lawrie*, 16935-7.
Inhalation a better method than through trachea *Col. E. Lawrie*, 17080-5.
Investigations into methods of, and records of cases *F. Hobday*, 16306-16.
Investigations into method of, chiefly carried out on dogs and cats *Sir V. Horsley*, 16301-5.
in Midwifery cases *Sir T. Stoker*, 1629-32.
No manner of measuring quantity respired when administered in natural way, *Col. E. Lawrie*, 16927-30.
Nurses and hospital orderlies should be taught, *Col. E. Lawrie*, 16938-9.

Safe, so long as regular respiration is maintained, *Col. E. Lawrie*, 16952-6.
by Students in Edinburgh during last century without any fatal results *Col. E. Lawrie*, 16942-51.
Symes' method, based on clinical experience and quite satisfactory *Col. E. Lawrie*, 16963-5.
System of introducing it through tube from another room quite satisfactory *Sir V. Horsley*, 15910-12.
through Tracheal tube, interferes with natural respiration and vitiates experiment *Col. E. Lawrie*, 16886-98.
through Tracheal tube, should be abandoned *Col. E. Lawrie*, 16911-22.

ANÆSTHETICS—*cont.*

Chloroform—*cont.*

Administration—*cont.*

Tracheotomy, illegality of performing, before, *Col. E. Lawrie*, 17001-7, 17058-66.
Value of giving morphia before, *W. E. Dixon*, 18672.

Alcohol, used in mixture with, *D. W. Buxton*, 12451.
All animals struggle more or less against, *Sir T. Stoker*, 837.
All experiments can be performed painlessly under correct administration of, *Col. E. Lawrie*, 17053-7.
an Absolute anæsthetic *Col. E. Lawrie*, 17000.
Atropin counteracts fatal tendency of, *E. A. Schäfer*, 10088, 10152-4.
Blood pressure just as delicate an indication of action of, as reflexes *W. E. Dixon*, 18690-3.
Blood pressure lowered as first effect of, and respiration stops from want of nutrition *Col. E. Lawrie*, 16825-30.
Cambridge experiments vitiated *Col. E. Lawrie*, 16969-74.
Continuous dose can be maintained in operations on human beings *D. W. Buxton*, 12675-7.
Cross circulation experiments on dogs with object of ascertaining effect of, on heart, methods adopted and results *L. E. Shore*, 19437-19456, 21373-21580.
Death under, occurs from failure of respiration leading to heart failure *Col. E. Lawrie*, 16860-1.
Discovered by accidental inhalation *Sir V. Horsley*, 16258.
Discovered by experiments on man, but its present position depends on animal experimentation *Sir L. Brunton, Col. E. Lawrie*, 7118-21, 16961-2.

Dogs:

Can be kept for several hours under, *Sir V. Horsley*, 16318-28.
Do not show anticipatory signs of terror *F. Hobday*, 16334-6.
Statement as to susceptibility of, not consistent with inspector's experience *Sir J. Russell, G. D. Thane*, 753, 1222-8.
Susceptible to death under, *Sir T. Stoker*, 813-14, 836, 1039.

Experiments brought into disrepute owing to physiologists' rejection of work of Hyderabad Commission *Col. E. Lawrie*, 16836.
Has no direct influence on heart, as proved by the Hyderabad Commission *Col. E. Lawrie*, 16822-4, 16834-5, 16862-6.
Margin between dose of, securing complete unconsciousness and lethal dose *F. Hobday*, 16454.
Noises made by animals under, not indicative of pain *E. A. Schäfer*, 10226-7.
Opium used before discovery of, *D. W. Buxton*, 12642-7.
Percentage to secure unconsciousness much the same in all warm-blooded animals *Sir V. Horsley*, 15645-9.
Preferable to A.C.E. mixture *F. Hobday*, 16322-6, 16473-5, 16497-500.
Progressive diminution of sensibility to pain under, *Col. E. Lawrie*, 17008-17.
Reflexes possible under, *W. E. Dixon*, 18997-19000.
Respiration affected by, and danger of using, *D. W. Buxton*, 12428-30.
Safe, if administered correctly *Miss Lind-af-Hageby, Col. E. Lawrie*, 7599-602, 17045-52.
Sensory nerves paralysed before motor nerves by, *W. E. Dixon*, 18897-900.
Specialists in anæsthesia called into existence by belief that fall of blood pressure under, is synonymous with heart failure *Col. E. Lawrie*, 16940-1.
Used with ether, *D. W. Buxton*, 12451.

Conflicting testimony as to efficacy of, *J. W. Graham*, 6096-110.

ANÆSTHETICS—*cont*

Cross circulation experiments performed on dogs without, *Col. E. Lawrie*, 16810-21, 16992-5.
Curare, use of, implies inefficiency of, *J. H. Levy*, 18500-1.
Curare administered only while animal is effectively under, *G. D. Thane*, 1705.
Distinction between nature of, employed in experiments and veterinary operations *Miss Lind-af-Hageby*, 7350-4.

Dogs :

Can be easily kept under, *Sir V. Horsley*, 15909.
Doubts as to possibility of securely anæsthetising, for long periods *Sir T. Stoker*, 862-8, 891-2.
Not more liable to succumb to effects of, than other animals *Sir L. Brunton*, 7179-85.
Overdosed, and methods adopted for revival *E. H. Starling*, 3481-7.
Unlikely to be completely unconscious during experiment on spleen *Mrs. K. Cook*, 1919.
See also under Chloroform *above*.

Doubts as to efficacy of, employed in experiments and cases where Act is evaded as regards, *Sir G. Kekewich*, 20715-24.
Drowning experiments, some conducted with, and some without, *G. D. Thane*, 1290-2.

Ether :

Experiment performed under inefficient, *Mrs. K. Cook*, 2058-2063.
Fleeting effect of, *Mrs. K. Cook*, 1955.
Used with chloroform *D. W. Buxton*, 12451.

Experiments with view of discovering action of digitalis carried out under, *A. R. Cushny*, 4684-8.
Experiments under Certificates B, B,EE or B,F all require, *G. D. Thane*, 467.
Experiments alleged to have been conducted without, *J. W. Graham*, 5908

Experiments performed without :

Condition enforcing painless killing of animal when main result of experiment attained *W. P. Byrne*, 10-11, 13.
Licence revoked for contravention of Act as to, *W. P. Byrne*, 38-40.
Necessity of certain, *F. Gotch*, *M. S. Pembrey*, 13754-60, 14067-71.
Permitted by licence without Certificate A *G. D. Thane*, 409-10.
Strict enforcement of antiseptic treatment in all cases *W. P. Byrne*, 12-13.
Universal condition for, *W. P. Byrne*, 6-9, 159.

Foreign experiments rarely carried out now without, *Sir V. Horsley*, 15887.
for Gelding horses, *S. Stockman*, 2875-9.
Horses frequently fired without, *F. Hobday*, 16520-3.
Impossible to remove consciousness to pain completely by, *Miss A. Kenealy*, 6426-44.
Inoculation of rabbit for rabies requires, *S. Stockman*, 2590-7, 2912.
Inoculation or bleeding experiments rarely require, *S. Stockman*, 2585-89.
Insufficiency of, to nullify pain *J. W. Graham*, 5878-82.
as to Length of time men and animals can be kept under, *A. R. Cushny*, *H. Morris*, 5255-8, 7802-4.
Lethal dose, duration of life under, *F. Gotch*, 13641-56.
Licensees frequently guilty of irregularities by administering, under Certificates A or A, E, *G. D. Thane*, *Sir J. Russell*, 477, 555-6.

Local :

Anæsthesia produced by injection into spinal cord *W. E. Dixon*, 18950, 18958-63.
Brings loss of local sensation of pain without loss of consciousness, and therefore not used for animals *A. R. Cushny*, 5132-7.

Cocaine :

Administered subcutaneously and depth of anæsthesia produced *W. E. Dixon*, 19067-70.

ANÆSTHETICS—*cont.*

Local—*cont.*

Cocaine—*cont.*

Advisability of using, under Certificate A, but possible difficulty *Sir J. Russell*, 557, 623-4, 624-7.
Anæsthetising powers of, first discovered by experiments on animals *A. R. Cushny*, 4751.
Castration could be rendered painless by use of, *W. E. Dixon*, 19071-2.
Chiefly used in eye-operations *Sir H. R. Swanzy*, 9913-18.
Danger of using, owing to difficulty of sterilising *A. R. Cushny*, 4751-3.
Introduction of, *A. R. Cushny*, *Sir L. Brunton*,, 4867-9, 7021-7.
Past researches into physiological action of, *A. R. Cushny*, 4869-72.
Search for substitutes for, led to discovery of the orthoforms *A. R. Cushny*, 4759-61, 4753-9.
See also under DRUGS.

Composition of, *G. D. Thane*, 1173.
Dangers in use of certain, *W. E. Dixon*, 18964-6.
Discovery of all, entirely by animal experimentation *A. R. Cushny*, 4761-2.
Eucaine, introduction of, as substitute for cocaine *A. R. Cushny*, 4753, 4758.
Investigations into relative action of new, *W. E. Dixon*, 18948-54.
Method of injecting, into spinal cord is quite painless *W. E. Dixon*, 19073-6.
Mode of determining effect of, *W. E. Dixon*, 18955-6.
Use of, always extending *A. R. Cushny*, 4980-6.
Use of, in certain cases, *G. D. Thane*, *D. W. Buxton*, 1171-6, 12631-9.

Minor, introduced by means of experiments on animals *A. R. Cushny*, 4819.
Narcotics, hypnotics, and, do not differ essentially *W. E. Dixon*, 18652-4.
Narcotics and hypnotics administered in large doses are complete, *W. E. Dixon*, 18652-3.
Narcotics administered as well as, *E. H. Starling*, 3607.
Nature of, discovered by experiments on animals *D. W. Buxton* 12649-50.
Nature of, generally used *G. D. Thane*, *D. W. Buxton*, 1170, 12467-9.
Nature of those, generally used in surgical practice, *D. W. Buxton*, 12447-56.
Nature of, used, generally stated at commencement of paper describing experiment, *E. H. Starling*, 3636-7.
Necessary for success of experiment, *G. D. Thane*, *J. N. Langley*, 1596-8, 15273.
No practical difficulty in keeping animal under, without pain *Sir J. Russell*, *G. D. Thane*, 733-6, 1617-22.
Non-existence of, would not justify prohibition of experiments, but would limit number of operators *E. H. Starling*, 4160.
Overdose of, generally adopted for killing animal *G. D. Thane*, 1325-6.
Pain not felt under, *A. R. Cushny*, *Sir V. Horsley*, 5194-5, 15899.
Pain indicated by struggles under, *R. J. Cowen*, 19419-25.
Pain, indications of, during operations on animals easily detected *F. Hobday*, 16329-31.
Physiological text books show indifference to use of, *Miss Lind-af-Hageby*, 7223, 7299.
Previous to discovery of, surgeons were justified in experimenting upon animals *Sir V. Horsley*, 15869-71.
Probable use of, in experiments previous to 1875, with regard to action of digitalis *A. R. Cushny*, 4660-3.
Spaying of bitches conducted under, *S. Stockman*, 2897.
Testimony of competent anti-vivisection witness required before believing in universal use of, at experiments *Sir G. Kekewich*, 20452-6.
Tracheotomy may or may not require, *F. Hobday*, 16517-18.
Unreliability of, and drug experiments cannot be made under *Miss Lind-af-Hageby*, 9208-15.

ANÆSTHETICS - *cont.*

Unnecessary both in case of animals and men, pain being a beneficent and protective mechanism *M. S. Pembrey*, 14119-23.

Urethane:

Complete anæsthesia produced by, in rabbits *A. R. Cushny*, 5948-55.
Efficacious if given in large dose, *A. R. Cushny, F. Gotch*, 4741-2, 13890-2.
Method of administering, is by injection *W. E. Dixon*, 18681.
Use of, *G. D. Thane*, 1635-8.

Use of, implies certain deviation from normal conditions, but their effect can be allowed for in judging experiment *E. H. Starling*, 4202-10.
Vivisectors' statements as to sufficiency of, unreliable, *Sir G. Kekewich*, 20593-8.

ANDERSON, HUGH KERR, M.A., M.D., F.R.S. 21636-21704.

Dr. Gaskell's cross circulation experiments:
Circumstances attending performance of, and completeness of anæsthesia during, vouched for 21636-704.

Present at, *L. E. Shore* 19465.

ANGINA PECTORIS:

Value of amyl nitrite as remedy for, *A. R. Cushny*, 4800-4.

ANKYLOSTOMA: *See under* PARASITIC DISEASES.

ANREP, PROFESSOR VON, effects of cocaine on animals first noted by, *A. R. Cushny, Sir L. Brunton*, 4751, 4867-91, 7021-7.

ANTHONY, *The late* JOHN, M.D., comparative insensibility of animals to pain maintained by, before last Royal Commission *S. F. Smith*, 13046-8.

ANTHRAX:

Anaerobic bacillus identified as cause of, by means of culture organisms *H. Morris*, 7694-7701.
Bacillus of, not always discoverable, *S. Stockman, H. Morris*, 3120-4, 7871-3.
Bacteriological origin of, admitted *S. F. Smith*, 13446.
Blood of animals suffering from, tested by veterinary surgeons *S. Stockman*, 3117-9.
Board of Agriculture notify local authorities of outbreaks of, *S. Stockman*, 2633.
Destruction of carcasses and careful disinfection not best method of dealing with outbreaks of, *S. Stockman*, 2743-5.
Diagnosis of, difficult without recourse to experiments *S. Stockman*, 2464-7, 2667-71, 2819-23.
Experiments in connection with investigation of, performed without necessary certificates *W. P. Byrne*, 38.
Experiments in relation to bacterial origin of, and immunising and curative influence of culture sera, *H. Morris*, 7726.
Organism besides causal one may be found, *S. Stockman*, 3067-70.
as to Pasteur's method of inoculating against, *S. Stockman*, 3140-4.
Pasteur's work demonstrated microbic cause of, and possibility of obtaining immunity from, *Sir J. F. Moulton*, 12730.
Pasteur's preventive inoculations for, generally confirmed *S. Stockman*, 2740-1.
Possible relation between braxy and, *D. J. Hamilton*, 20146.
Post-mortems in cases of, forbidden *S. Stockman*, 3110-11.
Prevalence of, and inoculation against, with consequent reduction of death rate *S. Stockman*, 2524-43.
Safe to argue from experience in animals to man in case of, *H. Morris*, 7873.
Slaughter not compulsory in cases of, *S. Stockman*, 2539-40.
Sources of, in man *S. Stockman*, 2634-41.
Testing of cases, in municipal laboratories *G. D. Thane*, 346-7.
Rival methods for prevention and cure of, *S. Stockman*, 3308-14.

ANTISEPTICS:

Care required in applying to eyes and aseptic treatment now substituted *Sir H. R. Swanzy*, 9955-61.
Certificates go to release conditions as to use of, *W. P. Byrne*, 221-3.

ANTISEPTIC SURGERY:

Anti-vivisection opposition to, shows distinct lack of moral feeling, *Sir V. Horsley*, 15672.
and Aseptic surgery, distinction between, *H. Morris, E. A. Schäfer, G. G. Bantock*, 7899, 10141-51, 14580-606, 14741-2, 15085-98.
Death rate after operations diminished owing to, *H. Morris*, 7750.
Definition *G. G. Bantock*, 15049-50.
Carbolic spray at first regarded as most important part of procedure in, but finally discarded *G. G. Bantock*, 14745-6.
Head's list of benefits derived from experimental research *Sir J. F. Moulton*, 12727-8.
Introduction of, entirely due to experiments on animals *Sir V. Horsley*, 15669-71.
Invention of, has saved incalculable degree of pain *Sir V. Horsley*, 15669-71.
Modifications of technique since 1876 *H. Morris*, 7845-7.
Pasteur's work on spontaneous generation is fundamental basis of modern, *H. Morris*, 7841-2.
Progress of, due entirely to study of bacteria by means of experiments on animals *H. Morris*, 7664-73, 7685-9, 7705-14.
Pyemia and blood poisoning after operations have disappeared owing to, *Sir V. Horsley*, 15669-71.

ANTI-TYPHOID INOCULATION COMMITTEE, tests carried out under auspices of, *C. J. Martin*, 11803-13.

ANTI-VIVISECTION HOSPITAL:

National Anti-Vivisection Society had no active share in promoting, *Hon. S. Coleridge*, 19905-07.
Origin of name *S. F. Smith*, 13033-7.
Sera or anti-toxins not used in, *S. F. Smith*, 13473-5.
Size of staff, *S. F. Smith*, 13476-80.

APES:

Anthropoid, are only animals susceptible to yellow fever, as shown by experiments *W. Osler*, 16545, 16695-6.
Experiments on, and alleged cruelty of such *Mrs. K. Cook*, 1910.

APOPLEXY, malpractice of formerly administering digitalis in treatment of, *A. R. Cushny*, 4972-6.

ARLOING:

Preventive inoculation for blackquarter devised by, *S. Stockman*, 2544.
Reference *S. Stockman*, 2798.

ARNOLD, SIR EDWIN, anti-vivisection cause supported by, *Hon. S. Coleridge*, 10262.

ARTIFICIAL RESPIRATION, new method of, arrived at by experiments on dogs and its superiority to other methods *E. A. Schäfer*, 10104-10.

ARTERIAL SCLEROSIS:

Discovery that adrenalin will cause, gives means of studying development of *J. Lorrain Smith*, 18236-7, 18288-96.
Experiments on animals justifiable in order to define cause of, *J. Lorrain Smith, W. E. Dixon*, 18236, 18435-6, 18933-4.
Not yet known whether that induced by adrenalin in animals is similar to that found in human beings *J. Lorrain Smith*, 18436-9.
Nicotin action may produce, *W. E. Dixon*, 18935-41.

ASHER, opinion *re* source of *post-mortem* lymph *Miss A. Kenealy*, 5296.

ASCITES, severe operations may be followed by, *G. D. Thane*, 472-3.

Aseptic Surgery :
Dirt, exclusion of, is main feature *G. G. Bantock*, 14545-6, 14840-55, 14969-83.
Listerism abandoned for, *G. G. Bantock*, 14545-6, 15051 64.
Listerian treatment embodied in, *Sir V. Horsley*, *W. Osler*, 15666-8, 16742-6.
Strict conformity with regulations as to use of, exists in all laboratories *G. D. Thane*, 450.
See also under Antiseptic Surgery.

Asphyxia, meaning of term and conditions giving rise to, *M. S. Pembrey*, 14078-82.

Asquith, Right Hon. H. H., Certificate EE substituted for E during régime of, *Sir V. Horsley*, 15762-3.

Asses and mules, Certificate F required for experiments on, *G. D. Thane*, 423.

Association for Advancement of Medicine by Research :
Applications for licences submitted to, *W. P. Byrne*, *G. D. Thane*, 208, 281-2, 393-5.
Constitution, aims and functions of, *W. P. Byrne*, *G. D. Thane*, *E. H. Starling*, 169-72, 1086-93, 3859-77.
Consulted by Home Office, and doubts as to wisdom of this policy *Sir T. Stoker*, 1066-7.
Consulted by Home Office, and report of, is separate from inspector's *W. P. Byrne*, *Sir J. Russell*, 175-6, 525-7.
Consulted by Home Office, before issue of licences and certificates *W. P. Byrne*, *G. D. Thane*, 24, 27-9, 131-3, 156-7, 435-8.
Consulted by Home Office, policy initiated by Sir W. Harcourt *W. P. Byrne*, *G. D. Thane*, 31, 397.
Delay in issue of licences and certificates sometimes occasioned by policy of consulting, *Sir J. Russell*, 566.
Highly qualified to give advice as to issue of licences *W. E. Dixon*, 19153.
Home Office has never acted contrary to advice of, *Hon. S. Coleridge*, 11049.
Necessity of Home Secretary being advised in granting of licences by, *Sir V. Horsley*, 16100-101.
No society in Ireland analogous to, *Sir T. Stoker*, 847.
Objection to Home Office policy of consulting, *Hon S. Coleridge*, 10675-91, 10909-14, 11098-109, 11615-21.
Procedure adopted by, in considering applications for certificates *E. H. Starling*, 4184-8.
Recommendation of, as to issue of licences and certificates not necessarily accepted by inspector, *Sir J. Russell*, 683.
Report of, read by inspector before making his own report, *G. D. Thane*, 1094-7.
Royal Society could not undertake consulting duty of, *Lord Rayleigh*, 5564-5.
References *G. D. Thane*, 1483-4, 1751.

Bader, Mr., reference *H. Morris*, 7944.

Bagehot, *The late* W., reference *J. W. Graham*, 5887.

Bainbridge, F. A., Guy's Hospital : useless nature of experiments by, in connection with flow of *post-mortem* lymph *Miss A Kenealy*, 5285-301, 6699-710.

Bain, Dr., experiment on gall bladder of dog, by, *G. D. Thane*, 1650-69.

Baker, N., Secretary of Royal Commission on Vivisection, 1875, correspondence between Dr. Klein and, re latter's evidence, *Hon. S. Coleridge*, 10858.

Balfour, F., reference *Sir J. F. Moulton*, 12768.

Baltimore :
Johns Hopkins College, *see that title.*
No active anti-vivisection society in, *W. Osler*, 16775-6.

Ballinakill, Ireland, private laboratory at, *Sir T. Stoker*, 773.

Balham, municipal laboratory at, *G. D. Thane*, 342.

Bamford, Surgeon-General, chloroform said by, to have no direct action on the heart *Col. E. Lawrie*, 17067.

BANBURY, SIR FREDERICK, BART., M.P., Royal Society for the Prevention of Cruelty to Animals 19484-851.
Bill for Prevention of Cruelty to Animals introduced by :
Similar to Mr. Coleridge's Bill with exception of clause with regard to certificate for humanity, 19624-7.
Reference 19554.
"Brown Dog of Battersea," particulars of case, suggest that pain was inflicted, 19522-6.
Certificate B, objection to experiments under, on ground of pain involved, 19714-20.
Inspectors :
Insufficient number of, and necessity of their being whole time men, 19499-502.
Present system of inspection unsatisfactory, 19621-2.
Work of, might be facilitated by limiting number of registered places, 19508, 19618-20, 19778-82.
Pain :
All precautions should be taken to prevent infliction of, on animals, 19498-9.
Animals should be destroyed after experiments involving subsequent, 19612-17.
No objection to experiments not involving, 19763-71.

Bang, Professor :
Swine fever organism discovered by,
Tuberculin test exploited in Denmark by, *S. Stockman*, 3204.

BANTOCK, GEORGE GRANVILLE, M.D., F.R.C.S. (Edinburgh), Parliamentary Association for the Abolition of Vivisection, 14530-15098.
Abdominal surgery :
Not indebted to experimental methods, 14774.
Special experience in, 14535, 14755.
Antiseptic surgery :
Abandoned in favour of cleanliness and aseptic methods, 14571-9, 14608-12.
Strong distinction between aseptic and, 14580-606, 14741-2, 15085-98.
Aseptic surgery :
Dirt exclusion is main feature, 14840-55, 14969-83.
Personal share in introduction of, 14969-83.
Bacilli :
Concurrent with but not cause of disease, 14538-43, 14545-6, 14732-8, 14911-17, 14990-1.
Fluid accompanying, is probably responsible for disease, 15014-28.
Improbability of isolating, from surrounding fluid 14857-96.
Presence of, does not necessarily imply anything specific, 14545-6.
Tetanus, improbability of its being cause of disease, 14856-60.
Toxins cannot be product of, 14550.
Tubercle :
Absence of, in early stages of disease justifies conclusion that it is not actual cause, 14622-30, 14678-82, 14861-5.
Erroneous views put forward as to entrance of into system, 14550.
Growth of, favoured by air and light 14670-7, 15003-6.
Typhoid never discovered in water 14717-22.
Bacillus coli, presence of, necessary for the maintenance of health, 14713-16.
Bacteriological theories of disease, opposition to, founded on practical work and long experience 14755, 15048.
Bacteriology, study of, has led surgeons astray 15048.
Biology cannot be treated as a science to be investigated by experimental methods 14804-18.
Cancer research obtains no help from experimental methods 14775-7.
Diphtheria :
Antitoxin, objection to, based solely on its inutility, 14930-4.
Loeffler's bacillus not cause of, 14545-6. 14550-2.
No evidence that fluid surrounding bacilli is cause of, but bacillus not found in many cases of clinical, 14644-59.
as to Sources of infection, 14545-6.

BANTOCK GEORGE GRANVILLE, M.D., F.R.C.S. —*cont.*

Evidence referred to:

Antiseptic surgery, views concerning quite incorrect *Sir V. Horsley*, 15665-74.
Views with regard to non-bacteriological origin of disease contrary to universal opinion *W. Osler*, 16685-90.

Experience in surgical work, 14728-9.
Experiments on animals objected to on grounds of their inutility, 14536-7, 14730-1, 14801-3, 14929, 14947-9, 14994, 15065-9.

Klebs-Loeffler's bacillus:

Frequently present in healthy persons, and in cases of tonsillotomy, 14639-43.
May exist in healthy throat without producing clinical symptoms of diphtheria, 14767-9.

"Listerism":

Abandonment of, for aseptic methods and personal share in opposition to, 14546, 14752-4, 14837-9, 15051-64.
Basis of theory, was concerned with notion of influence of atmospheric germs 14551-5.
Carbolic spray first regarded as most important part of procedure, but finally discarded 14556-63, 14745-6, 14822-32.
Date of introduction of treatment, 14546, 14564-70.
Definition of antiseptic surgery or, 15049-50, 15083-4.
No connection between work of Semmelweis and, 14759-60.

Medicine is not and can never be a science 14903-10.

Milk consumption:

Erroneous views put forward with regard to connection between, and prevalence of *tabes mesenterica* 14547-50
Statistics showing small, in East London 14547 9.

Modern Doctrine of Bacteriology, views upheld in, 14631-5.
Pasteur's treatment for rabies, acceptance of, discreditable to medical profession and falseness of statistics relating to, 14778-800, 15037-46.
Pharmacological research is useless and old remedies are superior to modern 14935-40.
Plague, theory that communicability of, is effected by agency of fleas ridiculous 14598-711, 14952, 15071-9.
Smallpox, specific bacillus cannot be cause of, 14545-6, 14636-8, 14897-902.
Tsetse fly does not communicate sleeping sickness, but poison of bite kills animals 15032-5.
Tuberculin fiasco, 14663-8, 14766.

Tuberculosis:

Erroneous views as regards bacteriological cause of, and attendant conditions 14547, 14550

Not communicable from men to animals 14683-9.

Views attributing prevalence of, to consumption of milk 14547.

Vaccination, protective effect of, admitted 14925-7.

BARBER, S. F., letter to, *re* incomplete anæsthesia, *Hon. S. Coleridge*, 10993.

BARLOW, DR. LAZARUS, Jensen's tumour not regarded as a malignant growth by, *H. Snow*, 2172.

BARNARD, H., experiments on dogs performed by, and alleged cruelty *J. W. Graham*, 5861-71.

BARR, SIR JAMES:

Address by, to British Medical Association at Toronto, *E. H. Starling*, 4262-5.
Oxygen treatment for pneumonia advocated by, disapproved of, *Sir L. Brunton*, 6900.

BARRATT, DR. WAKELIN, experiments on dogs' gall bladders by, and alleged cruelty *Mrs. K. Cook*, 1919.

BASHFORD, E. F., M.D., author of article on transplantation of Malignant New Growths in Report of Cancer Research Fund, *H. Snow*, 2110-15.

BASTIAN, reference, *Miss A. Kenealy*, 5288.

BAUMANN, experiments resulting in introduction of hypnotic sulphonal by *A. R. Cushny*, 4730.

BAYFIELD, DR., Member of Committee of National Canine Defence League, *J. Hughes*, 1724-4.

BAYLISS, W. M., M.A., F.R.S.:

Alleged misstatement by, regarding experiment described in *Shambles of Science Miss Lind-af-Hageby*, 9634-50.
Alleged neglect of anæsthetics during operations performed by, untrue *E. H. Starling* 3639-56.
Apology to, on account of certain libellous allegations in *Shambles of Science G. D. Thane*, 1280.
Cat incompletely anæsthetised during experiment by *Miss Lind-af-Hageby*, 9157-97.
Dog illegally experimented upon twice by, *Mrs. K. Cook*, 1917.
Experiments conducted by, and evidence of animal struggling *Miss Lind-af-Hageby*, *Hon. S. Coleridge*, 7451-2, 10720-2.
Experiments on abdominal nerves of dogs by, and alleged cruelty *Mrs. K. Cook*, 1917.
Experiments on spinal cord of dog performed by, and alleged cruelty *Mrs. K. Cook*, 1914-17.
Libel action brought by, *see* BAYLISS *v.* COLERIDGE.
Morphia said to be an an anæsthetic by, *Miss Lind-af-Hageby*, 7308-9.
References *Miss Lind-af-Hageby*, 7220, 9394,9396.

BAYLISS *v.* COLERIDGE:

Anæsthesia obviously complete during case disputed in, *D. W. Buxton*, 12626-8.
Misrepresentation of evidence in, as to control of animals during experiments *Sir V. Horsley*, 16010-11.
Morphia an anæsthetic stated in, *Miss Lind-af-Hageby*, 7308-9.
Proceeding in, and alleged breach of law *Hon. S. Coleridge*, 10470-6.
Sir Victor Horsley's evidence in, accurately quoted *Hon. S. Coleridge*, 19919-29.
References *Miss Lind-af-Hageby*, *Col. E. Lawrie*, *A. D. Waller*, *A. G. Scott*, 7220, 16996-8, 18077, 19775-7.

BEAUMONT, DR.:

Case of Alexis St. Martin and observations then recorded by, on digestive organs *E. H. Starling*, *Sir L. Brunton*, 3470, 7028.
Knowledge of nature and action of gastric juice derived from experiments by, *E. H. Starling*, 3442.

BEDDER, reference *Sir L. Brunton*, 7028

BEDFORD, cat illegally procured for vivisection purposes at, *G. D. Thane*, 1437.

BEEVOR, C. E., M.D., Secretary to Association for the Advancement of Medicine by Research:

Experiments in connection with brain localisation by, *E. A. Schäfer*, 10112.
References *G. D. Thane*, *E. H. Starling*, *Hon. S. Coleridge*, 1087, 3857-77, 10676.

BEHRING, MESSRS., diphtheria anti-toxin supplied by, *W. H. Power*, 2261-2.

BEHRING, PROFESSOR, as to Phthisis, remedy of, *H. Snow*, 2261-2.

BELFAST:

Experiments for demonstrating to students in, *Sir T. Stoker*, 820.
Experiments performed under curare by Dr. Thompson in, *Mrs. K. Cook*, 2008-10.
Inspection in, conducted by medical inspector from the Local Government Board *Sir T. Stoker*, 971-5.
Inspector assisted in, by report of Local Government Board inspector *Sir T. Stoker*, 831.

Queen's College:

Experiment under Certificate C at, *Sir T. Stoker*, 935, 937.

BELFAST—*cont.*

Queen's College—*cont.*

Pressure from President of, *re* granting of disallowed certificate *Sir T. Stoker*, 932.

Unlicensed experiment in, *Sir T. Stoker*, 913-15.

BELL, E., Publisher, York Street, Covent Garden, apology from, to Dr. Bayliss for publication of *Shambles of Science G. D. Thane*, 1280.

BELL, SIR CHARLES:

Feelings of, on subject of animal experimentation and work *H. Morris, Sir V. Horsley*, 7901-6, 7913-20, 15681-2.

Statement by, as to uselessness of experiments on animals, of no value *H. Head*, 17941-2.

Reference *Miss A. Kenealy*, 5467.

BELMONT, WEXFORD, Cattle Hospital of Department of Agriculture at, *Sir T. Stoker*, 765.

BENNETT, DR. A. HUGHES, cocaine, action of, and similar alkaloids discovered by experiments of, *A. R. Cushny, Sir L. Brunton*, 4869-72, 7021-7.

BENTHAM, JEREMY, quotation from works of, *re* animal rights *Rev. L. S. Lewis*, 8659.

BERDOE, DR., editor of *Zoophilist*, organ of National Anti-Vivisection Society *Hon. S. Coleridge*, 11598-600.

BERGMAN, VON, PROFESSOR, reference, *H. Snow*, 2259.

BERNARD, CLAUDE:

Biography of, *Miss Lind-af-Hageby*, 7311.

Curare:

Fallacious ideas concerning, originated with incomplete experiments *W. E. Dixon*, 18673-6.

Statements as to sufferings inflicted by use of, *Mrs. K. Cook, S. F. Smith*, 1801, 13079, 13295-302.

Experiments of, with regard to diabetes, and advance in knowledge of this disease *Sir L. Brunton*, 7124-6.

Morphia:

Mistranslation of statement as to action of, and word "sensitive" substituted for "reflex" *W. E. Dixon*, 18755.

Views as to action of, erroneous and based on false experiments *J. N. Langley*, 15421.

Statements as to inefficiency of, as anæsthetic *Miss Lind-af-Hageby*, 7308-16, 9472-85.

References, *Mrs. K. Cook*, 1921, 2089.

BIGELOW, *The late* PROFESSOR, Professor of Surgery, Harvard University, demoralisation of students at demonstration experiments asserted by, *Miss Lind-af-Hageby*, 7598.

BILLROTH, PROFESSOR, reference *Sir L. Brunton*, 6953.

BIRDS, organism of malaria discovered by experiments on, *W. Osler*, 16747-9.

BLACK, DR. CAMPBELL, reference *G. G. Bantock*, 14838.

BLACKQUARTER:

Inoculations against, and successful results *S. Stockman*, 2544.

Diagnosed frequently as braxy *D. J. Hamilton* 20112-3

BLACKWALL TUNNEL, cases of caisson disease in making of, *E. H. Starling*, 3907-9.

BLAKE, DR. JAMES, drug experiments by, as to connection between chemical constitution and physiological action *Sir L. Brunton*, 7019.

BLATIN, MONSIEUR, reference *Miss A. Kenealy*, 5465, 5470, 5473.

BLAXALL, F. R., M.D., reference *W. H. Power*, 4480.

BLONDLOT, experiments by, reference, *Sir L. Brunton*, 7028.

BLOOD, circulation can be taught without any demonstration experiments *Sir T. Stoker*, 761, 805, 1008-9, 1011-12.

BLOOD POISONING:

Animal experimentation has enabled classification of bacilli to be made, and distinction between aërobic and anaërobic bacilli *H. Morris*, 7690-4.

Disappearance of, after surgical operations due to introduction of aseptic surgery, *Sir V. Horsley*, 15666-8.

Koch's discovery of bacteriological origin of wound infections *H. Morris*, 7685-9.

Lister's and Pasteur's work in connection with, *H. Morris*, 7664-73.

Sapremia, bacteriological origin of, proved by experiments *H. Morris*, 7685-9

Septicemia:

Aërobic bacillus identified as cause of, by means of culture organisms *H. Morris*, 7694-7701.

Bacteriological origin of, proved by experiments *H. Morris*, 7673-7.

Different when inoculated into field and house mice *H. Morris*, 7876-9.

BLOOD PRESSURE:

Knowledge of, has been entirely obtained by experiments on animals and its vital importance both clinically and in operations *Sir V. Horsley*, 16040-1.

Recorded during experiments and is text of action of chloroform *W. E. Dixon*, 18690-3.

and Surgical Shock:

Closely connected, and therefore essential to acquire knowledge by experiments *Sir V. Horsley*, 15612-14.

Dr. Crile's experiments demonstrating connection between, *Sir V. Horsley*, 15691-9.

BLUE TONGUE, advances made in prevention of, *S. Stockman*, 2568-70.

BLYTH, SIR J. (*now Lord*), farms lent by, for use of Tuberculosis Commission *G. D. Thane*, 342-4.

BLYTHWOOD FARM, laboratory at, held by Tuberculosis Commission *G. D. Thane*, 342-3.

BOARD OF AGRICULTURE AND FISHERIES:

Annual number of experiments performed on behalf of, *S. Stockman*, 2852-5.

Anthrax outbreaks notified by, to local authorities, *S. Stockman*, 2633.

Certificate B only used by, for rabies cases, *S. Stockman*, 2858-70.

Contagious diseases of animals, investigations at present conducted by, *S. Stockman*, 2572-5, 2871-2.

Departmental Committee appointed by, to investigate pleuropneumonia *S. Stockman*, 2691-8.

Diagnosis of disease, experiments for, conducted by, but use is made of work done by local authorities *S. Stockman*, 3112-16.

Evidence of Chief Veterinary Officer, *see* STOCKMAN, S., 2423-3429.

Experiments performed on behalf of, *W. P. Byrne, G. D. Thane*, 286-91, 1139-44.

Experiments with view of discovering prophylactic for tropical diseases conducted by, *S. Stockman*, 2572-5.

Contagious diseases of animals, research with respect to, under control of, *W. H. Power*, 4574-5.

Departmental Committee to inquire into Diseases of Sheep:

Appointment of, and date of issue of Report *D. J. Hamilton*, 19990-5.

Experiments on behalf of, *D. J. Hamilton*, 20114-7.

Home Office control over experiments conducted by, *W. P. Byrne, G. D. Thane*, 295-8, 1339-40.

Knife and anæsthetics rarely used in experiments of, *S. Stockman*, 2579-84.

Laboratory for purpose of scientific investigation owned by, disapproved of *J. Hughes*, 17507-11.

Laboratories held by, *G. D. Thane*, 342.

Muzzling Order:

Absence of rabies in England due to, *Sir V. Horsley*, 15597-8.

Compulsory over whole country *Sir V. Horsley*, 16026-30.

BOARD OF AGRICULTURE AND FISHERIES—*cont.*
Muzzling Order—*cont.*
National Anti-Vivisection Society never opposed, but has been in favour of, *Hon. S. Coleridge*, 19847-51, 19901-19905.
Objected to, as being cruel and ineffective to prevent spread of rabies *J. Hughes*, 17120-7.
Rabies:
Returns inaccurate, *J. Hughes*, 17296, 17343-8.
Tests of, conducted by, *S. Stockman*, 3125-8.
Tract of heather at Frimley registered for experiments on grouse by, *G. D. Thane*, 344, 358-63.
Tuberculin and mallein, no instructions as to their use issued by, *S. Stockman*, 3248.

BOLTON ANTI-VIVISECTION SOCIETY, income of, *Hon. S. Coleridge*, 10260.

BOLTON, CHARLES, M.D., Resident Medical Officer, University College Hospital, experiments on cats by, and alleged cruelty *Mrs. K. Cook*, 1801-7.

BOMBAY:
Haffkine's experiments with plague prophylactics at, *W. H. Power*, 4366-7.
Plague in, and statistics as to use of Haffkine's antitoxin, *C. J. Martin*, 11792.

BOND, DR., Senior Surgeon, Westminster Hospital, letter from, *re* use of "incomplete anæsthesia" *Hon. S. Coleridge*, 10305, 10993.

BONSER, CYRIL A., charge against Mr. Gotch corroborated by, *Hon. S. Coleridge*, 11454.

BOOTH, GENERAL, anti-vivisection cause supported by, *Hon. S. Coleridge*, 10262.

BORCHARDT, PROF., reference, *Sir V. Horsley*, 15845.

BORDET, whooping cough organism put forward by, *C. J. Martin*, 12185.

BOREL, DR. F., statement of, as regards impossibility of completely anæsthetising dogs, *J. W. Graham*, 5878-82, 5960-70.

BOSANQUET, views of *re* paralytic effect of diphtheria antitoxin, *Miss A. Kenealy*, 6167.

BOUCHER, DR., reference *Miss Lind-af-Hageby*, 9682.

BOUCHIER, MISS H., reference *Miss A. Kenealy*, *Sir G. Kekewich*, 6314, 20613, 20842-4.

BOUILLAND, experiments on pigeons by, *Miss A. Kenealy*, 5288.

BOULEY, rabies statistics collected by, *C. J. Martin*, 11659.

BOWLBY, DR., St. Bartholomew's Hospital, anthrax cases referred to by, *H. Morris*, 7868.

BOYD, DR., reference *Hon. S. Coleridge*, 10381.

BRADFORD, Church Anti-Vivisection League meeting in 1898 at, and allegations concerning Dr. Hime's experiments *Miss A. L. Woodward*, 8789-810.

BRADFORD, JOHN ROSE, M.D., D.Sc., F.R.S.:
Committee of Medical and Scientific Societies 17621-800.
Certificates:
B:
Ambiguity in wording of, 17785.
Experiments requiring, performed entirely under anæsthetics 17745-6.
E:
Ambiguity in wording of, 17787-8.
Experiments on different kinds of animals might be covered by single, 17782.
Modification with regard to, and larger powers for responsible individuals, suggested 17789-95.
Demonstration experiments, essential for proper education of students and always conducted under anæsthetics 17667-76, 17702-2.
Diagnostic purposes demand recourse to experimental methods 17625, 17628-42, 17699-700, 17709-13.

BRADFORD, JOHN ROSE, M.D., D.Sc., F.R.S.—*cont.*
Diphtheria:
Antitoxin, efficacy of, undoubted 17717-21.
Organism of, can be recognised by cultural method and without recourse to experiments 17714-16.
Dogs:
Experiments on, essential for study of circulation and also digestive processes 17660-5, 17703-8.
No difficulty in anæsthetising, 17775-8.
Experience of, in physiological laboratories 17671.
Experiments performed by:
on Dogs' ears:
Involving much subsequent suffering *J. W. Graham*, 5842-4.
Misrepresentation of case which did not give rise to great pain 17678-87.
on Dogs' kidneys:
Cruelty of, and subsequent suffering *Mrs. K. Cook*, 1798.
Misrepresentation of actual facts 17689-98.
Free choice of animals for experimentation important 17654-60.
Heads of laboratories ought to have further facilities for experimentation 17796.
Legal control of experiments necessary in order to allay public apprehension 17797-800.
Member of Advisory Committee concerned with sleeping sickness and plague 17749-50.
Progress of medical science due to experiments 17723.
Tuberculosis:
Diagnosis of, demands recourse to animal inoculation 17644-61, 17762-4, 17766-7.
of Urinary tract, serum treatment for, 17766-73.

BRADY AND MARTIN, MESSRS.:
Laboratory at Newcastle-on-Tyne, reference *G. D. Thane*, 344.
Private laboratory registered for, *G. D. Thane*, 356.

BRAMPTON, *The late* LORD, antivivisection cause supported by, *Hon. S. Coleridge*, *Rev. S. L. Lewis*, 10262, 8726.

BRAXY, *see under* SHEEP DISEASES.

BRETTONEAU, name "diphtheria" introduced by, *C. J. Martin*, 11652.

BRISTOL AND WEST OF ENGLAND ANTI-VIVISECTION SOCIETY, income of, *Hon. S. Coleridge*, 10260.

BRISTOW, DR., reference, *C. R. J. A. Swan*, 19278.

BRITISH MEDICAL ASSOCIATION:
Address by Sir James Barr to, *E. H. Starling*, 4262-5.
Constitution and membership *Sir V. Horsley*, 15585-6.
Discussion at meeting of, in 1899 as to value of serum treatment in cases of suppuration and blood poisoning *S. F. Smith*, 13121.
Deputation sent from, to express to M. Pasteur feelings of profession as to value of his work 15603.
"Ernest Hart" Scholarship given by, *G. D. Thane*, 1459.
Evidence on behalf of, *see* HORSLEY, SIR V., 15583.
Muzzling Order, Mr. Long thanked for imposing, by, *Sir V. Horsley*, 16026-30.
Scientific Grants Committee, gives grants to students for research purposes *Sir V. Horsley*, 15586, 15782-4.
Repetition experiments, report concerning use of, *W. P. Byrne*, 195.
Report at meeting of, as to grafting of kidney to blood vessels in neck of dog *Sir. J. Russell*, 685-6.
Report of Committee of, in 1871 *W. P. Byrne*, 1A.
Views of, as to morality of vivisection *Sir V. Horsley*, 16135-41.

British Association, paper read before, maintaining presence of *bacillus coli* as necessary to the maintenance of health *G. G. Bantock* 14713-16.

British South Africa:
- Pleuro-pneumonia outbreak in, and how dealt with *S. Stockman*, 2494-2506.
- Rinderpest outbreaks in, successfully stamped out *S. Stockman*, 2484-90.

British Union for the Abolition of Vivisection, income of, *Hon. S. Coleridge*, 10260.

Broca, discovery of the speech centre by, *Miss A. Kenealy*, 5288.

Brockwell Hall, Messrs. Wellcome's laboratory at, reference *G. D. Thane*, 344.

Brodie, T. G., M.D., M.R.C.S., Professor of Physiology at the London School of Medicine for Women:
- Experiments performed by:
  - Anæsthesia incomplete in, *Miss Lind-af-Hageby*, 7448-50.
  - Anæsthesia incomplete during, and defence of same by Home Office, *Hon. S. Coleridge*, 10370-81.
  - on Dog's spleen and nerve stimulation:
    - Anæsthesia complete and no pain felt *E. H. Starling*, 3657-8.
    - Anæsthesia incomplete, *Mrs. K. Cook*, 1919.
  - "Pithing" of dogs improperly conducted *Miss Lind-af-Hageby*, 7415, 9730.
  - Preference for curare and morphia, expressed by, *Miss Lind-af-Hageby*, 4514A-21.
  - Text book by, shows lack of humane teaching and preference for light anæsthesia *Miss Lind-af-Hageby* 7223, 7232-47.
- References *A. R. Cushny*, *Hon. S. Coleridge*, 5168, 11163.

Brown, A. Crum, M.A., M.D.:
- Experiments by, as to chemical constitution of strychnin, *Sir L. Brunton*, 7019.
- Experiments by, with reference to soporific action of bodies similar in chemical composition to chloral *A. R. Cushny*, 4743-5.
- References, *A. R. Cushny*, 4737, 4746.

Brown, Dr. Orville Harry, St. Louis University, U.S.A.:
- Dogs injected with organ extracts of cold-blooded animals by, and futility of such experiments *Miss A. Kenealy*, 5302-15.
- Experiments by, *re* effect of injecting organ extracts of cold-blooded animals into veins of warm blooded animals *Miss A. Kenealy*, 5302-15.

Browne, Dr. Crichton: reference to, *S. F. Smith*, 13049.

"Brown Dog of Battersea":
- Particulars of case, suggest that pain was inflicted *A. G. Scott*, *Sir F. Banbury*, 19513-22, 19522-6.
- Subject of the Bayliss *v.* Coleridge libel action *A. G. Scott*, 19775-7.

Brown Institute:
- Cruelty of experiments on dogs and monkeys at, *Mrs. K. Cook*, 1798-1800.
- Cruelty of feeding experiments at, *Mrs K. Cook*, 1921.
- Registered, *G. D. Thane*, 1346-7.

Brown-Séquard, Professor, observations on functions of nervous system, made by, *H. Head*, 17945-6.

Browning, Robert, anti-vivisection cause supported by, *J. W. Graham*, *Rev. L. S. Lewis*, *Hon. S. Coleridge*, 5887, 8726, 10262.

BRUCE, COL. DAVID, C.B., F.R.S., R.A.M.C., Committee of Medical and Scientific Societies, 14184-529.
- Acted on Sleeping Sickness Commission of the Royal Society in 1903, 14187.
- Anti-typhoid serum, investigation of, at present moment, and instance of successful immunity after recent inoculation 14528-9.

BRUCE, COL. DAVID, C.B., F.R.S., R.A.M.C.—*cont.*
- Bacilli, fluid surrounding, is sterile and does not give rise to disease if injected into an animal 14505-12.
- Chairman of the Mediterranean Fever Committee of the Royal Society 14188.
- Difficulty of discovering specific germ causing a disease without recourse to experiments on animals 14221.

Enteric Fever:
- Difficulty of diagnosing, from Malta fever 14395.
- Milk often communicates germs of, 14396-8.

Koch's three postulates to be satisfied before identifying causal bacillus of disease 14222.

Malta Fever:
- Animal experimentation essential to investigation of, 14260, 14452-3, 14493-6.
- Antitoxins prepared for, without much success at present 14374-9.
- Case mortality, proportion compared with typhoid 14380.
- Cases of, on board S.S. Joshua Nicholson arising from goats' milk 14400-4.
- Cases of, on board S.S. St. Nicholas, arising from drinking milk of goats imported from Malta 14283-7.
- Cause of, in other places than Malta has not been investigated closely 14250-2.
- Caused in most cases by drinking goats' milk 14518-21.
- Charts showing monthly prevalence of, 14210-15.
- Claims put forward as to actual discoverer of cause of, 14405-7.
- Commission formed in 1904 to investigate, 14484-5.
- Communicated purely by food and not by inhalation 14465-8.
- Decrease in prevalence of, after adoption of preventive measures in 1906 14381-93.
- Dust, no proof that infection is carried by, 14465-7, 14492-3.
- Epidemiological methods of working at causation of, completely failed 14261.
- Entire elimination of, from army and navy, but native population is still subject 14490-1.
- Experiments in connection with investigation of, were not painful 14363-6.
- Experiments proved that cause of, was not conveyed by air, effluvia, or harbour water, but by goats' milk 14216-19, 14234-45, 14291.
- Goat not only susceptible to, but several species of animals 14253.
- Koch's three postulates satisfied in case of, and *micrococcus melitensis* demonstrated as cause by series of experiments on monkeys 14222-35, 14267-75.
- Maltese are less susceptible than foreigners to, 14255.
- Manner in which *micrococcus melitensis* spreads from goat to goat not exactly known, 14504.
- *Micrococcus melitensis* discovered to be cause of, in 1886 14483-4.
- *Micrococcus melitensis* multiplies in mammary glands of goats 14522-5.
- Nature and average duration of, 14202-210.
- Necessary to inoculate monkeys with suspected micrococcus before identifying it as cause of, 14272.
- Observational methods insufficient for investigation of, 14260-5.
- One attack of, is to a certain extent protective 14256-8.
- Precautions taken in Gibraltar against, 14288-90.
- Preventive methods adopted against, 14369-73.
- Remedies for, must be tested by animal experimentation 14473.
- Results of experimental work in connection with, have been of enormous assistance in stamping out the disease 14201.
- Stamped out after cause was traced to goats' milk 14245-9.
- Statistics of cases after stopping supply of goats' milk 14454-64.

BRUCE, COL. DAVID, C.B., F.R.S., R.A.M.C.—*cont.*
Malta Fever—*cont.*
Tables showing incidence of continued fevers including, among troops in Malta and number of cases invalided 14216-20.
Work in connection with, 14190-1.
Medical knowledge at a standstill without recourse to animal experiments 14196-8.
Member of the Advisory Board, Army Medical Service 14186.
Nagana:
Attempts to cure horses by dosing them with arsenic 14318.
Blood of animals suffering from, injected into dogs, results proving that trypanosome is causal micro-organism 14308-11.
Causal micro-organism is an animal parasite 14306.
Examination of blood of cattle suffering from, demonstrated existence of specific micro-organism 14293-8, 14299.
Experiments proving that bites of tsetse fly were responsible for, 14307-81.
Non-pathogenic in wild animals or man 14419-23.
Trypanosome is transferred from wild to domestic animals by tsetse fly 14418.
Tsetse fly disease and, discovered to be identical 14293-310.
Value of experiments in connection with, and remedy discovered thereby 14312-14.
Work in South Africa in connection with investigation of, 14192.
Wild animals are immune to, 14304, 14310.
Painful experiments, no association with, 14367.
Plague, transmission of, by agency of rat flea has been practically established by means of experiments on animals 14478-82.
Simple continued fever, decrease in prevalence of, in Malta after adoption of preventive measures 14381-93.
Sleeping Sickness:
Anatomical change in brain brought about by, 14329-35.
Atoxyl treatment for, has been useless 14442-3.
Blood and cerebro-spinal fluid of natives suffering from, found by microscopical examination to contain the suspected trypanosome 14500-1.
Blood of natives outside area of, examined and found free from trypanosomes, 14324-5.
Cerebro-spinal fluid examined in investigation of, because of its effect, on nervous system 14326-9.
Cerebro-spinal fluid of natives suffering from, injected into animals and resulting symptoms were those of, 14325-9.
Claim put forward for a streptococcus as cause of, previous to discovery of trypanosome 14424-30.
Could be prevented by removing population from tsetse fly area 14444-8.
Does not cause emaciation 14516-7.
Experiments on monkeys absolutely necessary in the investigation of, 14350-1.
Experiments proving that tsetse flies are carriers of, and as to distribution of the disease 14335.
Filaria perstans at one time asserted to be cause of 14431-5.
Investigations into, on behalf of the Royal Society 14315-14321.
Investigations into, on West Coast of Africa 14321-9.
Monkeys infected with, do not undergo pain 14514-5.
Monkeys inoculated with blood of persons suffering from, and disease thereby produced 14502-3.
Parasite in, closely related to malarial parasites and easily affected by drugs 14319-20.
Previous investigations of, especially by Portuguese 14321.
Reasons justifying conclusion that trypanosome is cause of 14329-335.
Remedies suggested for, and as to their value 14318.
BRUCE, COL. DAVID, C.B., F.R.S., R.A.M.C.—*cont.*
Sleeping Sickness—*cont.*
Trypanosome found in blood as well as in cerebro-spinal fluid of natives suffering from, 14324.
Trypanosome found in cerebro-spinal fluid of 100 per cent. of natives suffering from, 14324.
Tsetse Fly:
Curious distribution of, in Uganda 14344-9.
Experiments in connection with distribution of the trypanosome by, valuable and essential 14351-6.
Manner in which trypanosome is communicated to man from, 14342-3.
Work has been chiefly concerned with investigating cause of, rather than remedies for, various tropical diseases, 14193-4, 14475-6.
BRUNTON, SIR T. LAUDER, M.D., F.R.C.P., F.R.S., Committee of Medical and Scientific Societies, 6777-7185.
Alexis St. Martin, observations on digestive organs of, were of course valuable, but subsequent experimental research has been more so 7028, 7127.
Allegations of cruelty against, *Miss Lind-af-Hageby*, 9430.
Anæsthetics:
Dogs not more liable to succumb to effects of, than other animals 7179-85.
No difficulty in keeping animals under, for lengthened periods 7012-13.
Anti-vivisectionists actuated by praiseworthy but ignorant motives 6848-50.
Blood pressure, study of by means of experiments important 6943-6.
Cardiac disease, knowledge of, increased by results of experiments 6936-9.
Chloroform discovered incidentally, but its true properties investigated by experiments 7118-21.
Cocaine, introduction of 7021-7.
Collected Papers on Circulation and Respiration, by, shows absence of humane teaching *Miss Lind-af-Hageby*, 7379.
Consideration for animals and humanity not lacking in experiments 7105-6.
Continuation of experimental methods indissolubly bound up with advance in medical science 7082.
Curare:
Would not be inclined to allow use of, as anæsthetic 7077-81.
Rarely used since 1876 owing to doubts as to its effects 6918.
as to Use of, previous to existing law 6839-43
Diabetes, whole pathology of, not yet known, but experiments have thrown much light 7124-6.
Diphtheria antitoxin, value and use of, and contradiction of statement as to its paralysing effect 7128-35.
Distinction between observation and experimentation 7083-8.
Dogs are essential for experiments, and prohibition would hinder advance of medical science 7066-71.
Drugs:
Amyl Nitrite:
Experiments as to action of 7140.
Experiments with, upon animals led to its use and success as remedy for angina pectoris 6888-97.
Share in discovery of, as remedy for angina pectoris *A. R. Cushny*, 4800-3, 4894.
Anti-pyretics, discovery of large series, by means of experiments, *Sir L. Brunton*, 7019-20.
Calabar bean, experiments as to action of, upon nervous system 7113-4.
Chemical constitution and physiological action of 7019.
Chloral, use of, could not have been arrived at without Liebreich's experiments 7016-17.
Chloral, opium and morphia all produce insensibility 6902-6.
Chloral hydrate, action of, and share in discovery 7115, 7116.

BRUNTON, SIR T. LAUDER, M.D., F.R.C.P., F.R.S.—*cont.*

Drugs—*cont.*

Digitalis, efficacy of, in pneumonia, doubted 6886-7.
for Dropsy alleviation, discovered by means of experiments 6948-9.
Effect of, varies in different animals, but clear deductions can nevertheless be drawn 7162-7.
Evidence of Mr. Cushny in regard to, agreed with 6939-42.
Increase in number of useful, due to experimentation on animals 7005-11.
Nitroglycerine, value of, in cases of angina pectoris discovered by experiments 7142-6.
Sulphonal, action of, discovered incidentally 7018.

Evidence referred to :

Experience of experimental work 6779-82, 7102-4.
Surgery, views as regards, disagreed with *G. G. Bantock*, 14942-5.

Experiments :

Benefits accruing from injection of oxygen and strychnin 6898-900.
Deductions can be drawn from, allowing for small differences 7072-6.
Demonstration, necessary for students to have proper grasp of physiology and pharmacology 6980-2.
on Digestive organs, practical adjuncts to digestion resulting from, 7028.
Gastric fistula, not a condition involving pain 7029-40.
Hypodermic medication one of the most important results of, 6970-9.
Intestinal, were starting point of abdominal surgery 6952-7.
Medicine has gained enormously by knowledge acquired from, 7014.

Snake Poison :

Calmette's, 7098-02.
Interrupted by regulations of Act of 1876 6937-9.

Temperature fluctuations, knowledge acquired by, 7176-8.

Experiments on the influence of Digitalis on the pressure of blood in the arteries by, publication of, containing account of brutal experiments before 1876, shows want of human feeling *Miss Lind-af-Hageby* 7379-96.

Experiments performed by :

"Baking" of rabbits and cats :
Alleged, *J. W. Graham*, 5844-9, 6131-40.
Confusion on part of Mr. Graham in referring to, 6818.
Explanation and object of, 6785-829.
Maximum temperature in, 6818-26, 6906A-16.
Refutation of charge of cruelty in connection with, 6792-808, 6906A-16, 7089-97.

as to Digitalis and its precise action, *A. R. Cushny*, 4652-67.
on Pigeons, for testing action of aconite 6818-23.
Snake poison, demonstrating therapeutic value of permanganate of potash *Major L. Rogers*, 8040-70, 8217-18.

Hypodermic syringe at first confined to morphia injections, but use now extended 6974-9.
Hydrophobia, Pasteur's system of inoculation has completely revolutionised treatment 7147-57.
Inoculations, regulations with regard to painless, should be relaxed 6991.
Inspectors, increase of undesirable and any outside inspection should be authorised by Home Office 6845-7, 6919 23.
Licensee might be permitted to experiment in unlicensed premises 6992-5, 7046-7.
Measles epidemic in Fiji Islands 6854-60.
Myxedema and cretinism, knowledge and treatment of, resulting from experiments 6958, 7138.

BRUNTON, SIR T. LAUDER, M.D., F.R.C.P., F.R.S.—*cont.*

Oxygen and strychnin in pneumonia, use of, doubted 6900.
Pain, small amount of, inflicted in experiments 7122.
Powers of dealing with disease have increased enormously of late years 6925-35.
as to Sir Frederick Treves' statement concerning inutility of experiments 7110-11.

Snake Poison :

Antidotes for, efficiently tested by experiments on animals 7169-73.
Permanganate of potash a universal remedy against, 6861-5, 6868-9, 6867-70.
Reduction of mortality from, in India owing to use of remedy discovered by means of experiments on animals 6870-9.

Special licence might be more easily procurable 7050-8.
as to Suggested danger of introducing animal material into human body 6965-9.
Susceptibilities to suffering not blunted by witnessing experiments 7059-61.
Thyro-idine obtained from thyroid gland results from experiments 7041-3.
Tuberculosis, nature of, discovered by means of experiments, prospect of stamping out disease 6999-7004.
Vivisection Act, 1876, science to a certain extent impeded by, 6830-38.
Reference, *Miss Lind-af-Hageby*, 9214.

BRYANT, THOMAS, F.R.C.S., reply from, in answer to letter *re* use of "incomplete anæsthesia" *Hon. S. Coleridge*, 10308.

BUCHANAN, SIR GEORGE, reference *W. H. Power*, 4473.

BUDAPESTH, table showing case mortality from diphtheria in, before and after employment of antitoxin treatment *C. J. Martin*, 11711.

BUDDHA, moral teaching of, *J. W. Graham*, 5890.

BUISSON BATH, successful antidote for hydrophobia, merits of, *J. Hughes*, 17235-40, 17252-63.

BUNCH, DR., experiments on submaxillary glands by, *H. Snow*, 2224, 2226.

BURFORD, G. H., M.B., World League of Opponents of Vivisection, 8899-9104.

Antitoxins, possible preparation of, by homeopathic methods, 8997-8, 9033-8.
Belladonna, investigation of, on homeopathic lines, 8922-3.
Cholera, homeopathic remedies for epidemic of, put forward by Hahnemann 9049-52.
Colchicum, investigation of, conducted on homeopathic lines and methods pursued 8913-22.
Digitalis, homeopathic method of investigating action, 8928-35.

Drugs :

Action of, can be accurately ascertained by homeopathic methods, 9085-9.
Homeopathic investigation on men has introduced more than experimental investigation on animals 8993-6.
Experiments on animals for investigation of animal diseases may be justifiable 9011-14.
Homeopathic research, equipment necessary for 9101-4.

Homeopathy :

Drug testing by methods of, on volunteer human beings, should precede experiments on animals 8961-2, 9026-32, 9044-8.
Drug testing by methods of, on volunteer patients 8909-13, 8952-6, 9002-5.
Hahnemann's fundamental principles still embodied in, 8963-9.
Methods of, preferable to experiments on animals since final tests of remedies must always be on man 8942-49.
Remedies introduced into professional use through methods of, 8924-5, 9015-24.

BURFORD, G. H., M.B.—*cont.*

Serum therapy, properties utilised in, might have been used without recourse to animal experiments as in case of tuberculin 8971-80, 9033-7.
Surgical operations, testing of new methods does not require preliminary experiments on animals 9080-4.
Utilitarian results of experiments on animals admitted, though homeopathic investigations are of equal value 9074-6, 9092-5, 9098-9.
Vaccination, its utility admitted, but homeopathic administration of vaccine equally satisfactory 9053 70.
Views expressed by, represent views of majority of homeopaths 8989.

BURNABY, COLONEL, reference *Rev. J. P. Hopps*, 8357.

BURROUGHS AND WELLCOME, MESSRS.:

Alleged illegality of experiments conducted by, *Miss A. L. Woodward*, 8820, 8881-4.
Diphtheria antitoxin now manufactured by, *W. H. Power*, 4540.
Sole manufacturers of adrenalin in England, *E. H. Starling*, 3564.

BURY, MR., reference *Rev. L. S. Lewis*, 8767.

BUSK, DR., Inspector under Act, 1876-86, biassed in favour of vivisection *Hon. S. Coleridge*, 10413.

BUSK, SIR E. H., M.A., LL.B., nominated to give evidence by London University 18092.

BUSS, reference *A. R. Cushny*, 4782.

BUXTON, D. W., M.D., B.S., M.R.C.P., Consulting Anæsthetist to the National Hospital for Paralysis and Epilepsy, Anæsthetist and Lecturer on Anæsthetics in University College Hospital; Society of Anæsthetists 12383-12690.

Anæsthesia:

Animal always killed before recovery from, when required 12467-9.
Definition of different degrees of, 12510-22.
Loss of conjunctival reflex is main indication of surgical, 12414-18.
Marked by progressive effects divided into degrees of narcosis, and definition of such degrees 12389-96.
Progressive loss of sensation to pain through stages of, 12575-6.
Reflex movements occur in all stages of, and indicate no sensation of pain 12400-10, 12525-31.
Reflex movements and movements due to sensations of pain under, require skill to be distinguished 12612-19.
Surgical operations on animals carried out in similar manner to those on human beings as regards, 12684-7.

"Complete":

Can occur without abolition of corneal reflex 12523-4.
Definition of, 12544-56.
Experiments carried out carefully and under, 12573-4.
Must be capable of preventing all shock 12662-6.
Narcotics can induce, 12681.
No difficulty in maintaining, throughout experiment 12679-80.
No doubts as to, during case disputed in Bayliss *v.* Coleridge 12626-8.
Same precautions to ensure, are taken in experiments upon animals as in operations on human beings 12461-6.
Skilled anæsthetist has no difficulty in ascertaining complete, 12419-20.
Symptoms indicating, vary slightly with nature of anæsthetic used 12421-7.

"Incomplete":

Definition of, 12544-56.
Signifies patient is not necessarily free from pain 12437-8.
Suggested different use of term by Dr. Crile in reference to his experiments 12578-82.

"Light": Meaning of term, 12431-5, 12544-56.

BUXTON, D. W., M.D., B.S., M.R.C.P.—*cont.*

Anæsthetics:

Action of, similar upon men and animals, 12439-46.
Actual discovery of, not due to experiments on animals, but knowledge of precise nature of, entirely due to such 12539-40, 12649-50.
Act upon whole central nervous system 12599-604.

Chloroform:

Continuous dose of, can be maintained in operations on human beings 12675-7.
Opium used before discovery of, 12642-7.
and Volatile most affect respiration, and danger of using former 12428-30.

Dogs strapped down after administration of, to keep them in position, 12651-7.
Licence held with view to investigating action of, 12532-37.
Local, used in certain cases 12631-9.
Nature of, used in experiments on animals 12467-9.
Nature of, generally used in surgical practice 12447-56.
Personal experience shows no difficulty in administering, to animals, and ordinary method adopted 12488-500.
Use and action of, largely ascertained by experiments on animals 12457-60.

Cerebral hemispheres, loss of, removes all sensation of pain though there may be reflex actions 12606-12.
Curare, no experience of, but general consensus of opinion is that it is an anæsthetic, 12559-65, 12658-61.
"Pithing" of frogs destroys all sensation of pain 12666-74.

Morphia:

A complete anæsthetic if given in sufficient doses 12474-6.
Dose of, administered before general anæsthetic makes less amount of latter necessary 12502.
Objections to use of, as anæsthetic 12568-9.
Operation not advised on human subject under, alone 12541-2.

Shambles of Science, movements and cries of animals referred to in, probably reflex and not indicative of pain 12588-98.
Strapping of patients in position a frequent necessity in human surgery 12688-90.
Vivisection Act, 1876, animals sometimes unnecessarily killed under regulations of, but cruelty well safeguarded against 12477-87.

BYRNE, W.P., C.B., Principal Clerk, Home Office, 1-306.

Board of Agriculture, Home Office control over experiments conducted by, 295-8.
British Medical Association report as to repetition of experiments for demonstration purposes 195.

Certificates:

Applications for, for physiological and pathological experiments treated similarly 243-5.
Decision as to grant of, rests with authorities mentioned in Sect. II. of Act 241.
Go to release conditions as to anæsthetics, killing of animals and antiseptics 221-3.
May be granted nullifying usual restrictions as to experiments 260-5.
Special, granted to enable further investigation of alleged former discovery 242.
Specification of animals in application for, 250-4.
Table showing number of, granted from 1877-1905 Appendix A. I. Vol. I.
See also under Licences and Certificates *below*.

Evidence referred to:

Antiseptic treatment of wounds, misleading statements as to, *Mrs. K. Cook*, 1801.
Anti-vivisection movement, alleged ridicule of, *Hon. S. Coleridge*, 10449-68.
Licences, condition attached to, *G. D. Thane*, 1326.

BYRNE, W. P., C.B.—*cont.*
Evidence referred to—*cont.*
Painful nature of experiments, conflicting statements made as to Home Office responsibility in deciding, *Hon. S. Coleridge* 10266-75.

Experiments:
All published descriptions of, must be sent to Home Office 95-102, 190, 233-7.
Allegations concerning performance of, by unlicensed persons generally unfounded 305-6.
Care of animals after, conditions for, 255-9.
Carried out under instructions of Board of Agriculture in unregistered places 286-91.
Classification of painful and non-painful, no longer attempted 129-30, 163-4.
Dangerous trades, investigations in connection with, authorised 293.
Home Office, indirectly makes use of, 301.
Inoculations without anæsthetics, period of observation of animal after performance of, doubtful 134-8.
Large number of, duplicated, value or otherwise of results 196-8.
Number of, on each animal 274-7.
for Radium, Röntgen and other ray treatment 118-23.

Experiments without anæsthetics:
Conditions for painless killing of animal if in pain after, and strict enforcement of antiseptic treatment in all cases 10-11, 13.
Universal conditions for, 6-9, 159.
by Unlicensed persons, no steps taken to investigate 185.

Few complaints as to interference of Home Office in legitimate research 194.

Home Secretary:
All proposed new investigations submitted to, 4, 218-220.
May direct experimenters to report in more detail 103.

Inspectors:
Number and duties of, 185-7.
Report of, separate and independent from that of Association for the Advancement of Medicine by Research 175-6.

Licences:
Complaints regarding issue of, 19-23, 140.
Granted on advice of inspector and Association for the Advancement of Medicine by Research, 131-3.
Granted freely in cases where hardly necessary but for protection of applicant 205-7.
Increase in number of, 107-13.
Issue of, to veterinary surgeons controlled by Section II. of Act 70-2.
No complaints of experiments without, 47-8.
Procedure in obtaining, 149-56.
Revoked only four times in thirty years as punitive measure 177-9.
Table showing number of, granted from 1877-1905 Appendix A. I. Vol. I.
See also under Licences and Certificates *below.*

Licences and Certificates:
All names of applicants for, submitted to Association for the Advancement of Medicine by Research 24, 27-29, 281-2.
Applications for, submitted to four authorities 18, 208-12.
Contravention of Act in regard to, 36-50.
Issue of, to foreign applicants 273.
No experiments without, permissible and joint experimenters must both hold, 284-5.
Protection against misuse of, 224-6.
Most investigations require both, 213-15.
Inspectors consulted before issue of, 32-33.
Inspection of, by three officials at Home Office 199-204.
Number of refusals to grant, 166-7.
Memorandum of unsuitable applicants for, 65-9.

BYRNE, W. P., C.B.—*cont.*
Licences and Certificates—*cont.*
Practice of consulting Association for the Advancement of Medicine by Research before issue of, initiated by Sir William Harcourt, 31.
Suspension of, for irregularities 34-40.
Yearly renewal of, 48.

Prosecution of licensee:
Application for, and consequent proceedings 232.
Requires assent of Home Secretary 230-1.

Records of experiments:
Licensee makes his own 188 278-80.
Licensees' occasional neglect, 90-4.
Obligatory, 89.
Possibility of enlarging, 238-40.
Table showing number of experiments performed, 106-28, and App. A. I. Vol. 1.

Licence of certain unregistered places permitted under Act, 79-84.
Registered places, number of, 58-62.

Registration of premises:
Inspector's recommendation required before, 54-6.
Necessary before experiments can be performed there 53-62.
No private houses registered, but occasionally private laboratories, 62, 74-7, 281-2.
For Tuberculosis Commission 88.

Royal Commission on Vivisection, 1875:
Appointment, report of, and subsequent legislation, 1, 140.
Nature of evidence before, 1.

Vivisection Act, 1876:
Breaches of, occurring without knowledge of Home Office, 288-9.
Contraventions of, 246-8.
Contraventions of, generally disclosed by licensee's return of experiments 144-7, 179-83.
Contraventions of, set out in Inspector's annual return 44.
Experiments not restricted before introduction of, and its effect on number of experiments 193, 302-3.
Procedure in regard to administration of, 1-4.
Section 8, regulation of Home Secretary under, attached to each licence, 5, 14.
Section 11, no licence or certificate allowed without signatures of authorities enumerated in, 16.
State of affairs previous to, and then existing law as to experiments on animals 1.
Substance of, 1.

Byculla Jail, results of plague inoculations at, *Sir G. Kekewich*, 20640-75.

Cahn, experiments by, reference, *A. R. Cushny*, 4771.

"Caisson" Disease:
Conditions giving rise to, *G. D. Thane*, 373-6.
Experiments in connection with, *G. D. Thane, E. H. Starling*, 383-4, 1449, 3442, 3902-10.
Experiments in connection with, permitted in unregistered places *G. D. Thane*, 372.
Registration of premises for investigation of, *G. D. Thane*, 1384.
Reference, *G. D. Thane*, 1404.

Calmette, anti-venins, work in connection with discovery of, *Sir R. D. Powell, Sir L. Brunton, Major L. Rogers*, 5679-83, 6866, 6870, 8034.

Calves:
Premises for inoculation of, for vaccination purposes, not under supervision of Inspector, *G. D. Thane*, 1336.
Suggested substitution of, for dogs in some experiments, *Sir J. Russell*, 609-10.
Susceptibility of, to tuberculosis *Miss A. Kenealy*. 6401-11.

CAMBRIDGE:
Diphtheria outbreak, stamped out by careful examination of all cases in contact with disease and use of antitoxin *G. S. Woodhead*, 15528-9.
Experiments performed at, with regard to action of chloroform, vitiated *Col. E. Lawrie*, 16969-74.
Hospital for study of joint diseases opened in, *J. Lorrain Smith*, 18267-74.
Pathological and physiological laboratories at, licensed as a whole *G. D. Thane*, 501-3.
Physiological laboratory, cruelty of experiment on dog at, *Mrs. K. Cook*, 1785-9.
University of:
Evidence on behalf of, *see* LANGLEY, J. N., WOODHEAD, G. SIMS, 15099-15582.

CANCER:
Ample supply of living cells for research in, obtainable from human beings *H. Snow*, 2206-8.
Autositic theory the only valid theory of, *H. Snow*, 2152-6.
Causal organism, claim to have identified, not yet made *H. Snow*, 2246A.
Causal parasite, no evidence of its existence *H. Snow*, 2248-9, 2272-87, 2347-54.
Clinical experience necessary for proper investigation of, *H. Snow*, 2139, 2190, 2194-8.
Clinical characteristics of, and importance of such *H. Snow*, 2301-12.
Communicable only with great difficulty between man and animals *H. Snow*, 2176.
as to Communicability of, between animals of same species *H. Snow*, 2178-81.
Clinical diagnosis of, may be confirmed by microscopical examination *H. Snow*, 2232-5, 2416-8.
Congress suggested for investigation of, *H. Snow*, 2210-2210A.
Diagnosis of, rests on clinical symptoms *H. Snow*, 2250-4, 2403-4.
Disappearance of, in human subject, no authentic cases *H. Snow* 2215.
Distinctions between species and genera of, almost wholly ignored in laboratories, *H. Snow*, 2139.
Error of judgment in diagnosing tumour in dog as *H. Snow*, 2127-34.
Errors in diagnosing external, should be rare *H. Snow*, 2417-22.
Examination of individual cells most important in diagnosing *H. Snow*, 2201-2202.
Exists in some domestic animals *H. Snow*, 2265-7.
Experiments in connection with investigation of, *G. D. Thane, H. Morris*, 465-6, 7726.
Experiments useless in investigation of *H. Snow, G. G. Bantock*, 2121, 2221-3, 2243-6, 14775-7.
Experiments with view of communicating, to human beings *H. Snow*, 2258-9.
Failure in research due to lack of clinical knowledge *H. Snow*, 2344-6.
as to Hereditary nature of, *Miss A. Kenealy*, 5494.
Inoculations, methods adopted *G. D. Thane*, 1688-91.
International Congress, reference *H. Snow*, 2212-14.
Main feature of, is multiplication of cells by divisions *H. Snow*, 2157.
Malignancy of, cannot be decided without separate inspection of individual cells *H. Snow*, 2127.
Many types of, and necessity for differentiating particular kinds *H. Snow*, 2127.
Marrow-infection, discovery of, *H. Snow*, 2141.
in Mice, totally different from that in human beings *H. Snow*, 2105.
Mortality from, increasing *H. Snow*, 2405-9.
Mouse-tumour, study of, does not assist in diagnosing, in human subject *H. Snow*, 2188-9.
Negative results of research *H. Snow*, 2410-12.
Neglect of "control" experiment in investigation of, *H. Snow*, 2127-8.
Not communicable between animals of different species *G. D. Thane*, 1680-3, 1687.
Not easily communicable between human beings *H. Snow*, 2247.
Proper nature of research, *H. Snow*, 2138-9.
Reproductions of various types of, no progress lately made, *H. Snow*, 2175.
Research Fund; *see* IMPERIAL CANCER RESEARCH FUND.
Research laboratory at Liverpool University *G. D. Thane*, 1686.
Serum treatment advocated in France *H. Snow*, 2256-7.

CANCER—*cont.*
Systematic tabulation of knowledge of, necessary *H. Snow*, 2413.

CARDIFF, municipal laboratory at, *G. D. Thane*, 339.

CARDWELL, LORD, Chairman of the Royal Commission on Vivisection 1875 *W. P. Byrne*, 1.

CARLYLE, THOMAS, anti-vivisection cause supported by, *Hon. S. Coleridge*, 10262.

CARPENTER, DR., Vice-president of National Canine Defence League, *J. Hughes*, 17246.

CARROLL, DR.:
Member of United States Commission to investigate cause of yellow fever in Havannah, *W. Osler*, 16531.
Yellow fever contracted by, as result of submitting himself to infection by mosquitoes *G. S. Woodhead*, 15478-9.

CASH, J. THEODORE, M.D., F.R.S.:
Baking experiments on rabbits and cats said to have been performed by, *J. W. Graham, Sir L. Brunton*, 5844, 6079, 6804.
Experiments upon anti-pyretic action of aconite on pigeons by, *Sir L. Brunton*, 6818-23.
Reference, *A. R. Cushny*, 5159.

CASTELLANI, claim put forward for a streptococcus as cause of sleeping sickness by, *Col. D. Bruce*, 14424-30.

CASTRATION:
Anæsthetics sometimes administered for, *S. Stockman*, 2875-9.
Anti-tetanus serum generally injected in operation of, *S. Stockman*, 3281-2, 3287.
Brutal, *Rev. J. P. Hopps*, 8610-11.
Certificates B and F required if performed for scientific purposes, *S. Stockman*, 2884-7.
Could be rendered painless by use of cocaine *W. E. Dixon*, 19071-2.
Doubts as to desirability of, *Rev. J. P. Hopps*, 8435-46.
Health of animal not affected by operation of, *G. D. Thane*, 471.
Method of performing, *S. Stockman, M. S. Pembrey, F. Hobday*, 2873-87, 14162-9, 16401-13.
Necessity of, admitted *Hon. S. Coleridge*, 11582-6.
Objection to, if not for animals' good *Rev. L. Lewis*, 8664-84.
Pain involved in, *S. Stockman*, 3026-31.
Should be performed under anæsthetics *J. W. Graham, Miss Lind-af-Hageby, Hon. S. Coleridge*, 5928-31, 6111-13, 9281-4, 11332-50.
Reasons for not including, in same category as experiments on animals *Sir G. Kekewich*, 20791-802.

CATHODE RAYS, discovery of Röntgen Rays from, *E. H. Starling*, 3442.

CATHOLIC UNIVERSITY SCHOOL OF MEDICINE, IRELAND, experiments in connection with, *Sir T. Stoker*, 776-7.

CATTLE DISEASES, *see* particular names of diseases.

CATS:
"Baking" of:
Consisted merely in maintaining temperature during narcosis *Sir L Brunton*, 6906A-16.
Explanation of experiment and maximum temperature involved *Sir L. Brunton*, 6785-829, 6818-26, 6792-808, 7089-97.
Said to have been performed *J. W. Graham*, 5844-9.
Certificates E or EE required for experiments on, *G. D. Thane*, 423.
Condition of, after experiment not seriously painful, and in cases of great pain killed *G. D. Thane*, 1209-1215.
Condition of those experimented on by Dr. Head *G. D. Thane*, 1256.
Curare illegally used in experiment on, *Miss Lind-af-Hageby*, 9388-97.
Difficulty in housing large animals in towns makes it necessary to use, *Sir J. Russell*, 619.

Cats—*cont.*

Dogs preferable to, for experiment purposes *A. R. Cushny*, 5086-7.
Employed in experiments for investigating action of drug on intestine and stomach *A. R. Cushny*, 4824.
Experiments not sanctioned on, which could be done on other available animals *G. D. Thane*, 1197-1205.
Experiments on, involving cruelty *Mrs. K. Cook*, 1790, 1801-7, 1910-11, 1919.
Experiments upon brains of, and their value *F. Gotch*, 13569-70.
Experiment performed on nerves of, *G. D. Thane*, 1247-59.
Eyes of, inoculated with diphtheria bacillus and consequent suffering *Mrs. K. Cook*, 1919.
Gastric fistula made under anæsthetics, but without necessary certificates *W. P. Byrne*, 38-40.
Incompletely anæsthetised during experiment *Miss Lind-af-Hageby*, 9157-97.
Ink injected into eyes of, *Mrs. K. Cook*, 1913-4.
Inspected after experiment involving removal of portion of brain and as to painless condition *Sir J. Russell*, 649-54.
Necessity in some cases of experimenting upon, *Sir J. Russell*, 608.
Prevention of sale of, for laboratory purposes *G. D. Thane*, 1436-7.
Rapid recovery of, from anæsthetics *Sir J. Russell*, 540.
Scandal in connection with the Wellcome Research as to obtaining, for experimental purposes *Sir J. Russell*, 682.
Snake poison injected into, caused severe pain *Sir J. Russell*, 543.
Susceptibility of, to pain makes it desirable to minimise experiments upon, *Sir J Russell*, 607.
Thyroid gland of, excised and followed by tetany *G. D. Thane*, 1233.

Cazin, Professor, reference, *H. Snow*, 2129.

Cerebro-spinal Meningitis:

Experimental methods essential to knowledge of, *J. Glaister*, 12852-61.
More facilities necessary for investigation of, *J. Glaister*, 13003-5.
Outbreak of, and methods pursued by Local Government Board *W. H. Power*, 4304-5.
Propagation, experiments of little value as regards showing means of, *J. Glaister*, 12943-5.
Statistics of outbreak of, in Scotland during 1907 *J. Glaister*, 12852.

Cerna, David, reference, *Miss Lind-af-Hageby*, 9266.

Certificates:

Abolition of, need not eliminate advisory bodies concerned in issue of, *Sir V. Horsley*, 15775.
Amendment in method of granting, desirable *E. H. Starling*, *A. R. Cushny*, 3733, 3981, 4945-7, 5142-6.
Applications for, for physiological and pathological experiments treated similarly, *W. P. Byrne*, 243-5.
Applications for, carefully considered *Sir R. D. Powell*, 5736-9.
Applications for, not signed without knowledge of applicant and proposed experiment *E. H. Starling*, 3739-43.
Applications for, referred to inspector, *W. P. Byrne*, *G. D. Thane*, 32-3, 387-95.
Association for Advancement of Medicine by Research consulted before granting, *W. P. Byrne*, 24, 27-9.
Authorities concerned with granting of, *G. D. Thane*, 1483-4.
Conditions illegally assumed by successive Home Secretaries to modify character of, *E. A. Schäfer*, 10172.
Contravention of Act in regard to, *W. P. Byrne*, 36-50.
Delay in granting, complaints *W. P. Byrne*, *E. A. Schäfer*, *F. Gotch*, 216, 10172, 13910-12.
Delay in issue of, sometimes occasioned by necessity of consulting Association for Advancement of Medicine by Research *Sir J. Russell*, 566.
Delay in obtaining fresh, and advisability of substituting a comprehensive licence for, *W. E. Dixon*, 19025.

Certificates—*cont.*

Difficulties arising from restriction of number of experiments in, *Sir V. Horsley*, 15767-70.
Difficulty on part of licensees in understanding powers conferred by, *Sir J. Russell*, 535.
Disallowal of, by Home Office *W. P. Byrne*, *G. D. Thane*, *E. H. Starling*, *F. Gotch*, 166-7, 1098-1100, 1154-8, 3948-51, 13724-31.

Dispensing with Anæsthetics:

Home Office Annual Return suppresses names of those who sign, *Hon. S. Coleridge*, 10573-602.
May be granted, *W. P. Byrne*, *G. D. Thane*, 221-3, 260-5, 440.
Misleading answer in House of Commons to question as to number of persons holding, *Hon. S. Coleridge*, 10317-29.
Principle of protection to animals is nullified by, *Mrs. K. Cook*, *Sir G. Kekewich*, 2000-7, 20399-405, 20407.
See also Certificate D.

Foreigners should not be put under a disadvantage with regard to obtaining, *Sir J. F. Moulton*, 12751-4.
Go to release conditions as to immediate killing of animals and antiseptics *W. P. Byrne*, 221-3.
Heads of departments should have more liberty with regard to the range of work stipulated in, *J. Glaister*, 12885-7.
Home Office do not enquire into personal character or humanity of applicant for, *Hon. S. Coleridge*, 10264.
Inspection of, by three officials at Home Office *W. P. Byrne*, 199-204.
Inspector has responsibility of advising Home Secretary as to grant of, *G. D. Thane*, 1466-8.
Inspector's opinion should not overrule advice of authorities recommending grant of, *E. A. Schäfer*, 10172.
Issue of, to veterinary surgeons *W. P. Byrne*, 70-2.
Lapse of, experiments performed after, *G. D. Thane*, 477.
and Licences, important distinction between *W. P. Byrne*, 25.
Licensee's form of return to Home Office could be expanded so as to include all details supplied by, *Sir V. Horsley*, 15767.
Medical qualifications, absence of, should not disqualify applicant *C. J. Martin*, *Sir J. F. Moulton*, 12148-52, 12751-4, 12768-74.
Memorandum of unsuitable applicants for, *W. P. Byrne*, 65-9.
Nature and usefulness of experiments investigated by inspector before issue of, *G. D. Thane*, 422-4, 439.
Necessity of applying for, even in cases of painless inoculations, *W. E. Dixon*, 19017-20.
Not allowed for severe operation without anæsthetics, *W. P. Byrne*, 160.
Number of, in force in Ireland *Sir T. Stoker*, 765-7.
Pain inflicted in experiments under, when animal is allowed to recover from anæsthetic is that which occurs in surgical operation *J. N. Langley*, 15102-108.
Pressure put on Irish Chief Secretary as to granting of, disallowed *Sir T. Stoker*, 932.
Procedure in issue of, *G. D. Thane*, *Sir J. Russell*, *E. H. Starling*, 420, 737, 4184-8.
Protection against misuse of, *W. P. Byrne*, 224-6.
Refusal or modification of, on various grounds *Sir J. Russell*, 519-20.

Renewal of:

Yearly *W. P. Byrne*, 48.
Doubtful procedure as to, *Hon. S. Coleridge*, 10590-2.

Review of all, at close of year before renewal *G. D. Thane*, 480.
Separate, for experiments on cold-blooded animals unnecessary *Sir V. Horsley*, 16275-9.
Should be dispensed with, and licence drafted, so as to cover all details at present stated in, *Sir V. Horsley*, 16016-25, 16090.

Signatories:

Contradictory statements by Home Office as to, *Hon. S. Coleridge*, 11092-7.
Instance of inspector being one, *Hon. S. Coleridge*, 10418-22.

CERTIFICATES—*cont.*

Signatures of authorities enumerated in Act, Section 11, must be attached to, *W. P. Byrne*, 16.
Special, to enable further investigation of alleged former discovery, *W. P. Byrne*, 242.
Specification of animals required with all, *W. P. Byrne, Sir J. Russell*, 250-4, 628-32.
Unnecessary, and only complicate administration of Act *Sir V. Horsley*, 15756.

A:

Alteration in wording of conditions since 1888 and inhumane condition at present *Hon. S. Coleridge*, 10274-5.
Before 1888 no conditions attached to, and therefrom arose possibilities of torture *Hon. S. Coleridge*, 10272-3.
Decision to grant, rests with authorities mentioned in Section 11, *W. P. Byrne*, 241.
Experiments on cold-blooded animals require, *F. Gotch*, 13893-7.
Experiments under, followed by great pain *G. D. Thane*, 457.
Heads of departments should have wide instead of restricted form of, and reasons *J. Glaister*, 12952-5.
Increase of experiments under, *W. P. Byrne*, 114-16.
Insufficient for some important experiments which require to be done without anæsthetics *F. Gotch*, 13754-60.
Licensees frequently guilty of irregularities by administering anæsthetics under, *G. D. Thane, Sir J. Russell, Sir V. Horsley*, 477, 555-6, 15757-60.
Licensees making use of, in place of Certificate B, guilty of irregularity *W. P. Byrne*, 247-8.
Local anæsthetics might be allowed with, but possible difficulty *Sir J. Russell*, 555-6, 624-7, 730-1.
Mildness of experiments under, suggest advisability of permitting use of cocaine, *Sir J. Russell*, 622-4.
Number of experiments under, should not be limited *J. Glaister*, 12918-20.
Should be extended to skilled assistants working under licence *H. Morris*, 7805-9.
Starvation experiments could not be conducted without, *G. D. Thane*, 1319.

A2; issue of, and as to range of work permitted under, *J. Glaister*, 12921-8.

B:

Abolition of, desirable *Hon. S. Coleridge*, 11468-522.
Admits of large amount of pain and suffering to animals *Hon. S. Coleridge*, 10559-64, 11053-70.
"Advancement of physiological knowledge" sufficient certification in applying for, *E. H. Starling*, 4005-16.
Ambiguity in wording of, *J. R. Bradford*, 17785.
Ambiguity in wording of, none as suggested by Mr. Coleridge *Sir V. Horsley*, 15945-9.
Anæsthetics imperative under, *Sir J. Russell*, 557.
Anæsthetics used throughout experiments under, *J. N. Langley, Sir V. Horsley, J. R. Bradford, J. Lorrain Smith*, 15112-3, 15302-7, 15761, 17745-6, 18368-9.
Antivivisectionists' persistent misrepresentation of terms of, *Sir V. Horsley*, 15729.
Curare never administered with anæsthetics under, *E. H. Starling*, 4056-61.
Decision to grant, rests with authorities mentioned in Section II. *W. P. Byrne*, 241.
Demonstration experiments performed under, and animal not allowed to recover *Sir V. Horsley*, 15621-7.
Desirable to remove clause forbidding surgeons to acquire skill by experiment under, *E. H. Starling*, 4082-91.
Development of physiology likely to necessitate increase in applications for, *E. H. Starling*, 4119.
Experiments performed under, and meaning of term "initial operation" *F. Gotch*, 13901-9.
Experiments under, not necessarily followed by pain *G. D. Thane*, 471.

CERTIFICATES—*cont.*

B—*cont.*

Experiments witnessed under, *G. D. Thane*, 1639.
Gelding experiment for scientific purposes would require, and F *S. Stockman*, 2884-7.
Home Secretary may reduce number of experiments under, on advice of inspector *Sir J. Russell*, 633-4.
Inoculation of rabbit for rabies requires, *S. Stockman*, 2590-7, 2858-70, 2912-4.
Inspectors do not examine all animals in laboratories which have been operated on under, *Hon. S. Coleridge*, 11526-30.
Length of operations under, *Sir J. Russell*, 545.
Nature of experiments under, *G. D. Thane*, 467.
No contravention of Act for animal already used under, to be further operated on under *C. G. D. Thane*, 1560-2.
Obligation to kill animal after experiment under, a hardship *Sir J. Russell, G. D. Thane*, 557-61, 1180-5, 1301-2.
Objection to experiments under, on ground of pain involved *Hon. S. Coleridge, C. R. J. A. Swan, Sir F. Banbury*, 11538-47, 19302-9, 19714-20.
Pain subsequent to experiments under, *G. D. Thane, A. G. Scott*, 474-6, 1550, 19792-7.
Useless for demonstration experiments, *Sir J. Russell*, 614.

B, EE:

Nature of experiments under, *G. D. Thane*, 467, 471.
No general statement can be made as regards pain after operations under, *G. D. Thane*, 474-6.

B, F:

Experiments under, not necessarily followed by pain, *G. D. Thane*, 471.
Nature of experiments under, *G. D. Thane*, 467.
No general statement can be made as regards pain after experiments under, *G. D. Thane*, 474-6.

C:

Annual number of experiments under, *Sir T. Stoker*, 934-8.
Applications for, almost exclusively from physiologists *Sir T. Stoker*, 872.
Cases in connection with issue of, *Sir T. Stoker*, 793-5.
Demonstration experiments require, *Sir J. Russell*, 611-15, 665-6.
Difference of opinion between Chief Secretary in Ireland and inspector only in connection with, *Sir T. Stoker*, 789-90.
Experiment under, sometimes witnessed by inspector, *Sir J. Russell*, 567-8.
Inspector's advice with regard to issue of, frequently overruled *Sir T. Stoker*, 796.
Memorandum furnished by inspector for Ireland against use of, *Sir T. Stoker*, 760-1.
No contravention of Act for animal already used under B to be further operated on under, *G. D. Thane*, 1560-2.
Objections to, *Sir T. Stoker*, 860-904.
Objection to enforced destruction of animal operated on under, *G. D. Thane*, 1757-62.
Unnecessary, *Sir V. Horsley*, 15761.
Use of, necessary for effective teaching *G. D. Thane*, 1121.

D:

Never used, *E. H. Starling*, 3851-3.
Repetition of experiments desirable because of the introduction of new methods *F. Gotch*, 13761-77.
Unnecessary, and contrary to progress of scientific work *Sir V. Horsley*, 15761-2.

E:

Ambiguity in wording of, *J. R. Bradford*, 17787-8.
EE substituted for, in 1888 *Sir V. Horsley*, 15762-3.
Not in itself operative *Sir J. Russell*, 630.

CERTIFICATES.—*cont.*

E—*cont.*

Originally liable to misapplication, and refusal of a previous Home Secretary to reconstruct it *Sir V. Horsley*, 15762-5.

Required for operation on dogs or cats *W. P. Byrne, G. D. Thane*, 252, 254, 423.

EE :

Required for experiments on dogs or cats, *G. D. Thane*, 423.

Substituted for Certificate E since 1888 *Sir V. Horsley*, 15762-3.

F :

Gelding experiments for scientific purposes would require Certificate B and, *S. Stockman*, 2884-7.

Not in itself operative *Sir J. Russell*, 630.

Required for operations on horses, asses, or mules, *W. P. Byrne, G. D. Thane*, 252, 423.

Unnecessary, *Sir V. Horsley*, 15765-7.

See also under VIVISECTION ACT, 1876, Suggested Amendments.

CERVELLO, paraldehyd, effect of, on animals investigated by, *A. R. Cushny*, 4733.

CHANTEMESSE, PROFESSOR, reference, *J. W. Graham*, 6103.

CHELSEA, laboratory at, held by Lister Institute of Preventive Medicine, *G. D. Thane*, 344.

CHEYNE, W. WATSON, F.R.S., C.B., table prepared by, showing discoveries consequent upon Lister's work *H. Morris*, 7673, 7841, 7848.

CHICAGO, opinion of Medical Officer at, as to value of diphtheria antitoxin, *C. J. Martin*, 11763, 11766-7.

CHICAGO UNIVERSITY, experiments in, *J. W. Graham*, 5871-3.

CHOLERA :

Antitoxin, *see under* SERUM THERAPY.

Comma bacillus now accepted as distinctive test of, *W. H. Power*, 4427-9, 4495-8.

Experiments upon, still being conducted, *Sir J. Russell, Sir T. Stoker*, 575-6, 844-5.

Foreign Office must notify to other Governments all occurrences of, in this country *W. H. Power*, 4301.

Local Government Board must notify all cases of, to Foreign Office *W. H. Power*, 4301.

Homeopathic remedies for, put forward by Hahnemann *G. H. Burford*, 9049-52.

CHOVEAU, M., smallpox inoculation of horses and cows in France practised by, *W. H. Power* 4486-7.

CHRISTIAN SCIENTISTS, considerable number of, in America *A. R. Cushny*, 5248.

CHRISTIANI, reference, *Miss A. Kenealy*, 5288.

CHRISTISON, SIR R. :

Physotigmim, action of, examined on himself without knowledge of its effect and almost fatal result *A. R. Cushny*, 4789-93, 4889-90.

Share taken by, in introduction of hypodermic medication *Sir L. Brunton*, 6972.

References *A. R. Cushny, Sir L. Brunton*, 5149, 6972, 7163.

CHURCH ANTI-VIVISECTION LEAGUE :

Evidence on behalf of, *see* LEWIS, REV. L. S., and WOODWARD, MISS A. L., 8629-8898.

Income of, *Hon. S. Coleridge*, 10260.

CHURCH, SIR W. S., BART., K.C.B., M.D., reference, *C. R. J. A. Swan*, 19277, 19278.

CLELAND, JOHN, M.D., opinion given before last Royal Commission as to insensibility of animals to pain *S. F. Smith*, 13049-52.

CLINICAL SOCIETY OF LONDON, therapeutical contributions classified in presidential address to, *Miss A. Kenealy*, 6165.

CLOSE, *The late* DEAN, anti-vivisection cause supported by, *Rev. L. S. Lewis*, 8738.

COBBETT, DR., diphtheria outbreak at Cambridge controlled by precautionary methods and use of antitoxin by, *G. S. Woodhead*, 15528-9.

COBBE, MISS FRANCES POWER :

Experiments on cats said by, to have involved roasting to death, *Sir T. L. Brunton*, 6788.

Extract from letter to, *Rev. L. S. Lewis*, 8722.

COFFEY, PROFESSOR D. S., Catholic University School of Medicine, Dublin, Certificate C originally refused to, but subsequently granted against advice of inspector, *Sir T. Stoker*, 794A.

COHEN, DR. S. SALIS, views of, referred to *Miss A. Kenealy*, 5280.

COHNHEIM, experiments by, reference *Miss A. Kenealy, Sir H. R. Swanzy*, 5301, 9793.

COKE, LORD, statement by, as to interpretation of Acts of Parliament *Hon. S. Coleridge*, 10969.

COLAM, J., late Secretary to the Royal Society for the Prevention of Cruelty to Animals, evidence given by, before previous Royal Commission *A. G. Scott*, 19602-5.

COLCHESTER, municipal laboratory at, *G. D. Thane*, 339.

COLD-BLOODED ANIMALS :

Act should not have reference to, *E. A. Schäfer, F. Gotch, Sir V. Horsley*, 10187-8, 13824, 13864-9, 15952-4, 16267-74.

Experiments upon, require Certificate A *F. Gotch*, 13893-7.

Inclusion of, in Act at present hinders physiological research *J. N. Langley*, 15400-5.

Separate certificates for, unnecessary *Sir V. Horsley*, 16275-9.

Wiser to have separate certificates for, than to exclude them from Act *J. N. Langley*, 15399.

COLERIDGE, *The late* LORD CHIEF JUSTICE :

Anti-vivisection cause supported by, *Rev. L. S. Lewis*, 8726.

Important judgment of, in "Mignonette" case distinguishing between law and morality *J. H. Levy*, 18523-6.

COLERIDGE, THE HON. STEPHEN, Hon. Secretary to the National Anti-Vivisection Society, 10251-11629, 19842-983.

Abolition of all forms of cruelty must be proceeded with by degrees and no simple principle would discriminate 11351-70.

Anæsthesia, slight, meaning of term 10385-411, 11548-61.

Anæsthetics, meaning of term, 10385-411.

Anti-vivisection cause :

Quotation from *Idler* in support of, 10551.

Supporters of, 10261.

Anti-Vivisection Hospital, National Anti-Vivisection Society had no active share in promoting, 19905-19907.

Anti-Vivisection Societies, incomes of the various, 10260.

Anti-vivisectors' plea for consideration of their mental suffering, 10265.

Bill Prepared by :

Animal to be killed if found to be suffering after experiment 10830-42, 11261-7.

Bacteriological experiments upon eyes to be prohibited 10843-6, 11268-71.

Certificate A to be retained 10752.

Certificate B to be abolished and general anæsthetics insisted on throughout experiment 10809-18, 11231-49, 11468-522.

Certificates :

Signatories of, to be published 10847-52.

Signatories to have proposed *status* 10894-8.

To be granted by Home Office after inquiry as to humanity of applicant, 11210, 11213-26.

Curare to be prohibited, 10823-9.

Demonstration experiments to be prohibited 10819-22.

COLERIDGE, THE HON. STEPHEN—*cont.*

Bill prepared by—*cont.*

Experiments for purpose of attaining manual skill prohibited, as by present law, 11289-94.
Infliction of pain on animals for trade purposes not within purview of, 16396A-412.

Inspectors:

Reliance placed on, to safeguard animal from illegal treatment, 10736.
Reputation for humanity to be considered in appointment of, 11535-7.
To be appointed by Home Office 11208-9.
To be present at all experiments except inoculations and protection to animals thus afforded 10755-8, 11211, 11250-60.

Inspector to see that animal is killed after inoculations if found to be suffering 10765-7.
Letter from, to Mr. Ram, with reference to insertion of qualifying adjective to "pain" in, 19975-8.

Licences:

Time and place of experiment to be specified in each, 11272-5.
To be granted by Home Office 11208.
To specify only one experiment or a series of not more than six 11413.

Main provisions of, 10695-707.
No distinction to be made between vertebrate animals 10754.

Prosecutions:

Extension of time limit to two years, or proceedings must be instituted within six months of licensee's publication of experiment 11276-85.
Provisions obliging Home Secretary to institute, for offences 11115-23.

Suggested alterations made in, 11071.
Utilitarian object of experiments recognised in, 11227-30.
Will not hamper legitimate experimentation 10885-9.
Would amend present Act, 10749.

Castration:

Admittedly painful, and should be conducted under anæsthetics 11332-50.
Necessity of, 11582-6.

Certificates:

A:

Alteration in wording of conditions since 1888 and present inhumane condition 10274-5.
Before 1888 no conditions attached to, and therefrom arose possibilities of torture, 10272-3.

B:

Admits of large amount of pain and suffering to animals 10559-64, 11538-47.
Inspectors do not examine all animals which have been operated on under, 11526-30.

Renewal of, doubtful procedure as to, 10590-2.

Circular letter issued by, enclosing German catalogue of surgical instrument maker misrepresenting use of anæsthetics in England *Sir V. Horsley*, 15728-9.
Curare should be prohibited 11575.

Demonstration experiments:

Demoralising and bad for students 11371-96.
Feeling deterring students from complaint of, 11433-52.

Diphtheria-antitoxin, statistics hardly point to beneficial effect of, 10755-8.
Evidence of, printed and circulated by National Anti-Vivisection Society 19956-66.

Evidence of Mr. Gotch:

as to Acceptance of statement that no vivisection experiments were performed last year in Physiological Laboratory, Oxford, 19933-54.
Keble College undergraduates' case unfairly represented 19852-63.

COLERIDGE, THE HON. STEPHEN—*cont.*

Evidence of Sir V. Horsley:

Allegations with reference to circulation of catalogue of instruments unfounded 19877-9.
in Bayliss *v.* Coleridge libel case 19919-29.
Deception alleged with reference to letters to surgeons for definition of "incomplete anæsthesia" unfounded 19930-2.
Statement that permission to vivisect in unlicensed premises was not given by Home Office incorrect 19908-18.
Muzzling Order, allegation that National Anti-Vivisection Society opposed is untrue 19847-51

Evidence of Sir R. D. Powell criticised 19890-4.

Evidence referred to:

Certificate B:

No ambiguity in wording of, as suggested *Sir V. Horsley*, 15945-9.
Persistent misrepresentation of terms of, *Sir V. Horsley*, 15729.
Suggestion that anæsthetics are not used throughout experiments under, quite baseless *Sir V. Horsley*, 15761.
Term "initial operation" wrongly interpreted *F. Gotch*, 13904-9.

Charges against the Home Office baseless *Sir V. Horsley*, 15729.
Dr. Crile's experiments, statements criticised *Sir V. Horsley*, 15688-728.
Control of animals during experiments, misrepresentation of evidence during Bayliss libel case as to, *Sir V. Horsley*, 16010-11.
Demonstration experiments wrongly said to have demoralising effect upon students *Sir V. Horsley*, 15606.
Experiments of Messrs. Dixon and Brodie wrongly alleged to have been performed upon unanæsthetised animals *W. E. Dixon*, 19012-15.
Keble College undergraduates, actual facts of correspondence, and their subsequent withdrawal of charge *F. Gotch*, 13668-701.
Letter to surgeons *re* meaning of term "incomplete anæsthesia," deceptive and misleading *Sir V. Horsley*, 15728.
Mansion House meeting, actual facts in connection with incorrectly put forward *Sir V. Horsley*, 15594-601.
Pasteur Institute, statements with regard to proposal to institute, in England, contrary to fact *Sir V. Horsley*, 15672.
Dr. Shaw's experiments, allegation concerning, untrue, *J. Lorrain Smith*, 18402-23.
Statement that Home Office gave permission for vivisection to be carried out in unlicensed place utterly baseless *Sir V. Horsley*, 15735-43.

Experiments:

Dr. Bayliss', evidence of animal struggling in, 10720-2.

Dr. Crile's:

Description of, 10265, 19979-80.
Discrepancy between account of, in Home Office report and experimenter's description in *Surgical Shock* 10301.
Letter to surgeons requesting corroboration of Home Office statement as to operations under "incomplete anæsthesia," and replies received 10305-313, 10979-91, 10991-11043.
Reported as painless by Home Office 10289-300.
Subsequent explanation to Home Office not accepted 10938-51.

Dixon and Brodie's, torture involved in, 11562-9.

"Drowning":

Condemnation of Home Office for permitting, 10915-37.
Cruelty of, 10264-5.
Questions in House of Commons asked as to, 11049-53.

"Fasting," Dr. Noel Paton's, 11044-8.

COLERIDGE, THE HON. STEPHEN—*cont.*

Experiments—*cont.*

Feeding :

Absurdity of obtaining licence for feeding kittens on cow's milk 10565-9.

Dr. Grünbaum's, illegality of 11125-34.

Sleeping sickness, suffering demonstrated by picture of dog experimented on at Khartoum 11071-81.

Dr. Shaw's, sanctioned by Irish Office 11135-9.

Professor G. N. Stewart's operations, possible cruelty in 11053-70.

Ferrier-Yeo case, 10555-7.

Guide to the Charitable by, points out diversion of hospital funds to medical schools 10261.

Has no objection to benefitting from results of vivisection, which do not involve fresh suffering 10740, 10760-1.

Home Office :

Cases in which alleged illegality has been defended by, 11150-91.

Charges against :

Animals not protected from unjustifiable suffering 10266-75.

Annual Parliamentary Return suppresses names of those who sign certificates dispensing with anæsthetics 10573-602.

Annual Return asserts that no experiments entail pain 10640-41.

Appointment of biassed inspectors 10412-30.

Certificates signed by inspector 10418-22.

"Chemist and Druggist" case, breach of law by Dr. Grünbaum in demonstrating without proper certificates 10330-70.

Evasive and insufficient replies to plain questions on administration of the Act 10614-39.

Exemption of Sir Victor Horsley's experiments from inspection 10645-56.

Improper consultation with Association for the Advancement of Medicine by Research, 10675-91.

Misleading answer in House of Commons to question as regards number of persons holding certificates dispensing with anæsthetics 10317-29.

Officials have defended vivisectors from criticism and case of Dr. Crile 10275-314.

Permission to Sir Victor Horsley to experiment in unlicensed place objected to, 11082-90.

Proceedings in connection with experiments performed by Messrs. Dixon and Brodie 10370-81.

Shielding of licensees known to have broken the law 10603-13.

Starvation of animals assumed to be painless 10514-48.

Twelve different, 10262-4, 11205-7.

Conflicting statements as to responsibility of, in deciding painful nature of experiments 10270-2.

Contradictory statements by, as to signatories of certificates 11092-7.

Has constituted itself the spokesman of vivisectors and made disingenuous statements 10431-513.

Has never acted contrary to advice of Association for the Advancement of Medicine by Research 11049.

No inquiry made by, into personal character or humanity of applicant for licence and certificate 10264.

Permanent officials more responsible than Home Secretary 10276-83, 10899-912.

Policy of consulting Association for the Advancement of Medicine by Research objected to, 10265, 10909-14, 11098-109, 11615-21.

Home Secretary's answer to question dealing with number of experiments actually witnessed by inspector 10559.

Hospital Funds, diversion of, to Medical Schools protested against 10260-1.

COLERIDGE, THE HON. STEPHEN—*cont.*

Inoculations, pain can never be entirely eliminated from, 11603-5.

Muzzling Order, National Anti-Vivisection Society never opposed, but has been in favour of, 19847-51, 19901-19905.

Inspectors :

Dr. Poore, objection to, 10974-8.

Present system of inspection extremely imperfect 11572.

Keble College Undergraduates :

First correspondence with, 11444-67.

Unfair accusations against personal representation of case 19863-76.

Letter from Duke of Portland repudiating suggestion to employ lost dogs for vivisection purposes 11624-6.

Letters written by, to surgeons on subject of "incomplete anæsthesia" 10979-91.

Libel action brought against, and disclosures during evidence 10264.

Licences, doubtful procedure as to renewal of, 10590-2.

Mansion House Meeting for establishing a Pasteur Institute, originally intended to be public, but private conditions enforced by action of, 19880-19901.

Morphia, not a general anæsthetic, 11576-80.

National Anti-Vivisection Society :

Achievements of, 10260.

Aim of, to regulate vivisection 11140-4.

Castration, not within scope of, 11295-7.

Constitution and membership 10254-8.

Journal published by, 11598-600.

Letter from Queen Victoria sympathising with views of, 10714-15.

Object and aims of, 10261.

Would welcome complete abolition of vivisection if within region of practical politics 11570-1.

Pain :

Dr. Klein's admission of indifference to, before previous Royal Commission is typical of vivisector's attitude 10655-74.

Objection to experiments on grounds of infliction of, 10708-10, 10776-99.

Risk of licensees becoming callous towards infliction of, 11614.

Press, desirability of permitting attendance of, during sittings of the Commission 10711-13.

Royal Commission on Vivisection, 1876, humane recommendations 10265.

Torture, definition of, from point of view of animal 11302-13.

Unacquainted with experiments from personal knowledge 10768-72.

Vivisection Act, 1876 :

As administered has shielded the vivisector 10264.

Grounds of objection to, 10261.

Majority of licensees have contempt for, 11425-32.

Meaning of, may be interpreted by Report of previous Commission 10968-72.

No limit to suffering that may be inflicted under, 10716-19.

No protection afforded to animals by, 10264.

Precludes general public from witnessing experiments 11192-204.

Prosecutions under, desirability of extending time limit 11110-12.

Responsibility placed on Home Secretary by, has been abused 10264.

Secret administration of, 11091.

Section 13, no application to prosecute licensees has been made under, 11145.

Section 21, impossibility of prosecutions under, because of time limit 11146-9.

Should be amended so as to prevent serious pain 11314-31.

Viewed with contempt by physiologists, 10954-61.

COLLIER, MR., reference *Major L. Rogers*, 8220.

COLLINGS, RIGHT HON. JESSE, M.P., reply to Mr. S. MacNeill in House of Commons as to allegations concerning Dr. Hime's experiments *Miss A. L. Woodward*, 8804.

COLONIAL OFFICE, laboratory owned by, for purpose of scientific investigation disapproved of, *J. Hughes*, 17507-11.

COLOGNE, Local Government Board vaccine lymph derived in first instance from, *W. H. Power*, 4478.

COMMISSION ON PLAGUE IN INDIA, 1901:
- Appointed by Egyptian Government to investigate plague in Bombay and report against use of plague serum *Sir G. Kekewich*, 20485-90.
- Constitution of, and investigations in connection with Haffkine's prophylactic *C. J. Martin*, 12080-95, 12134-6.
- Investigations and report of *C. J. Martin*, 11654-6, 12291-3.

COMMITTEE OF MEDICAL AND SCIENTIFIC SOCIETIES:
- Evidence on behalf of, *see* STARLING, E. H., CUSHNY, A. R., BRUNTON, SIR L., MARTIN, C. J., BRADFORD, J. R., HEAD, H., BRUCE, COL. D., 3430-4280, 4640a-5274, 6777-7185, 11630-12382, 17621-17800, 17801-17995, 14184-14529.
- Object of forming, *E. H. Starling*, 3727-32.

CONDENSED MILK CO., IRELAND, experiments in connection with bovine tuberculosis performed at Limerick by, *Sir T. Stoker*, 765.

COOK, MRS. K. ("MABEL COLLINS"), Chairman of the Executive Committee of the Parliamentary Association for the Abolition of Vivisection 1780-2097.
- Abolition of vivisection advocated, and scope of experiments included, 1938-46, 1956-8, 1980-97.
- Anæsthetics, no confidence in efficiency of, employed 2018.
- Antiseptic treatment of wounds does not remove pain 2073-8.
- Antiseptic precautions not compelled by Act 1915-16.
- Baneful influence of scientists on public opinion 1785.
- Benefits possibly derived from experiments outweighed by moral considerations 1921.
- Certificates granted for operations without anæsthetics 2000-7.
- Curare:
  - Experiments under, without anæsthetics 2008-10.
  - Experiments should be made with, on willing human subjects 1971.
  - Use of, indefensible 1921.
- Distinction between sacrifice of animals for purposes of scientific inquiry and for other uses 1969.
- Ether, its fleeting effect 1955.
- Evidence referred to:
  - Antiseptic treatment, statement that pain is not diminished by, untrue *E. H. Starling*, 4110.
  - Cambridge experiments, allegation concerning absence of anæsthetics unfounded *J. N. Langley*, 15389-93.
  - Curare, statement that pain is intensified by use of, incorrect 4111.
  - Dr. Thompson's experiments misrepresented *E. H. Starling*, 3636.
  - Drs. Brodie and Halliburton's experiments, allegations *re* insufficient anæsthesia in, unfounded, *E. H. Starling*, 3657-8.
  - "Frozen rabbit" experiment imaginary *A. D. Waller*, 18159-67.
  - Harley and Barratt's experiments on gall bladder of dogs, allegations *re* pain involved untrue *E. H. Starling*, 3677-84.
  - Mr. Bayliss's experiments, allegations *re* insufficient anæsthesia in, unfounded *E. H. Starling*, 3639-55.
  - Précis, experts concerned in its preparation *Miss A. Kenealy*, 6754-7, 6765-70.
  - Prof. Langley's experiment, allegations *re* inefficient anæsthesia in, unfounded *E. H. Starling*, 3627-8.
  - Professor Pawlow unjustly accused of cruelty in experiments *E. H. Starling*, 3634-5.
  - Professor Starling's experiment on gasserian ganglion of dog misrepresented, and charges *re* inefficient anæsthesia unfounded *E. H. Starling*, 3666-76.
  - Professor Starling's experiments on action of fifth nerve and gasserian ganglion confused and misrepresented *E. H. Starling*, 4132-40.
  - Starvation experiments, allegations as to their painful nature unfounded *E. H. Starling*, 3686-8.
- Experiments:
  - Anæsthetic inefficient during, 1919, 2058-63.
  - Dog illegally used for two, 1917-18, 2014-2018.
  - Increase in number of, since 1876 1964.
  - Inoculations of guinea pigs for testing tubercle in milk, objected to 2048-53.
  - Nerve stimulation, painful 2079-82.
  - On optic nerve, and pain caused 2083-5.
  - Repetition of, on gasserian ganglion of cats 1919.
  - as to Reports of, in journals 2091-6.
- Experiments witnessed by, at Imperial Institute 1747-52, 2019-29.
- Home Office Returns make misleading statements as to health of animals after inoculations 1919.
- Inspectors, no security against animal suffering afforded by existence of, 1958.
- Instances of cruelty in vivisection during the last thirty years 1785-1807.
- Open letter sent to Commissioners, statements in 1922-37.
- Pain, Dr. Klein's admissions of indifference to 2064-7.
- Parliamentary Association for the Abolition of Vivisection:
  - Complaints to Home Office *re* irregularities of licensees not made by, 2043-5.
  - Constitution and objects of, 1972-9.
  - No prosecutions instituted by, 2092.
  - Open letter sent to Commissioners from, and as to its preparation 1932.
- Prohibition of severe experiments insufficient 1997.
- Public at present not in a position to prosecute 1960-3.
- Registration of premises protects vivisectors 1962-3.
- Sufferings of animals after return to consciousness 1908-10.
- Vivisection Act, 1876:
  - Greater cruelty under, than previous to 2030-4.
  - No knowledge of prosecutions instituted under, 2041.
  - Repeal of, desirable 1938-46, 2032-8.
  - Section 13, no knowledge of use of powers under, 2038A-40.
  - Useless nature of restrictions under, 1967.
- Vivisection Commission, 1875, evidence before, and useless nature of subsequent legislative restrictions 1785, 1921.
- Vivisection morally unjustifiable 1785.
- References *H. Snow*, *Miss A. Kenealy*, 2224-6, 5280.

COPE, MR., formerly Chief Veterinary Officer at Board of Agriculture *S. Stockman*, 2651.

COPEMAN, S. M., F.R.S., M.A., M.D., Medical Inspector, Local Government Board:
- Vaccination experiments made by, in private capacity *W. H. Power*, 4489-94.
- Reference *G. D. Thane*, 1337-9, 1736.

CORNEVIN, preventive inoculation for blackquarter devised by, *S. Stockman*, 2544.

CORK:
- Demonstration experiments in, *Sir T. Stoker*, 820.

CORK—*cont.*
Inspector assisted in, by report of Local Government Board medical inspector *Sir T. Stoker*, 831.
Inspection in, conducted by medical inspector from Local Government Board *Sir T. Stoker*, 971-5.

COUNTY OF LONDON, diphtheria case mortality for, *C. J. Martin*, 11711.

COWEN, R. J., L.R.C.P., L.R.C.S.I., National Canine Defence League, 19364-467 :
Anæsthetics, struggles of man or animal while under, are indicative of pain, 19419-25.
Dogs :
All animals that are mixed feeders are more suitable for experiments than, 19408-9.
Anatomical differences between men and, make results obtained from experiments on, erroneous 19371.
Cheapness and ease of procuring, for experiments 19403-7.
Complete anæsthetisation of, impossible for any length of time 19416-18.
Experiments on, should not be permitted 19426-7.
Experiments performed on, could in all cases have been performed on other animals 19384-5.
Not naturally mixed feeders, and hence conclusions drawn from experiments on digestive organs of, are valueless 19375-82.
Pigs more allied to man and more suitable for experiments than, 19372-4.
Special points of distinction between man and, rendering results of experiments on, inapplicable to man 19394-402.
Unsuitability of, for experiments proved by action of different drugs upon, 19410-15.
Experiments, extent of personal experience of, 19386-91.
Cows :
Diphtheria inoculations of, *Mrs. K. Cook*, 1796.
Dosed with arsenic, and reasons for not applying for certificate *J. Glaister*, 12956.
Local authorities examine, for detection of tubercle in milk *S. Stockman*, 3427-9.
Local Government Board have not of late years experimented with view to inoculating, with human small-pox *W. H. Power*, 4483.
Small-pox inoculations of, in France *W. H. Power*, 4486-7.
Tuberculin test, advisable to exclude all extraneous influences that might affect normal condition of, *S. Stockman*, 3178-89.

CRAMER, W., PH.D., Cancer Research Fund, experiments conducted by, *H. Snow*, 2114.

CRETINISM :
Endemic, as to treatment of cases in Savoy *W. Osler*, 16691-3.
and Goitre, connection between, long recognised *W. Osler*, 16631.
Thyroid extract administered for cure of, *Sir V. Horsley, W. Osler*, 15836-41, 16569, 16576-80.
and Thyroid Gland :
Clinical observation had never discovered connection between, *Sir V. Horsley*, 16231, 16238-9.
Experiments proving absence of latter responsible for, *Sir R. D. Powell, Sir L. Brunton, Sir J. F. Moulton, Sir V. Horsley*, 5684-93, 6958-64, 12735, 15688.

CRILE, DR. :
Experiments performed by, in connection with Surgical Shock :
Anæsthesia maintained throughout, and hence unjustifiably described as "terrible" *Sir V. Horsley*, 15893-7, 15975-6, 15977-80, 16220-2.
Anti-vivisectionists' persistent misrepresentation of, *Sir V. Horsley*, 15901-7.
Conclusions arrived at from, and their applicability to man *Sir V. Horsley*, 15857-60, 16202-3.

CRILE, DR.—*cont.*
Experiments performed by—*cont.*
Cruelty of, testify to personal inhumanity of experimenter *Hon. S. Coleridge*, 10265, 10284-8.
Crushing of dog's foot under incomplete anæsthesia reported as painless by Home Office *Hon. S. Coleridge*, 10289-300.
Discrepancy between experimenter's and Home Office report of, pointed out and Home Office defence *Hon. S. Coleridge*, 10301.
Description of, quoted *Hon. S. Coleridge*, 19979-80.
Explanation of, untrustworthy *Hon. S. Coleridge*, 10938-51.
"Incomplete anæsthesia" during :
Alleged deception as to meaning of, unfounded *Hon. S. Coleridge*, 19930-2, 19967-74.
Explanation of term as used to describe, *D. W. Buxton, Sir V. Horsley*, 12578-82, 15688-91, 16048-53.
Necessary and painless *E. H. Starling, Sir V. Horsley*, 4237-9, 15851-5.
Object was to investigate conditions of shock as arising in operations on human beings *Sir V. Horsley*, 15971-2, 16204-18.
Origin of, and as to Mr. Coleridge's observations on, *Sir V. Horsley*, 15688-91.
Proceedings and correspondence with Home Office and surgeons concerning, *Hon. S. Coleridge*, 10991-11043.
Some performed in America *Sir V. Horsley*, 16199-201.
References, *H. Morris, Hon. S. Coleridge*, 8021-4, 11154, 11168-71.

CROOKSHANK, PROFESSOR, views as to contagion of swine-fever *S. Stockman*, 2673-83.

CRUIKSHANK, early experiments of, with reference to surgical treatment of severed nerves *J. N. Langley*, 15140-6.

CRUISE, SIR F., Honorary Physician in Ordinary to H.M. the King in Ireland, Vice-President of National Canine Defence League *J. Hughes*, 17246.

CRYAN, DR. R., Catholic University School of Medicine, Dublin, Certificate C not allowed to, *Sir T. Stoker*, 794A.

CULLIS, MISS WINIFRED C., "pithing" of dogs improperly performed by, and without licence *Miss Lind-af-Hageby*, 7415-30, 9730.

CUNNINGHAM, PROFESSOR DOUGLAS :
Snake Poison :
Tested reputed antidotes for, with negative results *Major L. Rogers*, 8161-2.
Theory that immunity can be acquired by swallowing venom tested and disproved by, *Major L. Rogers*, 8202.

CUNYNGHAME, H. H. S., C.B., Asst. Under-Secretary, Home Office, reference *Hon. S. Coleridge*, 10301.

CURARE :
Activity of commercial, varies tremendously in quality *W. E. Dixon*, 18826-7.
Administered intravenously *W. E. Dixon*, 15992-3.
Administered in addition to anæsthetic to prevent reflex movements *G. D. Thane*, 1321-3, 1599-1605, 1600-17.
Administered only during effective anæsthetisation of animal *G. D. Thane, J. N. Langley, A. D. Waller*, 1705, 15169-78, 18130-7.
Administered to dog without an anæsthetic *Miss Lind-af-Hageby*, 9398-406, 9461-71.
Admission before last Royal Commission as to experiments performed under, *S. F. Smith*, 13054.
All indications of anæsthesia are absent under, *S. F. Smith*, 13084-98, 13316-18, 13498-504, 13519-26.
Animals dosed with, die under anæsthetic *J. F. Langley*, 15365-6.
Chemical constitution of, not yet known, though attempts have been made to discover it *W. E. Dixon*, 18910-11.

CURARE—*cont.*

Circumstances during experiment on cat suggesting improper use of, *Miss Lind-af-Hageby*, 9388-97.
Complete anæsthesia produced by large dose of, *W. E. Dixon*, 18673-6, 18745-51, 19055-6.
Description of case of poisoning by, *Sir V. Horsley*, 15918-24, 15965.
Difficulty of obtaining, and ignorance as to its chemical formula *A. R. Cushny, W. E. Dixon*, 5003-11, 18752-3, 18785-6.
Doubts as to effects of, *Sir L. Brunton*, 6918.
Excreted very rapidly, and hence its effect passes off before that of other anæsthetic administered *W. E. Dixon*, 18687-90.
Experimenters' preference for, *Miss Lind-af-Hageby*, 4514A-21.
Experiments requiring use of, not frequent, but important *W. E. Dixon*, 18697-708.
Experiments should be made on willing human subject with, *Mrs. K. Cook*, 1971, 2089.
Experiments testing effects of, and resulting in evidence that higher functions of brain are abolished by, *W. E. Dixon*, 18811-17.
General consensus of opinion is that it is an anæsthetic *D. W. Buxton*, 12559-65.
Illegal use of, *H. Snow*, 2328-9.
Impracticable to insist on attendance of inspectors at all experiments involving use of, *J. N. Langley*, 15367-8.
Involuntary mechanisms not paralysed by, and possibility of determining effect of, by change in blood pressure *F. Gotch*, 13778-90.
Nature and action of, *Sir J. Russell, E. H. Starling*, 642A-5, 3614-26.
Nature, and restrictions as to use of, *Mrs. K. Cook*, 1801.
Necessary to use, in some cases *J. N. Langley*, 15179, 15335-8.
Necessity of giving continuous anæsthetics with, *J. N. Langley*, 15359-61.
Never given until anæsthesia well established *E. H. Starling*, 4251-3.
Never administered with anæsthetics under Certificate B *E. H. Starling*, 4056-61.
Never administered without anæsthetics, *Sir R. D. Powell*, 5615-19.
No danger in using, with another anæsthetic *Sir V. Horsley*, 15913-18.
No objection to issue of special certificate for use of, *J. N. Langley, G. S. Woodhead*, 15362-4, 15576-80.
No objection to presence of inspector at all experiments involving use of, *Sir V. Horsley*, 16058-9.
No positive knowledge as to paralysing action of, in large doses *A. R. Cushny*, 4993-5002.
Not a unique drug, but one of a definite group which in big doses completely anæsthetises *W. E. Dixon*, 18673, 18809-11, 18828-47.
Not an anæsthetic *Sir J. Russell, G. D. Thane, E. H. Starling*, 643-5, 1320, 3618, 4115.
Not an anæsthetic, but pain intensified by, *S. F. Smith*, 13078-82, 13295-302.
Number of experiments referred to in Journal of Physiology in which it was used *S. F. Smith*, 13068-77.
Object and use of, *Sir R. D. Powell*, 5774-8.
Paralyses the motor nerves before the sensory, and hence advisability of legal restrictions concerning use of, *W. E. Dixon*, 18905-7.
Precautions adopted with administration of, *J. N. Langley*, 15170-8.
Prohibition of, desirable *H. Snow, Miss Lind-af-Hageby, Hon. S. Coleridge*, 2229-30, 2235, 2236-43, 2357-75, 2392-4, 9246-50, 11575.
Prohibition of, would be serious impediment to certain lines of research, but there might be special certificate for use of, *F. Gotch*, 13874-7.
Proportion of experiments reported in *Journal of Physiology* in which curare was used *S. F. Smith*, 13290-4.
Sensory impressions not intensified by use of, *E. H. Starling*, 4111.
Suggestion that morphia as well as, was used in experiment on dog *Miss Lind-af-Hageby*, 9500-12.
Use of, alone forbidden by Act *G. D. Thane*, 1320.
Use of, as anæsthetic deprecated, but employment of, with anæsthetics useful *Sir L. Brunton*, 7077-81.
Use of, deprecated *Mrs. K. Cook, Miss A. Kenealy, H. Morris, Hon. S. Coleridge*, 1921, 6445-59, 8018-19, 11053-70.
Use of, does not prevent knowledge of degree of anæsthesia attained *E. H. Starling, F. Gotch*, 4054-5, 13593-610.
as to Use of, previous to existing law *Sir T. L. Brunton*, 6839-43.
Used for certain blood pressure experiments *F. Gotch*, 13607-8.
Used rarely, and apparatus employed for administering chloroform in case of its use *A. R. Cushny, E. A. Schäfer, Sir V. Horsley*, 5003-11, 10085-7, 16054.

CUSHING, PROFESSOR HARVEY, Johns Hopkins College, Baltimore:

Students' courses of operative surgery on animals instituted by, *E. H. Starling, Sir V. Horsley, W. Osler*, 3989-90, 15638-40, 16587, 16591-4.

Views held by, as regards necessity of students acquiring surgical technique by operating on animals *W. Osler*, 16592-4.

CUSHNY, A. R., M.A., M.D., Professor of Pharmacology and Materia Medica in University College, London, Committee of Medical and Scientific Societies 4640A-5275.

Abdominal organs and intestines of men and animals not sensitive to pain 4988-9, 5058-67.

America:

Experiments in, only restricted by law against cruelty to animals, and anti-vivisection movement in, 5100-14.
Large amount of unauthorised drug taking in, and also considerable camp of Christian Scientists 5248.

Anæsthesia:

"Incomplete," no possibility of during experiments 5175-8.
Length of time it can be maintained in operations on men 5255-8.
Local, means entire loss of local sensation of pain 5132-37.
Sensation goes before motion under, 5176-8.

Anæsthetics:

and Analgesics, distinction between, 5270-4.
Certain experiments for pharmacological research cannot be satisfactorily performed under, 4847-8.
Efficient administration of, in experiments, and nature of those used 5039-57.
Local, use of, always extending 4980-6.
Paraldehyd largely used for experiments on rabbits 5184-7.
Use of, prevents all pain in operations 5194-5.

Antiseptics introduced as result of experiments on animals 4819.
Certificates, amendment in method of applying for, desirable 5142-6.
as to Choice of animals for experimental purposes 4820-6.

Curare:

Little used, and difficult to obtain 5003-11.
No positive knowledge as to paralysing action of, in large doses 4998-5002.

Demonstration experiments:

as Advocated, would be performed under anæsthetics and animal would be subsequently killed 4831-7.
Carried out in majority of large medical schools 5164-8.
Necessity of, 4827-30, 4920-30, 4953-5, 5159-60.

Dogs:

Blood drawn from, for examination after doses of lead 4693-702.
Much less liable to suffer from septic infection than other animals 4824-6.

CUSHNY, A. R., M.A., M.D.—*cont.*
Dogs—*cont.*
Preferable to cats for experimental purposes and no difficulty in maintaining anæsthesia 5086-7.
Show no signs of apprehension in laboratories 5096-9.
Drugs :
Absorption and excretion of, should be ascertained before inclusion of, in therapeutic medicine 4826.
Action and active principles of, have only been investigated by experiments on animals 4993A-7.
Adrenalin discovered by means of experiments, and great value of, 4808.
African arrow poison, examination of its effects on animals led to discovery of valuable cardiac remedy 4797-9.
Alcohol, large number of experiments with regard to action of, 5225-8.
Aldehyd, nature and action of, 4735-6.
Amount of, tolerated is more or less in proportion to bulk of body to which it is applied 5012-16.
Amyl Nitrate :
Discovery of, 4894-902.
Experiments as to effect of, on heart 4799.
Antipyretic action of certain, discovered incidentally from experiments with object of rendering animal tissues antiseptic by means of those drugs 4772-7.
Antipyretics and analgesics introduced by means of experiments on animals 4767-70.
Antipyretics, part played by clinical observation in discovery of, 4782-6.
Antipyrin has replaced quinin as an anæsthetic 4879-80.
Caffein, no medicinal use of diuretics established before introduction of, 4813, 4893.
Care required as to inferences to be drawn from effect of, on animals 4906-89.
Chloral, its valuable soporific powers discovered 3222-3, 4712-29.
Cocaine :
Anæsthetising powers of, first discovered by experiments on animals 4751.
Danger of using, as an anæsthetic owing to difficulty of sterilising 4751-3.
Date of its introduction as a local anæsthetic 4867-9.
Past research into physiological action of cocaine and similar alkaloids 4869-72.
Search for substitute for, led to discovery of the orthoforms 4753-9, 4759-61.
Curare, *see that title above.*
Digitalis :
Action of, on heart discovered by experiments on animals 4652-67.
Action of, much more complicated than was believed 4860-2.
Clinical observation of its action would not have led to important results attained by experiments 4653-4, 4665-7.
Experiments demonstrating true effect of, 5115-8.
of Great value as a cardiac tonic in pneumonia 4850-8.
Introduced in 1785 as treatment for dropsy 4652.
Malpractice of formerly administering, in case of apoplexy 4972-6.
Effect of, on man can generally be inferred from their effects on animals 5028-33, 5082-5.
Emetics discovered entirely by means of experiments 4819.
Ergot :
Clinical opinion divided with regard to use of, in midwifery cases 5203-4.
Experiments with regard to use of, 5203-7.
Inferior nature of certain preparations 5207-9.
Its use, and as to attempts to isolate its essential factor in purer form 4819.

CUSHNY, A. R., M.A., M.D.—*cont.*
Drugs—*cont.*
Few, have been discovered that are actual cures for disease 5230.
General rule that pharmacological action is dependent on chemical composition must be tested in each case 4746.
German and American firms have introduced an enormous number of new, 5246-7.
Great advances made in knowledge of effect of, on vital organs by means of experiments on animals 4651.
Inclusion of, in British Pharmacopœia 5231-35.
Increased accuracy in therapeutic use of, results from experiments on animals 4710-11.
Introduction of new, and resuscitation of old, by means of experiments 5119-21.
Main object of pharmacology is to find out effects of, 5263-9.
Many ways of applying, and impossibility of introducing new, without experiments 4839-47.
Mercury, its specific action, 5259-63.
Narcotics, initial effect of, is to produce sleep, and larger doses produce anæsthesia 5181-2.
Necessity for testing principles of new, by experiments 5034-8, 5068-74.
Operation of, has been hitherto a matter of clinical observation 4649.
as to Pain caused by pharmacological experiments 5125-8.
Physostigmin, action of, demonstrated by experiments, and its consequent introduction into ophthalmic therapeutics 4787-96.
Pilocarpin, introduced by other than experimental methods 4819.
as to Possibility of testing, on human beings 5149, 5241-5.
Purgatives, animal experimentation has added very little to knowledge of effects of, 4650.
Quinin :
Before 1870, the only reliable antipyretic 4770, 4990-2.
Specific action of, 5259-63.
Salicylic Acid :
Observation of its antipyritic action before 1875 4777-82.
Only used as an antipyritic in rheumatic fever 4885-6.
Specific action of, 5259-63.
Scientific knowledge of action of, differs from clinical knowledge 4965-70.
Some, have a composite action 5210-12.
Soporifics :
All, are more or less dangerous 4866.
Are mainly alcohol derivatives 4740.
Discovered by experiments which could not have been performed on human beings 4787-50.
Standardisation of, must in certain cases depend on animal experiments 4838.
Sufficient resemblance between human beings and animals to make experiments as to effect of, of value in pharmacology 4939-43.
Sulphonal, discovery of its soporific powers 4730-1.
Theocin affects dogs and rabbits differently 5079-81.
Trional and tetronal, their therapeutic powers discovered by means of experiments 4733.
Urethane :
Anæsthetic and hypnotic influence of, 4741-2, 5186-7.
Large mortality of animals from anæsthetic doses of, 4743-5.
Urotropin introduced into therapeutics in 1894, 4813-16.
Useless, sifted out from Pharmacopeia by means of experiments 4819.
Vascular contractors, all have been discovered by means of experiments on animals 4810-12.
Vascular dilators, all have been discovered by means of experiments on animals 4804.

CUSHNY, A. R., M.A., M.D.—*cont.*
Evidence referred to, statement as to absence of pain in experiments, disputed *Sir G. Kekewich*, 20428-33.
Experimental, inquiry leads to elimination of erroneous drug treatment 4689-707.
Experimental research in therapeutics gives clear definition of use of drugs 4665.
Experiments:
as to Hypnotic properties of various chemical bodies 4737-40.
Nature of, with object of discovering action of digitalis 4669-82, 4683-88.
for Testing anæsthetic properties of drugs 4763-7.
With view of noting anti-pyretic effects of certain drugs and success of same 4771-2.
See also under DRUGS *above.*
Experiments performed by:
on Cats, Dogs, and Rabbits, to ascertain contraction of uterus resulting from drug injections 5172-3, 5188-201.
Pain and needless suffering never inflicted 4931-8.
See also under DRUGS *above.*
Greater reliability of inference can be drawn from experiments on animals closest to man's status 5147-8.
Hemoptysis, opium substituted for lead in treatment of, 4863-5.
Licence held by, 4642.
Licence and certificate required for pharmacological experiments 4763-7, 5250-51.
Morphia an anæsthetic 5150-3.
Older remedies modified by chemical manipulations and advocated in medicine after preliminary trials on animals 4817-8.
Pneumonia:
Digitalis at one time erroneously used in treatment of, 5214-6.
Nature of heart affection in, 4850-8.
as to Toxin treatment of, 5220-1.
Pharmacology and physiology not taught in Nottingham University College, 5165-6.
Poison remedies discovered by experimental means, 4819.
Present outcry against vivisection arises from misconception 4957-62.
Results of experiments can generally be accurately applied to human beings 5170-1.
Rheumatism caused probably by a micro-organism 4887-8.
Teaching experience of, 5017-19.
Text Book of Pharmacology and Therapeutics by, expresses views which contradict evidence *Miss Lind-af-Hageby*, 7317-21, 7342-9.
Vivisection Act, 1876, satisfactory except as regards method of obtaining certificates 4945-7.
Reference, *F. Taylor*, 5600.

CUVIER, experiments by, reference, *Miss A. Kenealy*, 5288.

DANGEROUS TRADES COMMITTEE, evidence given before, as to poisonous effect of West African Boxwood *W. E. Dixon*, 18729-30.

DARWIN, CHARLES, *The late*, evidence before Vivisection Commission, 1875 *E. H. Starling, C. J. Martin*, 3442, 3776-7, 11824.
Reference *J. D. Graham*, 5887.

DASTRE, M., reference to views of, *Miss Lind-af-Hageby*, 7342.

DAWSON, DR. PERCY, views as to necessity of distinguishing between diartolic and systolic blood pressure *Miss A. Kenealy*, 5316-21.

DAVIS, Messrs. Parke and, *see* PARKE AND DAVIS, MESSRS.

DEAN, MR., Assistant Surgeon to London Hospital, 1892, alleged cruelty in operations on monkeys and dogs performed by, *Mrs. K. Cook*, 1796.

DEARDEN, J. A., letter to, *re* incomplete anæsthesia, *Hon. S. Coleridge*, 10993.

DELÉPINE, PROFESSOR:
Public Health Laboratory at Manchester superintended by, *J. Lorrain Smith*, 18179.
Reference, *S. Stockman*, 3161-3.

DENMARK, tuberculin test exploited in, and consequent reputation of Danish butter *S. Stockman*, 3204-18.

DESWATINES, DR., reference *Miss Lind-af-Hageby*, 9682.

DEUTSCHMANN, knowledge of eye disease, keratitis punctata, discovered by means of experiments by, *Sir H. R. Swanzy*, 9802-4.

DIABETES:
Extirpation of pancreas produces fatal, *E. H. Starling*, 3442-5, 4124.
Method of producing, in dogs, and resulting symptoms, *E. H. Starling*, 4042-8.
Whole pathology of, not yet known, but experiments have thrown much light on, *Sir L. Brunton*, 7124-6.

DIABETIC COMA, treatment of, is direct outcome of experiments, *E. H. Starling*, 3813-17.

DIGBY, SIR K., proposal by, that manner of recording experiments should form subject of conference, *W. P. Byrne*, 240.

DIPHTHERIA:
Anti-toxin, *see under* SERUM THERAPY.
Bacillus differentiated from other diphtheroid bacilli by means of experiments, *W. H. Power*, 4611-12.
Bacilli found in milk, *W. H. Power*, 4619.
Cambridge outbreak controlled and stamped out by careful methods and use of anti-toxin, *G. S. Woodhead*, 15528-9.
Cat's eyes inoculated with bacillus of, *Mrs. K. Cook*, 1919.
Communicability of, between men and animals doubted, *S. F. Smith*, 1336-43.
Conditions fostering spread of, *Sir R. D. Powell*, 5747-50.
Cow found to be suffering from, *W. H. Power*, 4474-6.
Diagnosis of:
Area enlarged by modern bacillary test, *G. S. Woodhead*, 15226-8.
Bacillus can be recognised by cultural method and without recourse to experiments, *J. R. Bradford*, 17714-16.
Bacteriological, gives greater certainty and effect upon statistics of case mortality, *W. H. Power, C. J. Martin, Sir J. F. Moulton*, 4613-16, 12257-70, 12715-16.
by Bacteriological methods allows slight chance of error, *C. J. Martin*, 12358-61.
Bacteriological, probably increases cases notified and affects statistics *W. H. Power*, 4613-16.
Based on experimental inoculation of animals with suspected organism *J. R. Bradford*, 17635-7.
Carried out by culture but guinea pigs inoculated in doubtful cases *J. Lorrain Smith*, 18187, 18196-201, 18210-13.
in Guinea pig after inoculation possible within 48 hours *J. Lorrain Smith* 18449-51.
More accurate now than hitherto, *Sir R. D. Powell*, 5747-50.
Previous to use of antitoxin clinical evidence was only method *W. H. Power*, 4398-402.
General mortality, as to non-decrease of, *Sir R. D. Powell, F. Taylor*, 5645-88, 5654-5.
Klebs Loeffler bacillus is cause of, *G. S. Woodhead*, 15512-18.
Klebs Loeffler bacillus not origin of, *S. F. Smith, G. G. Bantock*, 13229-31, 13436-42, 14545-6, 14550, 14660-2, 14767-9.
May be transmitted in milk, but unsanitary conditions less concerned with dissemination of, than in case of other diseases *W. H. Power*, 4392-4.
Mortality from, greater outside Metropolitan Asylums Board Hospitals, *W. H. Power*, 4387-91.

DIPHTHERIA—*cont.*

Mortality from, might be abolished by use of antitoxin in first stages of, *C. J. Martin*, 11763, 11766-91.
Mortality statistics fifteen years ago in Metropolitan Asylums Board hospitals compared with those of recent years *W. H. Power*, 4384-5.
No evidence that fluid surrounding bacilli is cause of, but bacillus not found in many cases of clinical, *G. G. Bantock*, 14644-59.
Observations of children in public elementary schools has led to detection of cases, *W. H. Power*, 4395-9.
Pathology of, known, and serious symptoms of, averted by use of antitoxin, *Sir R. D. Powell*, 5705-14.
Prevalence of, in some parts of the country may be due to neglect of antitoxin, *Sir R. D. Powell*, 5716-18.
Probability of varieties of, *S. F. Smith*, 13336-43.
Pneumonia often cause of death in patients suffering from, *F. Taylor*, 5829-30, 5833.
Reduction of case mortality in, undoubtedly due to use of antitoxin, *Sir R. D. Powell, F. Taylor*, 5641-2, 5643.
Reduction of death rate in Metropolitan Asylums Board hospitals :
Coincident with use of antitoxin, *W. H. Power*, 4541-50.
Suggested reasons for non-corresponding diminution in country generally, *W. H. Power*, 4541-50.
as to Sources of infection, *G. G. Bantock*, 14545-6.

Statistics :
Fallacies underlying, *S. F. Smith*, 13235-59.
Necessary conditions before reliable, can be obtained, *S. F. Smith*, 13244.
Showing decrease of mortality from, due to antitoxin treatment, *F. Taylor*, 5588-93.
Tables showing the case mortality from, before and after employment of the antitoxin treatment, *C. J. Martin*, 11711.
Testing of, in municipal laboratories *G. D. Thane*, 346-7.
Toxic, but not local symptoms of, can be produced in animals *G. S. Woodhead*, 15506-11.
See also Diphtheria Anti-toxin *under* SERUM THERAPY.

DISTEMPER :
Experiments for purpose of investigating, justifiable *F. Hobday*, 16358-65.
Experiments in connection with investigation of *G. D. Thane*, 1204-5.
Paralysis a symptom of, in young dogs, *S Stockman*, 3135-6.
Possible effect on rabbit if inoculated with canine, *S. Stockman*, 3373-8.
Symptoms of, in dogs, *G. D. Thane*, 1674-6.

DISEASES OF WOMEN, *see* PUERPERAL FEVER.

DIVING-BELL, conditions attending work in, lead to "caisson" disease, *G. D. Thane*, 373-6.

DIXON, W. E., M.A., M.D., Professor of Materia Medica and Pharmacology, King's College, London ; Therapeutical Section of the Royal Society of Medicine, 18646-19191.
Advanced students and qualified licensees witness experiments, 19087-94.
Advanced students should be permitted to acquire manual dexterity for surgical operations by experimenting on animals under supervision, 19029, 19034-8.
All experiments carried out in class room of, have been painless 19099-104.

Anæsthesia :
Blood pressure gauge of, not used in operations on human beings 18789-92.
Reflex actions are unconscious 18794-801.
Reflexes and blood pressure are chief gauges for testing, in animals, 18787-9.
Small doses of anæsthetic necessary for continuation of, when once produced, 18668.
Tested by corneal reflex of patient 18669.

DIXON, W. E., M.A., M.D.—*cont.*

Anæsthetics :

Chloroform :
Blood pressure just as delicate an indication of action of, as reflexes 18690-3.
Sensory nerves paralysed before motor nerves by, 18897-900.
Simple reflexes possible under, 18997-19000.

Local :
Anæsthesia produced by injection of, into spinal cord 18950, 18958-63.
Dangers in use of certain, 18964-6.
Investigations into relative action of new, 18948-54.
Method of injecting into spinal cord is quite painless, 19073-6.
Method of administering to animals and care taken in anæsthetising dogs 18677-9.
Mode of determining effect of, in animals 18955-6.
Narcotics and hypnotics administered in large doses are complete, 18652-3.
No essential difference between narcotics, hypnotics, and, 18652-4.
Renewal of, during experiment if necessary 18679-85.
Sensory cells paralysed before motor cells by, 18672.
Skilled anæsthetist unnecessary to assist in administration of, for experiments 18687.

Animals killed after experiments by blowing air into a vein 18734-9, 19062-3.

Arteriosclerosis :
Importance of experiments in connection with, 18933-4.
Nicotin action may produce, 18935-8.

Association for the Advancement of Medicine by Research is highly qualified to give advice as to issue of licences 19153.

Bacterial poisons act differently on different animals 18882-6.

Certificates :
Abolition of, desirable in interests of all concerned 19096-7, 19116-26.
Delay in obtaining fresh, and advisability of substituting a comprehensive licence for, 19020-19025.
Necessity of applying for, even in cases of painless inoculations 19017-19020.

Chloral :
Doses of, for rabbits and for man necessary to produce complete anæsthesia 18654-9.
Not often used as anæsthetic but method of administering, when employed, 18682.
Rarely used as an anæsthetic for man, 18654-7.
Used generally as an anæsthetic for animals, 18658.

Chloroform, *see under* ANÆSTHETICS *above*.

Cocaine :
Action of, 18901.
Action of, on cerebral hemispheres varies in different animals 18881.
Administered subcutaneously and depth of local anæsthesia produced 19067-70.
Would be an effective local anæsthetic in operation of castration 19071-2.

Curare :
Activity of commercial, varies tremendously in quality 18826-7.
Administered intravenously 18992-3.
Chemical constitution of, not yet known, though attempts have been made to discover it 18910-11.
Complete anæsthesia produced by large dose of, 18673-6, 18745-51, 19055-6.
Difficulty of obtaining, and ignorance as to its chemical formula 18752-3, 18785-6.
Excreted very rapidly, and hence its effect passes off before that of other anæsthetic administered 18687-90.
Experiments requiring use of, not frequent, but important 18697-90.

DIXON, W. E., M.A., M.D.—*cont.*

Curare—*cont.*

First paralyses the motor nerve endings and then the nerve cells, so that large dose is a complete anæsthetic, 18673-6.
Not a unique drug, but one of a definite group which in big doses completely anæsthetises 18673, 18809-11, 18828-47.
Paralyses the motor nerves before the sensory, and hence advisability of legal restrictions concerning the use of, 18905-7.
Personally taken and effects noted 18819-25.

Demonstration Experiments:

Familiarity with, does not tend to demoralise students 18732, 19077, 19081-3.
Necessity of, for proper physiological knowledge and no harmful effects produced by, 18742-4, 18918-23.

Dogs, no difficulty in anæsthetising, 18732.

Drugs:

Anæsthetics, *see that title above.*
Animals generally used for standardisation of, 18995.
Do not differ in their action on organs of animals and man except in case of brain 18881.
Certain, can only be standardised by physiological method 18770.
Chemical processes cannot detect the active principle of certain, 18778-83.
Contradictory opinions as to action of, resulting from mere clinical experience 18713-15.
Narcotics, large series which act on brain in same way and their differences are determined by differences in rate of absorption and excretion 18652-4.
Physiological standardisation of, absolutely necessary, and experiments for this purpose are painless 18976, 18979-91, 18994, 19105-112.
Varying opinions as to action of, resulting from mere clinical experience 18849-57.
See also particular names of Drugs.

Ergot, variations in quality and action, necessitate physiological standardisation, 18770-6.

Experiments performed by:

Ergot, action tested, *A. R. Cushny*, 5203-4.
for Investigating action of cardiac tonics 18942-7.
for Investigating action of drugs on kidneys 18968-74.
for Testing effects of curare and resulting in evidence that higher functions of brain are abolished by large doses 18811-17.
Proceedings in connection with, *Hon. S. Coleridge*, 10370-81.
with Mr. Brodie, and cruelty involved *Hon. S. Coleridge*, 11562-9,
With regard to effect of drugs on blood clotting 18976-8.
Wrongly alleged to have been conducted upon unanæsthetised animals 19012-15.

Has never witnessed a painful experiment upon an animal 19032-3.
Inspection is superfluous from vivisector's point of view, but it gives the public a sense of security 19165, 19167-72, 19180-6.
Inspector's visit and nature of his duties 19163-66.

Licences:

Delay in obtaining, for research 19016.
General Medical Council as now constituted would not be a suitable body to control issue of, 19152.
Issue of, should be in hands of some responsible body rather than Home Office 19098.
Medical qualifications need not be only guarantee for obtaining, 19626-9.
as to Unsuitable persons applying for assistance to obtain, 19172-9.

Lymphocytosis, research showing that dose of pilocarpine produces, 18927-32.

Morphia:

Absolute protection from pain afforded by, as at present administered 18887.

DIXON, W. E., M.A., M.D.—*cont.*

Morphia—*cont.*

Action of, different to chloroform, but produces similar insensibility to pain 18764-8.
Action of, similar in all animals 18869-76.
Claude Bernard's statement as to, mistranslated, and word "sensitive" substituted for "reflex" 18755.
Dose of, necessary for anæsthesia bears relation to amount of brain substance 19004-11.
Drugs having similar action to, 18862-4.
Knowledge of how to properly administer, was unknown till recently 19049-54.
Large dose of, produces complete anæsthesia 18757-63.
Motor cells not affected by, and hence combined with hyoscin for operations, 18664-8.
Not always absorbed, if given by the mouth 18756.
Reflex test of anæsthesia inapplicable in use of, 18793.
a Satisfactory anæsthetic if properly administered 19039-46.
a Specific drug and attacks sensory nerve cells so that distinct reflexes can be obtained under anæsthesia produced by, 18663-7.
Value of anæsthesia produced by combination of chloroform and, 18672.

Necessity of regulating experimental research by Act of Parliament 19095.
No objection to presence of accredited witnesses during experiments, 19085-6.
Royal Society of Medicine, constitution of, and representative of large body of medical opinion 18858-61.

Urethane:

Administered in large dose is a complete anæsthetic, but unsuitable for man on account of its prolonged action 18653.
Composition and action of, 18888-91.
Doses necessary to produce complete anæsthesia 18660.
Generally used 19029-31.
Method of administering, is by injection 18681.
a Useful and reliable anæsthetic 18895-6.

Vivisection Act, 1876:

Present inspection under, gives real security to public and irregularities cannot occur in licensed places 19157-60.
Security afforded to public and to vivisectors by, and necessity of continuing, 19130-9.
Series of experiments suspended by introduction of, owing to difficulty of obtaining necessary certificates 19130, 19140-4.
Vivisection practised before introduction of, by irresponsible persons 19145-51.

West African Boxwood:

Discovery of poison in, effected entirely by experiments on animals, and methods employed 18717-30.
Experiments showing poisonous effects of inhaling, and precautions suggested 18709-12, 18912-15.
Experiments for purpose of ascertaining poisonous action of alkaloids in, were not painful 19113-115, 19057-61.

Dogs:

Administration of anæsthetics to, used to be frequently attended by fatal results owing to want of skill and method *F. Hobday*, 16294.
All animals that are mixed feeders are more suitable for experiments than, *R. J. Cowen*, 19408-9.
All necessary experiments on, should be conducted under anæsthesia, and morphia should be given to dull pain after recovery from anæsthetic *C. R. J. A. Swan*, 19254-6.
Alleged cruelty of experiments on, *Mrs. K. Cook, Miss A. Kenealy, J. W. Graham, Hon. S. Coleridge*, 1785-9, 1796, 1798-9, 1913-4, 1910-11, 1914-17, 1919, 5302-21, 5842-4, 5857-60, 5861-71, 6047-8, 10265, 10289-300.
Anæsthetisation of, impossible for any length of time *J. W. Graham, J. Hughes, R. J. Cowen*, 5960-9, 17156-8, 17455-62, 17522-8, 19416-18.
Anæsthetisation of, more difficult than of men *E. H. Starling*, 3481-4.

Dogs—*cont.*

Anæsthetisation of, care taken *W. E. Dixon*, 18677-9.

Anæsthetisation of, no difficulty experienced *A. R. Cushny, D. W. Buxton, Sir V. Horsley, F. Hobday, J. R. Bradford, A. D. Waller, W. E. Dixon*, 5086-93, 12488-500, 15909, 16435-9, 17775-8, 18152-8, 18732.

Anæsthetising properties of cocaine first tested on, *A. R. Cushny*, 4751.

Anatomical differences between men and, make results obtained from experiments on, inapplicable to man *R. J. Cowen*, 19371, 19375-82, 19392-3, 19394-402.

Apprehension in laboratories not shown by, *A. R. Cushny*, 5096-9.

Bacterial inoculations of, rare *E. H. Starling*, 4174-5.

Blood drawn from, for examination after doses of lead *A. R. Cushny*, 4693-702.

Blood of animals suffering from tsetse fly disease, injected into, *Col. D. Bruce*, 14308-11.

Blood pressure experiments could be performed equally well on rabbits as on, *C. R. J. A. Swan*, 19214-20.

Breeding of, for experimental purposes objected to *G. D. Thane*, 1440-2.

Can be kept under chloroform now for several hours, *Sir V. Horsley*, 16318-28.

Case of graveratic fistula *G. D. Thane*, 472.

Case of performing further operation on, already under observation with a fistula *G. D. Thane*, 1551-69.

Certificates E or EE required for experiments on, *G. D. Thane*, 423.

Cheapness and ease of procuring, for experiments *R. J. Cowen*, 19403-7.

Chloroforming of:

- Dangerous effects counteracted by prior administration of atropin *E. A. Schäfer*, 10088.
- Series of experiments in connection with, and small percentage of deaths *F. Hobday*, 16434-5.
- Statement as to danger of, not consistent with inspector's experience *Sir J. Russell*, 752.

Clause in Dogs Act preventing sale of stray, foolish and irrelevant *E. H. Starling*, 3921-33.

Condition of, after operation not seriously painful and in cases of serious pain killed *Sir J. Russell, G. D. Thane*, 552-3, 1209-1215.

Cross circulation experiments on:

- Anæsthesia insufficient in, morphia alone being given *Lt.-Col. Lawrie, Sir G. Kekewich*, 16810-21, 16922-5, 16969-74, 20457-62, 20966-1372.
- Circumstances attending performance of, laboratory assistant's evidence *W. Hall*, 21581-35.
- Object of, circumstances attending, and contradiction of allegations *re* cruelty of, *L. E. Shore, H. K. Anderson, W. H. Gaskell*, 19430-1, 21636-704, 21373-580.

Curare administered to, without an anæsthetic *Miss Lind-af-Hageby*, 9461-71.

Curarised to prevent struggles *Miss Lind-af-Hageby*, 9398-406.

Demonstration experiments before students of a prolonged and agonising nature *J. Hughes*, 17450-1, 17467-73.

Differences between human and canine organs make experiments on, useless *J. Hughes*, 17158, 17359-60.

Difficulty in housing large animals in towns makes it necessary to use, *Sir J. Russell*, 619.

Digestive processes of absorption and secretion could be investigated in pigs instead of, *C. R. J. A. Swan*, 19231-4.

Digitalis, action tested on, *A. R. Cushny*, 4657.

Disapproval of destruction of superfluous, *J. Hughes*, 17491-95*a*.

Disapproval of experiments on, for purpose of investigating diseases of, *J. Hughes*, 17484-6.

Diseases of, *see* Distemper and Malignant Jaundice.

Do not show signs of terror in anticipation of chloroform *F. Hobday*, 16334-6.

Dr. Bain's experiment on gall bladder of, *G. D. Thane*, 1650-69.

Dogs—*cont.*

Dr. Rose Bradford's experiments on ears of, were performed under anæsthetics, and did not give rise to great pain *J. R. Bradford*, 17724-36.

Dr. Rose Bradford's experiments on kidneys of, misrepresented as painful *J. R. Bradford*, 17689-98, 17737-44, 17752-61.

Dr. Crile's experiments on:

- Anæsthesia maintained throughout, and hence unjustifiably described as "terrible" *Sir V. Horsley*, 15893-7, 15975-6, 15977-80, 16220-2.
- Conclusions arrived at from, and their applicability to man, *Sir V. Horsley*, 15857-60, 16202-3.
- Description of, *Hon. S. Coleridge*, 19979-80.
- Reported as painless by Home Office *Hon. S. Coleridge*, 10289-300.
- Reference, *H. Morris*, 8021-4.

Dr. Watson's experiments in dropping, from heights *Sir V. Horsley* 16225-9.

Doubts as to complete anæsthesia of, for long operations *Sir T. Stoker*, 862-8, 891-2.

"Drowning" experiments:

- Number of, *E. A. Schäfer*, 10194-201.
- Object of, now attained and repetition unnecessary *E. H. Starling*, 4078-81.
- Strongly disapproved of, *J. Hughes*, 17498-504.
- Undertaken with view to determine exact effect of death by, and as to best method of resuscitation, *Sir J. Russell, G. D. Thane, E. H. Starling, E. A. Schäfer* 739-40, 1287-99, 1749-51, 3569-84, 10104-5.

Drowning of superfluous, as practised in Edinburgh disapproved of, *J. Hughes*, 17502-3.

Early experiments on, with reference to surgical treatment of severed nerves *J. N. Langley*, 15140-6.

Eggs of tapeworms fed to, for purpose of observing development *S. Stockman*, 2444.

Error of judgment in diagnosing as cancer tumour in, *H. Snow*, 2127-34.

Excision of thyroid gland in, followed by tetany *G. D. Thane*, 1233.

Exemption of, from experiment would not satisfy those who advocate total abolition of vivisection *J. W. Graham*, 6157-61.

Exemption of, from experiments desired *J. Hughes, R. J. Cowen*, 17135-54, 17233-4, 17250-1, 17467-8, 19199-201, 19426-7.

Experiment on salivary gland of *G. D. Thane*, 1499-1515.

Experiments causing pain never conducted on unanæsthetised, *A. R. Cushny*, 5128-31.

Experiments on, at Sir Victor Horsley's laboratory under complete anæsthesia *E. H. Starling*, 4142-52.

Experiments upon brains of, *F. Goteh*, 13569-70.

Experiments on eye of, with view to testing anæsthetic properties of cocaine, *A. R. Cushny*, 4873-6.

Experiments on, justifiable for sake of discovering remedy for distemper *J. Hughes, C. R. J. A. Swan*, 17487-90, 19291-7.

Experiments on, justifiable if same can be proved to be of direct value to humanity *C. R. J. A. Swan*, 19289-90.

Experiments on, justifiable provided there is no suffering, *C. R. J. A. Swan*, 19282-5.

Experiments on kidneys of, objected to *C. R. J. A. Swan*, 19246.

Experiments on, not sanctioned which could be done on other available animals *G. D. Thane*, 1197-1205.

Experiments on, regrettable *W. Osler*, 16786.

Experiments performed on, could in all cases have been performed on other animals *R. J. Cowen*, 19384-5.

Experiments performed on, under morphia and insufficiency of dose to secure complete anæsthesia *Col. E. Lawrie*, 16869-85, 20986-21001.

Evidence of Professor Pritchard before previous Vivisection Commission as to chloroforming, *Sir J. Russell*, 697.

Fistulas in, would cause discomfort but not pain, *E. H. Starling*, 3762-7.

Frequency of experiments on, at Edinburgh Veterinary College, *Sir J. Russell*, 754-5.

Dogs—*cont.*

How obtained, by licensee, *Sir J. Russell*, 667-9.
Illegal use of, for second experiment *Mrs. K. Cook*, 2014-18.
In operations, as a rule, fastened to operating table *F. Hobday*, 16340-6.
Indications of suffering in, *Sir J. Russell*, 715-19.
Indispensable for certain important experiments, *G. D. Thane, Sir J. Russell, E. H. Starling, A. R. Cushny, J. N. Langley, Sir V. Horsley, G. S. Woodhead, J. R. Bradford*, 425-9, 608, 3445, 4039-40, 4824, 4234-6, 15180-2, 15942-3, 17660-5, 15582, 17703-8.
Injections of chloral in, for purpose of discovering its soporific action *A. R. Cushny*, 4713.
Investigation of canine diseases may require experiments on, but other means preferred *C. R. J. A. Swan*, 19353-63.
Irregular heart action of, makes it dangerous to chloroform, *Sir T. Stoker*, 813-14, 836, 1039.
Kidneys of, removed by Simon of Heidelberg previous to performing human operation *H. Morris*, 7786-8.
Knowledge acquired of digestive processes by experiments on, could have been obtained by syphonage *C. R. J. A. Swan*, 19221-30.
Lethal chamber is best means of destroying, *J. Hughes*, 17604-20.
List of operative experiments on, *G. D. Thane*, 1232-3.
Medical petition against vivisection of, and signatures obtained *J. Hughes*, 17186-216.
Members of Parliament pledged to support Bill to prevent vivisection of, *J. Hughes*, 17212.
Method of anæsthetising, and apparatus employed *G. D. Thane, E. H. Starling*, 1230-1, 3585-8.
Misrepresentations of account of experiment on gasserian ganglion of, *E. H. Starling*, 3662-6, 4132-9.
Morally wrong to chastise, unnecessarily *J. Hughes*, 17365-8.
Much less liable to suffer from septic infection than other animals *A. R. Cushny*, 4824-6.
Muzzling apparatus not used in operations on, *F. Hobday*, 16476-80.
Nature of experiments at University College in 1902 on, *E. H. Starling*, 3470.
No doubts as to possibility of anæsthetising, *C. R. J. A. Swan*, 19281.
No evidence that sufferings of, under chloroform greater than those of other animals, *G. D. Thane*, 1222-28.
No foundation for statement that stray, are procured for vivisection purposes, *Sir J. Russell*, 676-80.
No knowledge of alleged cruelty to, at Wellcome Laboratory, Khartum *G. D. Thane*, 1306-10.
Not less liable to succumb to effects of anæsthetics than other animals *Sir J. Russell, Sir L. Brunton*, 638, 7179-85.
No reason to disbelieve in ill treatment of, in physiological laboratories *C. R. J. A. Swan*, 19286-7.
Number of experiments on, *E. H. Starling*, 4033-4.
Objection to experiments on, mainly based on sentiment *C. R. J. A. Swan*, 19264-7.
Objection to experiments on, met by guarantee of anæsthesia and consequent painlessness of operation. *C. R. J. A. Swan*, 19262-3, 19326-9.
Other animals should be substituted for, in experiments whenever possible *C. R. J. A. Swan*, 19204-6, 19256-8.
Pain anticipated by, instance of, *C. R. J. A. Swan*, 19236-45, 19312-16.
Painless vivisection of, impossible because of difficulty of anæsthetising, *J. Hughes*, 17600-3.
Paralysis a symptom of distemper in young, *S. Stockman*, 3135-6.
Petition opposing vivisection of, and signatures received *J. Hughes*, 17166.
Police in Edinburgh, their practice with regard to stray, *Sir J. Russell*, 725-7.
Police may not sell stray, for vivisection purposes *Sir J. Russell, G. D. Thane*, 670, 1752-4.
Possibility of using fox instead of, *G. D. Thane*, 1428-30.
Preferable to cats for experimental purposes *A. R. Cushny*, 5086-93.
Purchase of, for laboratory purposes *G. D. Thane, E. H. Starling*, 1421-3, 3519-22.

Dogs—*cont.*

Prohibition of experiments on, would seriously hinder progress of science *E. H. Starling, Sir L. Brunton, Sir R. D. Powell, H. Morris, Sir V. Horsley*, 3479, 3966-9, 4035-6, 7066-71, 5610-11, 7810-11, 15808-11.
Quarantine of, for precaution against rabies, *S. Stockman*, 2868.
Relative development of various senses in, *Sir J. Russell*, 741.
Report as to grafting of kidney on blood vessels in neck of, *Sir J. Russell*, 685-6.
Selected for experiments on account of their docility and obedience *J. Hughes*, 17395-438, 17584.
Sensitiveness of, makes it desirable to conduct experiments on, with great reserve *Sir T. Stoker*, 807-8.
Spinal cord of, sensitive to pain *Miss Lind-af-Hageby*, 9563-84.
Stolen, prevention of their sale to laboratories a question for police *G. D. Thane*, 1435-8.
Strapping down of, in operations necessary to maintain position *Sir J. Russell, D. W. Buxton*, 640-2, 12651-7.
Stray, might be utilised for laboratory purposes instead of being destroyed in lethal chamber *G. D. Thane*, 1763-4.
Students could be taught rise and fall of blood pressure by aid of diagrams and without recourse to experiments on, *C. R. J. A. Swan*, 19214-15.
Suggestion that curare as well as morphia was used in experiments on, *Miss Lind-af-Hageby*, 9500-12.
Suggestion that stolen, are used for experiments *C. R. J. A. Swan*, 19347-9.
Suggestion to breed, for laboratory purposes *Sir J. Russell*, 674-6.
Susceptibility of, to pain makes it desirable to minimise experiments on them *Sir J. Russell*, 607.
Symptoms of distemper in, *G. D. Thane*, 1674-6.
"Terrible increase of experiments on, during past three years," and reasons for statement *J. Hughes*, 17544-64.
Terror of, in operating room *Sir T. Stoker*, 1048.
Unnecessary to test digestive processes by experiments on, *C. R. J. A. Swan*, 19317-25.
Unsuitability of, for experiments proved by action of different drugs upon, *R. J. Cowen*, 19410-15.
Use of, for experimental purposes, regretted on grounds of sentiment *W. Osler*, 16638-40.
Vivisection of, whether with or without anæsthetics unjustifiable *J. Hughes*, 17128-33, 17167, 17275-7, 17570-4.

Dougherty, J. B., reference *Hon. S. Coleridge*, 10490.

Douglas, Right Hon. A. Akers, *late* Home Secretary:

Memorandum by, as to Professor Schäfer's drowning experiments *G. D. Thane*, 1751.
Parliamentary question *re* number of experiments performed under licence alone and under Certificate B *Hon. S. Coleridge*, 10560.
Refusal of certificate by, involving starvation experiments *E. H. Starling*, 3949-51.

Drugs:

Absorption and excretion of, should be ascertained before use in therapeutics *A. R. Cushny*, 4826.
Action and active principles of, have only been investigated by experiments on animals *A. R. Cushny, Sir R. D. Powell*, 4993A-7, 5621-4.
Action of, can be accurately ascertained by homeopathic methods *G. H. Burford*, 9085-9.
Action of, on animals gives suggestion for use of, on men, but care required in drawing inferences *A. R. Cushny, Sir L. Brunton*, 4906-19, 5028-33, 5082-5, 7162-7.
Action of, on organs of men and animals not different except in case of brain *W. E. Dixon*, 18881.
Action of, should be impressed upon students by demonstration experiments *Sir V. Horsley*, 15630-1.
Advance in use of, due to experiments on animals *Sir L. Brunton*, 6925-35.

Alcohol:

Consensus of medical opinion as regards non dietetic value of, *Sir V. Horsley*, 15867.

DRUGS—*cont.*

Alcohol—*cont.*

Large number of experiments with regard to use of, *A. R. Cushny*, 5225-8.

All experiments with new, should be made on dogs rather than upon man *Sir V. Horsley*, 15653.

Amount of, tolerated is more or less in proportion to bulk of body *A. R. Cushny*, 5012-16.

Anæsthetics, *see that title.*

Animal experimentation contradictory, *S. F. Smith*, 13099-13107.

Antipyretics, part played by clinical observation in discovery of, *A. R. Cushny*, 4782-6.

Arsenic, horses dosed with, as remedy for nagana or tsetse fly disease *Col. D. Bruce*, 14318.

Atoxyl, use of, as remedy for nagana or tsetse fly disease, *Col. D. Bruce*, 14312-14.

Belladonna, homeopathic investigation of, 8922-3.

Chemical processes cannot detect the active principle of certain, *W. E. Dixon*, 18778-83.

Cholin, chemical test of, might be substituted for physiological test *Miss Lind-af-Hageby*, 7467-76.

Cocaine:

Action of, *W. E. Dixon*, 18901.

Action of, on cerebral hemispheres varies in different animals *W. E. Dixon*, 18881.

See also under Local Anæsthetics.

Colchicum, homeopathic investigation of, and knowledge derived from, *G. H. Burford*, 8913-21.

Contradictory opinions as to action of, resulting from mere clinical experience *W. E. Dixon*, 18713-15.

Curare: *see that title.*

Demonstration experiments necessary for students in case of, where actions are not universally recognised, *A. R. Cushny*, 4953-5.

Experimentation with regard to effects of, has been neglected and is most necessary *Sir V. Horsley*, 15865.

Experiments for purpose of investigating action of caffein, urea and saccharin on kidneys *W. E. Dixon*, 18968-74.

Experiments on animals have led to discovery of, tending to alleviate dropsy, *Sir L. Brunton*, 6948-9.

Few, have been discovered that are actual cures for disease *A. R. Cushny*, 5230.

German and American chemical firms have introduced an enormous number of new, *A. R. Cushny*, 5246.

Great advances made in knowledge of effect of, on vital organs by means of experiments an animals *A. R. Cushny*, 4651.

Homeopathic investigation on man has introduced more, than experimental investigation on animals *G. H. Burford*, 8993-6.

Homeopathic methods give accurate knowledge of action of, on "tout ensemble" of patient *G. H. Burford*, 9085-9.

Increase in number of useful, due to experiments *Sir L. Brunton*, 7005-11.

Increased accuracy in therapeutic use of, result from experiments on animals *A. R. Cushny*, 4710-11.

Injection of certain, followed by great pain *G. D. Thane*, 457, 462.

Introduced by means of experiments:

Aconite, effects noted on pigeons *Sir T. L. Brunton*, 6818-23.

Adrenalin:

Discovery that arterial schlerosis is caused by, gives means of studying development of the disease *J. Lorrain Smith*, 18236-7. 18288-96.

Fall of blood pressure due to viperine snake poison counteracted to some extent by, *Major L. Rogers*, 8133-7.

Great value of, *A. R. Cushny*, 4808.

Serves no useful purpose and opposition to all therapeutic system *Miss Lind-af-Hageby*, 9720-3.

Aldehyd, its nature and action *A. R. Cushny*, 4735-6.

DRUGS—*cont.*

Introduced by means of experiments—*cont.*

Amyl nitrite:

Action of, *Sir L. Brunton* 7140.

Value of, in treatment of angina pectoris *A. R. Cushny, Sir L. Brunton* 4800-3, 6888-97.

Analgesics, *A. R. Cushny*, 4767-70.

Anti-pyrin:

And other anti-pyretics, *A. R. Cushny, Sir L. Brunton*, 4767-70, 4771-7, 7019-20.

Has replaced quinin as an anæsthetic *A. R. Cushny*, 4879-80.

Once in great repute but now considered useless *Sir G. Kekewich*, 20588-92.

Antiseptics:

Introduction of various *A. R. Cushny, Sir L. Brunton*, 4819, 7019.

Their local action could only be tested on living microbes *A. R. Cushny*, 4819.

Apomorphin formed from morphin, *A. R. Cushny*, 4819.

Arygol: A remedy for disease of conjunctiva, *Sir H. R. Swanzy*, 9843-8.

Atropin: Dangerous effects of chloroform on dogs counteracted by prior administration of, *E. A. Schäfer*, 10088, 10152-4, 10229-31, 10238-40.

Caffein, medicinal use of, established *A. R. Cushny*, 4813, 4893, 5074-77.

Calabar Bean:

Action of, *Sir L. Brunton*, 7113-4.

Eserin discovered, as remedy for glaucoma *Sir H. R. Swanzy*, 9836-40.

Cardiac tonics *A. R. Cushny, W. E. Dixon*, 4797-9, 18942-7.

Chloral:

Discovery of its powers *A. R. Cushny, Sir L. Brunton*, 4712-29, 5222-3, 7016-17.

Doses of, necessary to produce complete anæsthesia in man and rabbits *W. E. Dixon*, 18654-9.

Rarely used as anæsthetic for man owing to its tendency to make the medulla give out *W. E. Dixon*, 18654-7.

Used generally as an anæsthetic for animals *W. E. Dixon*, 18658.

See also under ANÆSTHETICS.

Digitalis:

Action of, much more complicated than was previously believed *A. R. Cushny*, 4860-2, 5210-11.

Action of, on heart *E. H. Starling, A. R. Cushny*, 4262, 4652-67.

At one time erroneously used in pneumonia, *A. R. Cushny*, 5214-6.

Doubts as to efficacy of, in cases of pneumonia *Sir L. Brunton*, 6886-7.

First introduced in 1785 in treatment of dropsy *A. R. Cushny*, 4652.

Homeopathic method of investigating action of, *G. H. Burford*, 8928-35.

Malpractice of formerly administering, in case of apoplexy *A. R. Cushny*, 4972-6.

Method of standardising, introduced in 1896, *A. R. Cushny*, 4838.

Value of, and clinical observation of its action contradicted *A. R. Cushny*, 4653-4, 4665-7, 4669-82, 4683-8, 4944, 5115-8.

Value of, in pneumonia, *A. R. Cushny, Sir R. D. Powell*, 4850-3, 5704.

Emetics, *A. R. Cushny*, 4819.

Ergot:

Acts upon several functions of the body, *A. R. Cushny*, 5210-11.

Division of clinical opinion with regard to use of, in midwifery cases *A. R. Cushny*, 5203-4.

DRUGS—*cont.*

Introduced by means of experiments—*cont.*

Ergot—*cont.*

Inferior nature of certain preparations of, *A. R. Cushny*, 5207-9.

Use of, demonstrated and object has been to isolate its essential factor *A. R. Cushny*, 4819, 5203-7.

Variation in quality and action of, necessitates physiological standardisation *W. E. Dixon*, 18770-6.

Eucaine, its introduction *A. R. Cushny*, 4753, 4758.

Formaldehyd, most powerful disinfectant introduced of late years *A. R. Cushny*, 4819.

Inclusion of, in British Pharmacopeia, *A. R. Cushny*, 5231-5.

Jequirity principle of paternoster bean discovered to be remedy for trachoma *Sir H. R. Swanzy*, 9820-30.

Narcotics:

Action of, *E. H. Starling*, 3836-40.

Initial effect of, is to produce sleep and larger doses produce anæsthesia *A. R. Cushny*, 5181-2.

Large series of, which act on the brain in same way and their differences are determined by differences in rate of absorption and excretion *W. E. Dixon*, 18652-4.

Reasons for administering, in addition to anæsthetics *E. H. Starling*, 3607.

Nitro-glycerin:

Properties of, *F. Taylor*, 5585.

Value of, in cases of angina pectoris *Sir L. Brunton*, 7142-6.

Paraldehyd:

Largely used for experiments on rabbits *A. R. Cushny*, 5184-7.

Therapeutic effect of, *A. R. Cushny*, 4733.

Paramedophenols, many shown to be available as antipyretics *A. R. Cushny*, 4771.

Physostigmin:

Action of, on eye demonstrated and consequent inclusion of, in ophthalmic therapeutics *A. R. Cushny*, 4787-96.

Experiment on human eye for investigation of effect of, *A. R. Cushny*, 4889-92.

Use of, without knowledge of power, and almost fatal results *A. R. Cushny*, 4789-93.

Salicylic Acid:

Anti-pyretic nature of large doses of, *F. Taylor, Sir R. D. Powell*, 5701-2, 5703.

as to Observation of anti-febrile effects of, before 1875 *A. R. Cushny*, 4777-82.

Only used as anti-pyretic in rheumatic fever *A. R. Cushny*, 4885-6.

Originally given with object of destroying the fever micro-organisms and its action upon temperature thereby discovered, *A. R. Cushny*, 4772-7.

Strophanthus discovered during examination of effects of arrow poison on animals *A. R. Cushny*, 4797-9.

Soporifics:

Alcohol derivatives mainly *A. R. Cushny*, 4740.

All, are more or less dangerous *A. R. Cushny*, 4866.

Value of, *A. R. Cushny*, 4737-8, 5267.

Strychnin:

Benefits accruing from injection of, *Sir L. Brunton*, 6898-900.

Chemical constitution and action of, *Sir L. Brunton*, 7019.

Sulphonal:

Incidentally discovered *A. R. Cushny, Sir L. Brunton*, 4730-1, 7018.

Once in great repute, but now considered useless *Sir G. Kekewich*, 20588-92.

DRUGS—*cont.*

Introduced by means of experiments—*cont.*

Tetronal, therapeutic power of, discovered *A. R. Cushny*, 4733.

Trional, therapeutic power of, discovered *A. R. Cushny*, 4733.

Urethane, *see under* ANÆSTHETICS.

Urotropin, and other urinary disinfectants and solvents *A. R. Cushny*, 4813-16.

Vascular contractors *A. R. Cushny*, 4810-12.

Vascular dilators *A. R. Cushny*, 4804.

Veronal, use of, *A. R. Cushny*, 4738-40.

Introduction of new, and resuscitation of old, by means of experiments *A. R. Cushny*, 5119-21.

Laudanum, dogs tolerant of large dose *F. Hobday*, 16509.

Lead, experiments showed error in administering, for hæmorrhage and opium now substituted for, *A. R. Cushny*, 4689-709.

Many ways of applying, and impossibility of introducing any new, without experiments *A. R. Cushny*, 4839-47.

Mercury, its specific nature *A. R. Cushny*, 5259-62.

Morphia, *see that title.*

Nature of experiments for purpose of testing anæsthetic properties of, *A. R. Cushny*, 4763-7.

Nature of experiments with regard to effect of, on blood clotting *W. E. Dixon*, 18976-8.

Nicotin, its effect on blood pressure *W. E. Dixon*, 18935-41.

Object of experiments as to contraction of uterus resulting from injection of, *A. R. Cushny*, 5196-201.

Opium:

Insensibility produced by use of, *Sir L. Brunton*, 6902-6.

Substituted for lead in treatment of hæmorrhage *A. R. Cushny*, 4707, 4863-5.

Used before discovery of chloroform, *D. W. Buxton*, 12642-7.

Pharmacology means examination of action of, on animals, hitherto a matter of clinical observation *A. R. Cushny*, 4647-9, 5263-9.

Pilocarpin:

is Only drug of mediocre importance introduced by other than experimental methods *A. R. Cushny*, 4819.

Research showing that lymphocytosis is produced by dose of, *W. E. Dixon*, 18927-32.

Preparation of, in pharmaceutical laboratories *G. D. Thane*, 1348-53.

Purgatives, animal experimentation has added very little to knowledge of effects of, *A. R. Cushny*, 4650.

Purity of, insisted on under Drugs Adulteration Act *A. R. Cushny*, 5236-8.

Quinin:

Anti-pyretic nature of large doses of, *F. Taylor, Sir R. D. Powell*, 5701-2, 5703.

Antipyrin has replaced, as an anæsthetic *A. R. Cushny*, 4879-80.

Discovery of anti-pyretics other than, by means of animal experiments *A. R. Cushny*, 4770.

Only reliable anti-pyretic before 1870 *A. R. Cushny*, 4990-2.

Specific nature of, *A. R. Cushny*, 5259-61.

Salicin, experiments as to effect of, on children *Rev. L. S. Lewis*, 8766-75.

Some, have a composite action *A. R. Cushny*, 5210-12.

"Standardising" of, *G. D. Thane*, 356-8.

Animals generally used *W. E. Dixon*, 18995.

Experiments for purpose of, merely involve prick of needle and are painless *W. E. Dixon*, 18976, 18994.

Physiological methods necessary *A. R. Cushny, W. E. Dixon*, 4838, 18770, 18979-91, 19105-112.

Starting point of experiments as to connection between chemical constitution and physiological action *Sir L. Brunton*, 7019.

Testing of:

Chemical, should be as satisfactory as physiological *Miss A. Kennedy, Miss Lind-af-Hageby*, 6578-83, 7496-303.

DRUGS—*cont.*

Testing of—*cont.*

Experiments for purpose of, cannot be made under anæsthetics *Miss Lind-af-Hageby*, 9214-15.

Experimental methods necessary, *A. R. Cushny, F. Taylor, E. A. Schäfer*, 5068-74, 5585, 10202-8.

Experiments in connection with, *A. R. Cushny*, 4747-50.

Homeopathic methods better than animal experiments *G. H. Burford*, 9076-7.

as to Possibility of, on human beings *A. R. Cushny*, 5149, 5741-5.

Upon animals unscientific and wrong, *Miss A. Kenealy, Miss Lind-af-Hageby*, 6299-304, 9239-41.

Theocin affects dogs and rabbits differently, and reasons for same, *A. R. Cushny*, 5079-81.

Urethane:

Anæsthetic and hypnotic influence of, *A. R. Cushny*, 5186-7.

A complete anæsthetic if administered in large dose, but unsuitable for man on account of its prolonged action *W. E. Dixon*, 18653, 18895-6.

Composition and action of, *W. E. Dixon*, 18888-91.

Doses necessary to produce complete anæsthesia, *W. E. Dixon*, 18660.

Useless, have been sifted out of Pharmacopeia by means of experiments *A. R. Cushny*,, 4819.

Varying opinions as to action of, resulting from mere clinical experience *W. E. Dixon*, 18849-57.

DRYSDALE, DR., homeopathic investigations of, *G. H. Burford*, 8924.

DUBLIN:

Demonstration experiments at, *Sir T. Stoker*, 820-1.

Trinity College, experiment under Certificate C at, *Sir T. Stoker*, 935.

DUBLIN UNIVERSITY:

Experiments not allowed at one time in, *Sir T. Stoker*, 770-2, 976-7.

DUBOIS, M., of Lyons, writings and experiments of, on marmots, *Miss Lind-af-Hageby*, 9653.

DUCKWORTH, SIR DYCE:

Reference to address by, *G. D. Thane*, 1708-9.

Speech of, before Royal Medical Society of Edinburgh *G. D. Thane*, 1471-5.

DUPLAY, PROFESSOR, reference, *H. Snow*, 2129.

DUNCAN, MATTHEWS, drug investigations by, *Sir L. Brunton, A. R. Cushny*, 7118-9, 5149.

DUPRÉ, DR., engaged in detection of poison in Lamson case, *J. Glaister*, 12844.

DURHAM, BISHOP OF, antivivisection cause supported by, *Rev. L. S. Lewis*, 8728.

DUVAL, work of, referred to, *Miss A. Kenealy*, 6557.

DYSENTERY ANTITOXIN, *see under* SERUM THERAPY.

EDINBURGH:

Chloroform administered by students in, during last century without any fatal results *Colonel E. Lawrie*, 16942-51.

Dick College, no physiological experiments performed at, *S. Stockman*, 3051-3.

Practice of police in, with regard to stray dogs, *Sir J. Russell*, 725-7.

Royal College of Physicians, *see* ROYAL COLLEGE OF PHYSICIANS OF EDINBURGH.

Royal Society of, *see* ROYAL SOCIETY OF EDINBURGH.

Royal Medical Society of, *see* ROYAL MEDICAL SOCIETY OF EDINBURGH.

University of:

Evidence on behalf of, *see* SCHÄFER, E., A., 9980-10250.

Research scholarships given by, for purposes of studying on continent *Sir J. Russell*, 707.

EDINBURGH—*cont.*

Veterinary College, frequency of operations on dogs at, *Sir J. Russell*, 754-5.

ENTERIC FEVER:

Difficulty of diagnosing, from Malta Fever, *Colonel D. Bruce*, 14395.

Local Government Board research with view of finding prophylactic for, *W. H. Power*, 4301.

Very often communicated by milk, *Colonel D. Bruce*, 14396-8.

EDINGTON, DR., horse-sickness proved to be inoculable by, *S. Stockman*, 3392-7.

EDMUNDS, W.:

Alleged cruelty of experiments on dogs and monkeys by, *Mrs. K. Cook*, 1799-1800.

Alleged cruelty of feeding experiments by, *Mrs. K. Cook*, 1921.

EHRLICH, PROFESSOR:

Opinion of, as regards cancerous nature of Jensen's tumour *H. Snow*, 2297-300.

Possibility of immunising animals from jequirity discovered by, and serum derived from such experiments, *Sir H. R. Swanzy*, 9820.

Theory of, with regard to obtaining preventive sera for swine erysipelas from horses *S. Stockman*, 2557-62.

Reference *E. H. Starling*, 3692.

ELECTORAL ANTI-VIVISECTION SOCIETY, income of, *Hon. S. Coleridge*, 10260.

ELLIOTT, T. R., Physiological Laboratory, Cambridge, experiments on suprarenal gland by, *Miss A. Kenealy*, 5322-5.

EMBLEY, DR., improvement made in the administering of anæsthetics, owing to experiments of, *E. A. Schäfer*, 10238.

ERICHSEN, DR. J. E., member of the Vivisection Commission, 1876, *W. P. Byrne*, 1.

ERICHSEN, SIR J., reference, *Hon. S. Coleridge, Sir V. Horsley*, 10274, 16070-1.

ETHICAL STANDPOINT:

Anti-Vivisection:

Animal rights rest on same foundation as human rights *Rev. L. S. Lewis*, 8636.

Anti-vivisectionists' position not illogical because all forms of cruelty cannot be exterminated at once *J. H. Levy*, 18614-29.

Christian ethics opposed to practice of vivisection *J. W. Graham*, 5841.

Cowardice in profiting by infliction of pain on others *Rev. L. S. Lewis*, 8636.

Demoralisation and callousness to suffering consequent upon vivisection *Miss Lind-af-Hageby, Rev. J. P. Hopps, J. W. Graham, Hon. S. Coleridge, S. F. Smith*, 7357-79, 8315-18, 8523, 5884-5890, 10262-4, 13061.

Experiments unjustifiable on moral grounds *Mrs. K. Cook, Miss A. Kenealy, J. W. Graham, Rev. J. P. Hopps, Rev. L. S. Lewis, J. Hughes, J. H. Levy*, 1785, 5372, 6276, 6324-6, 5841, 5844-7, 8329, 8370-6, 8636, 17132-4, 17571-2, 17322-334, 18497.

Dogs, should be exempted from experiments on moral grounds *J. Hughes, C. R. J. A. Swan*, 17135-43, 17144, 19201.

Exploitation of animals for man's use is wrong *Miss Lind-af-Hageby, Rev. L. S. Lewis*, 7620-44, 8636.

Exploiting of lower animals for man's purposes, justification for, doubtful *Sir G. Kekewich*, 20714.

Hedonistic principles must not be applied in the mode of direct balance of advantages *J. H. Levy*, 18473, 18488-97, 18490-5, 18528-33, 18554-66.

Dr. Johnson's views *Hon. S. Coleridge*, 10551.

Logical consequence of vivisection must be experiments on human beings *J. W. Graham, J. H. Levy*, 5884, 18601-6.

Moral progress demands prohibition of experiments *Miss Lind-af-Hageby*, 7204, 7455-8, 7620-2.

ETHICAL STANDPOINT—*cont.*

Anti-Vivisection—*cont.*

Nature thwarted by practice of preventive inoculations *Miss A. Kenealy, J. H. Levy,* 5343-54, 18485-8, 18512.
Pain, its intention perverted by object of vivisection *Rev. L. S. Lewis,* 8636, 8643-52, 8662.
Philanthropic and philozoic sentiment are inseparably connected *J. H. Levy,* 18521-2.
Physiologists consider scientific before moral claims *Miss Lind-af-Hageby, Rev. J. P. Hopps, J. H. Levy,* 7288-99, 8523, 18493-9.
Scientific progress should go hand in hand with moral progress *Miss A. Kenealy, J. W Graham,* 5389, 5841.
Selfishness is basis of vivisection *Rev. J. P. Hopps,* 8829.
Sympathy is basis of moral actions and this is destroyed by practise of vivisection *J. H. Levy,* 18521-2.

Pro-vivisection:

Anti-vivisectionists not justified in accepting benefits derived from vivisection *Sir V. Horsley,* 16137-8.
Anti-vivisectionists not morally justified in accepting knowledge gained by vivisection *Sir V. Horsley,* 15589-94, 15872-4.
Cause of opposition to vivisection sentimental opinion as to *A. R. Cushny,* 4957-60.
Demoralisation not consequent upon practise of vivisection *F. Gotch, W. E. Dixon, E. A. Schäfer,* 13811, 19077, 10212.
Experimental research justified in not aiming entirely at practical results *Sir J. F. Moulton,* 12715-27.
Humane susceptibilities rather increased than not by performing operations *Sir. T. L. Brunton,* 7059.
Knowledge necessary for prevention of disease may be justifiably obtained by experiments on animals *Sir J. F. Moulton,* 12735-7, 12786-90, 12812-14.
Moral feelings and pursuit of knowledge are both parts of the evolution of the social feeling of the community *E. H. Starling,* 3807.
Moral right to take animal life in interests of man *E. H. Starling, H. Morris,* 3470, 8026.
Natural sentiment not deadened by vivisection *C. H. Morris,* 12335.
Observational methods quite inadequate for acquiring scientific knowledge *Sir J. F. Moulton,* 12708, 12716.
Obstruction of pursuit of knowledge is a moral offence *Sir Victor Horsley,* 15588, 15868, 15870.
Pain and suffering increased by ignorance which can be surmounted by knowledge acquired by experimental research 12707-8.
Pain, diminution of totality of, justifies practice of experimental research *Sir J. F. Moulton,* 12704-5, 12780-82.
Pain, distinction between prevention and infliction of, not properly realised by anti-vivisectionists *Sir J. F. Moulton,* 12707.
Pain inflicted in experiments is infinitesimal in comparison with totality of unnecessary unfruitful pain in world *Sir J. F. Moulton,* 12737, 12785.
Pain, responsibility of diminishing preventible, justifies experimental research in curative science *Sir J. F. Moulton,* 12702-4.
Scientific knowledge depends on testimony of experimental research *Sir J. F. Moulton,* 12708-9.
Wrong to try new operation on man before testing it on animals *E. A. Schäfer,* 10032.

ESDAILE, DR., hypnotic experiments performed by, *Miss A. Kenealy,* 6541.

EVANS, A. C. C. HARVEY, charges against Mr. Gotch corroborated by, *Hon. S. Coleridge,* 11454.

EXPERIMENTS:

Anti-septic precautions required for all, except those connected with sepsis and septicemia *G. D. Thane,* 469.

EXPERIMENTS—*cont.*

"Baking":

of Cats and rabbits, alleged *J. W. Graham,* 5844-9, 6131-40.
Consisted merely in maintaining temperature during narcosis *Sir L. Brunton,* 6785-829, 6906a-16, 7089-97.

Blood:

Withdrawal of, for purposes of examination after doses of lead *A. R. Cushny,* 4693-702.

Blood pressure:

Dogs can be dispensed with for rabbits and cats in, *F. Gotch,* 13956-9.
Importance of, *Sir L. Brunton, Sir V. Horsley,* 6943-6, 16040-1.

Bowels, fistulous openings cause discomfort but no pain *E. H. Starling,* 3762-7.

Brain:

Diagnosis of different diseases of, can only be learnt by, observation during *Sir V. Horsley,* 16036-9.
Essential to further progress of brain surgery *Sir V. Horsley,* 15842, 15846.
Paralysis caused by removal of portions of apes', *Mrs. K. Cook,* 1910.
Rabies injections under dura mater, *G. D. Thane,* 1671.
Rapid recovery of cat from, *Sir J. Russell,* 540.
Removal of portions, from dogs and monkeys *Mrs. K. Cook,* 1790, 1796.
Skull of dog trephined for stimulation of cortex *G. D. Thane,* 1519.
References *E. A. Schäfer,* 10111-16.

In Brain Surgery:

Nature of, and absence of pain after, *Sir V. Horsley,* 15986-97.
Optical surgery greatly aided by observations during, *Sir V. Horsley,* 16000-2.

Caisson disease investigations *G. D. Thane,* 383-4.
Cerebral arteries of dogs, cats and monkeys ligatured, and subsequently irritated by electricity *Mrs. K. Cook,* 1910-11.

Choice of animals:

Considerations determining, *A. R. Cushny,* 4820-6.
Limitation would hamper scientific research *Sir H. R. Swanzy, C. J. Matin, F. Gotch,* 9767-71, 12050-1, 13918.
Reasons for non-restriction, *C. J. Martin,* 11821-4.

Conditions for care of animals after, *W. P. Byrne,* 255-6.
Condition of animals after, and difficulty of distinguishing between those which have and have not been operated upon, *Sir J. Russell,* 552-3, 536.
Consensus of medical opinion in favour of, *Sir V. Horsley,* 15791-3.
Continuation of, indissolubly bound up with advance in medical science *Sir L. Brunton, Sir V. Horsley,* 7082, 16086.
Clinical observation should go hand-in-hand with, *H. Head,* 17880-5.

Control of animals during:

Misrepresentation by Mr. Coleridge of evidence as to, during Bayliss libel case *Sir V. Horsley,* 16010-11.
Strapping down, for sole purpose of maintaining position *Sir J. Russell, Sir V. Horsley,* 640-2, 16009.

Cross circulation (Drs. Gaskell and Shore):

Circumstances attending performance of, laboratory assistant's evidence *W. Hall,* 21581-35.
Dogs insufficiently anæsthetised in, morphia alone being given *Lieut.-Col. Lawrie, Sir G. Kekewich,* 16810-21, 16922-5, 16969-74, 20457-62, 20966-21372.
Object of, circumstances attending, and contradiction of allegations *re* cruelty of. *L. E. Shore, H. K. Anderson, W. H. Gaskell,* 19430-1, 21636-704, 21373-580.

EXPERIMENTS—*cont.*

For Demonstration purposes :

Anæsthesia completely secured throughout, and its necessity emphasised *J. N. Langley*, 15406-10.
Blood circulation, *Sir T. Stoker*, 827-9.
Blood pressure, *Sir T. Stoker*, 827-9.
British Medical Association report as to, *W. P. Byrne*, 195.
Callousness on part of students attending, no evidence as to, *Sir T. Stoker*, 1050-1.
Cerebral hemispheres of frogs destroyed for purpose of proving continuation of movements after consciousness has been destroyed *M. S. Pembrey*, 13972-3.
Certificate C required for, *Sir J. Russell*, 611-14, 665-6.
Cinematograph could not take place of, *G. D. Thane*, 1526-30.
Considerations determining choice of animal and anæsthetic used for, *F. Gotch*, 13640.
Criticisms of Dr. Pembrey's statement that this year he had not performed any, *Sir V. Horsley*, 16265-6.
Cruelty in, no indications of *Sir T. Stoker*, 1042.
Demoralisation of students not consequent upon, and no signs of levity are shown at, *Sir T. Stoker, E. A. Schäfer, Sir J. F. Moulton, F. Gotch, Sir V. Horsley, W. E. Dixon*, 1061, 10013-16, 10209-12, 12806-8, 13612-38, 13810-12, 15606, 15886, 16116-21, 18741-2, 19077, 19081-3.
Demoralising effect of, *Sir T. Stoker, Miss Lind-af-Hageby, Hon. S. Coleridge, Sir G. Kekewich*, 761, 776, 802-5, 809-11, 1050-1, 1061, 11371-96, 20419-22, 20701-12.
Dogs used for purpose of demonstrating flow of chyle *J. N. Langley*, 15243-50.
in Edinburgh *E. A. Schäfer*, 10009.
Essential for proper education of students *G. D. Thane, E. H. Starling, A. R. Cushny, Sir R. D. Powell, Sir L. Brunton, H. Morris, Sir H. R. Swanzy, E. A. Schäfer, C. J. Martin, F. Gotch, M. S. Pembrey, J. N. Langley, Sir J. F. Moulton, Sir V. Horsley, J. R. Bradford, W. E. Dixon*, 1122-4, 1533-6, 1543-4, 3479-80, 4050-2, 4827-30, 4920-30, 4953-5, 5612-14, 6980-2, 7751-2, 9860-5, 10009, 10017-30, 10155-70, 10209-12, 11825, 12741, 13571-9, 13581-2, 13611, 13732-43, 13810-12, 13971, 15606, 15183-91, 15614-20, 15630-1, 15798-9, 15939, 16105-11, 17667-76, 17667-76, 17701-2, 18742-4, 18918-23.
Frogs, rabbits and some dogs chiefly used for, *Sir J. Russell*, 662.
Heart exposed to illustrate respiration and blood pressure *G. D. Thane*, 1521-2.
Lecturers would not object to interested laymen attending, *H. Morris*, 7768-71.
Limitations, no further, necessary *Sir H. R. Swanzy*, 9788-90.
Manometer, its use in, *G. D. Thane*, 1524.
None at Manchester University but would be very valuable *J. Lorrain Smith*, 18424-8.
Number of, shown in inspector's annual report, *Sir T. Stoker*, 826.
Open to all qualified persons *E. H. Starling*, 3546-51.
Performed under Certificate B and animal not allowed to recover *Sir V. Horsley*, 15621-7.
Poisons, action of, need not be illustrated *J. Glaister*, 12915, 13015-17.
Practical teachers of physiology should have opportunity of witnessing, *H. Morris*, 8010-15.
Principle contained in Act that lectures may not be illustrated by, subsequently nullified by certificates *Sir G. Kekewich*, 20407.
Salivary gland dissected *G. D. Thane*, 1499-1515.
as to *Status* of students attending, *E. H. Starling, E. A. Schäfer*, 3541-54, 10155-70.
Sometimes witnessed by inspector *Sir T. Russell*, 567-8.
Students should see, in connection with blood pressure *G. D. Thane*, 1122-4.
Unnecessary, and should be prohibited *Sir T. Stoker, H. Snow, Miss Lind-af-Hageby, Sir G. Kekewich*, 760-1, 838-43, 871, 875-89, 893, 980-8, 1049, 2233-5, 7459, 9242, 14994, 20517.

EXPERIMENTS—*cont.*

Dependence of recent physiological research upon, *G. S. Woodhead*, 15439-41.
Desirable to minimise, on animals susceptible to pain, *Sir T. Russell*, 607.
as to Desirability of permitting lay inspection of, *Miss Lind-af-Hageby*, 9610-11.

for Diagnostic purposes : "

Necessity of, *Sir V. Horsley, J. R. Bradford*, 16087, 17628-42, 17709-13.
Public health, interests require, *J. R. Bradford*, 17699-700.

Difficulty in ensuring surgical cleanliness in, *S. F. Smith*, 13068.
on Digestive organs, resulting in discovery of practical adjuncts to digestion *Sir L. Brunton*, 7028.
Distinction between painful and painless, *J. N. Langley*, 15251.
"Drowning" of dogs (Professor Schäfer's experiments) :

Described in report of Suspended Animation Committee *E. A. Schäfer*, 10089-101.
Home Secretary petitioned to prohibit, *J. Hughes*, 17218.
Memorandum as to, *G. D. Thane*, 1749-51.
Number of dogs used, and value of new resuscitory method derived *E. A. Schäfer*, 10194-201.
Object and number of experiments performed *G. D. Thane*, 1287-99.
Object of, now attained and repetition unnecessary *E. H. Starling*, 4078-81.
Questions asked in House of Commons as to, *Hon. S. Coleridge*, 11049-53.
Strongly disapproved of *J. Hughes*, 17498-504.

on Ductless glands, and consequent fruitful results *Sir V. Horsley*, 16005-8.
Ears (Dr. Rose Bradford's experiments) :

Performed under anæsthetics and did not give rise to great pain *J. R. Bradford*, 17678-87, 17724-36.
Tympanic plexus destroyed and pain involved *J. W. Graham*, 5842-4.

Enormous advantage to medicine gained by, *Sir L. Brunton*, 7014.
Exhibition prohibited under Act, but permitted by Certificate C *Sir J. Russell*, 615

Eyes :

Ciliary body, its functions discovered, and clues afforded thereby to knowledge of disease *Sir H. R. Swanzy*, 9799-804.
Clinical observation could not have obtained knowledge derived from, *Sir H. R. Swanzy*, 9813-15.
Cocaine, its anæsthetic properties tested by, *A. R. Cushny*, 4751, 4873-6.
Conjunctiva, disease investigated and discovery of remedy *Sir H. R. Swanzy*, 9843-8.
Conjunctivitis research *J. Lorrain Smith*, 18215-26.
Cornea, transplantation of, *Sir H. R. Swanzy*, 9816-18, 9904-5.
Diphtheria bacillus, injections of, *Mrs. K. Cook*, 1913-4, 1919.
Endothelium, its functions discovered and value of such knowledge in optical operations, *Sir H. R. Swanzy*, 9805-12.
Glaucoma investigations *E. H. Starling*, 4169-70.
History, and value of knowledge attained by, *Sir H. R. Swanzy*, 9795-8.
Irritating drug rubbed into rabbits' *J. D. Graham*, 6141-2.
Jequirity, and discovery of possible immunising serum *Sir H. R. Swanzy*, 9820.
Jequirity, and explanation of Dr. Shaw's connection with same *J. Lorrain Smith*, 18402-23.
Physostigmin, its effect investigated on human eye, *A. R. Cushny*, 4889-92.
Students would not gain by performance of, *Sir H. R. Swanzy*, 9891-7.
Tuberculous aqueous humour injected for diagnostic purposes *Sir H. R. Swanzy*, 9819, 9941-7.

EXPERIMENTS—*cont.*

"Feeding":

Absurdity of obtaining licence for feeding kittens on cows' milk *Hon. S. Coleridge*, 10565-9.
Cruelty involved in, *Mrs. K. Cook*, 1921.
Doubts as to whether Act includes, *Sir T. Stoker*, 945.
Immoral, if involving cruelty *Miss A. Kenealy*, 6209.
Monkeys fed with thyroid gland *Mrs. K. Cook*, 1799-1800.
Painless, should be excluded from Act *J. N. Langley*, 15192
Starvation involves pain *Miss Lind-af-Hageby*, 9601-7.

"Freezing" of hibernating animals, fallacious charges brought by anti-vivisectionists as to, and actual facts of case *M. S. Pembrey*, 14018-20.

Fistulæ set up:

Digestive organs investigated by means of, *G. D. Thane*, 1232.
in Gall bladder *G. D. Thane*, 1646.

Gastric:

Act contravened by performing operation without necessary certificates *W. P. Byrne*, 38-40.
Nature of operation and earliest case recorded *E. H. Starling*, 3470-5.

Intestinal, give rise to no abnormal conditions *E. H. Starling*, 4222-5.
Pain does not follow, *G. D. Thane*, 1233.
Pain, varying degrees after operation *G. D. Thane*, 1640.
in Pancreas, *G. D. Thane*, 1642-5.

Gall bladder, gall stones introduced with object of discovering to what extent they were dissolvent *G. D. Thane, Mrs. K. Cook*, 1232, 1640, 1919.
Gelding, *see* CASTRATION.
Heart exposed with view of discovering action of digitalis *A. R. Cushny*, 4684-8.
re Hereditary transmission of acquired characters *W. P. Byrne*, 124.
House of Commons air on mice, as to effects of, *W. P. Byrne*, 125
Humanely conducted *G. D. Thane*, 1162.
Intestinal, may be followed by ascitis *G. D. Thane*, 472-3.

Kidneys:

Dr. Rose Bradford's experiments:
Cruelty involved in, *Mrs. K. Cook*, 1798.
Misrepresentation of, and actual facts of case *J. R. Bradford*, 17737-44, 17752-61, 17689-98.

Grafting on blood vessels in neck of dog, report as to, *Sir J. Russell*, 685-6.
Kidney disease, its treatment has undoubtedly benefited by, *C. R. J. A. Swan*, 19270-1.
Removal of dog's, previously to performing similar operation upon female patient *H. Morris*, 7786-8, 7988-91.

Knowledge of operative technique and manual skill should be acquired by, *Sir V. Horsley*, 16170-7.
under Licence alone, their prolonged nature *Sir J. Russell*, 546, 692-5.
Large number of, are negative in results *G. D. Thane*, 452.
Large number of, duplicated, and value or otherwise of such *W. P. Byrne*, 196-8.
Legal control of, necessary in order to allay public apprehension, *J. R. Bradford, W. E. Dixon*, 17797-800, 19095.
Legislative enactments not necessary with regard to, but no objection to licensed places *W. Osler*, 16738-41.
Liver, cruelty involved in applying plethysmograph *Mrs. K. Cook*, 1800.
Local Government Board research for administrative purposes *W. H. Power*, 4301.
Local Government Board's research for investigating purposes *W. H. Power*, 4301.
Local Government Board research for prophylactic purposes, *W. H. Power*, 4301.
Medical knowledge at a standstill without recourse to, *Col. D. Bruce*, 14196-8.

EXPERIMENTS—*cont.*

Nerves:

Abdominal, cruelty inflicted on dogs *Mrs. K. Cook*, 1917.
All functions of nervous system have been discovered by, *Sir V. Horsley*, 16088.
Division of, in cat *G. D. Thane*, 1247-59.
Exposure and irritation of cats', *Mrs. K. Cook*, 1790.

Gasserian ganglion:

Exposure of, in cats and cruelty involved *Mrs. K. Cook*, 1919.
Misrepresentation of account of, *E. H. Starling*, 3662-6.
Nature and results of, *E. H. Starling*, 4132-9.

No pain after section of nerves *G. D. Thane, E. H. Starling*, 1580-4, 3959-61.
No pain felt in division of nerves *G. D. Thane*. 1257-9.

Optic:

Cruelty involved in, on rabbit *Mrs. K. Cook*, 1793-5.
Pain caused by tying, *Mrs. K. Cook*, 2083-5.

Process of healing not necessarily painful *J. N. Langley*, 15332-4.
Professor Sherrington's, on the distribution of the posterior roots bore out theory concerning zones of referred pain *H. Head*, 17835-65.
Spinal, and necessity of repeating, *E. H. Starling*, 3847-50.
Stimulating, complete anæsthesia maintained during, *E. H. Starling*, 3657-8.
Stimulating of, in dog's neck, and cruelty involved *Mrs. K. Cook*, 1785-9.
Stimulation of, painful *Mrs. K. Cook*, 2079-82.
Superior cervical ganglion excised, and misrepresentation of operation *E. H. Starling*, 3666-76.
Value of, in surgical treatment of severed and diseased nerves *J. N. Langley*, 15139-40.

Number and nature of, for Ireland *Sir T. Stoker*, 767.
Number of, growing *Sir J. Russell*, 600.
Number of, in 1906 *Sir G. Kekewich*, 20528-31.
Number of, on each animal *W. P. Byrne*, 274-7.
Number of painful, relatively small *G. D. Thane*, 463.
Number of, witnessed by Assistant Inspector *Sir J. Russell*, 563-4.
Number of, witnessed by Inspector *G. D. Thane*, 447.
Numbers have increased since 1876 *W. P. Byrne, Mrs. K. Cook*, 193, 1964.

Pancreas:

Excision of, and diabetes produced *E. H. Starling*, 3442-5, 4124.
Excision of, for study of consequent changes in blood and urine *G. D. Thane*, 1232.

Pancreatic duct, dog required to be killed after, utilised for demonstration experiment under lethal anæsthetic *E. H. Starling*, 3695-705.
Pancreatic fistula set up in dog for study of pancreatic juice *G. D. Thane*, 1232.

Pathological:

Definition *E. H. Starling*, 3451.
Wider knowledge gained by, *G. D. Thane*, 1079-82.

"Peculiarly revolting and painful," *J. Hughes*, 17440-9.
Peritoneum, tuberculosis injected and no pain involved *G. D. Thane*, 1678-9.

Physiological:

Knowledge of physiological processes only obtained by, *E. H. Starling*, 3442.
Success of, demands elimination of pain *E. H. Starling*, 3451-4.

"Pithing".

Definition of, and distinction between removal of entire brain or cerebral hemispheres only, *Miss Lind-af-Hageby*, 7403-30.

EXPERIMENTS—*cont.*

'Pithing"—*cont.*

of Frogs:

Distinction between removal of brain and, with reasons justifying belief that purposive movements can exist without consciousness *M. S. Pembrey*, 14128-43.

Term denotes entire decerebration, and as to charges brought concerning, *M. S. Pembrey*, 14021-35.

Term denotes destruction of whole nervous system and consequent removal of all sensation to pain, *E. H. Starling, D. W. Buxton, F. Gotch*, 3462-70, 12666-74, 13702-10, 13930-4.

Poisoning:

Coal gas, practical value of results of, on rats and rabbits *M. S. Pembrey*, 13971.

on Dogs, in connection with investigation of different poisons *F. Hobday*, 16370-7.

Toot, rabbits dosed with, and effects *Sir J. Russell*, 543.

Progress of medical science due to, *H. Morris, J. R. Bradford*, 7837-40, 17723.

Published descriptions of, must be sent to Home Office *W. P. Byrne* 95-102, 233-7.

Spinal cord (Mr. Bayliss' experiments):

Anæsthesia complete during, and untrue statement as to neglect of same *E. H. Starling*, 3639-51.

Stimulation and excitation by electricity, and cruelty involved *Mrs. K. Cook*, 1914-17.

Spleen:

Health of animal not affected by removal, *G. D. Thane*, 471.

Nerves dissected *Mrs. K. Cook*, 1919.

"Starvation":

Certificate refused for, *E. H. Starling*, 3949-51.

Dr. Noel Paton's experiments, proceedings in connection with, *Hon. S. Coleridge*, 10514-48, 11044-8.

Object of, to study circumstances causing fatty degeneration *J. Lorrain Smith*, 18242-62, 18391-401, 18440-3.

Pain not felt after discomfort of first few days, *F. Gotch*, 13879-83.

Performed in Germany, and no similar investigations carried out in this country *J. Lorrain Smith*, 18320-5.

on Submaxillary glands, referred to *H. Snow*, 2224, 2226.

Sulphur dioxide, in connection with destruction of rats on plague ships, and position of physiologist compared with that of rat catcher *M. S. Pembrey*, 14058-66.

Suprarenals:

Excision of both, probably fatal *G. D. Thane*, 472.

One removed without affecting health of animal *G. D. Thane*, 471.

Transplantation, and useless results, *Miss A. Kenealy*, 5322-5.

re Surgical shock (Dr. Crile's experiments):

Anti-vivisectionists' persistent misrepresentation of, *Sir V. Horsley*, 15901-7.

Applicability to man of results *Sir V. Horsley*, 15850-60.

Crushing of dogs' feet under incomplete anæsthesia *Hon. S. Coleridge*, 10265.

Home Office defence of, *Hon. S. Coleridge*, 10289-300.

Necessary and painless *Sir V. Horsley*, 15851-5, 15893-7.

Object of, and conclusions *Sir V. Horsley*, 15688-728, 15971-2, 16202-3, 16204-18.

Same performed in America *Sir V. Horsley*, 16199-201.

Term "incomplete anæsthesia," as used in description of, does not mean consciousness to pain *Sir V. Horsley*, 16048-53.

Reference 8021-4.

EXPERIMENTS—*cont.*

Thyroid gland:

Excision followed by no painful symptoms in monkeys *Sir J. Russell*, 543.

Excision has varying effect in animals *G. D. Thane*, 1233.

Excision, in some cases, followed by nervous symptoms, *Sir J. Russell*, 543.

Excision probably fatal, though not causing acute pain *G. D. Thane*, 472.

Fatal symptoms in dogs resulting from excision, *Mrs. K. Cook*, 1799-1800.

Have led to no definite results *Miss A. Kenealy*, 5326-8.

Important results of, bearing on treatment of myxedema and cretinism *Sir L. Brunton, Sir V. Horsley, W. Osler*, 51825-7, 6959-64, 15688, 15836-41, 16569, 16573-5.

Removal of gland from monkeys has not always produced cretinous and myxedematous symptoms *Sir V. Horsley*, 15831-5.

Unnecessary repetition of, and number of animals used *Miss A. Kenealy*, 6210-11, 6165.

Repetition of, corrects previous erroneous ideas *Sir J. Russell*, 571-2, 574.

Repetition of, except for special object, undesirable *H. Morris*, 7908.

re Röntgen ray and radium treatment, reference, *W. P. Byrne*, 118-23.

Records of, *see that title.*

Returns of, *see under* HOME OFFICE.

Viscera exposed and cannulæ inserted for purpose of showing pulse action *J. W. Graham*, 6143-52.

Inoculations:

Anæsthetics not required for simple, *W. P. Byrne*, 6-9, 159.

Anæsthetics hardly required for, *Col. E. Lawrie*, 17038, 17044.

Could be performed under licence alone *Hon. S. Coleridge*, 10455-68.

for Diagnosis:

Accuracy and necessity of, *W. H. Power*, 4382.

of Bovine tuberculosis, *see under* TUBERCULIN.

of Canine distemper, *S. Stockman*, 3373-8.

of Glanders, *see under* MALLEIN.

Performed in municipal laboratories by licensees not possessing medical qualifications *G. D. Thane*, 406-7.

of Rabies, their reliability *S. Stockman*, 3371-2.

of Tuberculosis, in guinea-pigs *Sir J. Russell, S. Stockman, J. R. Bradford, J. L. Smith*, 711, 3415-8, 17630-5, 18185-8.

Difficulty in distinguishing animals which have undergone, from those which have not *G. D. Thane*, 452, 1576.

for Drug testing and standardising, *see under* DRUGS.

for Investigatory purposes:

Cancer, *G. D. Thane*, 465-6, 1688-91.

Cholin injections and uselessness of such *Miss Lind-af-Hageby*, 7219-20.

Chromic acid injections, *Sir J. Russell*, 543.

Diphtheria, and pain inflicted on cows thereby *Mrs. K. Cook*, 1796.

Local Government Board's, are mainly subcutaneous *W. H. Power*, 4351-2.

Louping ill, results obtained, *D. J. Hamilton*, 20016-19, 20020-8, 20212.

Plague, and pain suffered by infected animals *Sir J. Russell*, 543, 720.

Rabies:

Case of performing, without necessary certificates *W. P. Byrne*, 38.

Skull of rabbit trephined, *S. Stockman*, 2590-7, 3011-25, 3125-9.

Septicemia, its different effects on field and house mice *H. Morris*, 7876-9.

Smallpox, reference *W. H. Power*, 4486-7.

Smegma, manure and tubercle bacilli identified by means of, *S. Stockman*, 3358-60.

EXPERIMENTS—*cont.*
Inoculations—*cont.*
for Investigatory purposes—*cont.*
Snake poison:
Interrupted by introduction of 1876 Act *Sir L. Brunton*, 6987-9.
Uselessness of, *Miss Lind-af-Hageby*, 9225-31.
Toot, injections, and pain following *Sir J. Russell*, 646-8.
Tuberculosis, and cruelty inflicted thereby *Mrs. K. Cook*, 1919.
Tuberculosis Commission research *G. D. Thane*, 1116-7, 1679.
see also under particular names of diseases.
Length of, without anæsthetics, doubtful *W. P. Byrne*, 134-8.
as to Pain in connection with, *S. Stockman*, 25605-7, 2614.
Pain involved by, is small *Sir J. Russell*, 708-9, 8720.
Painless, regulations with regard to, should be relaxed *Sir L. Brunton*, 6991.
Propagation of disease by means of, unjustifiable *J. H. Levy*, 18485-7, 18509-14.
for Production of serum:
Amount of blood usually drawn from horse without inconvenience to animal *S. Stockman*, 2618-23.
Controlled by Act, if for new serum *G. D. Thane*, 1730-4.
Horses largely used on account of size and cleanliness *S. Stockman*, 3271-2.
Hyper-immunisation of animal which has suffered from infectious disease produces powerful preventive serum *S. Stockman* 3315-18.
Sold for therapeutic purposes, not controlled by Act *G. D. Thane*, 1730-2.
for Prophylactic purposes:
Attack of disease does not necessarily follow, *S. Stockman*, 3274-5.
African coast fever, Koch's treatment not successful in Rhodesia *S. Stockman*, 3331-50.
Braxy, failure of certain, *D. J. Hamilton*, 20247-8.
Sheep diseases, no pain caused *D. J. Hamilton*, 20118.
Rabies, no case of hydrophobia produced by, *C. J. Martin*, 12362-4.
Rinderpest:
Successful results in British South Africa *S. Stockman*, 2484-90.
Two methods of serum treatment *Major L. Rogers*, 8226-55.
Tetanus, horses undergoing immunity do not suffer *C. J. Martin*, 12044-9.
Vaccination, *see that title.*
see also SERUM THERAPY.
Returns of, *see* RETURNS OF EXPERIMENTS.

FACULTY OF PHYSICIANS AND SURGEONS OF GLASGOW, evidence on behalf of, *see* GLAISTER, J., 12819-13029.

FARADAY, scientific work of, referred to, *E. H. Starling, Sir J. F. Moulton*, 3442, 12769.

FAYRER, *The late* SIR J.:
Snake poison experiments by:
Cobra venom, action and antidote discovered, *Major L. Rogers*, 8032.
Hindered by conditions of Act, *Sir L. Brunton*, 6833-8.
Permanganate of potash found to be most practical remedy, *Major L. Rogers*, 8029-70, 8217-18.
Reference, *J. W. Graham*, 5856.

FERGUSSON, SIR W., statement to previous Royal Commission as to unnecessary repetition of experiments, *Sir V. Horsley*, 16254-6.

FERRIER, PROFESSOR:
Alleged cruelty of experiment on brain of monkey by, *Mrs. K. Cook*, 1790.
Pain sensations after removal of cerebral hemisphere admitted by, *Miss Lind-af-Hageby*, 7412.
Statement of, as to inapplicability of results of experimental physiology to human pathology quoted, *Miss A. Kenealy*, 6675-97.
Surgical treatment of nervous diseases due largely to experiments of, *Sir V. Horsley*, 15684.
References, *Hon. S. Coleridge*, 10559; *E. H. Starling, Miss A. Kenealy*, 3864, 5288.

FERRIER *v.* YEO, references, *Hon. S. Coleridge*, 10555-6, 10559.

FIJI ISLANDS, measles epidemic in, *Sir L. Brunton*, 6854-60.

FILEHNE, antipyrin introduced by means of experiments of, *A. R. Cushny*, 4784.

FINLAY, DR., of Havana, opinion of, with regard to the mosquito theory of yellow fever, largely responsible for steps taken by United States Commission, *W. Osler*, 16694.

FINSEN LIGHT, possibility of utilising, as eye bacteriacide, suggested by experiments, *Sir H. R. Swanzy*, 9849-52.

FISCHER, drug testing experiments of, referred to, *A. R. Cushny*, 4748.

FISH:
Feeding experiments on, licences granted for, *W. P. Byrne*, 207.
Investigations on, in connection with analysis of suspected river water, *J. Glaister*, 12957-63.

FISKE, JOHN, reference, *J. W. Graham*, 5887.

FLINT, PROFESSOR (U.S.A.), text book by, shows preference for no or light anæsthesia during experiments, *Miss Lind-af-Hageby*, 7262-6.

FLOURENS, experiments by, reference, *Miss A. Kenealy*, 5288.

FOOD POISONING, bacteriological experiments discovered various causes of, *C. J. Martin*, 11817-20.

FOREIGN OFFICE:
Local Government Board has to notify outbreaks of certain diseases to, *W. H. Power*, 4301, 4337-8.
Outbreaks of certain diseases have to be notified to foreign countries by, *W. H. Power*, 4301, 4337-8.

FORSTER, W. E., *The late* Right Hon.:
Member of the Vivisection Commission, 1875, *W. P. Byrne*, 1.
Minute by, as to use of animals in investigations of Local Government Board, *W. H. Power*, 4299.

FOSTER, GREGORY, Principal of University College, London, Slade School students' memorial to, *Miss A. L. Woodward*, 8824, 8856-61.
Reference, *W. P. Byrne*, 66.

FOSTER, *The late* SIR M., K.C.B., F.R.S.:
Chairman of the Tuberculosis Commission, *G. S. Woodhead*, 15484.
Life of Claude Bernard, by, *Miss Lind-af-Hageby*, 7311.
Reference, *Sir J. F. Moulton*, 12738, 12771.

FOXES, possibility of substituting, for dogs, in experiments *G. D. Thane*, 1428-30.

FRANCE:
Alfort, experiments on animals at, for purpose of acquiring surgical skill *S. Stockman*, 3054-7.
Anthrax, successfully inoculated against in, *S. Stockman*, 2510-35.
Smallpox, inoculations of horses and cows in, *W. H. Power*, 4486-7.

FRANKFORT, International Congress for Cancer Research at, *H. Snow*, 2212-14.

FRANKLIN, SIR BENJAMIN, reference *Sir T. L. Brunton* 7157.

Fraser, Sir T. R., m.d., f.r.s., Professor of Materia Medica in University of Edinburgh :
Cobra anti-venin, discovered by, *Major L. Rogers*, 8034.
Eserin, its use as a pupil contractor, discovered by, *Sir H. R. Swanzy*, 9839.
Experiments by, with reference to action of various drugs *A. R. Cushny, Sir L. Brunton*, 4737, 4746, 4787-96. 7019.
Reference, *G. D. Thane*, 1751.

Freeman, J. A. F., anti-vivisection cause supported by, *Hon. S. Coleridge*, 10262.

Friends' Anti-Vivisection Society, income of, *Hon. S. Coleridge*, 10260.

Frimley, Surrey, heather tract at, registered for investigation of grouse disease *G. D. Thane*, 344, 356-8, 358-63, 1404.

Fritsch, *The late* Professor, surgical treatment of nervous diseases due largely to experiments of, *Sir V. Horsley*, 15684.

Frogs :
Brainless, acts of, are not purposive, but merely reflex *Sir V. Horsley*, 16186-7.
as Cold-blooded animals, should not come under the Act, *Sir V. Horsley*, 16267-74.
Chiefly used for demonstration experiments, *Sir J. Russell*, 662-3.
Decerebration of :
for Demonstrating complex reflex movements *M. S. Pembrey*, 13972-3.
Destroys all consciousness to pain *E. A. Schäfer*, 10063-7, 10232-5.
Demonstration experiments on, not objected to, but of little value *Sir T. Stoker*, 1056-7.
Drugs standardised by experiments on, *A. R. Cushny*, 4838.
"Pithing" of :
Denotes removal of whole central nervous system *F. Gotch, M. S. Pembrey*, 13702-10, 13930-4. 14021-35.
Destruction of brain and spinal cord essential to complete, *Miss Lind-af-Hageby*, 9272, 9689-99.
Directions in physiological text-books as to, *Miss Lind-af-Hageby*, 9272.
Distinction between removal of brain and, with reasons justifying belief that there can be purposive movements without consciousness *M. S. Pembrey*, 14128-43.
Evidence insufficient to show consciousness removed by, *Miss A. Kenealy*, 6591-6605.
Nature of operation, *E. A. Schäfer*, 10055-8.
Pain sensations not destroyed by certain methods of, *Miss Lind-af-Hageby*, 9255-9, 9272.
Spinal cord of, sensitive to pain *Miss Lind-af-Hageby*, 9563-84.
Students should be forbidden to experiment on pithed, *Miss Lind-af-Hageby*, 7409-10, 9255-9, 9272.
Too small to admit of practical study of most important physiological functions *E. H. Starling*, 3445, 3479-80.

Fry, Sir Edward, member of committee appointed by King Edward's Hospital Fund, *Hon. S. Coleridge*, 10260.

Furbinger, reference *A. R. Cushny*, 4782.

Furneaux, W., Science Teacher of London School Board, experiments recommended to students in text-book by, expurgated after exposure by Church Anti-Vivisection League *Miss A. L. Woodward*, 8824-6, 8867-80.

Galen :
Knowledge acquired by, as to nervous system not especially valuable *H. Head*, 17938-9.
Vivisection of human beings said to have been performed by, *Sir V. Horsley*, 16160-3.

Galvani, scientific research of, reference *E. H. Starling*, 3442.

Galway, inspection in, conducted by medical inspector from the Local Government Board *Sir T. Stoker*, 831, 971-5.

Gamaleia, protective inoculation against poultry diseases devised by, *C. J. Martin*, 11792.

Gamgee, A., m.d., f.r.s., experiments by, led to discovery of amyl nitrite as remedy for angina pectoris *Sir L. Brunton*, 6888-97.

GASKELL, W. H., M.A., M.D., F.R.S. (a Member of the Commission), 21705, 21761.
Cross circulation experiments under direction of :
Dogs insufficiently anæsthetised in, morphia being alone administered, *Col. E. Lawrie*, 16969-73, 29066-1372.
Laboratory assistant's evidence *re* sufficiency of anæsthesia in, *W. Hall*, 21581-35.
Object of, circumstances attending, and contradiction of allegations *re* cruelty of, *L. E. Shore, H. K. Anderson*, 19430-1, 21636-704, 21373-580.

Gatty Marine Laboratory, St. Andrews, reference *G. D. Thane*, 344.

Geissler, cancer investigations by, *H. Snow*, 2129.

General Medical Council :
Not suited to be advisory body to Home Office *Sir T. Stoker, Sir V. Horsley, W. E. Dixon*, 1067, 15777-8, 19152.
Has no great power over details of medical education *G. D. Thane*, 1485-8.
Should have power to put a stop to unnecessary pain in vivisection *Col. E. Lawrie*, 16931-4.

Gengou, whooping-cough organism put forward by *C. J. Martin*, 12185.

Germany :
Chemical firms in, have introduced an enormous number of new drugs *A. R. Cushny*, 5246.
Hypnotism substituted for anæsthesia in certain experiments in, *M. S. Pembrey*, 14071-7.
Inquiries in, as to relationship between human and bovine tuberculosis *S. Stockman*, 3368-70.
Pasteur's method of inoculation against swine erysipelas now abandoned in, *S. Stockman*, 2824-8.

Gibbons, Cardinal, anti-vivisection cause supported by, *Hon. S. Coleridge*, 10262.

Gibraltar, precautions taken against Malta fever in, *Col. D. Bruce*, 14288-90.

Gibson, R. J. Harvey, m.a., West African Boxwood poison identified by experiments of, *W. E. Dixon*, 18718-28.

GLAISTER, J., M.D., Professor of Forensic Medicine and Public Health, Glasgow University ; Faculty of Physicians and Surgeons of Glasgow, 12819-13029.
Antidotes for number of mineral and vegetable poisons derived from knowledge acquired by experiments 12883-4.
Cerebro spinal meningitis :
Experimental methods essential to proper knowledge of, 12852-61.
More facilities necessary for investigation of, 13003-5.
Propagation, experiments of little value as regards showing means of, 12943-5.
Statistics of outbreak of, in Scotland during 1907 12852.
Certificates :
A :
Extension of scope, desirable 12833.
Heads of departments should have wide instead of restricted form of, 12952-5, 12964-72.
Limitation of number of experiments under, should not be imposed 12918-20.
A2, issue of, and as to range of work permitted under, 12921-8.
Heads of departments should have more liberty with regard to the range of work stipulated in, 12885-7.

GLAISTER, J., M.D.—*cont.*

Demonstration experiments unnecessary for illustrating action of poisons 13015-17.
Diphtheria anti-toxin, its success 13018-23.
Fish, investigations carried out on, in connection with analysis of suspected river water, and without applying for certificate 12957-63.
Has been engaged in researches without experimentation in animals for 25 years 12981-2.
Licence not held by, owing to lack of accommodation for experimental work 12824-8, 12836, 12910-14.
One of the statutory certificates under the Act, 12830-3.
Poisons:
Arsenic:
Antidote for poisoning by, discovered by experimental methods, and date of its introduction 12888-905, 12946-7.
Cows dosed with, and reasons justifying performance of these experiments without certificate 12956.
Chemical tests insufficient to detect certain alkaloids 12864-5.
Chloroform would mark effects of, and hence impossible to demonstrate such to students 13024-6.
Poisoning:
Food:
Bacilli more liable to destruction if food is well cooked 12999.
Cases in which investigation of causes of, has been hindered by inability to experiment on animals 12983-4.
Difficulty in detecting existence of ptomaines, without recourse to experiments 12986-999.
Gas, foreign experiments regarding physiological effects of arsenulated hydrogen 12879-80.
Investigations with regard to causes of, require experimental methods 12838-51, 12866-78, 12973-80, 13006-14.
Meat, necessary to resort to animal experimentation in cases of, owing to difficulty of identifying Gaertner's bacillus 12931-4, 12935-7.
in Scotland, cases rare, and as to procedure in obtaining certificate for investigating purposes 12948-51.

GLAUCOMA, *see under* OPHTHALMIC DISEASES.

GLASGOW:
Faculty of Physicians and Surgeons of, *see* FACULTY OF PHYSICIANS AND SURGEONS OF GLASGOW.
Municipal laboratory at, *G. D. Thane*, 339.
University, research scholarships at, for purposes of studying on Continent *Sir J. Russell*, 707.

GLANDERS:
Danger of occult form of, *S. Stockman*, 2703-7.
Diagnosis of:
Experimental method, essential *S. Stockman* 2464-7.
by Mallein, *see that title.*
Mallein, alternative test to, is by subcutaneous injection of suspected tissue in guinea-pig *S. Stockman*, 2941-2, 3227-34.
Immunity from, may be conferred to certain degree by attack of, *S. Stockman*, 3259.
Knowledge of, entirely due to experiments *S. Stockman*, 2807-18.
Possibility of its being communicated to men *S. Stockman*, 3251-6.
Protective serum not desired, but stamping out of, could be effected by use of mallein and isolating cases *S. Stockman*, 3260-4.

GMELIN, gastric juice, knowledge of its nature and action derived from experiments of, *E. H. Starling*, 3442.

GOATS:
Malta fever organism proved by experiments to be conveyed by milk of, *Col. D. Bruce*, 14234-45 14267-75, 14283-7.

GOATS—*cont.*
Suggested substitution of, for dogs in some experiments *Sir J. Russell*, 609-10.

GOLTZ, experiments on frogs by, reference *Miss A Kenealy, Miss Lind-af-Hageby*, 5288, 9582.

GOODBODY, DR., Assistant Professor of Pathological Chemistry at University College, present at some of Dr. Crile's experiments, and his statement as to maintenance of complete anæsthesia therein *Sir V. Horsley*, 15977-80.

GORDON, DR. MERVYN:
Report by, for Local Government Board, on diphtheria bacillus *W. H. Power*, 4301.
Work of, for Local Government Board in connection with diagnosis of disease, *W. H. Power*, 4628.

GORDON COLLEGE, KHARTOUM, Home Office has no control over, *Sir J. Russell*, 651.

GOSLING, G. D., letter to, *re* incomplete anæsthesia, *Hon. S. Coleridge*, 10993.

GOTCH, FRANCIS, D.Sc., F.R.S., Waynflete Professor of Physiology, Faculties of Medicine and Science, University of Oxford, 13539-13967.
Anæsthesia and analgesia not necessarily coincident 13898-900.
Anæsthetics:
Duration of life under lethal dose of, 13641-56.
Experience in administering, and confidence in possibility of securing complete anæsthesia, 13583-7.
Nature of, generally used and efficiency of chloral hydrate, and urethane 13890-2.
Choice of animals for experiments should not be limited 13563-70, 13918.
Certificates:
A:
New classification of experiments under, suggested 13831-45.
Insufficient for some important experiments which require to be done without anæsthetics 13754-60.
B:
Animals operated upon under, might be kept outside laboratory premises, 13913-15.
Meaning of term "initial operation" in, 13901-9.
D, repetition of experiments desirable because of the introduction of new methods 13761-77.
Delay in obtaining, and as to Sir J. F. Moulton's suggestions 13910-12.
Recommendation for, in connection with starving experiment, refused 13724-31.
Circulation and blood pressure experiments, their object and value 13924-6.
Cold-blooded animals, experiments upon, require Certificate A 13893-7.
Conservation of energy, its law discovered by observation of physiological processes 13549-54.
Curare:
Involuntary mechanisms not paralysed by, 13778-82.
Object of using, and as to possibility of noting indications of anæsthesia during use of, 13593-610.
Prohibition of, would be serious impediment to certain lines of research, but there might be special certificate for the use of, 13874-7.
Demonstration experiments:
Choice of animals and anæsthetic for, considerations determining, 13640.
Necessity and importance of, 13571-9, 13581-2, 13732-43, 13810.
for Physiological phenomena, particularly essential 13611.
Students are not demoralised by witnessing, 13810-12.
Students' conduct most serious, and average attendance at, 13612-38.

GOTCH, FRANCIS, D Sc., F.R.S.—*cont.*
Dividing line between highest animal and lowest form of human being can be drawn, justifying experiments on former 13919-23.
Dogs :
Have not been used for vivisection purposes of late years at Oxford 13954-5.
Rabbits and cats can be substituted for, in blood-pressure experiments 13956-9.
Evidence referred to :
Keble College undergraduates :
Charges denied *Hon. S. Coleridge*, 11454-67.
Unfair charges brought as to Mr. Coleridge's action in case *Hon. S. Coleridge*, 19852-63, 19863-76.
Statement that no experiments were performed last year in his laboratory *Hon. S. Coleridge*, 19933-54.
Heads of departments and laboratories should be entirely responsible for the work which goes on there 13711-13.
Humanity of physiologists, testimony to, 13916-17.
Inspector visits laboratory of, three or four times annually 13871-3.
Inspectors, no objection to increase of, but impracticable to insist on their presence at all experiments 13886-9.
Intimate association of all sciences, 13554-6.
Keble College undergraduates' accusations, actual facts of case and subsequent withdrawal of charge 13668-701.
Licence and certificate held by, and large experience in experimenting, 13543-5, 13714-18.
Licences, medical qualifications should not be required of applicants 13799-806.
Monkeys, desirability of using for certain experiments, but largely a matter of cost 13745-52.
Natural science, as a whole, is retarded if the free development of any one of her branches is unduly restricted, 13548.
Number of animals experimented on yearly, in Oxford 13719-21.
Pain :
as to Analogy between development of senses and sensitiveness to, in animals 13940-53.
Capacity for feeling, varies in proportion to stage of development of animals 13850-4.
Physiological knowledge, advance in, based upon results of experiments 13557-60, 13561, 13807-9, 13847-9.
Physiological knowledge, importance of extending, by experimental research 13547, 13960-64.
"Pithing" of frogs denotes removal of whole central nervous system and consequent insensibility to pain 13702-10, 13930-4.
Starving experiments :
No material pain in, after discomfort of first few days 13879-83.
Water generally allowed in, relieving discomfort to a certain extent 13935-9.
Students should have licence for carrying out certain experiments under supervision, 13813-19, 13855-63.
as to Supply of animals for experimental purposes, 13824-30.
Vivisection Act, 1876 :
Has worked well, and does not restrict scientific research, 13870.
Should be limited to experiments on warm-blooded animals, 13824, 13864-9.

GOUT, whole pathology of, not yet known, *E. H. Starling*, 4272.

GOWERS, SIR W., discovery of ascending tracts in lateral column of spinal cord due to experiments of, and is basis of present knowledge of anatomy of nervous system *H. Head*, 17807-12.
Reference, *Miss A. Kenealy*, 5288.

GOWERS, DR., reference, *Rev L. S. Lewis*, 8776.

GRAEFE, VON, discovery of cure for glaucoma, by, *Sir H. R. Swanzy*, 9836.

GRAHAM, J. W., M.A., Principal of Dalton Hall in the Victoria University, Manchester ; Parliamentary Association for the Abolition of Vivisection 5835-6131.
America, no federal regulation as to experiments in, 6049-53.
Anæsthesia :
Cruelty of experiment lies in incompleteness of, 6077-88.
Experiments not objected to provided complete, could be secured 5944-6.
Anæsthetics :
Danger to life of animal often prevents use of, and uncertain testimony as to efficacy of, 6096-110.
Efficient administration of, to men admitted 6089-93.
"Baking" of rabbits by Sir Lauder Brunton 5844-9, 6131-40.
"Borderland cases," problem should be left to judiciary to decide 6073-6.
Dr. Rose Bradford's experiments on dogs' ears and cruelty of same 5842-4.
Callousness and indifference to pain arise from constant practice of vivisecting 5898-906.
Castration should be performed under anæsthetics, 5928-31, 6111-113.
Curare, no personal recollection of its use without anæsthetic 5895-7.
Dogs :
Dropped from heights upon iron ledges and cruelty of such experiments 5857-5861.
Exemption of, from experiment would not satisfy Parliamentary Association 6157-61.
Experiments on, involving exposure of viscera and insertion of cannulæ into throats without administration of chloroform 5861-71.
Impossible to anæsthetise completely 5960-9.
Drugs, testing of new soporific, on animals not objected to 6070-2.
Evidence referred to :
"Baking" experiments, explanation of, *Sir L. Brunton* 6785-829, 6818.
Dr. Rose Bradford's experiments, actual facts in connection with, *J. R. Bradford* 17678-87.
Immorality of vivisection, views as to, criticised *Sir V. Horsley* 15661.
Manchester University views not represented, and as to witness's connection with University *J. Lorrain Smith* 18372-87.
Experiments on rats with view to discovering sense of direction involved extreme cruelty 5871-7.
Home Office, speculation as to sanction of experiments such as have been performed in America 6054-5.
Laymen might be permitted to witness experiments 6156.
Licence, experiment performed without, 6044-6.
Moral objections to vivisection 5883, 5885, 5887, 5943-9, 5989-93, 6119-23, 6127-30, 6163.
No personal experience of experiments 6117-18.
Opposed to all forms of cruelty to animals, but prepared only to speak on question of vivisection 5994-6034.
Pain :
Amount suffered by animals in experiments 5878-82.
Anti-vivisectionists protest against indifference to, 5883.
as to Vitiation of experiments by, 5933-7.
Painless experiments, opinion as to sanction of, 5971-86.
Penalties to be imposed for performance of experiments not considered 5957-9.
Possibility of experiments in future on human beings 5887-90.
Prohibition of experiments, possible effects, 5951-6.
Dr. C. Shaw's experiments on eyes of rabbits, involving prolonged irritation 5849-55, 6059-69, 6141-2.
Snake bite experiments in India 5855-6, 6059-60.

GRAHAM J. W., M.A.—*cont.*
Total abolition of vivisection desirable 5891-4, 5943-9, 6039-41.
Unwilling to give opinion on medical matters 5918-27.
Would not avail himself of doubtful advantages gained by vivisection 5917.

GRAVES' DISEASE, experiments in relation to bacterial origin of, and immunising and curative influence of culture sera *H. Morris*, 7726.

GRAY, CAPT., R.A.M.C., reference *Col. D. Bruce*, 14476.

GRAY, C. E., M.R.C.V.S., Principal Veterinary Surgeon, Transvaal, reference *S. Stockman*, 3337.

GREENWOOD, G., M.P., pamphlet of, reference *E. H. Starling*, 4142.

GRIEG, CAPT., I.M.S., reference *Col. D. Bruce*, 14476.

GROOM, SIR J. H., President of Royal College of Surgeons, Edinburgh, reference *G. D. Thane*, 1751.

GROUSE DISEASE, Frimley heather registered for investigation of, *G. D. Thane*, 344, 358-63, 1404.

GROUSE DISEASE COMMITTEE, Frimley selected for experiments by, *G. D. Thane*, 365.

GROVE, LADY, reference *Hon. S. Coleridge*, 10993.

GRÜNBAUM, DR.:
Apes, cruelty inflicted on, in experiments by, *Mrs. K. Cook*, 1910.
Experiments on the brain of the chimpanzee by, *E. A. Schäfer*, 10009.
Illegal exhibition of experiments in connection with action of snake poison on rabbits by, and consequent proceedings *Hon. S. Coleridge*, 10330-70, 11125-34, 11157, 11176-9, 19878.

GUINEA-PIGS:
Cocaine, its anæsthetising powers first tested on, *A. R. Cushny*, 4751.
Drugs, action and amount of toxic dose tested on, *A. R. Cushny*, 4824.
Inoculations for diagnostic purposes:
Diphtheria, *G. S. Woodhead, J. Lorrain Smith*, 15473-5, 18187, 18196-201, 18210-13.
Glanders, *S. Stockman*, 3228-34.
Necessity and value of, *E. H. Starling, W. H. Power*, 3445, 4306-7.
Objected to, *Mrs. K. Cook*, 2048-53.
Sheep disease, *G. D. Thane*, 373-6.
Tuberculosis, *Sir J. Russell, S. Stockman, J. R. Bradford, J. Lorrain Smith*, 711, 3073-4, 3415-8, 17630-5, 18452.
Microscopic examinations of bacilli in milk frequently made without resource to inoculation of, *S. Stockman*, 3088-90.
Physiological conditions prevent substitution of, for dogs or cats in certain experiments *G. D. Thane*, 427.
Supply of, for experiments:
Bred, *G. D. Thane*, 1431-4.
Certain number bred in laboratories, but majority brought from outside *Sir J. Russell*, 673-4

GULL, SIR WILLIAM:
Clinical study of cretinism by, did not discover its connection with thyroid gland *Sir V. Horsley*, 16231.
Work of, in connection with pathology of myxedema and cretinism *Sir R. D. Powell*, 5684-93.
Reference *Sir V. Horsley*, 15688.

GULF STREAM, possible influence of, on prevalency of sheep disease *D. J. Hamilton*, 20302-7.

GUTHRIE SOCIETY, Sturges lecture by Dr. Sims Woodhead before, and cruelty of experiments referred to, *Mrs. K. Cook*, 1921.

HAFFKINE, W. M. W., C.I.E.:
Cholera antitoxin devised by, and its success *W. H. Power*, 4324.

HAFFKINE, W. M. W., C.I.E.—*cont.*
Experiments conducted by, in connection with investigation of plague *F. Taylor*, 5597-9.
Explanation by, as to occurrence of tetanus in India with use of plague serum *W. H. Power*, 4500.
Plague antitoxin, *see under* SERUM THERAPY.

HAGEBY, MISS L. LIND-AF-, *see* LIND-AF-HAGEBY, MISS.

HAHN, EUGEN, experiment performed by, of inserting cancer from diseased into healthy breast of woman quite unjustifiable *J. H. Levy*, 18488-90, 18634-42.

HAHNEMANN:
Fundamental principles of, still embodied in homeopathy *G. H. Burford*, 8963-9.
Homeopathic measures against cholera indicated by, and successful result *G. H. Burford*, 9049-52.
Homeopathic remedies for cholera put forward by, *G. H. Burford*, 9049-52.

HALDANE, J. S., F.R.S.:
Appointed to give evidence on behalf of Oxford University, *F. Gotch*, 13791, 13796-7.
"Caisson" disease, experiments of, *E. H. Starling*, 3906.
Experiments by, resulting in treatment of poisoning by coal gas and charcoal fumes in mines *E. H. Starling*, 3442, 3809-10.
Report by, for Local Government Board on application of carbonic oxide to destruction of rats on plague-infected ships *W. H. Power*, 4301, 4631.

HALES, REV. STEPHEN, discovery of blood pressure by, *Sir T. L. Brunton, E. H. Starling*, 6944, 3442.

HALL, BASIL, protest against excessive operations on man by, *G. D. Thane*, 1579.

HALL, W., assisted by Drs. Gaskell and Shore's cross circulation experiments and sufficiency of anæsthesia vouched for by, 21581-635.

HALLIBURTON, W. D., M.D., F.R.S.:
Complete anæsthesia maintained during operation of stimulating nerve performed by, *E. H. Starling*, 3657-8.
Experiment on spleen of dog by, and cruelty involved *Mrs. K. Cook*, 1919.
Handbook of Physiology by:
Cholin tests referred to in, *Miss Lind-af-Hageby*, 7467-76.
Incomplete anæsthesia during experiments advised in, *Miss Lind-af-Hageby*, 7223-51.
Shambles of Science, quotes from paper by, *G. D. Thane*, 1269.

HAMILTON, municipal laboratory at, *G. D. Thane*, 339.

HAMILTON, D. J., Professor of Pathology at the University of Aberdeen, 19984-20378.
Aberdeen, little opposition in, to experiments on animals 20210-11.
Aberdeen University, evidence on behalf of general question of vivisection agreed with, 19986.
Agriculturists in Scotland would be entirely opposed to prohibition of experiments 20201-2.
Medical Faculty of Aberdeen:
Perfectly satisfied with existing Act and its administration 20250.
Unanimity of, as regards necessity of experimenting on animals 20203-4, 20209.
Sheep, no official return of number of, in Scotland 20221-3.
Sheep Diseases:
All, are acute febrile diseases 20250-3.
Bactericidal properties of sheep's blood introduce a most confusing element into problem of discovering prophylactic for, 20166-70.
Black quarter, diagnosed frequently as braxy and remedy for latter disease does not meet case of, 20112-3.

HAMILTON, D. J.—*cont.*
Sheep Diseases—*cont.*
Braxy:
Average percentage of deaths from, in years 1901-3 20119-20.
Bacillus of, voided in soil 20130-2.
Better fed sheep are more susceptible to, 20291.
Experiments with preventive remedy discovered showed that drenched animals did not die of, 20134-7.
Essentially a disease of first-year sheep, and hence suggestion that immunity is acquired through some agency in the soil 20059-63, 20219-20.
Failure of certain subcutaneous inoculations of, to produce immunity 20247-8.
Highland and Agricultural Society, committee appointed to investigate *habitat* of, 20131.
Immunity from, conferred by preventive treatment, generally lasts the lifetime 20183-4.
Incubation period of, 20293.
Lambs immune to, while suckling 20280-4
Malignant oedema symptoms often mistaken for, and hence results of preventive methods vitiated 20162.
Mortality from, among drenched sheep considerably lower than among undrenched sheep 20226.
Not primarily a blood disease, and therein differs from anthrax 20250A-6.
Organism of, discovered by Nielsen and corroborated by experimental investigation 20033-9.
Organism of, revealed by microscopical examination 20140-2.
Origin and meaning of name 20041-2.
Other diseases often diagnosed erroneously as, 20171.
as to Risk in eating carcases of animals that have died from, 20353-5.
Symptoms of, not in the least similar to those of ptomaine poisoning 20272-3.
as to Weather effects in outbreaks of, 20292.
Cure for, not claimed to have been discovered, but preventive remedy obtained 20127-9.
Departmental Committee appointed to investigate, 19990-5.
Date of first drenching methods adopted, 20181-2.
Distinction between different, sometimes confused, and bacteriological diagnosis necessary 20139, 20143-5, 20154, 20268.
Essential that experiments should be performed where disease is found and not in laboratory 20207-8.
Experimental investigations pursued have been approved of in Scotland 20196-200.
Experimental methods adopted with object of obtaining immunisation and remedy arrived at 19987-9, 20056-8, 20064-83.
Experiments in connection with, all conducted under licence 20122
Experiments on behalf of the Board of Agriculture 20114-7.
Experiments performed under travelling licence 20205-6.
Farmers have given every encouragement to drenching method of immunisation 20230.
Gulf Stream influence on prevalency of, 20302-7.
Immunisation from, secured by drenching throats of animals and success of remedy in particular instance 20083-110, 20185-94.
Immunity obtained by giving animal mild form of disease at time of year when it is not naturally susceptible 20238-47.
Inoculation with bacillus of, attended with risk, but its administration by drenching process at proper season of year safe 20311-14.
Inoculation with virus produced at the symptoms of the disease 20233-4, 20269-70.

HAMILTON, D. J.—*cont.*
Sheep Diseases—*cont.*
Louping Ill:
Bacillus not found microscopically in case of, but invariably discovered after incubation of peritoneal liquid 20259-61.
Best mode of investigating, was by allowing animal to die and examining peritoneal fluid 20179-80.
Caused by specific bacillus inhabiting intestine and method of its spread 20029-32.
Derivation of name, 20279.
Experiments to test theory that ticks communicated, were negative except in instance where tick was swallowed 20174-8.
First investigations into, carried out in valley of the North Tyne 20006-7.
Inoculations of blood and cerebro spinal fluid produced negative results 20016-19.
Liquid in peritoneal cavity of sheep suffering from, injected into healthy animals with fatal results 20020-8, 20212.
Post-mortem examinations revealed nothing as to cause of, 20012-16, 20126.
Pyæmia not analogous to, in 20262-6
Symptoms and fatal results of, 20008-11.
Mortality statistics not always reliable owing to difficulty of differentiating between, 20340-8.
Pain not caused in inoculation experiments in connection with, 20118.
Popular remedies for, quite useless 20050-3.
Prevalency of, and disastrous effects on sheep farming industry in Scotland 19996-20004.
Prophylactic treatment:
General success of, 20349.
How suggested 20329-30.
Preparation of remedy and as to charge for its distribution 20350-1.
Method of protecting simultaneously against all, attempted but results not yet ascertained 20147-9, 20163-4.
Pens and folds, their condition as affecting, 20295-301.
Romney Marsh Outbreak, uncertainty as to its specific nature 20155-9.
Tuberculin, its reliability as diagnostic agent 20357-72.
Reference 7882.

HAMILTON, SIR W., reference, *Sir L. Brunton*, 7163-4.

HANAU, PROFESSOR VON, Zurich, cancer experiments on rats by, *H. Snow* 2178-80.

HANKIN, MR., Chemical Examiner and Bacteriologist for the N.W. Provinces and Oudh, Report to Plague Commission in 1899 by, concerning occurrence of plague among individuals in which no microbes were visible *G. G. Bantock* 14954.

HARBERTON, LORD, reference *Hon. S. Coleridge*, 10993.

HARCOURT, *The late* SIR WILLIAM, Home Office policy of consulting Association for the Advancement of Medicine by Research initiated by, *G. D. Thane, W. P. Byrne, Hon. S. Coleridge* 31, 397, 10909-14.

HARLEY, DR. VAUGHAN, cruelty of experiments on dogs' gall bladders performed by, *Mrs. K. Cook* 1919.

HARVEY, discovery of circulation of the blood, by, *E. H. Starling* 3442.

HARVEY, CAPT., R.N., anatomical change in brain brought about by sleeping sickness discovered by, *Col. D. Bruce* 14329-35.

HARVEY, PROFESSOR REUBEN, certificate C not allowed to, *Sir T. Stoker* 795.

HAUGHTON, *The late* PROFESSOR, experiments in Dublin University not permitted by, *Sir T. Stoker*, 770-2.

HANSEMANN, PROFESSOR VAN, doubtful as to malignant character of tumour in mice *H. Snow*, 2118-20.

HAVANNA:
Commission sent by United States in 1900 to, for investigation of yellow fever *W. Osler* 16531.
Mosquitoes in, methods adopted for extermination of, and yellow fever consequently stamped out *G. S. Woodhead, W. Osler* 15555-6, 16539, 16553-65.

HEAD, HENRY, M.A., M.D., F.R.S., F.R.C.P., Physician to the London Hospital 17801-17995.
Sir C. Bell's statements, as to uselessness of experiments of no value 17941-2
Clinical observation should go hand in hand with experimental methods 17880-5.
Experiments on man should not be undertaken without full knowledge of circumstances attending his condition 17953-4.
Experiments performed by, on nerves of cats, and their comfortable condition after operation *G. D. Thane* 1247-59.

Experiment performed on nerves in hand of:
Conditions of operation, 17960-8.
Knowledge acquired from, though unobtainable from experiments on animals is useless if not associated with results derived from latter 17987-95.
Licence was not required for, 17889-90.
Object of experiment, *G. D. Thane, E. H. Starling*, 1249-51, 1257, 3961-2, 17874-9.
Result entirely revolutionised conception of sensation, 17891-908.
Result necessitated revision as to distinction generally drawn between muscular and cutaneous nerves 17918-23.
Tested theory arrived at by previous experiments on animals 17955-8.
Value of, with regard to future treatment and diagnosis 17972-82.
Licensed to perform experiments at University College and the London Hospital Medical College, *G. D. Thane*, 1385.

Nervous system:
Anterior root, value of knowledge as to its motor nature 17937.
Brown Séquard's observations on functions of, 17945-6.
Cases in which knowledge of, can be ascertained from operation on man
Cases in which man is operated upon under conditions closely representing those of animal experiment are rare 17813-15.
Cerebral functions, localisation of, one of advances made 17947-52.
Experiments demonstrating connection between brain and limb movements 17812.

Functions and structure:
All rational diagnosis and treatment must be based upon knowledge of, 17804.
Ignorance as to, 60 years ago 17804-5, 17880, 17944.
Present knowledge of, entirely due to experiments on animals 17806, 17812, 17835.
Galen's knowledge as to, 17938-9.
Ganglion, irritation of, produced by shingles and knowledge acquired by studying this material 17873-4.
Gasserian ganglion, removed in man for case of persistent neuralgia and successful results 17813-34.
Nerve regeneration, opinions as to, are too complex to be classified as "periphalist" and "centralist" 17930-5.

Posterior roots:
Experiments on distribution of, bore out theory concerning zones of referred pain 17835-65.
Value of knowledge as to sensory nature of, 17937.

HEAD, HENRY, M.A., M.D., F.R.S., F.R.C.P.—*cont.*
Nervous system—*cont.*
Pain:
Difficulty of locating perception of, 17983-4.
Localisation of, is not the only factor in diagnosis 17928-9.
Prof. Sherrington's experiments greatly aided clinical observation 17971.
Spinal cord, discovery of ascending tracts in lateral columns of, due to experimental methods and is basis of knowledge of anatomy of, 17807-12.
Ulnar nerve, observation and experiments threw much light on sensation of, 17906-12.
Removal of nerve from horse's feet can be effected so that there is permanent insensibility to pain 17866-72.
Professor Sherrington's experiments were entirely separate to those of, but published results greatly aided, 17926-7.
Uselessness of experiments for merely practical ends 17886-8.

HEALD, GEOFFREY, charge against Mr. Gotch corroborated by, *Hon. S. Coleridge*, 11454.

HEARTWATER DISEASE, advances made in prevention of, *S. Stockman*, 2568-70

HEHMAN, PROFESSOR, mallein discovered by, *S. Stockman*, 2376-8.

HEIDELBERG, International Congress for cancer research at, *H. Snow*, 2212-14.

HEMOPTYSIS, as to date of research which led to substitution of opium for lead in cases of, *A. R. Cushny*, 4863-5.

HEMPSON, MESSRS., Solicitors, reference, *G. D. Thane*, 1280.

HENDERSON:

HEROPHILUS, alleged to have vivisected human beings *Sir V. Horsley*, 16153-9.

HERTZ, PROFESSOR, reference to scientific research of, *E. H. Starling*, 3442.

HEWLETT, PROFESSOR, reference, *Miss Lind-af-Hageby*, 9682.

HIBERNATION, a natural condition of anæsthesia, *M. S. Pembrey*, 14152-5, 14178-83.

HIGHLAND AND AGRICULTURAL SOCIETY:
Committee appointed by, to investigate *habitat* of braxy bacillus *D. J. Hamilton*, 20131.
Experiments with regard to sheep disease performed at suggestion of, *D. J. Hamilton*, 19989.

HILL, DR. WOODROFFE, F.R.C.V.S.:
Letter from, objecting to vivisection of dogs *J. Hughes*, 17205-7.
Views of, as regards impossibility of anæsthetising dogs *J. Hughes*, 17523, 17455-62.

HILL, LEONARD E., M.B., F.R.C.S., F.R.S.:
Alleged cruelty of experiments performed by, *Mrs. K. Cook, J. W. Graham*, 1910-11, 5861-71.
"Caisson" disease experiments by, *E. H. Starling*, 3442, 3902-10.
"Caisson" disease, memorandum *re, G. D. Thane*, 381.
Physiology and Pathology of the Cerebral Circulation by, record experiments conducted chiefly under morphia and shows dislike of anæsthetics *Miss Lind-af-Hageby*, 7300.

HILL, LEONARD E., M.B., F.R.C.S., F.R.S.—*cont.*
Recent Advances in Physiology and Bio-Chemistry edited by, makes no mention of anæsthetics *Miss Lind-af-Hageby*, 7265-70.

HIME, DR. T. W., BRADFORD:
Allegations concerning experiments performed by, *Miss A. L. Woodward*, 8828-55, 8789-810, 8885-93.
Church Anti-Vivisection meeting at Bradford in 1898 and charges then brought against, *Miss A. L. Woodward*, 8789-810, 8828-55.
Home Secretary's unjustifiable action in connection with charges brought against, *Miss A. L. Woodward* 8829-55.
Object of experiments performed by, ignorance as to *Miss A. L. Woodward*, 8885-93.

HIPPEL, VON:
Cornea, its successful transplantation from eye of rabbit to man first performed by, *Sir H. R. Swanzy*, 9816-18.
Tuberculin treatment for eye diseases introduced by, *Sir H. R. Swanzy*, 9820.

HIRST, MR., remarks of, on measles epidemic in Fiji Islands, *Sir L. Brunton*, 6854-60.

HITZIG, *The late* PROFESSOR:
Surgical treatment of nervous diseases due largely to experiments of, *Sir V. Horsley*, 15684.
Reference, *E. A. Schäfer*, 10009.

HOBDAY, F., F.R.C.V.S., F.R.S.E., 16284-523:
Anæsthetics:
Administered by trained assistant previous to operation 16332-3.
After effects of, on animals, 16441-6.
Chloroform, *see that title below.*
Investigations into method of administering, chiefly carried out on dogs and cats 16301-5.
Knowledge that a sufficient dose of, has been given is denoted by animal's irresponsiveness to severe pain, 16441-6.
No difficulty in determining whether animal is conscious of pain under, 16329-31.
Study of, specially undertaken at the Royal Veterinary College 16294.
Tracheotomy may or may not be performed under, 16517-18.
Antiseptic treatment of surgical wounds does away with the necessity of bandaging 16347-51.
Castration of horses, method adopted 16401-13.
Chloroform:
Administered by a mask always 16382.
Danger in administering, is at beginning of procedure 16455-60.
Investigations into method of administering, and records of cases 16306-16.
Margin between dose of, securing complete unconsciousness and lethal dose 16454.
Preferred to the A.C.E. mixture 16322-6, 16473-5, 16497-500.
Series of experiments in connection with administration of, to dogs and small percentage of deaths 16434-5.
Dangers attending abdominal operations in pre-antiseptic days 16391-4.
Dogs:
Anæsthetisation of, not difficult 16318-28, 16435-9.
Anæsthetisation of, used to be frequently attended with fatal results owing to want of skill and method, 16294, 16378-80.
Experiments on, justifiable for extension of knowledge with regard to distemper 16358-65.
Fastened to the operating table as a general rule 16340-6.
Muzzled during operation, but not to prevent cries 16476-80.
Terror not shown by, in anticipation of chloroform 16334-6.
Experiments performed by, as to most humane way of destroying animals 16416-33.
Frequent operations performed without anæsthetics on animals by, 16515-16.
Has performed very few experiments 16291-2.

HOBDAY, F., F.R.C.V.S., F.R.S.E.—*cont.*
Horses:
Chloroform can safely be given to, 16398-400, 16414-15.
Fired frequently without anæsthetics 16520-3.
Personal experience shows no danger in anæsthetising, 16440.
Large number of animals treated and operated on by, 16290.
Laudanum, dogs tolerant of large doses 16509.
Licence and certificate held by, in connection with investigation of methods of administering anæsthetics 13667-70.
Licence held by, while at Royal Veterinary College 16512-14.
Majority of surgical wounds heal apparently without pain 16352-6.
Morphia:
Affects different dogs differently 16487.
Dogs insusceptible to toxic dose of, 16483-5.
Instance of administering 20 grains to dog without fatal result 16501-7.
A narcotic, and used largely for stopping pain 16461-3.
Used for certain minor operations on dogs 16481-2.
Morphia said not to be an animal anæsthetic by, *Miss Lind-af-Hageby*, 7316-7, 7322.
Poisoning, experiments performed on dogs in connection with investigation of different methods of, 16370-7.
Professor of Therapeutics at the Royal Veterinary College for seven years 16286, 16366.
Reference *E. H. Starling*, 4156.

HOGG, DR., Coroner for Middlesex:
Letter from, opposing vivisection of dogs *J. Hughes*, 17209.
Member of Committee of National Canine Defence League *J. Hughes*, 17244.

HOLMES, DR. TIMOTHY, F.R.C.S., correspondence with, as to use of "incomplete anæsthesia" *Hon. S. Coleridge*, 11308, 10991-11006.

HOLMES, OLIVER WENDELL, infectious nature of puerperal fever noted by *C. J. Martin*, 11647.

HOME OFFICE:
Action taken by, to prevent licensee delegating his powers to others *G. D. Thane*, 488-91.
Association for the Advancement of Medicine by Research advises, in issue of licences and certificates *W. P. Byrne, G. D. Thane, Sir J. Russell, Sir T. Stoker, Sir V. Horsley*, 24, 27-9, 131-3, 175-6, 435-8, 525-7, 1066-7, 16100-1.
Board of Agriculture experiments under control of, *W. P. Byrne*, 295-8.
Breaches of Act occurring without knowledge of, *W. P. Byrne*, 288-9.
Certificates nullifying usual restrictions as to experiments authorised by, *W. P. Byrne*, 260-5.
Certificates, responsibility of advising, as to their grant rests with inspector *G. D. Thane*, 1466-8.
Certificates sometimes disallowed by, *G. D. Thane*, 1154-8.
Charges brought by Mr. Coleridge against:
Animals not protected from unjustifiable suffering, *Hon. S. Coleridge*, 10266-75.
Annual Return asserts that no experiments entail pain, *Hon S. Coleridge*, 10540-1.
Annual Return suppresses names of those who sign certificates dispensing with anæsthetics *Hon. S. Coleridge*, 10573-602.
Appointment of biassed inspectors *Hon. S. Coleridge*, 10412-30.
Association for the Advancement of Medicine by Research improperly consulted in issue of licences and certificates 10675-91, 11049, 11093-109, 11615-21.
Baseless, *Sir V. Horsley*, 15729.
re "Chemist and Druggist" case *Hon. S. Coleridge*, 10330-70.
re Dr. Crile's experiments *Hon. S. Coleridge*, 10289-300.
re Dixon and Brodie's experiments *Hon. S. Coleridge*, 10370-81.

HOME OFFICE—*cont.*

Charges brought by Mr. Coleridge against—*cont.*

Evasive and insufficient replies to plain questions on administration of the Act *Hon. S. Coleridge*, 10614-39.

Exemption of Sir Victor Horsley's experiments from inspection *Hon. S. Coleridge*, 10645-56, 11082-90, 19908-18.

Misleading answer in House of Commons to question as regards number of persons holding certificates dispensing with anæsthetics *Hon. S. Coleridge*, 10317-29.

Officials have constituted themselves spokesmen of vivisectors and made disingenuous statements *Hon. S. Coleridge*, 10275, 10431-513.

Shielding of licensees known to have broken the law, *Hon S. Coleridge*, 10603-13.

Starvation of animals assumed to be painless *Hon S. Coleridge*, 10514-48.

Twelve different, *Hon. S. Coleridge*, 10262-4, 11205-7.

Complaints as to cruelty in experiments would be referred to inspector by, *G. D. Thane*, 1260.

Conflicting statements as to responsibility of, in deciding painful nature of an experiment *Hon. S. Coleridge*, 10266-75.

Correspondence with, *re* Dr. Crile's experiments and subsequent proceedings *Hon. S. Coleridge*, 10289-316, 10991-11043.

"Drowning" experiments required special permit from, *G. D. Thane*, 1291-7.

"Drowning" experiments should have been prohibited by, *Hon. S. Coleridge*, 10915-37.

Evidence of Principal Clerk, *see* BYRNE, W. P. 1-306.

Experiments indirectly made use of by, *W. P. Byrne*, 301.

Few complaints as to interference of, with legitimate research *W. P. Byrne*, 194.

Gordon College, Khartoum, not under control of, *Sir J. Russell*, 661.

Inspection carried out by, on behalf of public *G. D. Thane*, 1777-9.

Inspectors:

Evidence of, *see* THANE, G. D., RUSSELL, SIR J., 307-504, 1071-1231, 505-755.

Additional inspection could be secured by making whole time officers *Sir V. Horsley*, 16046.

All painful experiments should be prohibited except in presence of, *A. G. Scott*, 19529-43, 19577-86, 19666-70, 19673-80.

Applications for licences and certificates submitted to, *W. P. Byrne*, 32-33, 208.

Daily inspection of laboratories should be made by, *A. G. Scott*, 19591-19601.

Duties of, minutes as to, *G. D. Thane*, 1085.

Duties of, superfluous from vivisectors' point of view, but inspection gives public a sense of security *Sir V. Horsley*, *W. E. Dixon*, 16083-4, 19165, 19167-72, 19180-6.

Fulfil no useful purpose, *Sir V. Horsley*, 16043-5.

Impracticability of requiring, to watch all possible painful developments of inoculation experiments, admitted *A. G. Scott*, 19702-8.

Increase of, not objected to, *J. N. Langley*, 15345-9.

Increase of, not objected to, but impracticable to insist on presence of, at all experiments *F. Gotch*, 13886-9.

Increase of, undesirable and any outside inspection should be authorised *Sir L. Brunton*, 6919-23.

Increase of, useless *Miss Lind-af-Hageby*, 7462-5.

Influenced by recommendations of Association for the Advancement of Medicine by Research *Hon. S. Coleridge*, 10689-90.

Insufficient number of, and necessity of their being whole time men *A. G. Scott*, *Sir F. Banbury*, 19499-512, 19544-51, 19577-86, 19798-836.

Licences granted on advice of, *W. P. Byrne*, 131-3.

Local Government Board's investigations subject to supervision of, *W. H. Power*, 435-6.

HOME OFFICE—*cont.*

Inspectors—*cont.*

Necessary qualifications of, *A. G. Scott*, 19544-51.

Number and duties of, *W. P. Byrne*, 185-7.

Part time officers *Sir V. Horsley*, 16082.

Publications of licensees scrutinised by *W. P. Byrne*, 190-1.

Report of, as to suitability of premises for experimental work *W. P. Byrne*, 54-6.

Report of, records all irregularities *G. D. Thane*, 477-8.

Report of, with regard to suitability of applicants for licences quite apart from report of Association for the Advancement of Medicine by Research *W. P. Byrne*, 175-6.

Returns:

All experiments recorded in, *Sir. J Russell*, 659-60.

Alteration in form of, *G. D. Thane*, 1755-6.

Certificates, number of, permitting experiments on dogs and cats and recovery from anæsthesia issued during 1906, set out in, *J. Hughes*, 17174-82.

Contraventions of Act set out in, *W. P. Byrne*, 44.

Increase in number of licensees and experiments shown in, *Sir J. Russell*, 600.

Local Government Board, investigations recorded in, *W. H. Power*, 4348-50.

Misleading statements in, as to health of animals after inoculations, *Mrs. K. Cook*, 1919.

Nature of experiments now required to be distinguished in, *G. D. Thane*, 1334-5.

1900, painful inoculations, position with regard to, fully explained, *G. D. Thane*, 464.

Painful and painless experiments, distinction formerly made between, of no value *G. D. Thane*, 1723-9.

Sufficient number of, *Sir J. Russell*, *G. D. Thane*, 604, 1188-93.

Unregistered places licensed for experiments subject to, *W. P. Byrne*, 82-7.

Visit of, and nature of duties, *W. E. Dixon*, 19163-6.

Visits of, have caused no trouble, *J. N. Langley*, *G. S. Woodhead*, *Sir V. Horsley*, 15345-9, 15574-5, 16042.

Work of, might be facilitated by limiting number of registered places, *A. G. Scott*, *Sir F. Banbury*, 19618-20, 19508, 19778-82.

Inspector and, do not disagree as to issue of licences, *G. D. Thane*, 1151-3.

Inspector notifies all irregularities under the Act to, *G. D. Thane*, 1145-7.

Investigations authorised by, *W. P. Byrne*, 293.

Licences and certificates inspected by three officials of, *W. P. Byrne*, 199-204.

Licences and certificates issued by, to veterinary surgeons on same terms as other applicants, *W. P. Byrne*, 70-2.

Licences, applications for, made to, and subsequent procedure, *W. P. Byrne*, *G. D. Thane*, 155-6, 388-95.

Licensees may be required to report in more detail by, *W. P. Byrne*, 103.

Letter from Sir Arthur Rücker to, in connection with statements contained in *The Shambles of Science*, *A. D. Waller*, 18094-7.

Local Government Board investigators make yearly return to, and figures for 1901, *W. H. Power*, 4333-6.

Local Government Board investigations supervised by, *W. H. Power*, 4517.

Personal character and humanity of applicant for licence and certificate not investigated by, *Hon. S. Coleridge*, 10264.

Painfulness of experiments not decided by, *W. P. Byrne*, 129-30.

Private places rarely registered for experimental purposes by, *W. P. Byrne*, 74-7.

Publications of licensees must be sent to, *W. P Byrne*, 95-102.

HOME OFFICE—*cont.*
Records of Experiments:
Conference suggested to report as to, *W. P. Byrne*, 240.
Return formerly provided for, now dispensed with *W. P. Byrne*, 188.
Responsibility of permanent officials *Hon. S. Coleridge*, 10899-12.
Takes no steps to investigate cases of experiments performed by unlicensed persons *W. P. Byrne*, 185.
Time limit usually imposed by, in granting special certificates *W. P. Byrne*, 267.

HOME SECRETARY:
General powers under the Act granted to, *W. P. Byrne*, 10-15.
Justified in imposing conditions on licences, *E. A. Schäfer*, 10741-6.
no Legal proceedings under Act instituted by, *W. P. Byrne*, 45-6.
Letter from, as to allegations concerning Dr. Hime's experiments *Miss A. L. Woodward*, 8804.
Letter from, concerning alleged vivisection of frog at physiological lecture by Dr. Langdon Down *Miss A. L. Woodward*, 8811-20.
Minutes of, as to inspector's duties, *G. D. Thane*, 1085.
Necessity of obtaining consent of, for the prosecution of a licensee should be abolished, *A. G. Scott*, 19559-67.
Number of experiments under Certificate B may be reduced by, on advice of Inspector *Sir J. Russell*, 633-4.
Petitioned to prohibit Professor Schäfer's drowning experiments on dogs, *J. Hughes*, 17218.
Proposed investigation of painful character submitted to, *W. P. Byrne*, 218-20.
Prosecution of licensee for contravention of Act cannot be instituted without assent of, *W. P. Byrne, Sir J. Russell*, 230-1, 591.
Prosecution of licensees should be instituted by, *Hon. S. Coleridge*, 11115-23.
Responsibility of protecting animals has been delegated by, to vivisectors themselves *Hon. S. Coleridge*, 10265.
Statement made by, in 1903 with regard to increase of experiments on dogs *J. Hughes*, 17547-58.
Sanction of, required for all fresh licences and certificates, submission to, of all proposed investigations of a new character, *W. P. Byrne*, 2, 4.
Unjustifiable action of, in connection with allegations against Dr. Hime *Miss A. L. Woodward*, 8829-55.

HOMEOPATHY:
Colchicum investigated on principles of, and method adopted *G. H. Burford*, 8913-22.
Digitalis, homeopathic method of investigating action of, *G. H. Burford*, 8928-35.
Drugs can be tested better by methods of, than by animal experiments *G. H. Burford*, 9076-7.
Drug testing by methods of, on volunteer patients *G. H. Burford*, 8909-13, 8952-6, 9002-5.
Drug testing by methods of, on volunteer human beings should precede experiments on animals *G. H. Burford*, 8961-2, 9026-32, 9044-8.
Equipment necessary for research on principles of, *G. H. Burford*, 9101-4.
Hahnemann's fundamental principles still embodied in, *G. H. Burford*, 8963-9.
Investigatory methods of, give accurate knowledge of action of drugs on "tout ensemble" of patient *G. H. Burford*, 9085-9.
Many remedies have been introduced into medical practice by means of, *G. H. Burford*, 8924-6.
Methods of, preferable to experiments on animals since final tests of remedies must always be on man *G. H. Burford*, 8942-49.
Methods of, should supersede animal experimentation for pharmacological purposes *G. H. Burford*, 8908-13.
Nature of experiments necessary for investigations on principles of, *G. H. Burford*, 9101-4.
Remedies introduced into professional use through methods of, *G. H. Burford*, 8924-5, 9015-24.
Vaccination as performed by methods of, *G. H. Burford*, 9053-69.

HOOKER, experiments by, reference, *Miss A. Kenealy*, 5296.

HOPPS, REV. J. PAGE, Social Purity Alliance 8312-628.
Abolition of all experiments desirable 8501-4.
Accounts of experiments published by Anti-Vivisection Societies indicate pain suffered 8449-53.
Acquainted with general conditions of Act, but does not wish to give evidence as to evasion of, 8330-45.
All operations on animals except for their good are criminal 8516-22.
Castration, doubts as to justification for, 8435-46, 8610-11.
Continental practice of experimenting on patients in hospitals 8319-27.
Distinctions between using animals for food and other purposes 8482-500.
Distrust of experiments derived entirely from reading and conversation 8589-96.
Distrust of vivisection generally, 8615-28.
Ethical objections to vivisection 8315, 8390-420.
Experiments should be regulated by general law of cruelty to animals 8581-4, 8614.
Illegal to obtain knowledge by experiments on animals 8447-8.
Individual judgment must be standard of what is ethically right 8560-65.
Justified in making statements as to tortures inflicted on animals by vivisectionists 8421-3.
Man not justified in inflicting pain upon animals 8425-34.
Medical profession not united as to desirability of vivisection 8352-3A.
Morals deteriorated by practice of vivisection 8370-6, 8329, 8523.
Observations made by experimenters untrustworthy and objectless 8354-69.
Painless nature of experiments, scepticism as to, 8555-9.
Practice of vivisection has fascination for those who engage in it, 8315-18.
Public attention should be turned to improvement of sanitary conditions rather than to discovering remedies for disease 8585-8.
Rats, their destruction permissible if painlessly conducted 8549-50.
Sport of all kind objected to, 8542-5, 8597-608.
Various grades of objections to vivisection 8569-72.
Vegetarianism, doubts as to question of, 8377-8, 8471-5.
Wrong to kill an animal painlessly for purposes of *post-mortem* observations 8463

HORROCKS, MAJOR, R.A.M.C., Sanitary Officer at Gibraltar:
Experiments performed by, in connection with communication of Malta fever by dust, not successful 14467.
Measures adopted by, in stamping out Malta fever at Gibraltar 14288-90.

HORSES:
Act does not control use of, for production of sera *G. D. Thane, C. J. Martin*, 1747-8, 11845-7.
Anæsthetisation of, no danger involved *F. Hobday*, 16440.

Castration of:
Anæsthetics may or may not be used for, *S. Stockman*, 2873-87.
Anti-tetanus serum generally injected before, *S. Stockman*, 3281-2, 3287.
Method adopted, *F. Hobday*, 16401-13.

Certificate F. required for experiments on, *G. D. Thane*, 423.
Chloroform can safely be given to, *F. Hobday*, 16398-400, 16414-15.
Diphtheria anti-toxin, prepared from, *G. S. Woodhead*, 15473-5.

Docking of:
Anti-tetanus serum generally injected before, *S. Stockman*, 3281-2, 3287.
Superficial pain only caused *E. H. Starling*, 3956-8.

Exported to Continent for horseflesh, meat tested on arrival with mallein, *S. Stockman*, 3250.

HORSES—*cont.*

Fired frequently without anæsthetics, *F. Hobday*, 16520-3.
Inoculated with tenatus anti-toxin and immunity thereby produced, *S. Stockman*, 2507-23.
Inoculation of, for purposes of immunising against tetanus, does not involve suffering, *C. J. Martin*, 12044-9.

Inoculations for serum production:

Blood, amount that can be drawn without inconvenience to animal, *S. Stockman*, 2618-23.
Care taken to secure healthy conditions, *G. D. Thane, C. J. Martin*, 1443-7, 11696-710.
Swine-erysipelas, *S. Stockman* 2557-62.

Inoculations of small pox into, in France, *W. H. Power*, 4486-7.
Inoculations of, with toxin, do not necessarily produce attack of disease, *S. Stockman*, 3274-5.
Reaction of, from mallein, not always conclusive proof of glanders, *S. Stockman*, 3235-45.
Removal of nerve from feet of, can be effected so that there is permanent insensibility to pain, *H. Head*, 17866-72.
Sera largely obtained from, on account of its quantity and cleanliness, *S. Stockman*, 3271-2.

Horse-sickness.

Advances made in immunising mules from South African, *S. Stockman*, 2568.
Fairly accurate knowledge of, derived from experiments, *S. Stockman*, 3388-3402.

HORSLEY, SIR VICTOR, F.R.S., F.R.C.S., British Medical Association, 15583-16283.

Alcohol, consensus of medical opinion as regards its non-dietetic value, 15867.

Anæsthesia:

Absence of purposive movements under, is criterion of unconsciousness to pain, 15929-35.
Death under, possible difficulty of distinguishing cause of, 15863-4.

"Incomplete":

Mr. Coleridge's letter to surgeons regarding use of, deceptive and misleading, 15728.
Explanation of term as used in connection with Dr. Crile's experiments, 15721-8.

Inquest or public enquiry not held in Scotland in case of death in hospital from, 15861-2.
Object of modern research on, is to know how to paralyse higher centres of brain, 15900.

Anæsthetics:

Administration of:

Knowledge of, should be acquired by practice on animals, 15644.
Necessity of teaching by experiments, 15651-2.
Pain, its gradual diminution during, 16012-14.

Anti-vivisectionists' mistatements regarding performance of experiments in England without, 15728-9.
Dogs can be easily kept under, 15909.
Foreign experiments are rarely conducted now without, 15887.
in Midwifery cases, 16015.
No experiments involving cutting, of a painful character, have been performed during administration of Act without, 16188-98.
Pain not felt under, 15899.
Previous to discovery of, surgeons were justified in experimenting upon animals, 15869-71.
Respirable gases and vapours, action of, established by experiments, 15652-3.

Animals used in experiments, 16064.

Antiseptic surgery:

Anti-vivisection opposition to, shows distinct lack of moral feeling, 15672.
Blood poisoning and pyemia after operations have disappeared owing to, 15669-71.

HORSLEY, SIR VICTOR F.R.S., F.R.C.S.—*cont.*

Antiseptic surgery—*cont.*

Introduction of, entirely due to experiments on animals, 15669-71.
Invention of, has saved incalculable degree of pain, 15669-71.

Anti-vivisectionists not morally justified in accepting knowledge gained by vivisection, 15589-94, 15872-4, 16137-8.
Aseptic surgery is logical outcome of Lord Lister's teaching, 15666-8.
Association for the Advancement of Medicine by Research, necessity of Home Secretary being advised by, in issue of licences, 16100-1.
Boy employed in laboratory of, testifies to cruelty of vivisection practised there, *Miss A. L. Woodward*, 8824.
Blood pressure, knowledge of, has been entirely obtained by experiments and its vital importance both clinically and in operations, 16512-14, 16040-1.

Brain:

Diagnosis of different diseases of, can only be learnt by observation during experiments, 16036-9.
Optical surgery advanced by observations made during experiments on, 16000-2.

Brain surgery:

Nature of experiments, and absence of pain in same, 15986-97, 16003-4.
Successful operative treatment of brain and spinal cord wholly due to experiments on animals 15842, 15846, 15998-16000.

British Medical Association:

Constitution and membership 15585-6.
Deputation sent from, to express to M. Pasteur feelings of the profession as to value of his work 15603.
Only public body in this country that thanked Mr. Long for imposing Muzzling Order 16026-30.
Scientific Grants Committee gives grants to students for purposes of research 15586, 15782-4.
Views of, as to morality of vivisection and immorality of anti-vivisection 16135-41.

Carbolic ligature, statement as to its failure untrue 15962-5.
Certificates held by, 16062-3.

Certificates:

A, difficulties arising from fact that anæsthetics are not permitted under, 15757-60.
Abolition of, desirable 15767.
Abolition of, need not eliminate advisory bodies concerned in issue of, 15775.

B:

No ambiguity in wording of, as suggested by Mr. Coleridge 15945-9.
Suggestion that anæsthetics are not used throughout experiments under, quite baseless 15761.

C, unnecessary, 15761.
D, unnecessary, and contrary to progress of scientific work 15761-2.
E, originally liable to misapplication and refusal of a previous Home Secretary to reconstruct it 15762-5.
EE, substituted for Certificate E since 1888 15762-3.
Experimenters' form of return to Home Office could be expanded so as to include all details supplied by, 15767.
F, unnecessary, 15765-7.
Restriction of number of experiments in, and difficulties arising therefrom 15767-70.
Unnecessary, and only complicate administration of Act, 15756, 16090.

Charges brought against Home Office concerning, *see under* HOME OFFICE.

Chloroform:

Discovered by accidental inhalation 16258.
Percentage of, to secure unconsciousness, much the same in all warm-blooded animals 15645-9.

HORSLEY, SIR VICTOR, F.R.S., F.R.C.S.—*cont.*

Chloroform—*cont.*

System of introducing, from another room through a tube quite satisfactory 15910-12.

Cold-blooded Animals :

Act should not have reference to, 16267-74.

Distinction between warm-blooded animals and, should be only form of differentiation between animals under Act 15952-4.

Separate certificates for experiments on, unnecessary 16275-9.

Mr. Coleridge's charges against Home Office *re*, baseless, and actual facts in connection with permission to perform two experiments away from laboratory 15729, 15733-56.

Control of Animals during Experiments :

Animals are tied down for sole purpose of keeping them in position 16009-11.

Misrepresentation by Mr. Coleridge of evidence during Bayliss libel case as to, 16010-11.

Dr. Crile's experiments performed in laboratory of, *Hon. S. Coleridge*, 10265.

Dr. Crile's Experiments :

Anæsthesia maintained throughout, and hence application of term "terrible" to, unjustifiable 15893-7, 16220-2.

Anti-vivisectionists' persistent misrepresentation of, 15901-7.

Conclusions arrived at from, and their applicability to man 15850-60, 16202-3.

"Incomplete anæsthesia," term as used in description of, does not mean consciousness to pain 16048-53.

Necessary and painless 15851-5.

Object was to investigate conditions of surgical shock as arising in operations on human beings 15971-2, 16204-18.

Origin of, and as to Mr. Coleridge's observations on, 15688-91.

Personally witnessed six or seven of, and no suffering observed 15975-6.

Some performed in America 16199-201.

Curare :

No danger in use of, with accompanying anæsthetic 15913-18.

No objection to presence of inspector at all experiments involving use of, 16058-9.

Rarely used, 16054.

Mr. White's case of accidental poisoning by, 15918-24, 15965.

Demonstration Experiments :

Essential, for proper education of students 15630-1, 15606, 15614-20, 15798-9, 15939, 16105-11.

Mr. Pembrey's statement *re*, criticised 16265-6.

Performed under Certificate B, and animal not allowed to recover 15621-2.

Students not demoralised by witnessing, 15606, 15886, 16116-21.

Diagnosis and operative technique of surgery require to be advanced by experiments 16087.

Director of Brown Institute for several years, 15981.

Dogs, absolutely essential, both for demonstration and original research purposes 15808-11, 15942-3.

Drugs :

All experiments with new, should be made on dogs, rather than upon man, 15653.

Experimentation with regard to effects of, has been neglected, and is most necessary 15865.

Ductless glands, fruitful results of experiments on, 15005-8.

Evidence of, in Bayliss v. Coleridge libel case accurately represented *Hon. S. Coleridge*, 19919-29.

Evidence referred to :

Catalogue of instruments, charges *re* circulation of, *Hon. S. Coleridge*, 19877-9.

Deception alleged in letter to surgeons with reference to meaning of "incomplete anæsthesia" unfounded *Hon. S. Coleridge*, 19930-2, 19967-74.

HORSLEY, SIR VICTOR, F.R.S., F.R.C.S.—*cont.*

Evidence referred to—*cont.*

Mansion House meeting, charges *re* inaccurate account of, *Hon. S. Coleridge*, 19845, 19880-901.

National Anti-Vivisection Society never opposed Muzzling Order as stated *Hon. S. Coleridge*, 19901-19905.

Suggestion that witness' experiments were only ones witnessed last year by inspector *Sir G. Kekewich*, 20433-8.

Exemption of, from inspection by Home Office *Hon. S. Coleridge*, 10645-56, 11082-90, 19908-18.

Experiments on dogs at laboratory of, under complete anæsthesia *E. H. Starling*, 4142-52.

Experiments performed by, conducted mainly at University College and Brown Institute, and inspection frequent 15981-4, 16075-9.

Experiments performed by, on thyroid gland demonstrated that its absence or disease is responsible for cretinism and myxedema, *Sir R. D. Powell, W. Osler*, 5684-93, 16570, 16576-80, 16626.

Explanation of statement that vivisection is a narrow and restricted province, in physiology 15805-7.

Foreign experiments, conduct of, irrelevant to present inquiry 16126.

Foreign experiments, connection with, repudiated by, *Miss Lind-af-Hageby*, 7223.

Foreign experiments rarely performed now without anæsthetics, 16122-3.

Frogs deprived of their cerebral hemispheres capable of most complex reflex acts, but not purposive ones 16185-7.

Galen's experiments are the foundation of medical knowledge 16160-3.

General Medical Council not suited to be advisory body to Home Office 15777-8.

Herophilus is alleged to have vivisected human beings 16153-9.

Human vivisection would be immoral, and knowledge gained thereby immorally gained 16143-52.

Immorality of obstructing pursuit of knowledge 15588, 15868.

Inspectors :

Additional inspection could be secured by making, whole-time officers 16046.

Duties of, superfluous 16043-5, 16083-4.

Part-time officers 16082.

Intestinal surgery :

Experiments in connection with, not painful 15686-8.

Success of, due to preliminary experiments on animals 15686.

Johns Hopkins' Hospital, Baltimore, animals operated upon by students under most modern conditions at, 15638-44.

Listerism :

Carbolic spray never a leading feature of antiseptic surgery, and abandoned owing to demonstration that air was not toxic to the degree first imagined 15668, 15800-1.

First use of antiseptic treatment 16260-4.

Generally adopted, not only in England, but over the whole Continent 15679.

Modern aseptic surgery is logical outcome of, 15665-8.

Licence held continuously by, since 1883 16060-1.

Licences :

Details of proposed experiments should be stated on application for, and licence should be drafted so that certificates could be dispensed with 15767, 15771-4, 16016-25, 16099.

Draft form suggested, if certificates were abolished 15955-61.

Medical opinion, consensus of, in favour of experiments 15791-3.

Member of past committee to inquire into tuberculosis in animals and minority report of, 16243-53.

Morality of vivisection 16135-41.

Morphia, sufficient dose is an anæsthetic of the most pronounced kind 15926-8.

HORSLEY, SIR VICTOR, F.R.S., F.R.C.S.—*cont.*
National Anti-Vivisection Society, action taken by, with respect to Muzzling Order was immoral 15605.
Nerve sutures, successful modern treatment due to experiments on animals 15684-5.
Nervous system:
All functions of, have been discovered by experiments 16088.
Fundamental knowledge of, all derived from experiments on animals 15680.
Marchi's investigations of the anatomy of, most valuable 15682.
Surgical treatment of diseases of, due largely to experiments 15684.
New surgical operations should always be tested on animals 15653.
Oppenheim's views concerning diagnosis of cerebral tumours 15845.
Operative technique and manual skill should be acquired by experiments 16170-7.
Pasteur Institute:
Actual facts in connection with meeting held at the Mansion House in 1889 *re* benefits derived from work of, 15594-601.
Statements by Mr. Coleridge with regard to institution of English, contrary to fact 15672.
Pasteurian treatment for hydrophobia:
Efficacy of, undoubted 15813, 15819-21.
Rabbits used for propagation of virus, and very little pain involved 15814-22.
Physiology can only be advanced by experiments, 16086.
a Practising surgeon, and has been operating for last twenty years 15967-70.
Rabies:
Absence of, in England, due to Muzzling Order and quarantine imposed by Board of Agriculture 15597-8, 15880-3.
Anti-vivisection campaign against Muzzling Order and Pasteurian treatment for, 15597-600.
Bill for universal collaring of dogs, suggested in connection with outbreak of, 15884.
Infectious not otherwise than by contact or bite 15876-9.
Knowledge of, and efficacy of muzzling dogs for stamping out, entirely due to Pasteur's experiments on animals 15602-3.
Muzzling Order in connection with suppression of, was compulsory over whole country 16026-30.
Records of experiments, Home Office regulations as to inspection of, 15770.
Reflex action, definition 16178-83.
Statement of, as to result of experiments upon thyroid glands *Miss A. Kenealy*, 6165.
Students should be permitted to acquire manual skill in surgery by experimenting on animals 15632-5, 15794, 15936-8, 16032-6, 16115.
Students should learn administration of anæsthetics by experiments, 16112-114.
Surgical practice no longer reserved to specialists, but carried out by general practitioners 15795-7.
Surgical shock, question of, closely connected with blood pressure, and therefore knowledge of circulation, which can only be acquired by experiments, is essential 15612-4.
Thyroid gland:
Clinical investigation had not discovered connection between cretinism and, 16231.
Clinical observation of, had never discovered connection between cretinism and, 16238-9.
Date of first successful operation of transplanting, from sheep to human subject not known 16241-2.
Loss of, demonstrated by experiments to be cause of cretinism and myxedema 15688.
Outcome of experiments on, has been discovery of value of thyroid extract in treatment of myxedema and cretinism 15836-41.
and Parathyroid, their functions differ only in degree 15829.
HORSLEY, SIR VICTOR, F.R.S., F.R.C.S.—*cont.*
Thyroid gland—*cont.*
Removal of, causes symptoms of cretinism and myxedema, but no pain 15825-7.
Removal of, from monkeys has not always caused cretinous and myxedematous symptoms 15831-35.
Treves, Sir F.:
Letter to *The Times* from, *re* misrepresentation of his views on experimental methods *Sir V. Horsley*, 16031, 16131-2.
Quotation from address by, on subject of intestinal surgery, so often misrepresented by anti-vivisectionists 15803-5, 16130-2.
University College, inspectors' connection with, has made no difference to inspection 16072-4.
Vivisection Act, 1876:
Administration of, hinders progress of physiology 16095.
Drafting of, shows ignorance of conditions surrounding experiments on animals 15762
Licensing and registration principles embodied in, should be preserved 15729.
Necessary, in view of public opinion, but superfluous from physiological standpoint 16091-2, 16096-8.
Section 3, sub-section 5, should be repealed 15606.
Title of, objected to, 16092, 16096.
Vivisection Commission, 1875:
Evidence before, as to unnecessary repetition of experiments, unwarrantable 16254-6.
Evidence before, as to value of clinical observation 16164-9.
No evidence before, as to "inhumanity" in this country 16129.
Dr. Watson's experiments referred to, 16225-9.
References, *Sir L. Brunton, E. A. Schäfer, C. R. J. A. Swan*, 6958-64, 10032, 19273.
Houghton, Mr. (Parke, Davis, and Co.), method of standardising drugs, introduced by, *A. R. Cushing* 4838.
Hospital Funds, protest against diversion of, to medical schools *Hon. S. Coleridge*, 10260-1.
House of Commons, effect of air of, on mice *W. P. Byrne*, 125.
Houston, Dr., Local Government Board investigations conducted by, *W. H. Power*, 4301.
Howard, Dr., resuscitory methods invented by, *E. A. Schäfer*, 10107.
Howell, Professor, physiological demonstrations in laboratory of, at Johns Hopkins Hospital, and their advantage to students *W. Osler*, 16758-67.
Hughes, Captain. R.A.M.C.:
Claim put forward by, as to cause of Malta fever, *Col. D. Bruce*, 14405-13.
Work of, in investigating Malta fever *Col. D. Bruce*, 14485.
HUGHES, JOHN, F.R.G.S., Secretary of the National Canine Defence League, 17109-17620.
Buisson bath treatment for hydrophobia:
National Canine Defence League agreed as to merits of, 17248-9, 17252-63.
National Canine Defence League originated, in opposition to Pasteur treatment 17235-40.
Dogs:
Anæsthetisation of, difficult without causing death 17156-7.
Anæsthetising impossible 17455-62, 17567-8.
Certificates, number of, issued during 1906 permitting experiments on, and recovery from anæsthesia 17174-82.
Chastisement of, unnecessarily, morally wrong 17365-8.
Demonstration experiments upon, of a prolonged and agonising nature 17450-1, 17467-73.
Destruction of superfluous, disapproved of 17491-95a.

HUGHES, JOHN, F.R.G.S.—*cont.*

Dogs—*cont.*

Differences between human and canine organs make experiments on, useless 17158, 17359-60.

Drowning experiments on, strongly disapproved of 17498-504.

Drowning of superfluous, as practised in Edinburgh, disapproved of 17502-3.

Exemption of, from experiments desirable on moral grounds 17135-54, 17233-4, 17570-4, 17467-8.

Experiments on, for purpose of extending knowledge *re* canine diseases, questionable, 17361-4, 17484-6.

Experiments on, terrible increase of, during past three years, and reasons for statement 17544-64.

Lethal chamber is best means of destroying, 17604-20.

Medical petition against vivisection of, and signatures obtained 17186-216.

Members of Parliament pledged to support Bill to prevent vivisection of, 17212.

Operations on, for curative purposes justifiable 17487-90.

Opinion with regard to impossibility of anæsthetising, might possibly be modified 17463-6.

Painless vivisection of, impossible because of difficulty of anæsthetising, 17600-3.

Petition opposing vivisection of, circulated and signatures received 17166-185.

Selected for experiments on account of their docility and obedience 17395-438, 17384.

Vivisection of, with or without anæsthetics unjustifiable 17128-33, 17167, 17275-7, 17467-8.

Government laboratories for purpose of experimental investigations disapproved of 17507-11.

Medical profession not entirely on side of vivisection 17512-18.

Morally wrong to cause pain unnecessarily to any animal 17369-86.

National Canine Defence League:

Bill embodying views of, has been before Parliament 17159-5.

Committee of, its constitution 17241-6.

Dogs, anæsthetisation of, considered impossible by, 17520-34.

Dogs, their exemption from vivisection approved by all members of 17250-1.

Founded in 1891 as an Anti-muzzling League 17120-7.

Dr. Hutchinson, late M.P. for Rye, unseated owing to efforts of, 17212-3.

Influence of, far-reaching 17226.

Membership and income of, 17114-118, 17279-85.

Object of, does not include general opposition to practice of vivisection on other animals than dogs 17269-74.

Objects, one is one total suppression of support of vivisecting institution by public money 17227-31.

Object to protect dogs from all ill-treatment 17119.

Petition presented to Parliament by, 17536.

Sport indefensible on moral grounds, but question not dealt with by, 17384-90.

Stewart, Sir Mark, candidature of opposed at General election by, 17287-95.

"Peculiarly revolting and painful" experiments 17440-9.

Rabies:

Diagnosis of, unreliability of methods adopted 17338-42.

Existence of, denied in certain districts and as to inaccuracy of statistics 17296-342.

Existence of, in this country previous to muzzling order to a less extent than stated by Board of Agriculture 17351-8.

Existence of, was not such as shown by Board of Agriculture Returns 17343-8, 17585-6.

Muzzling of dogs ineffective to prevent, and also cruel 17591-9.

HUGHES, JOHN, F.R.G.S.—*cont.*

Mr. Starling's statement that he had never seen pain inflicted during experiments incredible 17575-9.

Useless nature of knowledge acquired by vivisection 17233.

HUGHES, DR. LUCAS, Liverpool, letter from, with regard to impossibility of anæsthetising dogs 17524-8.

HUGHES-BENNETT, Dr. A., cocain, its anæsthetic properties first discovered by, *Sir T. L. Brunton*, 7025, 7027.

HUGO, VICTOR, anti-vivisection cause supported by, *Hon. S. Coleridge*, 10262.

HUMPHREY, PROF., reference, *S. F. Smith*, 13049.

HUNGARY:

Anthrax successfully inoculated against in, *S. Stockman*, 2528.

Statistics in, with regard to mortality from swine erysipelas, *S. Stockman*, 2562.

HUNTER, DR. WILLIAM, cruelty in experiments for jaundice on dogs, *Mrs. K. Cook*, 1796.

HUTCHINSON, *The late* C. F., M.P., M.D., defeated at General Election partially owing to efforts of National Canine Defence League, *J. Hughes*, 17212-3.

HUTCHINSON, JONATHAN, F.R.C.S.:

Letter from, as to "incomplete anæsthesia" *Hon. S. Coleridge*, 10308.

Man kept purposely uncured for several days in diseased condition by, *Rev. L. S. Lewis*, 8775.

Reference, *G. G. Bantock*, 14723.

HUTTON, R. H., member of Vivisection Commission 1875, and reservation signed by, *W. P. Byrne*, 1.

HUXLEY, *The late* RIGHT HON. T. H.:

Comparative insensibility of animals to pain maintained by, *S. F. Smith*, 13046-8.

Member of Vivisection Commission 1875, *W. P. Byrne*, 1.

Statement by, that field of morality is a reclamation from a state of nature, *J. H. Levy*, 18515-18.

Views of, with regard to regulation of painless inoculations *Sir L. Brunton*, 6991.

Reference, *Hon. S. Coleridge*, 10657, 10660-2, 10669.

"HUXLEY" LECTURE, Psychical condition of dogs referred to in, *E. H. Starling*, 4230-4.

HYDERABAD COMMISSION ON CHLOROFORM:

Action of chloroform laid down by, and disregarded by English physiologists, *Col. E. Lawrie*, 16834-6.

Conclusions arrived at with regard to morphin *Col. E. Lawrie*, 20993-6.

Conclusions of, have been absolutely ignored, *Col. E. Lawrie*, 16924-5.

Experiments performed by, were necessary to refute results of previous experiments, *Col. E. Lawrie*, 16986A-7.

Method of administering chloroform laid down by, is only safe method, *Col. E. Lawrie*, 16935-7.

HYDROPHOBIA:

Bacillus of, not yet discovered *C. J. Martin*, 11909.

Buisson bath treatment:

Exploded *Sir L. Brunton*, 7147-57.

National Canine Defence League generally agreed on merits of, *J. Hughes*, 17252-63.

National Canine Defence League originated, in opposition to Pasteurian treatment, *J. Hughes*, 17235-40.

Deaths from, occurring during, or within 15 days after completion of treatment excluded from statistics *C. S. Martin*, 11914-19.

Experiments in relation to bacterial origin of, and immunising and curative influence of culture sera, *H. Morris*, 7726.

HYDROPHOBIA—*cont.*
Pasteur's treatment:
Efficacy of, undoubted, *Sir V. Horsley*, 15808-11.
Rabbits used for propagation of virus and very little pain involved, *Sir V. Horsley*, 15814-22.
Pasteur's inoculations produced no case of, *C. S. Martin*, 12362-4.
Pasteur's reasons for expecting virus of, might be discovered in nervous system, *C. S. Martin*, 11910-3.
Permanganate of potash useful in cases of, *Major L. Rogers*, 8186.
Preventive and curative methods discovered by experiments and Pasteur's work *C. J. Martin*, 11658-95.
Stamped out in this country without recourse to Pasteur's treatment, *C. S. Martin*, 11924.
See also RABIES.

HYPNOTISM:
Experiment on animals under influence of, in Germany, *M. S. Pembrey*, 14071-7.
an Unreliable substitute for anæthesia, *J. N. Langley*, 15270.

IMPERIAL CANCER RESEARCH FUND:
Authorities directing, *H. Snow*, 2113.
Causal organism of cancer never proclaimed by, *H. Snow*, 2246A.
Congress for investigation of cancer suggested to, *H. Snow*, 2210-2210A.
Experiments on behalf of, *H. Snow*, 2110-5.
Laboratory of, at Ponsfall's Farm, Hatfield *G. D. Thane*, 344.
Reports:
Article in, on "Transplantation of malignant new growths" referred to, *H. Snow*, 2110-15, 2289 92.
Error of judgment in diagnosing tumour in dog as cancer, *H. Snow*, 2127-34.
Error in statement as regards, admitted *Miss A. Kenealy*, 5495.
Statement in, as to nature of tumour investigated in mice *H. Snow*, 2108-9.
Unsatisfactory conclusions of, *H. Snow*, 2118-20.
Table of tumours examined by, *H. Snow*, 2182.
Tumour specimens forwarded to, but reports of such not founded on clinical diagnosis *H. Snow*, 2191-8.
Work of, useless with regard to Jensen's tumour *H. Snow*, 2163.

IMPERIAL INSTITUTE, experiments at, *Mrs. K. Cook*, 1947-52, 2019-29.

INDIA:
Effort made by Commander-in-Chief in, to secure inoculation of troops against typhoid *C. J. Martin*, 11803-16.
Kasauli Institute, working of, *Major L. Rogers*, 8299-306.
Plague, investigations in, *C. J. Martin*, 11654-6.
Rinderpest in, *see that title.*
Snake-bite, reduction of mortality from, owing to use of remedy discovered by means of experiments on animals *Sir L. Brunton*, 6870-9.
Snake-poison experiments in, *see under* SNAKE POISON.
Students in, taught to operate by experiments on animals *Col. E. Lawrie*, 17019-35.
Tetanus, its prevalance in certain parts of, *S. Stockman*, 2510.
Tetanus, explanation of its occurrence, with use of plague serum in, *W. H. Power*, 4500.
United Provinces, outbreak of rinderpest in, when inoculated animals did not suffer as uninoculated, *Major L. Rogers*, 8264-9.
Unrest in, alleged to be partly due to unsuccessful use of plague serum *Sir G. Kekewich*, 20627-31.

INDUSTRIAL DISEASES, necessity of using dogs for experiments in connection with, *G. D. Thane*, 1205.
351.

INFLUENZA:
Ignorance of medical profession as regards, is evidence of uselessness of experimental methods *Sir G. Kekewich*, 20746-55.
Pneumonic, possible difficulty in diagnosing, *W. H. Power*, 4629.
Theories with regard to bacterial cause of, have been useless in practical treatment *Sir G. Kekewich*, 20583-7.

INTERNATIONAL MEDICAL CONGRESS, 1891, Lord Lister's address before, and acknowledgment of errors in antiseptic surgery, *G. G. Bantock*, 14545-6.

IRISH OFFICE, Dr. C. Shaw's experiments sanctioned by, *Hon. S. Coleridge*, 11135-9.

IRELAND:
Administration of Act in:
Careful, and with humanity *Sir T. Stoker*, 760, 785.
Improvements effected by Mr. Morley, *Sir T. Stoker*, 853.
More continuity desirable, and should be in hands of permanent official *Sir T. Stoker*, 782-3, 854, 953-5, 1068.
Certificates, number of, in force in, 765-7.
Chief Secretary:
Administration of Act by, lack of consistency in, *Sir T. Stoker*, 761.
Applications for licences go through inspector direct to, *Sir T. Stoker*, 848-9.
Applications for licences referred to, and granted on advice of inspector *Sir T. Stoker*, 789-90.
Difference of opinion between inspector and, in connection with granting Certificate C *Sir. T. Stoker*, 789-90.
Inspector's advice as to issue of licences sometimes overruled by, *Sir T. Stoker*, 932.
is Licensing authority *Sir T. Stoker*, 761, 767.
Prosecution of licensee requires consent of, *Sir T. Stoker*, 917-18.
Department of Agriculture:
Cattle hospital of, at Belmont *Sir T. Stoker*, 765.
Veterinary Department now under, *Sir T. Stoker*, 858.
Experiments in, total number performed *Sir T. Stoker*, 767.
Inspection in, efficient *Sir T. Stoker*, 966-7.
Inspector for:
Evidence of, *see* STOKER, SIR T., 756-1070.
Salary of, insufficient *Sir T. Stoker*, 787.
Licences:
No practice of submitting applications for, to a society analogous to Association for Advancement of Medicine by Research, *Sir T. Stoker*, 847.
Number of, for class purposes, *Sir T. Stoker*, 762.
Procedure in obtaining, the same as in England, *Sir T. Stoker*, 789, 832-3 920.
Held by veterinary surgeons, *Sir T. Stoker*, 1043-4.
Licensing authority, change of, desirable *Sir T. Stoker*, 778.
Local Government Board:
Medical Inspectors:
Functions of, *Sir T. Stoker*, 971-5.
Inspection in certain places conducted by, *Sir T. Stoker*, 971-5.
Should be licensing authority *Sir T. Stoker*, 855.
Private laboratories in, reason for institution of some, *Sir T. Stoker*, 770-4.
Rabies in, practically stamped out *Sir T. Stoker*, 777, 860-1.
Registered places in, statistics *Sir T. Stoker*, 764-5.
Separate inspector for, *G. D. Thane*, 325.
Under-Secretary:
Appointment permanent, and recently non-political *Sir. T. Stoker*, 956.
Uncertain connection of, with administration of Act *Sir T. Stoker*, 849-51.

Irthlingborough, Northamptonshire, cases of cerebro-spinal fever at, *W. H. Power*, 4304-5.

Irving, *The late* Sir H., anti-vivisection cause supported by, *Hon. S. Coleridge*, 10261.

Jackson, Hughlings, reference *H. Head*, 17812.

Jackson, Sir R., Vice-President of National Canine Defence League *J. Hughes*, 17246.

Jacques, pain not experienced in fast undertaken by, *Hon. S. Coleridge*, 11046.

Japanese Army, successful inoculations against tetanus in, *H. Morris*, 7744-5.

Jenner, Dr.:
Father of modern preventive medicine *S. Stockman*, 3319.
Vaccine of, analogy between, and modern prophylactics *W. H. Power*, 4587-8.

Jenner, Sir William, part played by, in foundation of Association for the Advancement of Medicine by Research *Hon. S. Coleridge*, 10677.

Jensen's Tumour, *see under* Tumours.

Jesse, *The late* G., evidence of, before the Vivisection Commission, 1875, *Mrs. K. Cook*, 1785.

Jessop, T. R., letter to, *re* "incomplete anæsthesia" *Hon. S. Coleridge*, 10993.

Johnson, Dr.:
Idler quoted in support of anti-vivisection cause *Hon. S. Coleridge*, 10551-2.
Views of, *re* immorality of vivisection *Rev. L. S. Lewis*, 8726.

Joint Diseases:
Rheumatoid arthritis, nothing definite with regard to, has yet been discovered *J. Lorrain Smith*, 18457.
Research into, especially requires experimental investigation *J. Lorrain Smith*, 18267-74.

Jolly, V. A., animals used by, in experiments on thyroid glands *Miss A. Kenealy*, 6165.

Joseph, Don R., St. Louis University, U.S.A., injections into dogs of organ extracts of cold-blooded animals by, *Miss A. Kenealy*, 5302-21.

Josue, value of discovery of, that arterial sclerosis is caused by adrenalin, *J. Lorrain Smith*, 18236, 18288-96.

Johns Hopkins College, Baltimore, students' courses of operative surgery on animals at, and value of same, *E. H. Starling, Sir R. D. Powell, Sir V. Horsley, W. Osler*, 3989-90, 5768, 15638-44, 16583-7, 16590-5, 16636, 16646-52, 16752-7.

Journals and Publications:
Animal Physiology, by W. Furneaux, experiments recommended to students in, expurgated after exposure by Church Anti-Vivisection League, *Miss A. L. Woodward*, 8824-6, 8867-80.
Brain, Dr. Head's experiments on nerves published in, *G. D. Thane*, 1257.
Bradford Observer, Church Anti-Vivisection League meeting reported in, *Miss A. L. Woodward*, 8792.
British Medical Journal:
Address by Sir F. Treves reported in, *Sir V. Horsley*, 16131.
Anti-venin referred to in, *Sir R. D. Powell*, 5679-83.
Case of chronic ulcer benefiting by presence of micro-organisms, brought to notice of, *G. G. Bantock*, 14723-7.
Case of curare poisoning described in, *Sir V. Horsley*, 15965.
Diphtheria, sources of infection discussed in, *Miss Lind-af-Hageby*, 7223-31.
Egyptian Plague Commission's Report published in, *Sir G. Kekewich*, 20485.
Experiments reported in, referred to, *Mrs. K. Cook, Sir R. D. Powell, J. W. Graham, Hon. S. Coleridge*, 1910-11, 5721, 5849-55, 5857-60, 6047-8, 10481-513.
Journals and Publications—*cont.*
British Medical Journal—cont.
Results of physiological research published in, *E. H. Starling*, 4181-2.
Unlicensed experiments reported in, *Sir T. Stoker*, 914.
References, *A. R. Cushny, M. S. Pembrey*, 5172-4, 5887-90, 14019.
Broadway or Westminster Hospital Gazette, incidental cruelties practised in experiments for causation of disease reported in, *Mrs. K. Cook*, 1921.
Cancer and Cancer Progress, by H. Snow, M.D., views contained in, *H. Snow*, 2144-9.
Chemist and Druggist, proceedings in connection with Dr. Grünbaum's experiments reported in, *Hon. S. Coleridge*, 10330-70.
Christison on Poisons, antidote for arsenic recommended in, *J. Glaister*, 12888-12905.
Collected Papers on Circulation and Respiration, by Sir Lauder Brunton, M.D., F.R.S., absence of humane teaching in, *Miss Lind-af-Hageby*, 7379.
Confessions of a Physician, by Dr. Smidovich, necessity of disregarding animal suffering admitted in, *J. H. Levy*, 18497.
Dictionary of Treatment, by Dr. Whitler, statement in, as to uncertain success of anti-tetanus serum, *S. F. Smith*, 13132.
Directions for Class Work in Practical Physiology, by E. A. Schäfer, F.R.S., absence of humane teaching evident in, *Miss Lind-af-Hageby*, 7223.
Elements of Human Physiology, by E. H. Starling, M.D., F.R.S., absence of humane teaching evident in, *Miss Lind-af-Hageby*, 7223, 7354-63.
Essentials of Experimental Physiology, for the Use of Students, by T. G. Brodie, absence of humane teaching and preference for light anæsthesia evident in, *Miss Lind-af-Hageby*, 7223, 7232-47.
Essentials of Human Physiology, by D. Noel Paton, absence of humane teaching evident in, *Miss Lind-af-Hageby*, 7223.
Exercises in Practical Physiology, by Aug. D. Waller:
Absence of humane teaching and preference for light anæsthesia evident in, *Miss Lind-af-Hageby*, 7223, 7234-51.
Caution against use on anæsthetics in, merely a statement of fact, *A. D. Waller*, 18086.
Experiments on Animals, by Stephen Paget, criticism of accuracy of statements made in, *S. F. Smith*, 13099-13132.
Criticism of statements in, *re* anti-tetanus serum, *S. F. Smith*, 13132-5.
Criticism of statements in, *re* myxedema, *S. F. Smith*, 13130-1.
Statements in, with regard to serum treatment in suppuration and blood poisoning criticised *S. F. Smith*, 13121-9.
Experiments on the Influence of Digitalis on the Pressure of Blood in the Arteries, by Sir T. L. Brunton, present publication of, containing account of brutal experiments before 1876, shows want of humane feeling *Miss Lind-af-Hageby*, 7379-96.
Functions of the Brain, by Ferrier, quotation from, relating to consciousness of pain in animals after removal of cerebral hemispheres *Miss Lind-af-Hageby*, 7412.
Guide to the Charitable, by the Hon. S. Coleridge, diversion of hospital funds to medical schools pointed out in, *Hon. S. Coleridge*, 10261.
Handbuch der Speciellen Arzneimittelehre, erroneous statement as to action of digitalis on heart in, *A. R. Cushny*, 4653.
Handbook of Physiology, by W. D. Halliburton:
Absence of humane teaching evident in, *Miss Lind-af-Hageby*, 7223.
Incomplete anæsthesia advised in, *Miss Lind-af-Hageby*, 7223-31.
Handbook of Physiology for Students and Practitioners of Medicine, by Austin Flint (American):
Absence of humane teaching evident in, *Miss Lind-af-Hageby*, 7223.
Preference for light or no anæsthesia evident in, *Miss Lind-af-Hageby*, 7262-6.

JOURNALS AND PUBLICATIONS—*cont.*

Hospital, The:
Sir V. Horsley's views on experiments upon thyroid glands quoted in, *Miss A. Kenealy*, 6165.
Therapeutics, decline of interest in, commented on by, *Miss A. Kenealy*, 6165.

Introduction to Physiology, by L. A. Hodgkinson Lack, absence of humane teaching evident in, *Miss Lind-af-Hageby*, 7223, 7357-74.

Journal of Medical Science (America), successful operation for nerve disease recorded in, *J. N. Langley*, 15156-62.

Journal of Bacteriology, bogus cancer parasite displayed in, *H. Snow*, 2352.

Journal of Pathology and Bacteriology, experiments reported in, *Mrs. K. Cook*, 1796, 1799-1800, 1913-4, 1919.

Journal of Physiology:
Experiments reported in, *Mrs. K. Cook, E. H. Starling, Miss A. Kenealy, J. W. Graham, Miss Lind-af-Hageby, Hon. S. Coleridge, W. E. Dixon*, 1785-9, 1790, 1793-5, 1798, 1800, 1914, 1917, 1919, 3648-52, 5296-301, 5302-21, 5322-5, 5842-4, 7415-30, 11053, 19012-15.
Home Office proceedings in connection with Messrs. Dixon and Brodie's experiments reported in, *Hon. S. Coleridge*, 10370-81.
Physiological research, chief results published in, *E. H. Starling*, 4180.
Proportion of experiments reported in, in which curare was used, *S. F. Smith*, 13290-4.
Seventy-one per cent. of experiments from 1895 to 1900 published in, were cutting experiments *S. F. Smith*, 13065-8.

Keetley's *Index of Surgery* quoted, with reference to operation for harelip in children *S. F. Smith*, 13055.

Laboratory Manual of Physiology, by F. C. Busch (America), absence of humane teaching evident in, *Miss Lind-af-Hageby*, 7223.

Lancet:
Article in, with regard to value of serum treatment in cases of suppuration and blood poisoning, *S. F. Smith*, 13121.
Experiments in connection with amyl nitrite referred to in, *A. R. Cushny*, 4895-902.
Statement in, as to uncertain success of anti-tetanus serum *S. F. Smith*, 13132.

Leçons de Physiologie Opératoire, by Claude Bernard:
Morphia no anæsthetic acknowledged in, *Miss Lind-af-Hageby*, 7316.
Quotation from, as to fatal dose of morphia for dog, *Miss Lind-af-Hageby*, 9262.

Life of Pasteur, by Réné Vallery Madot, reference *H. Morris*, 7705.

Manual of Pharmacology and Therapeutics, by W. Murrell, statement in, as to fatal doses of morphia for dogs *Miss Lind-af-Hageby*, 9262-71.

Manual of Physiology, a, by G. N. Stewart, absence of humane teaching, and preference for light anæsthesia evident in, *Miss Lind-af-Hageby*, 7223, 7234, 7253-62.

Manual of Practice of Medicine, by F. Taylor, M.D., M.R.C.S., reference *F. Taylor*, 5596.

Manual of Surgery, by Messrs. Rose and Carless, statement in, as to disappointing results of anti-tetanus serum *S. F. Smith*, 13132.

Military Hygiene of the Japanese Army, by Baron Takaki, statement in, as to successful inoculations against tetanus *H. Morris*, 7744-5.

Morning Leader, statements in, as to continental method of experimenting upon patients in hospitals *Rev. J. P. Hopps*, 8319-27.

Nature of Man, by Professor Metchnikoff, deplorable suggestions in, *Mrs. K. Cook*, 1785.

New Hygiene, by Professor Metchnikoff, Director of the Pasteur Institute, statement that morality is second to hygiene contained in, *Rev. L. S. Lewis*, 8754-8.

New Serum Therapy, by Dr. Montgomery Paton, reference *A. Kenealy*, 6392-6, 6560-1.

Outlines of Practical Physiology, by W. Sterling, absence of humane teaching evident in, *Miss Lind-af-Hageby*, 7223.

JOURNALS AND PUBLICATIONS—*cont.*

Oxford Chronicle, letter in, from Vice-Chancellor of University, making public apology from Keble undergraduates in connection with charges brought against Professor Gotch, *F. Gotch*, 13668.

Oxford Times, letter in, from Vice-Chancellor of University, making public apology from Keble undergraduates in connection with charges brought against Professor Gotch, *F. Gotch*, 13668.

Pall Mall Gazette, letters on subject of anæsthetics in, *J. W. Graham*, 5878-82.

Pathology of Asthma, by T. G. Brodie and W. C. Dixon, experiments recorded in, conducted without anæsthetics *Miss Lind-af-Hageby*, 7299.

Pfluger's Archives, research resulting in introduction of cocaine published in, *A. R. Cushny*, 4867-9.

Physiological Action of Drugs, by M. S. Pembrey and C. D. F. Phillips, students should be permitted to experiment on frogs, stated in, *Miss Lind-af-Hageby*, 7410.

Physiology and Pathology of the Cerebral Circulation, by Leonard Hill, experiments recorded in, conducted principally under morphia, and dislike of anæsthetics evident in, *Miss Lind-af-Hageby*, 7300.

Practical Physiology, by Beddard, Edkins, Hill, Macleod and Pembrey:
Absence of humane teaching evident in, *Miss Lind-af-Hageby*, 7223.
Case of anæsthetisation by morphia alone referred to in, *G. D. Thane*, 1628-9.
Experiments referred to in, *G. D. Thane*, 1499-1506.
Preference for light, or no anæsthesia evident in, *Miss Lind-af-Hageby*, 7273-5.

Practitioner, heating experiments on animals reported in, *Sir L. Brunton*, 804-808.

Quarterly Reminder, reference, *J. W. Graham*, 5875-9.

Rational Organo-Therapy, by Professor von Poehl, reference *Miss A. Kenealy*, 5284.

Recent Advances in Physiology and Bio-Chemistry, edited by Leonard Hill, anæsthetics, use of, not mentioned in *Miss Lind-af-Hageby*, 7262-70.

Recent Advances in the Physiology of Digestion, by E. H. Starling, F.R.S., researches mentioned in, *G. D. Thane*, 1546-9.

Revue Scientifique, curare not an anæsthetic, stated by Claude Bernard in, *Mrs. K. Cook*, 1801.

St. Bartholomew's Reports, experiments recorded in, *Sir L. Brunton*, 6786-7.

Scientific Research, by S. F. Smith:
Experiments performed at University College with suggested insufficient anæsthesia described in, *S. F. Smith*, 13303-15.
Object of writing, *S. F. Smith*, 13261-4.

Shambles of Science, by L. Lind-af-Hageby and L. K. Schartau:
Anæsthesia fully maintained through experiments described in, and movements seen were merely reflex *A. D. Waller*, 18109-10.
Anæsthesia incomplete during experiments described in, *Miss Lind-af-Hageby*, 9130-1.
Adherence to views honestly expressed in, *Miss Lind-af-Hageby*, 9630-3.
Authors of, attended advanced demonstration lectures in London *E. H. Starling*, 3545, 3552-3.
"Brown dog," contradictory statements as to health of, and illegality of two successive operations *Miss Lind-af-Hageby*, 9730-51.
Charges brought in, contradicted *M. S. Pembrey*, 14036-56.
Curare not used in any of experiments described in, *A. D. Waller*, 18128.
"Dog infected with a substance derived from a lunatic":
Animal fully anæsthetised in, *A. D. Waller*, 18048-56.
Method of killing dog referred to in, *A. D. Waller*, 18139-41.
"Dog that escaped," curare used in experiment described in, and no anæsthetic *Miss Lind-af-Hageby*, 9398-406, 9461-70.

JOURNALS AND PUBLICATIONS—*cont.*

Shambles of Science—cont.

Enquiry into allegations against vivisectionists contained in, *G. D. Thane, E. H. Starling,* 1261-82,4274-80.

Evidence of joint author of, *see* LIND-AF-HAGEBY, MISS.

"Experimental production of blood clotting by injection of a nucleo proteid," complete anæsthesia maintained throughout experiment described in, *A. D. Waller,* 18034-42.

"Experiment that is not supposed to be useful":

Animal was not curarised in, and absolutely anæsthetised *A. D. Waller,* 18043-7.

Suggestion that morphia as well as curare was used in, *Miss Lind-af-Hageby,* 9500-12.

"Grand Demonstration," a, suggestion throughout chapter is of difficulty of anæsthetising animal, *Miss Lind-af-Hageby,* 9408-17.

a Highly coloured representation of facts, *A. D. Waller,* 18010-13.

Lecture given immediately after publication of, answering allegations contained in, *A. D. Waller,* 18077-8, 18100.

Letter from Sir A. Rücker to Home Office in connection with statements contained in, *A. D. Waller,* 18094-7.

Marmot incident:

Actual facts in connection with, *A. D. Waller,* 18142-3.

Misstatement by Dr. Thane as to, *Miss Lind-af-Hageby,* 9354-86, 9651-7.

Spinal cord of animal had never been divided and other erroneous statements with regard to, *M. S. Pembrey,* 13975-14017.

Materialism attributed to physiologists in, denied, *M. S. Pembrey,* 14106.

Movement of animals during experiments described in, indicated returning consciousness, *Miss Lind-af-Hageby,* 9144-7.

Movements in physiological demonstrations referred to in, were probably reflex, *D. W. Buxton, J. N. Langley,* 12588-98, 15314-15.

"Painless Experiments":

No vivisection was performed at lecture described in, *A. D. Waller,* 18025, 18032-3.

Notes on statements contained in, *A. D. Waller,* 18014.

Publication, legal proceedings in connection with, and statement as to withdrawal of, *Miss Lind-af-Hageby,* 7567-89.

"Quiet Cat" circumstances described in, suggesting improper use of curare, *Miss Lind-af-Hageby,* 9388-97.

Reasons for not making direct representations as to cruelty of experiments described in, *Miss Lind-af-Hageby,* 9608-9.

"Scarcely any Anæsthetic," preference for curare and morphia in experiments, *Miss Lind-af-Hageby,* 4514A-21.

"Struggling Cat":

Adherence to statement as to lack of artificial respiration during experiment and misstatements by Drs. Thane and Bayliss, *Miss Lind-af-Hageby,* 9634-50.

Incomplete anæsthesia during experiment described in, *Miss Lind-af-Hageby,* 9157-97.

Mr. Thane's criticism of, objected to, *Miss Lind-af-Hageby,* 9148-53.

"The Only Completely Satisfactory Method," curare not used as stated in, and students are not necessarily aware of every fresh dose of anæsthetic, *A. D. Waller,* 18066-76.

"Troublesome Dog" lecture described in, did not take place, as stated, at London University, *A. D. Waller,* 18001-8, 18058-65.

JOURNALS AND PUBLICATIONS—*cont.*

Shambles of Science—cont.

as to Withdrawal of, from publication, *G. D. Thane,* 1276-80.

Withdrawal from publication, statement as to, incorrect, *Miss A. L. Woodward,* 8826-7, 8894-8.

References, *E. H. Starling,* 3497-501; *Sir G. Kekewich,* 20470.

Standard, letter from Dr. De Watteville in, arguing morality of vivisection, *J. H. Levy,* 18497.

Surgical Shock, by Dr. Crile:

Discrepancy between account of experiments described in, and Home Office report and consequent proceedings, *Hon. S. Coleridge,* 10289-316.

Experiments described in, testifying to personal inhumanity of author, *Hon. S. Coleridge,* 10284-8.

Star, statements in, as to continental method of experimenting upon patients in hospitals, *Rev. J. P. Hopps,* 8319-27.

Surgical Diseases of the Dog and Cat, by F. Hobday, morphia not an animal anæsthetic, stated in, *Miss Lind-af-Hageby,* 7316-7.

Text Book of Pharmacology, by W. E. Dixon, quotation from, as to anæsthesia produced by narcotics or hypnotics, *W. E. Dixon,* 18653.

Text Book of Pharmacology and Therapeutics, by A. R. Cushny, views as to anæsthetic powers of morphia in, contradict evidence given by author, *Miss Lind-af-Hageby,* 7317-21, 7342-9.

Text Book of Physiology, by E. A. Schäfer:

Absence of humane teaching evident in, *Miss Lind-af-Hageby,* 7223.

Reference in, to pain sensations after removal of cerebal hemispheres, *Miss Lind-af-Hageby,* 7411.

Text Book of Physiology, by E. H. Starling, statements in, referred to, *Miss A. Kenealy,* 5280.

Text Book of Physiology, by W. S. Hall (America), absence of humane teaching evident in, *Miss Lind-af-Hageby,* 7223.

Text Book of Physiology for Medical Students and Physicians, by W. S. Howell (America), absence of humane teaching evident in, *Miss Lind-af-Hageby,* 7223.

Text Book of Human Physiology, by Robert Tigerstedt, quotation from, showing foreign practice of disregarding anæsthesia, *Miss Lind-af-Hageby,* 7299.

The Buddhist Ray, vivisection condemned in, *J. W. Graham,* 5890.

Therapeutics, by Sir L. Brunton, lancet for injecting permanganate of potash as antidote for snake poison, described in, *Major L. Rogers,* 8069.

Times:

Letters from Dr. Timothy Holmes to, *re* correspondence with Mr. Coleridge as to "incomplete anæsthesia," *Hon. S. Coleridge,* 10995-11001.

Letter from Sir Victor Horsley in, repudiating connection with foreign experimentation on animals, *Miss Lind-af-Hageby,* 7223.

Letter from Dr. J. G. Rogers in, stating that plague is best dealt with by sanitary measures, and opposing use of serum, *Sir G. Kekewich,* 20485-90.

Letter from Sir F. Treves to, *Sir V. Horsley,* 16031, 16131-2.

Toxicology and Public Health, by John Glaister, reference, *J. Glaister,* 12908.

Vita Medica, by Sir B. W. Richardson, statements in, as to action of amyl nitrite, *Sir L. Brunton,* 6888-97.

Work of the Digestive Glands, by Professor Pawlow, lectures published in, show that ideal conditions of experimentation are by no means yet attained, *Miss Lind-af-Hageby,* 7276-87.

Zentral-blätter, results of physiological research published in, *E. H. Starling,* 4183

Zeitschrift für Klinische Medicin, results of starvation experiments in Germany, published in, *Lorrain Smith,* 18320-5.

JOURNALS AND PUBLICATIONS—*cont.*

Zoophilist, The, published by National Anti-Vivisection Society, *Hon. S. Coleridge*, 11598-600.

JOYCE GREEN HOSPITAL, permission of Metropolitan Asylums Board required for registration of, but no experiments yet performed there, *G. D. Thane*, 1743-6.

KANTHACK, PROFESSOR, paper read before British Medical Association, pointing out that presence of bacillus coli is necessary to health, *G. G. Bantock*, 14713-16.

KARSLAKE, SIR J. B., member of the Vivisection Commission, 1875 *W. P. Byrne*, 1.

KASAULI INSTITUTE, constitution and work of, *Major L. Rogers*, 8299-306.

KAST, PROFESSOR, therapeutic powers of trional and tetronal discovered by means of experiments on animals by, *A. R. Cushny*, 4733.

KEBLE COLLEGE UNDERGRADUATES:

Accusations brought by, with reference to vivisection at Oxford, and charges against Mr. Gotch *Hon. S. Coleridge*, 11444-67.
Actual facts of case, and subsequent withdrawal of charge by, *F. Gotch*, 13668-701.
Case of, unfairly represented by Mr. Gotch *Hon. S. Coleridge*, 19852-63, 19863-76.

KEITH, GEORGE, M.D., Edinburgh, action of drugs investigated by, *A. R. Cushny*, 5149.

KEKEWICH, SIR G., K.C.B., M.P., Hon. Sec. of the Parliamentary Association for the Abolition of Vivisection, 20380-965.

All experiments arising from other than scientific investigations should be controlled by one Act 20470.

Anæsthetics:

Doubts as to efficacy of, employed in experiments and cases where Act is evaded as regards, 20470, 20715-24.
Experiments with, or without, unjustifiable 20599.
Testimony of competent anti-vivisection witness required before believing in universal use of, at experiments 20452-6.
Torture of animals implied by fact that certificates disallow use of, 20736-43.
Vivisectors' statements as to sufficiency of, unreliable 20593-8.

Anti-pyrin and sulphonal once in great repute, but now considered useless 20588-92.
Cancer experiments on mice, necessarily painful, 20600-5.
Castration, reasons for not including, in same category as experiments on animals 20791-7.
Certificates, as to procedure gone through before granting, 20810-15.
Clinical research confessedly superior to experimental research 24023, 20882-4.
Clinical research subordinated to experimental research, and no beneficial knowledge obtained by latter 20568-79.
Cross-circulation experiments performed without anæsthetics 20457-62.

Demonstration experiments:

Demoralising effect of, on students 20419-22, 20701-12.
Not necessary for the training of medical students, and evidence supporting this view 20517.

Demoralising effect of experiments 20903-910.
Diphtheria antitoxin objected to, 20788-90.
Evidence before the Commission has aggravated the widespread disquietude as regards vivisection 20415-8.
Germ theory of disease not proveable 20899-900.
Humanity, lack of, in medical profession 20557-64.

Influenza:

Ignorance of medical profession as regards influenza is evidence of uselessness of, 20746-55.

KEKEWICH, SIR G., K.C.B., M.P.—*cont.*

Influenza—*cont.*

Theories with regard to bacterial cause of, have been useless in practical treatment 20583-7.

Inspectors, increase of, would not meet objections 20465-7.
Medical knowledge, its present barren state 20434-7, 20886-94.
Medical opinion as to value of experiments, biassed 20858-80.
Morphia not an anæsthetic 20728-35.
Number of experiments performed in 1906, 20528-31.

Pain:

Fact that healing of wounds inflicted in experiments causes, is ignored 20765-79.
Mr. Pembrey's admissions with regard to infliction of, contradict statements of other vivisectors 20439-50.
Mr. Pembrey's statement with regard to necessary infliction of, 20931-52.
Statements as to absence of, in experiments disputed 20428, 20533-47, 20615-17.

Parliamentary Association for the Abolition of Vivisection:

Experiments considered unproductive of any beneficial result by, 20387.
Increase of inspection would not meet objections of, 20465-9.
Objects and membership of, 20385-8, 20465-9, 20780-4.
Vice-presidents increased since publication of evidence before Royal Commission 20318.
Views of, not yet drafted in a Bill 20411-14.

Plague, outbreak in Alexandria, and successful treatment of by methods of sanitation only 20485-90.

Plague serum:

Enormous amount of suffering caused in preparation of, 20471.
Inefficacy of, for conferring permanent immunity 20861-7, 20640-75.
Use of, has propagated the disease, and partly responsible for unrest in India 20472-5, 20485, 20621-31, 20633-7, 20671-5.

Précis of, experts responsible for its preparation and accuracy, 20606-14, 20836-48, 20924-30.
Public Authorities Protection Act affects prosecution of licensee under Vivisection Act, 20818-35.
Serum therapy, its commercial aspect 20494-516.
Vaccination objected to, 20787.

Vivisection Act, 1876:

has Acted as stimulus to vivisection 20410.
Bill introducing, was not properly discussed in Parliament 20523-7.
Framed in accordance with views of medical profession 20553-6.
Motive power of, and inadequate consideration of Bill in Parliament 20389-98.

Principle of protection to animals, is nullified by exceptions allowed on certificates 20399-405, 20407.

Prosecutions under:

Objection to provision concerning, 20408.
Made impossible by provisions of Public Authorities Act, 1898 20409.

KELLARD, DR., Southsea, horror of vivisection expressed by, *J. Hughes*, 17209.

KEMPE, A. B., M.A., Treasurer of Royal Society, reference, *Lord Rayleigh*, 5548.

KENEALY, MISS ARABELLA, L.R.C.P. (Dublin), Parliamentary Association for the Abolition of Vivisection, 6164-6776:

Alkmaon identified brain with centre of consciousness by intuitive knowledge 6197, 6201.
Anæsthetics, impossible to remove consciousness to pain completely by, 6426-44.

KENEALY, MISS ARABELLA, L.R.C.P.—*cont.*
Anti-toxins :
Diphtheria, paralysis caused by use of, 6166-70, 6384-91.
Disbelief in all, and statistics as to value of such, deceptive 5504-5529.
Exploded theory of, 6369-75.
Harmful, and use of, should be legal offence 6171-87.
Injurious, and objections to immunity conferred by 6355-67.
Tendency of medical mind to be diverted to study of, 6261-3.
Anti-vivisection movement chiefly from outside medical profession, 6470-2.
Assumed right of man to kill animals for food, but painless killing should be enforced, 6473-86.
Cancer :
Pain probably suffered by mice inoculated with, 5496-5503.
Hereditary nature of, 5494.
Cancer Research Fund :
Admission of error in statement as regards report of, 5495.
Castration, a question not considered by Parliamentary Association for the Abolition of Vivisection 6305-12.
Clinical observations neglected 6487-95.
Contagious Diseases of Animals :
Experimentation unnecessary in connection with preventative measures for, 6241-8.
No knowledge of, but reliance placed upon general principles 6351-55.
Curare, use of, 6445-59.
Does not claim to speak as an expert 5426-7.
Drugs, testing of, on animals unnecessary 6578-83, 6299-304.
Experience as medical practitioner 6512-517.
Experiments :
Abolition of all desirable, 5411-16, 6235-40, 6316-17, 6327-33.
Brain, different conditions arising from, 5288-92.
Conflicting results of, prove their futility, 5286, 5329-40, 5463-75, 6379-83.
Demonstration of heart action by, unnecessary 6224-7.
Erroneous deductions from, 6292-7.
Futility of, in connection with flow of *post-mortem* lymph 5295-301, 6699-710.
Justifiable to certain extent when aim is to benefit animals themselves 6341-3.
on Suprarenal glands, conflicting results of 5322-5, 6645-58.
on Thyroid gland unnecessarily repeated 5326-8, 6165.
on Thyroid gland unnecessary to prove beneficial result of thyroid extract in treatment of myxedema 6210.
Valueless when concerned with artificial phenomena 5294.
Evolution hindered by thwarting natural process of disease 6543-6.
Feeding experiments are immoral if involving cruelty 6209.
Ferrier's statement as to worthlessness of experiments on brain and glands 6675-95.
Frogs :
Ignorant that law compelled anæsthetisation or pithing of, during experiments 6584-90.
Not sufficient evidence that pithing of, destroys pain sensations 6591-6605.
Futility of experimental physiology, 5281-4, 5295-301.
Hypnotism, possibility of employing, in performing experiments, 6539-42.
Immorality of experiments and as to misleading results 5372-91, 5406-9, 6276-91, 6324-6, 6461-9, 6771.
Immunity to noxious gases and microbes acquired by men working in sewers 5450-62.
KENEALY, MISS ARABELLA, L.R.C.P.—*cont.*
Inoculations :
Susceptibilities of animals conferred on human beings by, 5418, 6392-411, 6547-63, 6564-77.
an Unscientific principle of obtaining immunity from disease 5341-71, 5369-71.
Medical knowledge has gained no useful addition from experiments 6344-50.
Medical profession a prey to fetish of vivisection 6520-32.
Micro-organisms not yet proved to be causes of disease 8440-6.
Monkeys, analogy between man and, not close enough to make experiments on, valuable, 6607-15.
Moral standard by which vivisection should be judged 6532-8.
No practical experience of the treatment of animals 6340-1.
Number of experiments, reticence on part of experimenters as to, 5476-93.
Objective and scientific methods of research should be abandoned in favour of more intelligent and pathological methods 5392-5.
Object of medical science nowadays to render us immune to diseases incurred by neglect of natural laws 5429-38.
Open letter sent to Commissioners drafted by, *Mrs. K. Cook*, 1932.
Optic nerves, probably do not carry pain 6759.
Organ extracts of cold-blooded animals injected into warm-blooded animals and useless results of such injections 5302-21, 6711-52.
Pain, optimistic statements as to absence of, in experiments doubted 5280.
Pathology can be studied without recourse to experiments 6249-60.
Physiological discoveries made without help of experiments 6341-3.
Physiological knowledge not advanced by experiments 5280, 6202-5, 6616-20, 6318-23, 6496-9.
Plea for preservation of humane sense 5395-403.
Practice of vivisection has existed for centuries 6195-6.
Précis of Mrs. Cook's evidence, as to its preparation 6754-7, 6765-770.
Suprarenal glands, knowledge as to, acquired chiefly by clinical observation 6633-43.
Therapeutics, decline of interest in, 6165.
Torture of animals involved in experiments 6412-25.
Tuberculosis :
Susceptibility of calves to, 6401-11.
Uncertain that tubercle bacillus is cause of, 6500-11.
Vaccination : an abnormal practice, 6565-71.
Vegetable world supplies sufficient healing substances without recourse to animal extracts 6218-21.
Vivisection should be made a legal offence 6327-33.
Zymotic diseases have developmental functions in scheme of Nature 6264-75.
References *Sir G. Kekewich*, 20613, 20840, 20845-8.
KENT COUNTY ASYLUM, first trial of anti-typhoid vaccination at, *C. J. Martin*, 11793.
KEPP, drug experiments by, *A. R. Cushny*, 4771.
KERR, DR., Bradford, reference, *Miss A. L. Woodward*, 8792.
KHARTOUM :
Dog inoculated with sleeping sickness at, and signs of suffering shown in photograph, *Hon. S. Coleridge*, 11071-81.
Dog inoculated with sleeping sickness at, no knowledge of alleged cruelty, *G. D. Thane*, 1306-10.
Gordon College, *see that title.*
KINGDON, J. A., letter to, *re* "incomplete anæsthesia," *Hon. S. Coleridge*, 10993.
KING'S LYNN, typhoid outbreak, water said to be source of, but no bacillus discoverable, *G. G. Bantock*, 14717-22.

KITASATO, tetanus bacillus first isolated and cultivated by, *C. J. Martin*, 11653.

KLEIN, EDWARD E., M.D., F.R.S.:
Certificates dispensing with anæsthetics held by, *Miss Lind-af-Hageby*, 9429.
Comma bacillus now accepted as distinctive test of cholera by, though doubts previously held *W. H. Power*, 4429-30, 4495-8.
Cows inoculated with diphtheria by, and consequent suffering *Mrs. K. Cook*, 1796.
Employed as investigator by Local Government Board and as to evidence of, before previous Vivisection Commission *W. H. Power*, 4414-22.
Evidence of, before Vivisection Commission 1875, admitting indifference to animal suffering, *Mrs. K. Cook, J. W. Graham, Hon. S. Coleridge, Sir G. Kekewich*, 1919, 2064-7, 5883, 10656-74, 10852-78, 20450.
Inoculation experiments performed for Local Government Board by, of a most cruel character *Mrs. K. Cook*, 1919.
Local Government Board investigations carried out by, *W. H. Power*, 4584-5.
Report by, for Local Government Board on agglutination by blood of emulsion of microbes *W. H. Power*, 4301.
Report for Local Government Board by, on nature of Haffkine's Plague Prophylactic *W. H. Power*, 4301.
Smallpox inoculations conducted by, and unsatisfactory results *W. H. Power*, 4484-5.
Tuberculosis, its communicability proved by experiments on guinea pigs by, *Sir J. F. Moulton*, 12712.
References *G. D. Thane, W. H. Power*, 1737-40, 4628.

KLENCKE, communicability of tuberculosis discovered by, *C. J. Martin*, 11643.

KOCH, ROBERT:
Antiseptic surgery, value of experiments in connection with, *H. Morris*, 7673.
Atoxyl treatment for nagana used with success in Uganda by, *Col. D. Bruce*, 14314.
Atoxyl treatment for sleeping sickness put forward by, without success *Col. D. Bruce*, 1442-3.
Comma bacillus accepted generally as diagnostic agent of cholera, *W. H. Power*, 4427-9.
Failure of experiments with regard to Rhodesian fever conducted by, *S. Stockman*, 3331-50, 3403.
Failure of, to develop successful method of inoculation against horse-sickness *S. Stockman*, 3401.
Infectious diseases, knowledge of cause of various, due to experiments of, *C. J. Martin*, 11643.
as to Phthisis remedy of, *H. Snow*, 2261-2.
Postulates established by, demanding satisfaction before a specific micro-organism can be identified as cause of a disease, *H. Morris, S. F. Smith, Col. D. Bruce*, 7678-83, 13229-31, 14222.
Preventive inoculations against Rhodesian fever conducted by, unsuccessful *S. Stockman*, 3331-50, 3403-8.
Rinderpest, inoculation against, devised by, *Major L. Rogers*, 8226.
Statement of, as to relation between human and bovine tuberculosis *S. Stockman, G. S. Woodhead*, 3366-7, 15499-502.
Transvaal expedition of, its cost *S. Stockman*, 3347.
Tubercle bacillus discovered by, *S. Stockman*, 3098-9.
Tuberculin discovered by, *S. Stockman, F. Taylor*, 2576, 3149, 5594.
Tuberculin prepared by, and as to its rejection as curative agent *S. Stockman*, 3146-55.
Tuberculin treatment, fiasco of, *G. G. Bantock*, 14663-8.
Views of, as to non-communicability of bovine tuberculosis to man *S. Stockman*, 3098-9, 3102-15.

KOCHER, THEODOR, reference, *Sir V. Horsley*.

KOEPPE, experiments on himself by, *A. R. Cushny*, 5149.

KOLLE, inoculations against rinderpest devised by, *Major L. Rogers*, 8226.

KOLLER, PROFESSOR, anæsthetising properties of cocaine tested on animals by, *A. R. Cushny*, 4751, 4873-6.

KUSKOW, PROFESSOR, reference to work of, *G. G. Bantock*, 14695.

LABORATORIES:
Cambridge, pathological and physiological, licensed as one *G. D. Thane*, 501-3.
Chemists, list of, *G. D. Thane*, 344.
Government, list of, *G. D. Thane*, 342-4.

Municipal:
List of, *G. D. Thane*, 339-42.
Object of, *G. D. Thane*, 346-50.
Officials attached to, *G. D. Thane*, 351.
Science graduates without medical qualifications licensed to, *G. D. Thane*, 404-5.
Licences held by qualified chemists in official or municipal, *G. D. Thane*, 1450.
Oxford Physiological, statements as to howling of animals in, *Hon. S. Coleridge*, 11444-67.
Pharmaceutical, registered for preparation of sera, toxins, and drugs *G. D. Thane*, 1348-53.
Private pharmaceutical, reasons for registration *G. D. Thane*, 356, 1366-70.

at Research Institutions:
List of, *G. D. Thane*, 344.
Salaried and unsalaried licensees attached to, *G. D. Thane*, 354.
Used by private investigators *G. D. Thane*, 355.

Proximity of, to dwelling-houses not complained of *G. D. Thane*, 1343-6.
see also REGISTERED PLACES.

LACK, S. HODGKINSON, *Introduction to Physiology* by, shows indifference to pain produced in experiments, *Miss Lind-af-Hageby*, 7357-74.

LAHMANN, DR., reference, *Miss Lind-af-Hageby*, 9687.

LAMB, CAPTAIN, bitten by cobra and saved by use of anti-venin *Major L. Rogers*, 8034.

LAMSON POISONING CASE, aconitin employed in, and only detected by experimental methods *J. Glaister*, 12844-50.

LANGDON-DOWN, DR., frog vivisected at lecture given by, *Miss A. L. Woodward*, 8811-20.

LANGLEY, J. N., M.A., D.Sc., F.R.S., Professor of Physiology in the University of Cambridge, 15099-15425.

Anæsthesia:
Can be maintained for eight or ten hours without artificial respiration 15114-18.
First movements which return after complete, are not indicative of consciousness 15274-5.
Margin between disappearance of consciousness and disappearance of reflexes under anæsthesia much greater in case of animals than in man 15266-7.
Meaning of term varied, but usually denotes absence of pain 15411-16.

Anæsthetics:
A.C.E. mixture generally used, and as to its gradual action 15311-313.
Entirely necessary for all operations and experiments 15273.
Knowledge of administering, to animals would be of advantage in human practice 15268.
Maintained throughout all demonstration experiments 15387.
Slight operations involving mere discomfort do not require, 15325-8.

Applicability to man of results obtained from experiments, 15137.

Certificates:
B, anæsthesia maintained throughout experiments under, and animal killed if found to be suffering, 15112-3, 15302-7.
B and E E, a single certificate should be substituted for, 15192-201.

LANGLEY, J. N., M.A., D.Sc., F.R.S.—*cont.*
Cold-blooded animals :
Inclusion of, in Act at present hinders physiological research 15400-5.
Separate certificates for experiments on, wiser procedure than inclusion of, in Act 15399.
Control over experiments necessary 15253-7.
Mrs. Cook's statement as to experiment performed by, without anæsthetics, unfounded 15389-93.
Cruelty of experiment on dog performed by, *Mrs. K. Cook*, 1785-9.
Curare :
Animals dosed with, die under anæsthetic, 15365-6.
Inspector's attendance at all experiments involving use of, impracticable 15367-8.
Necessary to use, in some cases 15179, 15335-8.
Necessity of giving continuous anæsthetics with, 15359-61.
No difficulty in maintaining anæsthesia when curare is given 15169-78.
Precautions adopted with administration of, 15170-8.
Special certificates for use of, not objected to 15362-4.
Demonstration experiments :
Anæsthetics, method of administering, for, and necessity of securing perfect anæsthesia throughout, emphasised 15406-10.
at Cambridge, three or four yearly for illustration of lectures 15101.
Dogs used in certain, to illustrate flow of chyle 15243-50.
Essential, and no levity shown by students at, 15183-91.
Dogs essential for certain experiments 15180-2.
Evidence referred to, *re* pain caused in experiments *Sir G. Kekewich*, 20449.
Hypnotism an unreliable substitute for anæsthesia 15270.
Inspectors, visits of, cause no annoyance, and no objection to increase of, 15345-9.
Licence held by, since 1876 and certificates 15231-4.
Licences :
Experiments under, alone, involve no pain since animal is not allowed to recover 15102.
Medical training not necessary to qualify applicants for, 15294-7.
Necessity of taking out certificates in addition to, should be lessened 15192.
Should be endorsed after being granted for ten years and necessity of certificates dispensed with 15394-5.
Students might be permitted to hold, and experiment under careful supervision of heads of departments 15298-301.
Morphia :
Acts gradually on nervous centres and less rapid action than chloroform 15417-9.
An absolute anæsthetic if given in sufficient quantities 15351.
An analgesic but less rapid action than chloroform 15422-5.
Claude Bernard's views as to action of, erroneous and based on false experiments 15421.
Precise action of 15120-2.
Reflex action less controllable by, than other anæsthetics 15350.
Nerves :
Certain, not sensitive to both temperature and pain 15322-4.
Early experiments on dogs with reference to surgical treatment of severed, 15140-6.
Experiments on animals bearing on surgical treatment of severed and diseased, 15139-63.
Functions of certain, can only be determined by actual experiments 15130-7.

LANGLEY, J. N., M.A., D.Sc., F.R.S.—*cont.*
Nerves—*cont.*
Healing process after regeneration experiments not necessarily painful 15332-4.
Rival schools known as the central and peripheral schools, 15286-91.
Stimulation of, severed from central nervous system not painful 15316-18.
Surgical operations for severed and diseased, successful owing to preliminary experimental work 15276-83.
Nerve Diseases :
Acute anterior poliomyelitis successfully treated owing to knowledge acquired by experiments 15156-62.
Infantile paralysis, its treatment benefited by results of experiments 15381-5.
Successful treatment of, due to knowledge acquired by experiments on animals 15163-8.
Number and nature of animals experimented on by, 15236-7.
Pain :
as to Amount of, caused in experiments 15335-6.
Animal always killed after experiment if found to be in, 15339-44.
Animals' susceptibility to, is less than man's 15308-10.
Diminution of, desirable 15272.
Experiments under certificate do not involve more, than that occurring in recovery from surgical operation 15102-108.
Intestines not generally sensitive to, but subject to special stimulus which may cause, 15319-21.
Limit of range between disappearance of, and disappearance of reflex action is far wider in animals than in man 15120-9.
Painful and painless experiments, distinction between, 15251.
Personal experience points to strictest care in maintaining anæsthesia throughout experiments 15108-11.
Physiological and medical knowledge, progress of, depends on experiments 15130, 15138.
Reflex action is never conscious 15259-63.
Shambles of Science, movements of animals during experiments referred to in, probably reflex ones 15314-15.
Students occasionally see some research experiments 15329-31.
Vivisection Act, 1876 :
Amendments Suggested :
Animals should be allowed to be kept in any place provided address is notified to inspector 15210-16.
Elimination of non-painful experiments and injection of non-irritating substances 15192, 15369-80.
Penalties should not be imposed for mere technical infringements 15225-30.
Second operation should be permissible upon animal required to be killed before recovery 15216-24.
Teaching Certificates, word "absolutely" should be struck out of expression "absolutely necessary" in clause relating to, 15202-210.
Physiological research not seriously hindered by, 15253-7, 15397-8.
Reference, *E. H. Starling*, 3978.
LAWRIE, LT.-COL. E., M.B., I.M.S. (Retired), 16793-17108 :
Anæsthetics specially studied by, since 1865 16957-9, 17018-19.
Anæsthetics :
Administration of, to animals as at present conducted wrong and involves cruelty 16798, 16808, 16801-7, 16838-53.
Chloroform :
A safe anæsthetic if administered correctly, 17000, 17045-52, 17053-7.

LAWRIE, LT.-COL. E., M.B., I.M.S. (Retired)—*cont.*
Anæsthetics—*cont.*
Chloroform—*cont.*
Administration of, through trachea instead of by inhalation has no advantages and should be abandoned 16886-98, 16911-22, 17080-5.
Administration of, without fatal results, by students in Edinburgh during last century 16942-51.
Can be given with perfect safety, so long as regular respiration is maintained 16952-6.
Clinical experience rather than laboratory experiments has been truer guide in administration of, 16975-86.
Death under, occurs from failure of respiration leading to heart failure 16860-1.
Discovered by experiment on man, but its present position depends on animal experimentation 16961-2.
Experiments brought into disrepute owing to physiologists' rejection of work done by Hyderabad Commission on, 16836.
Experiments performed with view of ascertaining action of, on heart, *see* Dr. Gaskell's cross circulation experiments *below*.
Fallacy to suppose that heart failure under anæsthesia is due to, 16822-4.
First effect of, is to lower blood pressure and respiration stops from want of nutrition 16825-30.
Has no more direct action on heart than bullet wound in brain or hanging process 16862-6.
Hyderabad Commission's conclusions with regard to action of, have been absolutely ignored 16924-5.
Hyderabad method of administering, is the only safe method 16935-7.
Nurses and hospital orderlies should be taught how to administer, 16938-9.
Progressive diminution of sensibility to pain under, 17008-17.
Quantity respired cannot be measured 16927-30.
Specialists in anæsthesia were called into existence by belief that fall of blood pressure under, is synonymous with heart failure 16940-1.
Symes' method of administering, based on clinical experience and quite satisfactory 16963-5.
Theory that heart failure is directly due to action of, contradicted by finding of Hyderabad Commission 16834-5.
Tracheotomy performed on animals before administration of, is illegal 16801-7, 16838-53, 17058-66.
Discomfort and fear not caused to animals by administering, 17039-42.
Students learn wrong methods of administering, 16905-9.
Curare, no experience of, 17089-94.
Evidence referred to:
Cross circulation experiments, performance of, under morphia alone *Sir G. Kekewich*, 20457-62.
Cross circulation experiments, record of, forwarded for signature but no reply received *L. E. Shore*, 19472-7.
Haffkine's serum, its frequent impurity *Sir G. Kekewich*, 20642.
Morphia, inaccurate statements as to amount of dose given to dogs during experiment *L. E. Shore*, 19457-63.
Experience of, in administration of chloroform and statistics of cases published 16960.
Experiments are necessary for the advancement of medical science and benefits derived from them admitted 16988-91.

LAWRIE, LT.-COL. E., M.B., I.M.S. (Retired)—*cont.*
Dr. Gaskell's cross circulation experiments:
Circumstances attending performance of, laboratory assistant's evidence, *W. Hall*, 21581-35.
Dogs insufficiently anæsthetised in, morphia alone being given, 16810-21, 16922-5, 16969-74, 20966-21372.
Object of, circumstances attending, and contradiction of allegations *re* cruelty of, *L. E. Shore, H. K. Anderson, W. H. Gaskell*, 19430-1, 21636-704, 21373-580.
General Medical Council should have power to put a stop to unnecessary pain in experiments 16931-4.
Haffkine's plague prophylactic frequently impure 17107.
Hyderabad Commission's experiments *re* action of chloroform, necessity of, 16986A-7.
India, students in, taught to operate by experimenting on animals 17019-35.
Inoculations hardly require anæsthetics 17035, 17044.
Morphia:
Amount of dose likely to prove fatal to dog, 17098-100.
Not an anæsthetic unless lethal dose is given 17086-8, 17101-5.
Tracheotomy performed on rabbit without anæsthetic 17072-9.

LENARDIN, observations of, as regards insensibility to pain of internal organs, *Sir R. D. Powell*, 5584.

LEVY, J. H., Honorary Secretary of the Personal Rights Association, 18463-645:
Anæsthetics, grounds for doubting efficacy of, based on fact that curare is used 18500-1.
Animal rights must be protected 18502, 18567-88.
Animal rights, reasons for including, in sphere of personal rights, 18465.
Anti-vivisectionists' position not illogical because of impossibility of exterminating all forms of cruelty at once 18614-29.
Cancer inoculation performed on woman by Eugen Hahn unjustifiable 18634-42.
Cruelty, definition of, 18608-10.
Ethical ground of vivisection is a repudiation of morals 18497.

LEVY, J. H.—*cont.*

Evidence of Lord Justice Fletcher Moulton:

Arguments advanced in, as to analogy between destruction of rats and practice of vivisection for good of community, unsound 18552.

Ethical views in, one-sided and unsound 18473, 18546.

Criticism of statement as to proof of communicability of tuberculosis by experiments 18550-2.

Criticism of statement with regard to absence of progress in observational sciences 18549-50.

Experiments not justified by the fact of obtaining thereby beneficial knowledge 18488-91.

Experiments on animals are to a large extent illusory owing to complexity of conditions relating to human beings 18546-8.

Experiments on men justifiable in case of their voluntary submission and under strong public guarantee of their necessity 18534-7.

Experiments only justifiable under complete anæsthesia and animal is killed before regaining consciousness 18477-83.

Hedonistic principle must not be applied in the mode of direct balance of advantages 18528-33, 18554-66.

Huxley's statement as to field of morality being a reclamation from a state of nature agreed with 18515-18.

Logical consequence of experiments on animals must be experiments on men 18601-6.

Immorality of taking cosmic process as a moral exemplar 18518-20.

Inoculations:

No good results have ever been obtained from practice of propagating disease by, 18485-7.

Propagation of disease by means of, unjustifiable 18509-14.

Justifiable to kill animals for food 18504-8.

Objection to causing pain to animals varies with regard to their sensibility 18607.

Objections to vivisection based on grounds of disbelief in anæsthesia and pain 18477-83.

Personal Rights Association:

Membership of, 18467-9.

Reasons for including animal rights within scope of, 18465.

Philanthropic and philozoic sentiment are irreparably connected 18521-2.

Dr. Smidovich, his views as to necessity of being indifferent to animal suffering 18538-9, 18643-5.

Syphilis experiments on monkeys by Professor Metchnikoff unjustifiable 18544-5, 18630-3.

Unjustifiable to protect ourselves by infliction of serious pain upon animals 18506-8.

Vivisection, though immoral, cannot be regulated entirely by law 18524-7.

Vivisectionist argument of primacy of science over morals 18493-9.

LEVY, DR., cruelty of experiments performed by, *Mrs. K. Cook*, 1917.

LEWIS, *The late* G. H., reference, *S. F. Smith*, 13049.

LEWES, G. H., student, Physiological Laboratory, Cambridge, experiments on suprarenal glands of different animals by, *Miss A. Kenealy*, 5322-5.

LEWIS, REV. L. S., M.A., Church Anti-Vivisection League 8629-8785.

Castration, objected to, if not for animal's good 8664-84.

Church Anti-Vivisection Society:

Constitution and membership, 8633-5.

Objects and aims of, 8715-18, 8721-2.

Complete anæsthesia of human beings accepted as possible 8655-6.

Cowardly to share in advantages derived from infliction of pain on animals 8685-8.

Experiments on man must be logical outcome of experiments on animals, and as to foreign experiments on man 8630, 8759-85.

LEWIS, REV. L. S., M.A.—*cont.*

Immorality of vivisection 8636-42.

Inoculations against disease with serum obtained from animals unjustifiable 8751-4.

Inoculations, pain involved in, 8719-20.

Justifiable to use whip and spur to horse as punishment 8699-708.

Man kept purposely uncured for several days in condition of disease by Dr. Jonathan Hutchinson 8775.

Metchnikoff's statement that morality is second to hygiene 8754-8.

Morality abused by principle of inflicting pain and views of great thinkers on subject 8723-32.

Rights of animals rest on same foundation as rights of man, and distinction between legitimate and illegitimate sacrifice of animals 8657-61.

Right to kill animals admitted in certain circumstances but unjustifiable to inflict suffering 8643-52.

Snake poison, justifiable to use antidote for, which is not in itself product of vivisection 8741-5.

Sport involving suffering to animals is immoral 8689-98.

Vivisection, its whole principle objected to and anæsthesia for animals disbelieved in, 8662, 8746-50.

Would refuse to avail himself of diphtheria anti toxin 8733-40.

LICENCES:

Anæsthetics compulsory in all experiments under licence alone *E. H. Starling*, 3470.

Applications for signature carefully considered *Sir R. D. Powell*, 5736-9.

Applications for signature not signed without knowledge of applicant and proposed experiment, *E. H. Starling*, 3739-43.

and Certificates:

Bulk of investigations require both, *W. P. Byrne*, 213-15.

Important distinction between, *W. P. Byrne*, 25.

Conditions attached by Home Secretary to, quite justifiable *E. A. Schäfer*, 10241-6.

Condition requiring animal experimented on under, to be killed before recovery from anæsthesia strictly conformed with *D. W. Buxton*, 12467-9.

Contravention of Act in regard to use of, *W. P. Byrne*, 36-50.

Difficult to forbid use of knife when issuing licence for inoculation purposes *G. D. Thane*, 412.

Draft form suggested in event of abolishing certificates, *Sir V. Horsley*, 15955-61.

Drugs, experimental administration of, requires, *A. R. Cushny*, 4763-7, 5250-1.

Experiment alleged to have been performed without, *J. W. Graham*, 6044-6.

Experiments not permissible without, and joint experimenters must both hold, *W. P. Byrne*, 284-5.

Experiments under licence alone are painless since anæsthesia is maintained throughout until animal is killed *J. N. Langley*, 15102.

Experiments under licence alone of a prolonged nature *Sir J. Russell*, 546.

Experiments without, no foundation for report as to, in Scotland *Sir J. Russell*, 586.

Experiments without, no possibility for performance of, in registered places *Sir J. Russell*, 587-8.

Foreigners frequently licensed *W. P. Byrne*, 273.

Foreigners should not be put under a disadvantage with regard to obtaining, in this country *C. J. Martin, Sir J. F. Moulton*, 12153-63, 12751-4.

Granted for fish feeding experiments *W. P. Byrne*, 207.

Granted for testing and standardising of antitoxins, *G. D. Thane*, 1374-5, 1741-2.

Granted freely in cases where hardly necessary but for protection of applicant, *W. P. Byrne*, 205-7.

Inoculations could be performed under, without certificates *Hon. S. Coleridge*, 10455-68.

LICENCES—*cont.*

Issue of:

Applicant's qualifications carefully investigated before, *W. P. Byrne*, 18.
Applications for, must be submitted to Home Office *W. P. Byrne*, 155-6.
Applications for, referred to inspector after submission to Association for Advancement of Medicine by Research *G. D. Thane*, 387-95.
Applications never refused in area of Assistant Inspector *Sir J. Russell*, 519.
Association for the Advancement of Medicine by Research consulted before, *W. P. Byrne*, 24, 27-9, 281-2.
Complaints regarding, *W. P. Byrne*, 19-23, 140.
Delay in, complaints as to, *W. P. Byrne*, *W. E. Dixon*, 216, 19016.
Delay sometimes occasioned by consulting Association for Advancement of Medicine by Research, *Sir J. Russell*, 566.
Further restrictions with regard to, would hamper research *J. Lorrain Smith*, 18277-8.
General Medical Council, as now constituted, would not be a suitable body, to control, *W. E. Dixon*, 19152.
Home Office and Inspectors do not disagree as to, *G. D. Thane*, 1151-3.
Home Office do not inquire into personal character or humanity of applicant *Hon. S. Coleridge*, 10264.
Inspectors consulted before, *W. P. Byrne*, 32-33.

in Ireland:

Applications referred directly to Inspector *Sir T. Stoker*, 924-5.
Applications require similar signatures as in England *Sir T. Stoker*, 832-3.
Inspector's advice to, occasionally overruled, *Sir T. Stoker*, 932.
No practice of submitting applications to Association for Advancement of Medicine by Research, *Sir T. Stoker*, 847.
Procedure *W. P. Byrne*, *Sir J. Russell*, 149-56, 516.
Procedure might be simplified and amendment suggested *E. H. Starling*, 3723, 3981.
Procedure similar to that in England *Sir T. Stoker*, 789, 920.

Sanction of Secretary of State required for *W. P. Byrne*, 2.
to Students, with condition that experiments shall be performed under supervision *G. D. Thane*, 415-18.
Three officials at Home Office concerned in, *W. P. Byrne*, 199-204, 208-12.
to Veterinary surgeons under similar conditions as to other applicants *W. P. Byrne*, 70-2.

Licensees' returns practically give assurance of complete precautions taken during experiment *G. D. Thane*, 1771-6.
Licensee tacitly accepts conditions attached to, though giving no actual undertaking *G. D. Thane*, 494.
Medical qualifications need not be only guarantee for obtaining, *G. D. Thane*, *E. A. Schäfer*, *C. J. Martin*, *J. N. Langley*, *A. D. Waller*, *W. E. Dixon*, *Sir J. F. Moulton*, 404-5, 1706-7, 1449-51, 10192-4, 12148-52, 15294-7, 18120-5, 19026-9, 12751-4, 12765-74.
Memorandum of unsuitable applicants for, *W. P. Byrne*, 65-9.
Necessary qualifications of applicants for, *G. D. Thane*, 399-403.
Necessity of taking out certificates in addition to, should be lessened *J. N. Langley*, 15192.
No complaints as to performance of experiments without, *W. P. Byrne*, 47-8.
No restrictions as to animals except a horse, ass, or mule, under, *G. D. Thane*, 434.
Number of, in Great Britain *G. D. Thane*, 369-70.
Number of, increase in, *W. P. Byrne*, 107-13.
Number of, held for class purposes in Ireland *Sir T. Stoker*, 762.

LICENCES—*cont.*

One granted for observation of prostate gland in dogs *Sir T. Stoker*, 909-10.
Premises where experiments are to be performed specified in, *G. D. Thane*, 499-500.
Production of vaccine and diphtheria antitoxin does not require, *G. S. Woodhead*, 15550-1.
Prosecution of licensee for non-fulfilment of conditions requires assent of Home Secretary *W. P. Byrne*, 230-1.
Refusal of, to foreigners unjustifiable *C. J. Martin*, 12338-40.
Refusals to grant, cases of, *W. P. Byrne*, *Sir J. Russell*, *G. D. Thane*, 166-7, 522-4, 1098-1100.
Regular exercise of power to annex conditions to, *W. P. Byrne*, 5.
Regulations of Home Secretary under Section 8, Vivisection Act, 1876, attached to, *W. P. Byrne*, 14.

Renewal of:

Annual, *W. P. Byrne*, 48.
Annual, and pressure in inspector's work caused by *Sir J. Russell*, 598-9.
Doubtful procedure as to, *Hon. S. Coleridge*, 10590-2.

Signatures of authorities enumerated in Vivisection Act, 1876, Section 11, must be attached to, *W. P. Byrne*, 16.
Suspended for irregularities *W. P. Byrne*, 34-40.
Suspended only four times in thirty years as punitive measure *W. P. Byrne*, 177-9.
Veterinary surgeons in Ireland holding, *Sir T. Stoker*, 1043-4.
See also under Suggested Amendments, *under* VIVISECTION ACT, 1876.

LIEBREICH, PROFESSOR, Berlin, valuable soporific powers of chloral discovered by experiments on animals by, *A. R. Cushny*, *Sir L. Brunton*, 4712-29, 7016-7.

LILLE, cobra antivenin discovered by, *Major L. Rogers*, 8034.

LIMERICK, laboratory of Condensed Milk Company at, *Sir T. Stoker*, 765.

LIND-AF-HAGEBY, MISS L., Joint Author of *The Shambles of Science*, 7186-7650, 9105-9751.

Adrenalin serves no useful purpose and opposition to all therapeutic system 9720-3.

Anæsthesia:

Distinction between that employed in experiments and that in veterinary operations 7350-4.
Foreign text books, quotations from, showing practice of disregarding use of, 7299.
Imperfect, frequently required by some experiments 7438-41, 7620-5.
Incomplete, frequently advised in physiological text books 7223-97.
Light, means incomplete 9137-40, 9486-91, 9546-62.
Light, means incomplete, and as to unreliability of narcotics 9658-61.
Movement of animals on operating table indicates incomplete, 9661-4.
Physiologists' expressions of admiration for Professor Pawlow's experiments without, 7276-87.
Unreliability of, and drug experiments cannot be made under 9208-15.

Castration should be performed under anæsthetics 9281-4.
Chloroform a true anæsthetic if used properly 7599-602.
Cholin, chemical test of, should be as satisfactory as physiological test 7496-503.
Demonstration experiments should be prohibited 7459, 9242.
Diphtheria antitoxin valueless 9675-88.
Distinction between right and wrong use of animals 9325-45.
Education and experience of, in physiological study 7186-95.

LIND-AF-HAGEBY, MISS L.—*cont.*

Evidence referred to:

Anæsthetics, unreliable methods of, said to be in vogue *Sir G. Kekewich*, 20470.

Exercises in Practical Physiology, caution in, against use of anæsthetics *A. D. Waller*, 18086.

Marmot, erroneous statements made with regard to condition of, *M. S. Pembrey*, 13975-14017.

Movements in physiological demonstrations at University College referred to by, probably reflex ones *J. N. Langley*, 15314-15.

Experiments are performed under abnormal conditions and therefore valueless 9452-8.

Experiments on the higher animals especially objected to 7459-61.

General grounds of opposition to vivisection 9586-9.

Has written exclusively on vivisection of late years, 9105-13.

Inoculations:

Objected to, 7466.

Principle of conferring artificial immunity by, objected to 7645-50, 9347-53.

Inspectors, increase of, useless 7462-5, 9598-600.

Lay inspection of experiments, as to desirability of permitting, 9610-11, 9665-9.

Lectures attended by, application for permission made in usual way 9628-9.

Lectures attended by, conditions with regard to admission 7493-5, 9115-27.

Lectures attended by, Mr. Starling's misrepresentation of methods adopted for gaining admission 7590.

Limitation of experiments and prohibition of morphia and curare would be accepted by, as preliminary measures 9590-2.

Moral objections to all experiments on animals 7204, 7455-8, 7620, 9200-6.

Morphia:

Amount of fatal dose, 9262-71.

and Curare should be prohibited as anæsthetics 9246-50.

No anæsthetic and difference between narcosis and anæsthesia 7602-17.

Pain sensations under, and its unanæsthetic effect on animals 9472-85

Should be prohibited as an anæsthetic 7300a-46, 7345-9.

Myxedema, its treatment by thyroid extract might have been discovered by chemical experiments, 9719.

No useful results obtained from experiments 7627, 7644, 9700-11.

Opposed to all forms of cruelty to animals 9618-21.

Pain, its absolute elimination from experiments would not affect moral opposition to vivisection 9312-24.

Pasteur treatment of hydrophobia objected to 9712-15.

Physiological text books contain callous references to pain and dislike of anæsthetics 7299, 7354-76.

Physiologists consider scientific claims before moral ones 7288-99.

Physiologists' publications show absence of humane teaching, 7375-7379.

"Pithing" of frogs:

Essential conditions for complete, and as to wrong use of expression 9272, 9689-99.

Improperly conducted by Dr. Brodie and Miss Cullis who held no licence 9730.

Publication of experiments illegal under present Act shows want of humane feeling and should be prohibited 7379-96.

Removal of cerebral hemispheres does not mean removal of consciousness of pain 7411-27.

Röntgen Rays:

Infinite possibility in discovery of, for physiological investigation and treatment of disease 9726-7.

Study of intestinal movements of animals under, are conducted under normal conditions and should be encouraged 9242.

LIND-AF-HAGEBY, MISS L.—*cont.*

Serum therapy, its useless nature 9717-18.

Shambles of Science, the:

Adherence to views honestly expressed in, 9630-3.

Anæsthesia incomplete in some experiments described in, 7350-3, 7454, 9130-1, 9157-97, 9408-17, 9594-7.

"Brown dog":

Contradictory statement as to health of, made by vivisectors 9730-51.

Illegality of two successive operations upon, 9730-51.

"Dog injected with substance derived from a lunatic":

as to Anæsthetics used in, 7482-9.

Cholin tests conducted by Dr. Halliburton referred to in, 7219-220, 7467-76.

Method of killing animal chiefly criticised in, rather than insufficiency of anæsthesia 7504-38.

"Dog that Escaped," curare used in experiment described in, 9398-406, 9461-71.

"An Experiment that is not supposed to be useful," suggestion that morphia as well as curare was used in, 9500-12.

"An Experimental Production of Blood clotting by injection of a Nucleo Proteid," justification of statements made in, 7432-3.

Humane feeling absent and indifference to pain shown during experiments described in, 7223.

Lectures described in, attended by authors 7477-81.

Levity of students referred to in, 7598.

Marmot referred to in, had been previously experimented upon and its spinal cord divided 9354-86, 9651-7.

Movements of animals during experiments described in, indicated returning consciousness 9144-7.

Morphia used as an anæsthetic during experiments described in, 7300A-9.

Object of writing, 7194-7204.

"Pain," operators engaged in experiments described in, 7448-52.

"Painless experiments," statements in, adhered to 7399.

Pithed frog, theory supporting statements made as to possibility of pain sensations in, 7403-30.

Publication, legal proceedings in connection with, and statement as to withdrawal of, 7567-89.

"A Quiet Cat," circumstances described in, suggesting improper use of curare 9383-97.

Reasons for not making direct representations as to cruelty of experiments described in, 9608-9.

"Scarcely Any Anæsthetic," preference for curare and morphia in experiments described, 4514A-21.

Section 3 of Act abused by performance of experiments described in, 7213-22, 7442-5.

"The Struggling Cat," adherence to statement as to lack of artificial respiration during experiment and misstatements by Drs. Thane and Bayliss 9634-50.

Mr. Thane's criticisms of, objected to, 7539-60. 7590-8, 9148-53.

"a Troublesome dog," operators engaged in experiment described in, 7448-52.

Snake-bite experiments, their scientific value doubted 9225-31.

Spinal cord of frogs, dogs and monkeys sensitive to pain 9563-84.

Sports, all involving cruelty to animals, objected to 9232-8.

Starvation experiments, pain involved in 9601-7

Students should be forbidden to experiment upon pithed frogs, and as to certain modes of pithing which do not destroy sensation of pain 9255-9, 9272.

Tuberculin, its failure 7634-8.

Uselessness of experiments, since final test must always be on man 9239-41.

LIND-AF-HAGEBY, MISS L.—*cont.*

Vaccination, objection to, and to whole principle of serum therapy, on humanitarian and hygienic grounds 9216-24.

Vivisection Act, 1876:

Condition of things under, an improvement on foreign conditions 9287-90.

Experiments can be controlled to a certain extent under, but great deal of cruelty admitted by, 9297-303.

Repeal of, desirable, and abolition of all experiments enacted 9275-8.

Vivisectors are artists in black art of producing utmost agony, 9419-50.

Would make no personal use of supposed advantages derived from experiments 7631-8.

References, *G. D. Thane, E. H. Starling,* 1280, 3545. 3552-3.

LINDGARD, DR., reference, *Major L. Rogers,* 8226.

LISTER, THE RIGHT HON. THE LORD.

Antiseptic surgery introduced by, *see* LISTERISM.

Errors of antiseptic treatment acknowledged by, *G. G. Bantock,* 14545-6.

Evidence of, before previous Royal Commission with regard to part played by experiments in discovery of antiseptic surgery, *H. Morris,* 7664-73.

No connection between work of Semmelweis and, *G. G. Bantock,* 14759-60.

Opponents of, do not realise distinction between prevention and infliction of pain *Sir J. F. Moulton,* 12707.

Statement of, as to possibility of experimenting on human beings *J. W. Graham,* 5887-90.

Work of, *Sir R. D. Powell,* 5584.

Reference, *S. F. Smith,* 13049.

LISTERISM:

Abandonment of, for aseptic methods of surgery *G. G. Bantock,* 14546-6, 15051-64.

Antiseptic and aseptic surgery are both applications of the principle of, *W. Osler,* 16681-4.

and Aseptic surgery, clear distinction between, *G. G. Bantock,* 15085-98.

Basis of theory, was concerned with notion of influence of atmospheric germs *G. G. Bantock,* 14551-5, 14822-32.

Beneficent results of, *H. Morris, Sir J. F. Moulton, W. Osler,* 7726, 7750, 12707, 16675-80.

Carbolic Spray:

At first regarded as most important part of procedure, but finally discarded *G. G. Bantock,* 14745-6.

Never a leading feature, and reasons for discarding it *Sir V. Horsley,* 15800-1, 16259.

Use of, now discarded owing to proof that risk of bacterial infection from air was slight *Sir V. Horsley,* 15668.

Date of introduction of treatment *G. G. Bantock, Sir V. Horsley,* 14564-70. 16260-4.

Definition of, *E. A. Schäfer, G. G. Bantock,* 10141-51, 15083-4.

Essence of, was to destroy atmospheric germs by use of carbolic acid spray, and error of such a theory *G. G. Bantock,* 14556-63.

Generally adopted not only in England, but over the whole Continent *Sir V. Horsley,* 15679.

Modern aseptic surgery is logical outcome of, *Sir V. Horsley,* 15665-8.

Modifications of technique since 1876 *H. Morris,* 7845-7.

Opposition to, *G. G. Bantock,* 14752-4.

Principles of, embodied in modern aseptic surgery *W. Osler,* 16742-6.

See also ANTISEPTIC AND ASEPTIC SURGERY.

LISTER INSTITUTE OF PREVENTIVE MEDICINE:

Authorities' conclusions as to reasons for cases of tetanus following use of Haffkine's serum at Malkowal *C. J. Martin,* 12295-9.

Constitution of, is on similar lines to the Pasteur Institute in France *Sir V. Horsley,* 15672.

Evidence of Director of, *see* MARTIN, C. J., 11630-12140.

LISTER INSTITUTE OF PREVENTIVE MEDICINE—*cont.*

Experiments performed in, almost exclusively confined to inoculations and injections *C. J. Martin,* 11826-7.

Local Government Board investigators' work at, *W. H. Power,* 4284.

Not exactly a private institution *G. D. Thane,* 1366-70.

Paralysis following use of antitoxins, cases of, quoted in report of, *Miss A. Kenealy,* 6166-7.

Research work on behalf of, carried out at Chelsea and Aldenham, *G. D. Thane,* 344.

Salaried and unsalaried licensees attached to, *G. D. Thane,* 354.

Salaries of staff do not depend on amount of products sold *C. J. Martin,* 11844.

Substances produced in, *C. J. Martin,* 11831-4.

Work done at, *C. J. Martin,* 12074-9.

LIVERPOOL:

Corporation, investigations on behalf of, performed in University buildings *G. D. Thane,* 340-41.

University of:

Cancer research laboratory at, *G. D. Thane,* 1686.

Professorship of bio-chemistry founded by, *Sir V. Horsley,* 16008.

Work on behalf of, *G. D. Thane,* 340.

LOCAL GOVERNMENT BOARD:

Annual Report, 1889, inoculations of Dr. Klein reported in, *Mrs. K. Cook,* 1919.

Bacteriological investigations not undertaken by staff of, *W. H. Power,* 4582-3.

Bacteriologists employed by, diagnosis of diseases, *W. H. Power,* 4627-8.

Dairies and Cowsheds Order, its administration *S. Stockman,* 3419-22.

Diphtheria antitoxin and cholera preventive recommended by, *W. H. Power,* 4310-12.

Diphtheria antitoxin issued by, but without specific instructions *W. H. Power,* 4604, 4624-6.

Epidemiological method of working at causation of Malta Fever authorised by, unsuccessfully *Col. D. Bruce,* 14261.

Evidence on behalf of, *see* POWER, W. H., 4281-4640.

Experimental investigations on behalf of, reported annually in Parliamentary paper *W. H. Power,* 4339-50.

Experiments for, in connection with destruction of rats on plague ships *M. S. Pembrey,* 14058-66.

Experiments on behalf of, subject to supervision of inspector *G. D. Thane,* 1339-40.

Foreign Office is informed by, of outbreaks of certain diseases for notification to foreign countries *W. H. Power,* 4301, 4337.

Functions of, as regards experimental investigations *W. H. Power,* 4299.

Haffkine's plague serum issued by, *W. H. Power,* 4624-6.

Inspection:

Investigatory work no longer carried out by, *W. H. Power,* 4299.

Work of, *W. H. Power,* 4534.

Investigators employed by, and as to supervision of such *W. H. Power,* 4284-97.

Koch's consumption cure not applied by, to human beings, *W. H. Power,* 4467.

Laboratories not owned by, *W. H. Power,* 4283.

List of scientific authorities employed by, *W. H. Power,* 4413-4.

Local authorities generally adopt prophylactics suggested by, *W. H. Power,* 4325.

Local authorities notified by, of all new prophylactics discovered, *W. H. Power,* 4310.

Medical Officers of, since 1900, *W. H. Power,* 4297.

Medical staff of, *W. H. Power,* 4302.

Nature of research investigations carried out by, *W. H. Power,* 4300-1.

Painful experiments on behalf of, would be reported to W. H. Power, *W. H. Power,* 4529-31.

Procedure of, in outbreaks of disease, *W. H. Power,* 4304-5.

Prophylactics not actually recommended by, but notified to and placed at disposal of local authorities, *W. H. Power,* 4368-9, 4437-40.

LOCAL GOVERNMENT BOARD —*cont.*

Prophylactics tested before recommendation to local authorities, *W. H. Power*, 4318-20, 4440.
Reports received by, from local authorities as to efficacy of prophylactics recommended, *W. H. Power*, 4317, 4322-4.

Research Work:

Aim of investigations, *W. H. Power*, 4423-4, 4578-9.
Animals chiefly used, *W. H. Power*, 4343-5.
Experiments essential for, *W. H. Power*, 4357.
Experiments with view to discovery of preventive sera, *W. H. Power*, 4307-9.
Few experiments of painful character, *W. H. Power*, 4526.
Home Office inspection, extent of, *W. H. Power*, 4356, 4519.
Inspectors no longer carry out, *W. H. Power*, 4299.
Investigators employed in, and as to supervision of such, *W. H. Power*, 4284-97.
Investigators make yearly returns to Home Office, *W. H. Power*, 4333-6.
Laboratory formerly rented for, but practice now discontinued, *W. H. Power*, 4411.
List of investigators employed, *W. H. Power*, 4413-4.
Majority of experiments are subcutaneous inoculations and painless *W. H. Power*, 4351-4, 4532, 4574-5.
Nature of, *W. H. Power*, 4300-1.
Reasons for employing outside investigators, *W. H. Power*, 4359-60.
Sir J. Simon's and Mr. Forster's minutes concerning principles governing, *W. H. Power*, 4299.
Smallpox inoculations not latterly conducted, *W. H. Power*, 4483-5.

Treasury grant to, for purposes of conducting experiments, *W. H. Power*, 4408-10.
Tuberculin, its curative value not yet considered by, *W. H. Power*, 4405-6.
Tuberculosis treatment, recommendations of Board as to, in abeyance until report of Tuberculosis Commission is issued, *W. H. Power*, 4455-6.
Vaccination lymph carefully tested before issue from, *W. H. Power*, 4513.
Vaccine tested and prepared by, and as to derivation of lymph, *W. H. Power*, 4477-8, 4482, 4488, 4513, 4591-7.

in Ireland:

Experiments on behalf of, *Sir T. Stoker*, 776-7.
Licences should be issued by, *Sir T. Stoker*, 778-80, 855.
Medical inspector assists Inspector under Vivisection Act in some places, *Sir T. Stoker*, 831.

LOCK, REV. W., D.D., Warden of Keble College, Oxford, letter from, with reference to apology from Keble undergraduates *F. Gotch*, 13668.

LONDON ANTI-VIVISECTION SOCIETY:

Application from, to prosecute licensee for supposed breach of conditions and consequent proceedings *W. P. Byrne*, 232.
Income of, *Hon. S. Coleridge*, 10260.

LONDON HOSPITAL, cats kept at, by Dr. Head *G. D. Thane*, 1248A, 1256.

LONDON HOSPITAL MEDICAL COLLEGE, Dr. Head licensed to perform experiments at *G. D. Thane*, 1385.

LONDON:

King's College:

Demonstration experiments at, *A. R. Cushny*, 5164.
Harben lecture at, delivered by Professor Metchnikoff *Mrs. K. Cook*, 1785.

School Board, Experiments recommended to students in manual of, expurgated after exposure *Miss A. L. Woodward*, 8824-6, 8867-80.

LONDON—*cont.*

School of Medicine for Women:

Demonstration experiments at, *A. R. Cushny*, 5168.
Not registered for experiments, *Miss Lind-af-Hageby*, 9626-7.

University:

Evidence on behalf of, *see* WALLER, A. D., 17996-18167.
Lectures at, attended by authors of *The Shambles of Science*, *Miss Lind-af-Hageby*, 7477-81.
Resolution passed by, in favour of giving evidence, and witnesses appointed *A. D. Waller*, 18091-3.

University College:

Cruelty of experiments on cats and dogs at, *Mrs. K. Cook*, 1801-7, 1917-19.
Demonstration experiments at, *A. R. Cushny*, 5164.
Dog used illegally for two experiments at, *Mrs. K. Cook*, 1917.
Experiments resulting in discovery of adrenalin at, *E. H. Starling*, 3555-60.
Dr. Head licensed to perform experiments at, *G. D. Thane*, 1385.
Inspectors' connection with, has made no difference to inspection *Sir V. Horsley*, 16072-4.
Nature of experiments in 1902 on dogs at, *E. H. Starling*, 3470.
Number and nature of experiments on dogs at, *E. H. Starling*, 3527-33.
Physiological Laboratory, *G. D. Thane*, 1237-46.

LONG, THE RIGHT HON. W. H., muzzling orders for suppression of rabies introduced by, *see* Muzzling Order *under* BOARD OF AGRICULTURE.

LONGET, experiments by, reference, *Miss A. Kenealy*, 5288.

LOUPING ILL, *see under* SHEEP DISEASES.

LOREBURN, THE RIGHT HON. THE LORD, antivivisection cause supported by, *Hon. S. Coleridge*, 10262.

LUDWIG, experiments by, were starting point of present abdominal surgery *Sir L. Brunton*, 6952.

LUTAUD, DR.:

Letter from with regard to fallaciousness of statistics of Pasteur's treatment for rabies *G. G. Bantock*, 14786-96.
Reference, *Miss Lind-af-Hageby*, 9686.

MACAULAY, DR., quotation from essay by, shows little experience and knowledge of drugs *H. Morris*, 7982-6.

MACCARTHY, DR., Abbeyfeale, County Limerick, total abolition of vivisection except by expert original investigators desired by, *J. Hughes*, 17209.

MCDONNELL, R., M.D., evidence of, before Vivisection Commission, 1875, *S. F. Smith*, 13049.

MCEWEN, PROFESSOR, reference, *G. H. Burford*, 9081.

MACFADYEAN, ALLAN, investigation into cause of Malta fever caused death of, *Col. D. Bruce*, 14414-7.

MACKARNESS, DR., *The late*, Bishop of Oxford, antivivisection cause supported by, *Rev. L. S. Lewis*, 8728.

MACKENDRICK, PROFESSOR, experiments by, leading to discovery of anæsthetic properties of cocaine, *Sir L. Brunton*, 7025-7.

MACLAGAN, MR., reference *A. R. Cushny*, 4781-2.

MACNEILL, J. G. SWIFT, M.P., question in Parliament to Home Secretary by, as to Dr. Hime's experiments *Miss A. L. Woodward*, 8804, 8846.

MCVAIL, DR., antiseptic methods of, *G. G. Bantock*, 14748-51.

MCWEENEY, PROFESSOR, experiments conducted by, for Irish Local Government Board *Sir T. Stoker*, 776-7.

MAGENDIE:

Experiments performed by, previous to use of anæsthetics *E. H. Starling*, 3445-9.
Experiments by, reference *Miss A. Kenealy*, 5288.

MAIDSTONE, typhoid outbreak, bacillus not discoverable in suspected water *G. G. Bantock*, 14707-22.

MALARIA:
Combatted by destroying agent of communication *Sir J. F. Moulton*, 12732-5.
Communicated by mosquitoes *W. Osler*, 16699-71.
Destruction of mosquito and isolation of cases is best method of stamping out, *W. Osler*, 16703-4.
Discovery of mode of transmission of, will make the tropics habitable *W. Osler*, 16543.
Experiments on birds not essential in proving that mosquitoes convey, *S. F. Smith*, 13114-117.
Large proportion of population in malarial districts though practically immune to, are yet capable of infecting mosquitoes *W. Osler*, 16789-90.
Method of controlling, resulting from experiments will enable Panama Canal to be built *W. Osler*, 16541-2.
Might be stamped out if infected district could be wholly immunised *W. Osler*, 16705-6.
Mosquito probably infectious after having bitten infected patient at any period during course of, *W. Osler*, 16701-2.
Organism of, discovered by experiments on birds *W. Osler*, 16747-9.

MALKOWAL, INDIA, conclusions of Lister Institute as to tetanus following use of Haffkine's vaccine at, *C. J. Martin*, 12295-9.

MALLEIN:
Board of Agriculture do not issue instructions as to use of, *S. Stockman*, 3248.
Discovery of, as diagnostic agent of glanders *S. Stockman*, 2576-8.
Errors, possibility of, in assuming that all reactions prove existence of glanders *S. Stockman*, 3235-45.
Generally accepted as diagnostic agent of glanders *S. Stockman*, 3246.
Has no curative power *S. Stockman*, 3257-8.
Horses exported to Continent for horse-flesh meat tested on arrival with, *S. Stockman*, 3250.
Prepared similarly to tuberculin, *S. Stockman*, 3227-34.
Value of, and small proportion of errors in its use as diagnostic agent *S. Stockman*, *F. Taylor*, 2576-8, 2807-18, 3379-83, 5722-4.

MALTA:
Chart showing monthly prevalence of Malta fever among troops in, *Col. D. Bruce*, 14210-15.
Investigation of Mediterranean fever at, and satisfactory results *Lord Rayleigh*, 5557, 5568.
Tables showing incidence of fever among troops in, and number of those invalided home *Col. D Bruce*, 14216-20.

MALTA FEVER:
Animal experimentation essential to investigation of, *Col. D. Bruce*, 14260, 14495-6.
Case mortality, proportion compared with typhoid *Col. D. Bruce*, 14380.
Cases of, on board s.s. "Joshua Nicholson," arising from goats' milk, *Col. D. Bruce*, 14400-4.
Cause of, could never have been discovered without experiments on animals *Col. D. Bruce*, 14452-3.
Cause of, has not been investigated so closely in other places than Malta, *Col. D. Bruce*, 14250-2.
Caused in most cases by drinking goats' milk, *Col. D. Bruce*, 14216-19, 14518-21.
Charts showing monthly prevalence of, *Col. D. Bruce*, 14210-15.
Claims put forward as to actual discoverer of cause of, *Col. D. Bruce*, 14405-7.
Commission formed in 1904 to investigate, *Col. D. Bruce*, 14484-5.
Communicated purely by food, and not by inhalation, *Col. D. Bruce*, 14465-8.
Decrease in prevalence of, after adoption of preventive measures in 1906 *Col. D. Bruce*, 14381-93.
Difficulty of distinguishing enteric fever from, *Col. D. Bruce*, 14395.
Entire elimination of, from Army and Navy, but native population is still subject to, *Col. D. Bruce*, 14490-1.

MALTA FEVER—*cont.*
Experiments proved that cause of, was not conveyed by air, effluvia, or harbour water, but by goats' milk *Col. D. Bruce*, 14234-45, 14291.
Goat not only susceptible to, but several species of animals, *Col. D. Bruce*, 14253
Koch's three postulates satisfied in case of, and *micrococcus melitensis* demonstrated as cause by series of experiments on monkeys *Col. D. Bruce*, 14222-35.
Maltese less susceptible to, than foreigners *Col. D. Bruce*, 14255.
Manner in which *micrococcus melitensis* spreads from goat to goat not exactly known, *Col. D. Bruce*, 14504.
Measures taken to stamp out, after cause was traced to drinking of goats' milk *Col. D. Bruce*, 14245-9.
Micrococcus melitensis discovered to be cause of, in 1886 *Col. D. Bruce*, 14267-75, 14483-4.
Micrococcus melitensis multiplies in mammary glands of goats *Col. D. Bruce*, 14522-5.
Nature and average duration of, *Col. D. Bruce*, 14202-10.
No proof that infection is carried by dust, *Col. D. Bruce*, 14465-7, 14492-3
Observational methods alone insufficient for investigation of, *Col. D. Bruce*, 14260-5.
One attack of, is to a certain extent protective, *Col. D. Bruce*, 14256-8.
Precautions taken in Gibraltar against, *Col. D. Bruce*, 14288-90.
Preventive methods adopted against, *Col. D. Bruce*, 14369-73.
Remedies for, must be tested by animal experimentation *Col. D. Bruce*, 14473.
Results of experimental work in connection with, have been of enormous assistance in stamping out the disease *Col. D. Bruce*, 14201.
Serums prepared for, without much success at present, *Col. D. Bruce*, 14374-9.
Statistics of cases after stopping supply of goat's milk *Col. D. Bruce*, 14454-64.
Tables showing incidence of, among troops in Malta and number of those invalided home *Col. D. Bruce*, 14216-20.
Widespread and known under different names, *Col. D. Bruce*, 14204-09.

MALVERN WELLS, municipal laboratory at, *G. D. Thane*, 342.

MANCHESTER:
Inoculation experiments in, for detecting tuberculous cows *J. Lorrain Smith*, 18344-57.

Victoria University:
Dalton Hall:
Evidence of Principal, *see* GRAHAM, J. W., 5837-40.
Object and constitution of, *J. W. Graham*, 5837-40.

Evidence on behalf of, *see* LORRAIN SMITH, J., 18168-18462.

MANCHESTER ANTI-VIVISECTION SOCIETY, views of, *see* GRAHAM, J. W., 5836.

MANCHESTER FRIENDS' ANTI-VIVISECTION SOCIETY, views of, *see* GRAHAM, J. W., 5836.

MANCHESTER SOCIETY FOR THE PROTECTION OF ANIMALS FROM VIVISECTION, income of, *Hon. S. Coleridge*, 10260.

MANNING *The late* CARDINAL, anti-vivisection cause supported by, *Rev. L. S. Lewis*, *Hon. S. Coleridge*, 8728, 10262.

MANSION HOUSE MEETING, 1899:
Object of, was merely to pass resolution in recognition of Pasteur's work, and actual facts of case misrepresented by Mr. Coleridge *Sir V. Horsley*, 15594-601.
Promoters' object was to establish Pasteur Institute in England, but this intention, as well as public character of, frustrated *Hon. S. Coleridge*, 19880-19901.

MANSON, SIR PATRICK:
Disagreement with views of, concerning doubtful cause of sleeping sickness *Col. D. Bruce*, 14436-40.

MANSON, SIR PATRICK—*cont.*
Experiment in connection with investigation of filaria sanguinis hominis proposed by, *Sir V. Horsley*, 15733-5.
Opinion of, with regard to cause of sleeping sickness, altered *Col. D. Bruce*, 14449-51.

MARCHI, method devised by, in investigating anatomy of the nervous system most valuable *Sir V. Horsley*, 15682.

MARCONI, reference *E. H. Starling*, 3442.

MARMOT (referred to in *The Shambles of Science*):
Adherence to statement that spinal cord of, had been divided *Miss Lind-af-Hageby*, 9354-86.
Spinal cord of, had never been divided, and erroneous statements made by Miss Lind-af-Hageby *re* condition of, *M. S. Pembrey*, 13975-14017.
Spinal cord of, had never been divided, and *post-mortem* examination of, made *G. D. Thane*, *M. S. Pembrey*, 1272-4, 14124-7.

MARSHALL, DR. F. A. H., reference, *A. E. Schäfer*, 10193.

MARTIN, Messrs. Brady and, *see* BRADY AND MARTIN, MESSRS.

MARTIN, C. J., M.B., D.Sc., F.R.S., Director of the Lister Institute of Preventive Medicine, 11630-12382.
Anti-toxins, their production, and precautions taken in their manufacture 11696-710.
Anti-vivisection feelings natural but unreasonable 12331-5.
Bacterial origin of most infectious diseases 11879-88.
Causes of several infectious diseases not yet identified, and obstacle in some cases has been their non-communicability to animals 11904-9, 12178-92, 12314-5.
Choice of animals for experiments should not be limited 11821-4, 12050-1.
Colonial regulations of experiments differ in different countries, but restrictions generally looser than in England 12053-8.
Cruelty not involved in experiments and anæsthesia always complete 12342-9.
Diagnosis of infectious diseases, importance of experiments in, 11657.
Demonstration experiments necessary for students to have clear conception of physiological facts 11825.
Diphtheria:
Anti-toxin:
Cost per unit 11836-43.
Effect of, upon mortality of laryngial cases 11730-1.
and Hydrophobia vaccine, distinction between principles of, 11920-2.
Mortality could be abolished by immediate application of, 11763, 11766-91.
Most successful of all serum treatments and necessity of its use in early stages of disease 11985.
Paralysis following use of, as to statistics of cases 12316-24.
Prophylactic action of, 11739.
no Statistics of London cases treated with and without, 12252-6.
Success of, 11985-12030, 12356-7.
Tables showing curative value of, and conclusions drawn from such statistics 11711-35.
Tables showing influences of early and late administration of, upon case mortality 11733-7.
Bacterial diagnosis of, its accuracy and effects upon statistics of case mortality 12257-70, 12358-61, 11985-12030.
Knowledge of, acquired by experimental methods 11652.
Dysentery anti-toxin:
Not used in India to any great extent 12031.
Possesses preventive and curative properties in animals, but no extensive data as to its value in man yet available 11755-9.
Practical value of, predicted 11764.

MARTIN, C. J., M.B., D.Sc., F.R.S.—*cont.*
Evidence of, agreed with *J. R. Bradford* 17749-50.
Evidence referred to:
Diphtheria statistics, fallacy of, *S. F. Smith*, 13235-59.
Haffkine's plague vaccine, statement *re*, criticised *Sir G. Kekewich* 20471.
Experimental methods the only possible way of properly advancing science of medicine, 11643.
Hydrophobia:
Deaths from, occurring during, or within fifteen days after completion of Pasteur's treatment excluded from statistics 11914-19.
No specific microbe of, 11909.
Pasteur's inoculations created no case of, 12362-4.
Pasteur's reasoning for assuming nervous system would be site of virus of, 11910-3.
Preventive and curative sera for, discovered by experiments and requiring inoculation of animals for their production 11658-95.
Stamped out in this country without recourse to Pasteur's treatment, 11924.
Injections of toxins derived from specific microbes of disease produce that disease in modified form 11900-1.
Licences:
and Certificates, medical qualifications should not be necessary for obtaining, 12148-52.
Home Office action in refusing, to foreigners unjustifiable 12338-40.
Melbourne regulations as to, quite proper 12350-3.
Lister Institute:
Experiments performed in, almost exclusively confined to inoculations and injections 11826-7.
Salaries of staff do not depend on amount of products sold 11844.
Substances produced in, 11831-4.
Work carried on at, 12074-9.
Number of experiments performed by, 12032-5.
Plague:
Advisory Committee on, in India and Commission appointed by, 12286-91.
Anti-toxin (Haffkine's):
Discomfort not involved by inoculation, 12097-102.
Discovery of, and statistics as to its use 11792.
Effect of, in preventing spread of disease in India and statistics 11925-39, 12300-310.
Immunity conferred by, no accurate data as to period of, 12128-33.
Precautions taken for purity and strength of, 12071-3.
Use of other than, 11939-41.
Bubonic form not infectious 12141-5.
Commission on, in India, its constitution, investigations and report 12080-95, 12134-6, 12291-3.
in India, experimental investigations *re* spread of, 11654-6.
Transmission of, by rat flea discovered to be most serious mode of spread, 12103-26.
Pneumonia anti-toxin not popular 11969.
Public Health, importance of experiments in connection with testing of water and food 11817-20.
Puerperal fever:
Knowledge of, acquired by experimental methods 11967-8.
Serum treatment for, not always satisfactory 11967-8.
Rabies:
Abolition of, in this country 12241-51.
Mortality statistics affected by inclusion of all cases dealt with by Pasteur's treatment 12169-73.

MARTIN, C. J., M.B., D.Sc., F.R.S.—*cont.*
Rabies—*cont.*
Pasteur's treatment had nothing to do with the stamping out of, in this country 12164-8.
Serum production, experiments for, not under the Act 11845-7.
Sleeping sickness, case of Khartoum dog, inoculated with, 12137-40.
Snake poison:
Anti-venin only useful treatment for, 12283-5.
Futility of certain remedies advocated, 12271-82.
Stamping out and control of certain infectious diseases have been effected without use of preventive sera 11850-8, 12193-205.
Syphilis, as to cause of, 12229-40.
Tetanus:
Anti-toxin:
A certain remedy if promptly administered 11760-2.
Chiefly used, as prophylactic 11970-6, 12038-49.
a Curative and prophylactic agent 11740-54.
Has not justified expectations 11963-5.
Method of obtaining, 12038-49.
Production of, involves no pain 12065-70.
Knowledge of, acquired by experimental methods 11653.
Occurrence of, after use of Haffkine's plague vaccine at Malkowal, Lister Institute's conclusions as to, 12295-9.
Sanitary conditions chief preventive, 11984.
South African war, few cases in, and consequently small use of serum 11977-81.
Tuberculin, as to its prophylactic use, 12209-12, 12373-82.
Tuberculosis:
Communicability of, from animals to man proved by recent research 12219-24.
Contended at one time to be no specific disease 12206-8.
Knowledge of, acquired by means of experiments 11644-6.
Sanitary conditions, enforcement of, best preventive, 12214-16.
Typhoid anti-toxin:
First trial of, and statistics as to its use 11793-813.
Wright's, and as to its value, 11942-6, 11952-7.
Vaccination against small-pox:
Difference between lymph used in, and other protective sera, 11867-76, 11902-3.
Jenner's discovery involved no experiments on animals, 11859-62.
Vivisection Act has not materially hindered cause of science, 12336.
References *Sir L. Brunton, E. A. Schäfer*, 7161, 10238.

MERING, drug experiments by, *A. R. Cushny*, 4748.

METABOLISM, effect on, of diverting or obstructing flow of bile into large intestine can only be performed on dogs, *G. D. Thane*, 1232.

METCHNIKOFF, E., Director of the Pasteur Institute.
Statement by, as to supremacy of science over morality, and award of Harben gold medal to, *Rev. L. Lewis, J. H. Levy*, 8754-8, 18496-7.
Syphilis experiments on monkeys by, *Sir J. Russell, J. H. Levy*, 684, 18544, 18630-3.
Teaching and suggestions of, *Mrs. K. Cook*, 1785.

METROPOLITAN ASYLUMS BOARD:
Diphtheria anti-toxin reported upon and its preparation undertaken for, *G. S. Woodhead*, 15449-54.
Hospitals:
Percentage of deaths from diphtheria fifteen years ago in, and comparison with recent years, *W. H. Power*, 4384-5.
Statistics *re* use of diphtheria anti-toxin in, *C. J. Martin, G. S. Woodhead*, 11711, 15457-64.
Statistics showing decrease in diphtheria mortality at, due to antitoxin treatment, *W. H. Power, F. Taylor, Sir R. D. Powell*, 4361-2, 4387-91, 4541-50, 4632-8, 5585-93, 5657, 5666-71.
Joyce Green Hospital, registration required consent of, *G. D. Thane*, 1744.
Licensees in connection with, engaged in testing and standardising anti-toxins *G. D. Thane*, 1741-2.

METTAM, PROFESSOR:
Licence held by, *Sir T. Stoker*, 1043-5.
Statement by, that all diseases of the human eye affect also eyes of animals, *Sir H. R. Swanzy*, 9898.

MICE:
Action of respirable gases and use of vapour in anæsthesia established by Priestly's experiments on, *Sir V. Horsley*.
Cancer inoculations in, no grounds for supposing they involve pain *G. D. Thane*, 1692-3.
Cancer inoculations in, *G. D. Thane*, 465-6.
Cancer inoculations in, necessarily painful *Miss A. Kenealy, Sir G. Kekewich*, 5495-503, 20600-5.
Experiments to test effect of House of Commons air on, *W. P. Byrne*, 125.
Glanders sometimes diagnosed by inoculating, *S. Stockman*, 3233.
Jensen's tumour predominates in, and symptoms differentiating it from human cancer *H. Snow*, 2105-8, 2120-1, 2125

MICE—*cont.*
Septicemia has different effects in field, and house, *H. Morris*, 7876-9.
Tuberculosis inoculated in, and cruelty of such experiments *Mrs. K. Cook*, 1919.
Tumour in, doubts as to its malignant character, *H. Snow*, 2118-20.
Tumour in, incorrectly diagnosed as cancer, and therefore its investigation can lead to no useful result *H. Snow*, 2121, 2125, 2127, 2134-7A.
Used chiefly for inoculation experiments *E. H. Starling*, 3445.

MICHIGAN UNIVERSITY, U.S.A., no law regulating vivisection in, *A. R. Cushny*, 5019-27.

MIDDENDORP, DR., reference, *G. G. Bantock*, 14696-7.

MIDWIFERY, clinical opinion divided as to use of ergot in cases of, *A. R. Cushny*, 5203-4.

"MIGNONETTE" CASE, judgment of Lord Chief Justice Coleridge in, and its bearing on question of morality *J. H. Levy*, 18523-6.

MILL, J. S., immorality of taking cosmic process as a moral exemplar argued by, *J. H. Levy*, 18518-20.

MILROY, T. H., Queen's College, Belfast:
Certificate C not allowed to, in first instance, but afterwards granted *Sir T. Stoker*, 793-4.
Six experiments under certificate C performed by, *Sir W. Thornley Stoker*, 937.

MONKEYS:
Act does not specify, *Sir T. Stoker*, 775.
Anæsthetised without difficulty *A. R. Cushny*, 5095.
Analogy between men and, close enough to make experiments valuable *E. A. Schäfer*, 10126.
Analogy between man and, not close enough to make experiments on valuable, *Miss A. Kenealy*, 6607-15.
Cretinous and myxedematous symptoms not always produced in, by removal of thyroid gland *Sir V. Horsley*, 15831-5.
Cruelty of experiments on, *Mrs. K. Cook*, 1790, 1796, 1799-1800, 1910-11, 1913-4.
Desirability of using, for certain experiments, but use of is largely a matter of economical cost *F. Gotch*, 13565-8, 13745-52.
Experiments on, proving removal of thyroid gland is cause of cretinism and myxedema *W. Osler*, *Sir V. Horsley*, 16582.
Experiments on, valuable owing to their highly developed nervous system *G. D. Thane*, *E. H. Starling*, 1205, 3445.
Inoculated with blood of persons suffering from sleeping sickness and disease thereby produced *Col. D. Bruce*, 14502-3.
Killed by overdose of anæsthetic *Sir J. Russell*, 549.
Local Government Board do not experiment upon, *W. H. Power*, 4343-5, 4528.
Micrococcus melitensis proved to be cause of Malta fever by series of experiments on, *Col. D. Bruce*, 14222-35, 14272.
Nervousness of, *G. D. Thane*, 1427.
Pain not indicated after brain operations on, *E. A. Schäfer*, 10127-31.
Spinal cord of, sensitive to pain *Miss Lind-af-Hageby*, 9563-84.
Susceptibility of, to pain makes it desirable to minimise experiments on them *Sir J. Russell*, *Sir T. Stoker*, 607, 807-8.
Syphilis communicated to, *J. H. Levy*, 18544.
Syphilis experiments on, application to perform, would require to be urged by strong reasons *Sir J. Russell*, 684.
Thyroid gland excision followed by no painful symptoms *Sir J. Russell*, 543.
Tuberculosis common among caged, and care taken to guard, from infection *S. Stockman*, 3225.

MONTENEGRO, PROFESSOR JOSE VERDES, statement of, as to results following inoculation with plague serum *Sir G. Kekewich*, 20640, 20664-6.

MOONEY, DR., argyrol first used by, in case of inflammation of interior of eye, *Sir H. R. Swanzy*, 9845.

MOORHOUSE, DR., *The late* BISHOP OF MANCHESTER, anti-vivisection causes supported by, *Rev. L. S. Lewis*, 8728.

MOORSON, COL., Chief Constable of Lancashire, reference, *Sir V. Horsley*, 15883.

MORLEY, THE RIGHT HON. JOHN (*now* Viscount), O.M.:
Anti-vivisection cause supported by, *Hon. S. Coleridge*, 10262.
As Chief Secretary for Ireland effected improvement in Irish administration of Act, *Sir T. Stoker*, 767, 853-4.

MORPHIA:
Absolute protection from pain afforded by, as at present administered *A. R. Cushny*, *J. N. Langley*, *W. E. Dixon*, 5150-3, 15119-351, 18887, 19039-46.
Action of, different to chloroform but produces similar insensibility to pain *W. E. Dixon*, 18764-8.
Action of, in frog *E. H. Starling*, 3836-40.
Action of, similar in all animals *W. E. Dixon*, 18869-76.
Acts gradually on nervous centres and less rapid action than chloroform *J. N. Langley*, 15120-2, 15417-9.
Affects different dogs differently *F. Hobday*, 16487.
Amount of dose likely to prove fatal to dog *Col. E. Lawrie*, 17098-100.
as to Amount of fatal dose *Miss Lind-af-Hageby*, 9262-71.
an Analgesic but has less rapid action than chloroform *J. N. Langley*, 15422-5.
Chief value of, and reasons for administering *E. H. Starling*, 3607-10.
and Cholorform, value of anæsthesia produced by combination *W. E. Dixon*, 18672.
Claude Bernard's views as to action of, erroneous and based on false experiments *J. N. Langley*, 15421.
Dogs insusceptible to toxic dose of, *F. Hobday*, 16483-5.
Dose of, administered before general anæsthetic makes less amount of latter necessary, *D. W. Buxton*, 12502.
Dose of, necessary for anæsthesia bears relation to amount of brain substance *W. E. Dixon*, 19004-11.
Drugs having similar action to, *W. E. Dixon*, 18862-4.
Except in large doses, only affects sensory cells and therefore not suitable anæsthetic for vivisection experiments *W. E. Dixon*, 18755.
Experimenters' preference for, *Miss Lind-af-Hageby*, 4514A-21.
Experiments performed on dogs under, and insufficiency of dose to produce complete anæsthesia *Col. E. Lawrie*, 16869-85.
Fatal dose of, probably necessary to secure complete anæsthesia *G. D. Thane*, 1631-3.
Hypodermic syringe at first confined to injection of, *Sir L. Brunton*, 6974.
Injection of, frequently before operations, *G. D. Thane*, 1624-5.
Insensibility produced by use of, *Sir L. Brunton*, 6902-6.
Instance of administering 20 grains to dog without fatal result *F. Hobday*, 16501-7.
Knowledge of how to properly administer was unknown till recently *W. E. Dixon*, 19049-54.
Large dose of, produces complete anæsthesia *E. H. Starling*, *E. A. Schäfer*, *D. W. Buxton*, *Sir V. Horsley*, *H. Morris*, *W. E. Dixon*, 3610, 3970-3, 8027-8, 10189, 12474-6, 15926-8, 18757-63.
Motor cells not affected by, and hence hyocin combined with, for operations *W. E. Dixon*, 18664-8.
a Narcotic and used largely for stopping pain *F. Hobday*, 16461-3.
a Narcotic but can produce profound anæsthesia *A. D. Waller*, 18150-1.
Not a complete anæsthetic, but not used alone *H. Morris*, 7797-9.
Not a general anæsthetic, *Hon. S. Coleridge*, 11576-80.
Not always absorbed if given by the mouth *W. E. Dixon*, 18756.
Not an anæsthetic, *Miss Lind-af-Hageby*, *S. F. Smith*, *Sir G. Kekewich*, 7300A-46, 7602-17, 9472-85, 13316-18, 20728-35.
Not an anæsthetic unless lethal dose is given, *Col. E. Lawrie*, 17086-8, 17101-105.

MORPHIA—*cont.*

Operation on human subject under morphia alone not advised *D. W. Buxton*, 12541-2.
Prohibition of, as anæsthetic desirable *Miss Lind-af-Hageby*, 7345-9, 9245-50.
Prolonged action of, *G. D. Thane*, 1634.
Rarely used as an anæsthetic alone *G. D. Thane*, *D. W. Buxton*, 1626-32, 12448.
Reasons for objecting to use of, as anæsthetic *D. W. Buxton*, 12568-9.
Reflex action less controllable by, than other anæsthetics *J. N. Langley*, 15350.
Reflex test of anæsthesia inapplicable in use of, *W. E. Dixon*, 18793.
a Specific drug, and attacks sensory nerve cells so that distinct reflexes can be obtained under anæsthesia produced by, *W. E. Dixon*, 18663-7.
Used for certain minor operations on dogs, *F. Hobday*, 16481-2.

MORPHIN, *see* MORPHIA.

MORRIS, HENRY, F.R.C.S., President of the Royal College of Surgeons of England 7651-8028.

Anæsthesia:

Complete, always aimed at and secured during experiments 8020.
Consciousness disappears long before movement under, 7937-52.
as to Length of time animals and men can be kept under, 7802-4.
Movement and cries possible without consciousness under light, 7996-8002.

Anæsthetics:

Local, never used personally in surgical practice 7969 73.
Unnecessary to prescribe particular forms of, in granting certificates 7964-7.

Animals appear less susceptible to pain than man 7957-9.

Antiseptic surgery:

Advance in, due to experiments on animals 7705-22, 7726, 7750.
Aseptic surgery has taken the place of, 7899.
Koch's discovery of bacteriological origin of wound infections 7673, 7685-9.
Lister and Pasteur's discoveries, necessity for continuing research bearing on, 7778-82.
Lister's and Pasteur's experiments in connection with, 7664-73.
Modifications of technique in Lister's treatment since 1876 7845-7.
Pasteur's work on spontaneous generation is fundamental basis of modern, 7841-2.
Wounds treated antiseptically heal with practically no pain 7723-6.

Anti-vivisection feelings, causes contributing to, 7814-18.

Anthrax:

Antitoxin, its success in United Kingdom and in Japan 7741-9.
Bacillus of, not always discoverable 7871-3.
Safe to argue from experience in animals to man in cases of, 7873.
Sclavo's serum for, 7868-70.

Bacillus and coccus, distinction between 7674.
Bacilli originally alleged to be causes of diseases have in some instances been disproved by experimental research 7880-5.
Bacteria, study of, and their effects on animals has opened up question of obtaining immunity from diseases 7705.
Bacteriological culture and toxin production 7669-73.
Blood poisoning, bacilli responsible for, discovered by experiments on animals 7690.
Certificate A, skilled assistants working under licensee holding, should be permitted to perform inoculations, 7806-9.
Clinical inquiry important as well as experimental inquiry, 7900.
Dr. Crile's experiments in relation with surgical shock, 8021-4.
Curare, its use deprecated, 8018-19.

MORRIS, HENRY, F.R.C.S.—*cont.*

Demonstration experiments:

Lecturer would not object to interested laymen attending, 7768-71.
Necessary, for proper training of students, 7751-2.
Practical teachers of physiology should have opportunity of witnessing, 8010-15.

Diagnosis of disease by means of experimental methods, and importance of Pasteur's work in this connection, 7694-701.
Distinction between bacilli which are themselves origin of poison and those whose toxin are source, 7888-90.
Dogs, their exclusion from experiments, would seriously hamper progress of science, 7810-11.
Evidence of, disagreed with as regards debt of surgery to experiments, 14774.
Experiments for acquiring surgical technique might be permitted, 8004-8.
Experiments in relation to bacterial origin of certain diseases, and immunising and curative influence of culture sera, 7726.
Experiments in relation to cancer research, 7726.
Experiments in relation to knowledge of shock, 7726.
Experiments upon dog by Simon of Heidelberg previously to removing kidney from female patient, 7786-88.
Hæmorrhage now more successfully controlled by methods other than acupressure, 7978-81.
Hypnotism, as to possibility of employing, in performing experiments, 7960-3.
"Immunity," "serum therapy and immunity," and "increasing resisting power of the body" impossible without experiments, 7848-9.
Koch's three postulates bearing on infectious disease and consequent discoveries, 7678-83.
Levity on part of experimenters never witnessed by, 7790-2.
Medical science, its progress inseparably connected with experimental work, 7837-40, 7932-3, 7909-11.
Moral justification for experiments, 8026.
Morphia is not an anæsthetic in small doses, but poisonous dose removes all consciousness, 7797-9, 7819-23, 8027-8.
No experiments ever performed by, *Sir G. Kekewich*, 7824-7, 20517, 20916.
Opposition to statement that differences between animal and human intestines nullify application of experimental work, 7977.
Pasteur's treatment for hydrophobia advocated, 7993-5.
Repetition of experiments, except for special object, undesirable, 7908.

Royal College of Surgeons:

Council of, its constitution and membership, 7924-31.
Regulation relating to Fellowships of, require candidates to have attended course of practical physiology, 7754-65.
Unanimous resolution from, practically supports existing law, 7653-4, 7921-3.

Septicemia:

Experiments show bacilli to be cause of, 7673-7.
Inoculations of, into field and house mice have different results, 7876-9.

Statement of Sir Charles Bell *re* uselessness of experiments contradicted by his work, 7901-6, 7913-20.
Surgeons cannot perform experiments on animals for acquiring manual skill, 7827-32.
Surgical experience of, 7934-6.
Surgical knowledge, advances due to experiments, 7657-63.
Surgical practice, advances which have been made independent of experimental research, 7891-4.
Tetanus anti-toxin, its success in America, 7727-40.

Vivisection Act, 1876:

Amply protective against cruelty to animals and sufficiently free for proper scientific inquiry, 7805.
With exception of small amendment suggested, no modification of, required, 7833-6.

MORRIS, HENRY, F.R.C.S.—*cont.*
Wound ligatures, improvement in methods of, due to careful study by experiments of bacteriological organisms, 7705-14.

MOSQUITOES :
Destruction of, best method of abolishing yellow fever *W. Osler*, 16623-4, 16703-4.
Methods adopted to exterminate, in Havannah *W. Osler*, 16553-65.
Reasons for suspecting that yellow fever was propagated by, *W. Osler*, 16694.
Reduction in numbers of, owing to methods adopted for extermination, very remarkable *W. Osler*, 16562-8.
Susceptibilities of, to pain doubtful *Mrs. K. Cook*, 1988.
Yellow fever infection proved by experiments to be carried by, *W. Osler*, 16535-9.
Yellow fever transmitted by, after biting infected persons *W. Osler*, 16548-9.
see also under MALARIA *and* YELLOW FEVER.

MOTT, DR. :
Anatomical change in brain during sleeping sickness described by, *Col. D. Bruce*, 14329-35.
Cruelty of experiments performed by, *Mrs. K. Cook*, 1910-11.

MOULE, DR., Bishop of Durham, anti-vivisection cause supported by, *Rev. L. S. Lewis*, 8728, 8738.

MOULLEN, MANSELL, letter to, *re* "incomplete anæsthesia," *Hon. S. Coleridge*, 10993.

MOULTON, THE RIGHT HON. SIR J. FLETCHER, F.R.S., Lord Justice of Appeal, 12691-818.

Anæsthesia :
Humanitarian principles do not call for interference with experiments under, 12741.
No doubts as to maintenance of efficient, during experiments, 12809-11.
Anthrax, Pasteur's work demonstrating microbic cause of, and possibility of obtaining immunity from, 12730.
Antiseptic surgery heads list of benefits derived from experimental research, 12727-8.
Anti-vivisectionists do not realise distinction between prevention and infliction of pain, 12707.
Certificates, men of acknowledged capacity in research should have general, entitling them to perform experiments subject to fully reporting the same to Home Office, 12741-8, 12757-62.
Demonstration experiments :
Absolutely essential for the proper education of students 12741.
No justification for statement that students are demoralised by witnessing, 12806-8.
Diphtheria, diagnosis, progress in, has possibly affected statistics of case mortality 12715-16.
Diseases combatted by means of destruction of agent of communication 12732-5.
Diseases, their microbic causes discovered by experimental methods 12728-30.
Evidence referred to :
Arguments advanced as to analogy between destruction of rats and practice of vivisection for good of community, unsound *J. H. Levy*, 18552.
Criticism of statement with regard to absence of progress in observational sciences 18549-50.
Ethical views are one-sided *J. H. Levy*, 18546.
Suggestions *re* granting general certificates to men of acknowledged reputations, approved *F. Gotch*, 13910-12.
Tuberculosis, statement as to first proof of its communicability by experiment *J. H. Levy*, 18550-2.
Experiments on men not justifiable 12735-7, 12791.
Home Office, control over non-painful experiments should only have regard to reliability of experiments and not to nature of experiment 12756.
Humanitarian morals, growth of progress in, 12697.

MOULTON, THE RIGHT HON. SIR J. FLETCHER, F.R.S.—*cont.*
Knowledge necessary for prevention of disease may be justifiably obtained by experiments on animals 12735-7, 12786-90, 12812-14.
Licences, Mr. Coleridge's suggestion that applicants for, should produce certficate of humanity is absurd 12775-7.
Licences and certificates :
Applicants for, should not be restricted to those holding medical qualifications 12751-4, 12768-74.
Foreigners should not be put at a disadvantage with regard to obtaining, in this country 12751-4, 12766-7.
Malaria, combatted by destroying agent of communication 12732-5.
Man justified under certain circumstances in experimenting upon himself, 12798-805.
Misrepresentation responsible for opposition to experimental research 12737-41.
Observational methods quite inadequate for acquiring scientfic knowledge 12708, 12716.
Pain :
Diminution of totality of in men and animals should be a guiding motive 12701-2.
Diminution of totality of, justifies practice of experimental research 12704-5, 12730-2.
Inability to diminish, is due to ignorance 12707.
Responsibility of diminishing preventable, is ethical standpoint of experimental research in curative science 12702-4.
and Suffering increased by ignorance which can be surmounted by knowledge acquired by experimental research 12707-8.
That inflicted in experiments is infinitesimal in comparison with totality of unnecessary and unfruitful pain in world 12737, 12785.
Painful experiments should be controlled by two classes of certificates 12741.
Physiological functions, essential to acquire knowledge of, by experiments 12735.
Practical results should not always be main object of experiments 12717-27.
Prophylactic methods due entirely to knowledge of microbic causes of disease obtained from experiments 12730-2.
Prophylactic methods of destroying invading organisms of disease by stimulating natural agencies of resistance 12732.
Scientific knowledge depends on testimony of experimental research 12708-9.
Sufferings of men and animals, distinction between, 12697-700.
Thyroid gland, its relation to myxedema and cretinism discovered by means of research into functions of physiological organs 12735.
Tuberculosis, its communicability, ignorance as to, dispelled by series of experiments on guinea-pigs 12709-15.

MULLER, PROFESSOR, Royal Veterinary School, Berlin, views of, as to treatment of anthrax *S. Stockman*, 2743-5.

MUNK, experiments by, reference *Miss A. Kenealy*, 5288.

MURRAY, DR. G., thyroid treatment for cretinism and myxedema put forward by, *Sir L. Bruton, Sir V. Horsley*, 7138, 15688.

MURRAY, J. A., M.B., B.SC., cancer research experiments conducted by, *H. Snow*, 2114.

MURRELL, W., *Manual of Pharmacology* by, gives amount of fatal dose of morphia for dogs *Miss Lind-af-Hageby* 9262-71.

MURRILL, Dr., experiments *re* effect of pure nitrate of sodium on animals by, *Rev. L. S. Lewis*, 8778.

MUZZLING ORDERS, *see under* BOARD OF AGRICULTURE.

MYXEDEMA :
Cure of, effected by administration of thyroid extract, *Sir R. D. Powell, Sir L. Brunton, Sir V. Horsley, W. Osler*, 5758-60, 7041-3, 15836-41, 16569.

MYXEDEMA—*cont.*

Experiments unnecessary to prove beneficial effect of thyroid extract in cases of *Miss A. Kenealy*, *Miss Lind-af-Hageby*, 6210-11, 9719.
Method of administering thyroid extract for, and necessity of continuous treatment *W. Osler*, 16576-80.

and Thyroid gland:

Clinical investigation had not demonstrated connection between, *W. Osler*, 16627, 16631.
Connection between, discovered by experiments *Sir R. D. Powell*, *Sir L. Brunton*, *Sir J. F. Moulton*, *Sir V. Horsley*, *W. Osler*, 5684-93, 6958-64, 7138, 12735, 15836-41 16570.
Connection between, might have been discovered without experiments *S. F. Smith*, 13325-35.

NAGANA:

Animal parasite is micro-organism causing, *Col D. Bruce*, 14306.
Arsenic used in first instance as remedy for, without success *Col. D. Bruce*, 14318.
Examination of blood of cattle suffering from, demonstrated existence of specific micro-organism *Col. D. Bruce*, 14293-8.
Non-pathogenic in wild animals or man *Col. D. Bruce*, 14419-23.
Trypanosome of, is transferred from wild to domestic animals by tsetse fly, *Col. D. Bruce*, 14418.
Tsetse fly disease and, discovered to be synonymous *Col. D. Bruce*, 14293-310.
Value of experiments in connection with, and remedy discovered thereby *Col. D. Bruce*, 14312-14.
Wild animals are immune to, *Col. D. Bruce*, 14304, 14310.

NARCOTICS, *see under* DRUGS.

NATAL, rinderpest outbreaks in, *S. Stockman*, 2492-3.

NATIONAL ANTI-VIVISECTION SOCIETY:

Evidence on behalf of, *see* COLERIDGE, THE HON. STEPHEN.
Muzzling orders and Pasteur's rabies inoculations opposed by, *Sir V. Horsley*, 15597-600, 15605.
Muzzling orders not opposed by, *Hon. S. Coleridge*, 19849-51.

NATIONAL CANINE DEFENCE LEAGUE:

Bill embodying views of, has been before Parliament *J. Hughes*, 17159-5.
Buisson bath treatment for hydrophobia originated by, *J. Hughes*, 17235-40.
Candidature of Sir M. Stewart opposed at General Election by, *J. Hughes*, 17287-95.
Committee of, its constitution *J. Hughes*, 17241-6.
Dogs, anæsthetisation of, considered impossible by, *J. Hughes*, 17520-34.
Dogs, their exemption from vivisection approved by all members of, *J. Hughes*, 17250-1.
Evidence on behalf of, *see* HUGHES, J., SWAN, C. R. J. A., COWEN, R. J., 17109-620, 19192-19427.
Founded in 1891 as an Anti-Muzzling League, *J. Hughes*, 17120-7.
Dr. Hutchinson, late M.P. for Rye, unseated owing to efforts of, *J. Hughes*, 17212-3.
Influence of, far-reaching *J. Hughes*, 17226.
Membership and income of, *J. Hughes*, 17114-118, 17279-85.
Muzzling Order opposed by, and not by National Anti-Vivisection Society *Hon. S. Coleridge*, 19849-51.
Object of, does not include general opposition to practice of vivisection on other animals than dogs, *J. Hughes*, 17269-74.
Object of, to protect dogs from all ill treatment, *J. Hughes*, 17119.
Objects, one is total suppression of support of vivisecting institutions by public money *J. Hughes*, 17227-31.
Petition presented to Parliament by, *J. Hughes*, 17536.
Sport, question of, not dealt with by, *J. Hughes*, 17384-90.

NEISSER, PROFESSOR, reference, *Rev. L. S. Lewis*, 8754.

NERVE DISEASES:

Acute anterior poliomyelitis, successfully treated owing to knowledge acquired by experiments on animals *J. N. Langley*, 15156-62.
Infantile paralysis, successful union of nerves in cases of, due to previous experiments on animals *J. N. Langley*, 15156, 15381-5.
Successful treatment of, based on results of experiments on animals *J. N. Langley*, *J. Lorrain Smith*, 15139-63, 15163-8, 18262-7, 18312-19, 18388-90.

NETTLESHIP, E., letter to, *re* "incomplete anæsthesia" *Hon. S. Coleridge*, 10993.

NEURALGIA, gasserian ganglion removed in cases of persistent, and successful results *H. Head*, 17813-34.

NEWCASTLE-ON-TYNE:

Brady and Martin's laboratory at, reference, *G. D. Thane*, 344.
Experiments in connection with "caisson disease" at, *G. D. Thane*, 372.

NEW SOUTH WALES, no separate vivisection law in, but clause regulating practice in Cruelty to Animals Act, *C. J. Martin*, 12053-9.

NEW YORK, table showing case mortality from diphtheria in, before and after employment of the anti-toxin treatment *C. J. Martin*, 11711.

NICOLAIER, introduction of urotropin into therapeutics by, after successful experiments on animals, *A. R. Cushny*, 4813-16.

NICOLLE, M., Pasteur Institute, opinion of, with reference to use of atoxyl, *Col. D. Bruce*, 14314.

NIELSEN, PROFESSOR, braxy organism first discovered by, *D. J. Hamilton*, 20331-9.

NIGERIA, domestic animals practically annihilated in, by indigenous diseases *S. Stockman*, 2569-71.

NOCARD, PROFESSOR:

Experiments on horses by, for prevention of tetanus *S. Stockman*, 2507-23.
Pleuro-pneumonia organism demonstrated by, *S. Stockman*, 2790-800.

NOEL, REV. C., statement by, as to proceedings at meeting of Church Anti-Vivisection League at Bradford, 1898, *Miss A. L. Woodward*, 8789-810.

NOON, MR., Lister Institute, experiments by, *re* effect of suprarenal extract on action of diphtheria anti-toxin, *Miss A. Kenealy*, 5325.

NORRIS, MR., M.R.C.V.S., Irish Department of Agriculture, licence held by, *Sir T. Stoker*, 1043-5.

NORTHERN HOSPITAL, success of diphtheria anti-toxin treatment in, *G. S. Woodhead*, 15462-4.

NORTHUMBERLAND, THE DUKE OF, assistance given by, to those engaged in investigating sheep disease *D. J. Hamilton*, 20006.

NOTT, MR., mosquito theory of yellow fever first suggested by, *W. Osler*, 16694.

NOTTINGHAM UNIVERSITY COLLEGE, pharmacology and physiology not taught in, *A. R. Cushny*, 5165-6.

NUNN, T. W., letter to, *re* "incomplete anæsthesia" *Hon. S. Coleridge*, 10993.

OERSTED, reference to scientific research of, *E. H. Starling*, 3442.

OLIVER, DR. G.:

Clinical observations by, on effects of various organ extracts upon circulation, leading to no definite results *E. A. Schäfer*, 10250.
Experiments resulting in discovery of adrenalin by, *E. H. Starling*, *A. R. Cushny*, 3442, 3555-60, 4808-9.

OPENSHAW, T. H., correspondence with, *re* "incomplete anæsthesia," *Hon. S. Coleridge*, 10993.

OPPENHEIM, PROFESSOR, views of, concerning diagnosis of cerebral tumours *Sir V. Horsley*, 15845.

Ophthalmic Diseases:
Cataract, knowledge of, gained by experiment *Sir H. R. Swanzy*, 9841.
Conjunctivitis:
Argyrol a remedy for, discovered by experiments on rabbits *Sir H. R. Swanzy*, 9843-8.
Experiments in connection with investigation of, *J. Lorrain Smith*, 18215-26.
Generally common to men and animals *Sir H. R. Swanzy*, 9898-903.
Glaucoma:
Clinical observation has increased knowledge of, *Sir H. R. Swanzy*, 9836.
Curable only in early stages, at present *Sir H. R. Swanzy*, 9937-40.
Leber's experiments demonstrated reason of, and have led to use of eserin as remedy, *Sir H. R. Swanzy*, 9836-40.
Physostigmin used in treatment of, *A. R. Cushny*, 4787-96.
Keratitis punctata, knowledge of, discovered by means of experiments on animals *Sir H. R. Swanzy*, 9802-4.
Serum therapy now utilised for, *Sir H. R. Swanzy*, 9819.
Sympathetic Ophthalmitis:
Dr. C. Shaw's experiments in connection with, *Sir H. R. Swanzy*, 9921-8.
Experiments on animals with view to discover precise nature of, *Sir H. R. Swanzy*, 9831-5.
Trachoma:
Jequirity a remedy for *Sir H. R. Swanzy*, 9820-30.
Nature and frequency of, *Sir H. R. Swanzy*, 9907-12.
Successful treatment of, could not have been arrived at without experiments *Sir H. R. Swanzy*, 9869-71.

Ord, Dr., work of, in connection with thyroid gland *Sir V. Horsley*, 16231-2.

Orfila, drug experiments upon animals by, *Sir L. Brunton*, 6972-3.

OSLER, W., F.R.S., F.R.C.P., Regius Professor of Medicine at the University of Oxford 16524-16792.
Agreement with general line of medical and physiological evidence 16529.
Appointed to give evidence on behalf of Oxford University *F. Gotch*, 13791-5.
Aseptic surgery embodies "Listerism" 16742-6.
Bacillus theory of disease is universally recognised 16685-90.
Baltimore, no active anti-vivisection society in, 16775-6.
Cretinism:
Association between goître and, long recognised 16631.
As to treatment of cases of endemic, in Savoy 16691-3.
Difference between men and animals not sufficiently great to make results of experiments misleading 16730-1.
Dogs, their use for experimental purposes, regretted on grounds of sentiment 16638-40, 16786.
Has performed a certain number of experiments when teaching physiology in Canada 16727-9.
Humanity of physiologists should be implicitly trusted 16606-7.
Hunterian laboratory supported by the University 16783-4.
Johns Hopkins University, Baltimore:
Advantage to students gained by courses of practical operative surgery at, 16583-7, 16590-5, 16636, 16752-7, 16758-67.
Hunterian laboratory at, equipped as animal hospital, and operations performed by students in. 16583-7.

OSLER, W. F.R.S., F.R.C.P.—*cont.*
Johns Hopkins University, Baltimore—*cont.*
Possibility of establishing similar hospital in this country where diseased animals could be operated on by students 16643-52.
Legislative enactment not necessary with regard to experiments, but no objection to licensed places 16738-41.
Listerism:
Antiseptic and aseptic surgery are both applications of the principle of, 16681-4.
Introduction of, has revolutionised surgery 16675-80.
Malaria:
Communicated by mosquitoes 16699-71.
Destruction of mosquito and isolation of cases is best method of abolishing, 16703-4.
Discovery of mode of transmission of, will make tropics habitable 16543.
Large proportion of population in malarial districts, though practically immune to, are capable of infecting mosquitoes 16789-90.
Mosquito probably infectious after having bitten infected patient at any period during course of. 16701-2.
Organism of, discovered by experiments on birds 16747-9.
Stamping out, might be effected if infected district could be wholly immunised 16705-7.
Myxedema, previous clinical work had not demonstrated the connection between the thyroid gland and, 16627.
Oxford, no practical medical school at, 16637.
Pig possibly a more useful animal for purposes of experiments than dog 16732-7.
Students' courses of experimental surgery on animals:
Control of hæmorrhage which requires technical and manual skill could be learnt 16720-6.
Lethal dose of anæsthetic might be enacted in event of allowing, 16709-17.
Surgical technique could be acquired 16583, 16592-4, 16665-6.
Thyroid extract, methods of administering, and necessity of continuous treatment 16576-80, 16773.
Thyroid gland:
Myxedema produced by disease or failure of development of, 16570.
Removal of, from animals resulted in symptoms of myxedema and cretinism 16573.
Value of experiments showing that cretinism and myxedema are due to absence of, 16569-71, 16573-5, 16576-80, 16625-6.
United States, absence of legal restrictions of vivisection in, does not induce carelessness for pain inflicted in experiments 16653-64.
Vivisection Act, 1876, operations on animals for purpose of acquiring manual skill forbidden by, 16599-61.
Voluntary consent of individual to be experimented upon changes the question of immorality of such experiments 16609-10.
Yellow fever:
Animals in infected district, other than anthropoid apes, not susceptible to, 16695-6.
Commission appointed by United States in 1900 to investigate, and their work 16531-6, 16611-14.
Controlled by preventing breeding of mosquitoes and careful isolation of early cases of, 16553-65.
Destruction of mosquito and isolation of cases is best method of abolishing, 16623-4, 16703-4.
Discovery of relation of mosquito to, and consequent success in controlling spread of, will enable Panama Canal to be built 16541-2.
Discovery of mosquito as cause of infection not directly due to experiments on animals 16697-700.

OSLER W., F.R.S., F.R.C.P.—*cont.*
Yellow fever—*cont.*
Experiments carried out by United States Commission were on men who voluntarily submitted themselves to infection 16543, 16608, 16667-9.
Experiments have shown that apes can be infected with, 16545.
Experiments in connection with investigation of, though on man, could never have been devised without the investigators' previous experience of experiments on animals 16544.
Experiments prior to those carried out by United States Commission 16611-13.
Experiments proved that mosquitoes communicated infection 16535-9.
Failure to discover cause of, before 1900 16531.
History of, illustrates enormous benefit conferred on mankind by experiments on animals 16530.
Incubation period 16538-9.
Mosquitoes are capable of transmitting, after biting infected persons 16548-9.
Natives have it in a mild form, 16546-7.
Organism of, not yet discovered 16540-1, 16610-2.
Reason for suspecting that mosquito propagated, 16694.
Reduction in numbers of mosquitoes owing to methods adopted for their extermination, very remarkable 16562-8.
Sanitation undoubtedly necessary for extinction of, but experimental methods have contributed to knowledge of how to carry out sanitation 16787-8.
Theory and practice previous to 1900 based on bacillus as cause of, is erroneous 16615-20.

OWEN, E., F.R.C.S., Senior Surgeon at St. Mary's Hospital and Hospital for Children at Great Ormond Street:
Correspondence with, *re* "incomplete anæsthesia" *Miss Lind-af-Hageby, Hon. S. Coleridge*, 7438, 10305, 10993.
Statement by, as to use of deep anæsthesia in operations on men *Miss Lind-af-Hageby*, 7438 40.

OXEN, eggs of tapeworms fed to, for purpose of observing development *S. Stockman*, 2444.

OXFORD UNIVERSITY:
Evidence on behalf of, *see* GOTCH, F., OSLER, W., 13539-67, 16524-792.
Keble College undergraduates, *see that title.*

PAGE, DR. F., Newcastle-on-Tyne, letter from, objecting to vivisection of dogs *J. Hughes*, 17205-7.

PAGET, *The late* SIR JAMES:
Evidence before previous Royal Commission as to value of clinical observation *E. H. Starling, H. Morris, Sir V. Horsley*, 3776-9, 7899, 16164-9.
References *S. Stockman, S. F. Smith*, 2659, 13049.

PAGET, STEPHEN, *Experiments on Animals*, by, *see under* JOURNALS AND PUBLICATIONS.

PAIN:
Abdominal organs and intestines of men and animals not sensitive to, *A. R. Cushny*, 4988-9.
Absence of, in experiments, statements as to, disputed *Miss A. Kenealy, S. F. Smith, Sir G. Kekewich*, 5280, 13464-8, 20428, 20533-47, 20615-17.
as to Amount of, caused by experiments, *A. R. Cushny, J. W. Graham, J. N. Langley*, 5125-8, 5878-82, 15335-6.
Anæsthesia during experiments prevents all, *A. R. Cushny*, 5194-5.
Animals may suffer without vocal manifestations of, *S. F. Smith*, 13061-4.
Animals speedily killed after operation if found to be in, *W. P. Byrne, G. D. Thane, E. H. Starling*, 10-11, 13, 1209-15, 4017-21.
Animal's susceptibility to, is less than man's *H. Morris, J. N. Langley*, 7957-9, 15308-10.
Animals used for preparation of anti-toxins show no visible signs of, *S. Stockman*, 2902-7.

PAIN—*cont.*
Antiseptic methods of surgery have greatly diminished, *Sir R. D. Powell*, 5761-4.
Antiseptic treatment of wounds does not remove, *Mrs. K. Cook*, 2073-8.
Blunting of physiologists' sensibilities to, *S. F. Smith*, 13061.
Can never be entirely eliminated from experiments, *Miss A. Kenealy, Hon. S. Coleridge*, 6412-25. 11603-5.
Cancer inoculations not necessarily followed by, *G. D. Thane*, 465-6, 1692-3.
Capacity for feeling, varies in proportion to stage of development of animals *E. H. Starling*, 3963-5, 13850-4.
Castration and spaying of animals attended by, *S. Stockman*, 3026-31.
Cerebral cortex, its removal destroys consciousness to, *E. H. Starling*, 3462-70.
Cerebral hemispheres, loss of, removes all sensation of, though there may be reflex actions *D. W. Buxton*, 12606-12.
Cerebral hemispheres, removal of, does not remove consciousness to, *Miss Lind-af-Hageby*, 7411-27.
Classification of painful and non-painful experiments no longer attempted by Home Office *W. P. Byrne, G. D. Thane*, 163-4, 1723-9.
Consciousness to, under anæsthesia returns considerably later than power of movement *E. H. Starling, H. Morris*, 3591-3, 7937-52.
Cowardly to share in advantages derived from infliction of, *Rev. L. Lewis*, 8685-8.
Details of experiments connected with, given in inspector's report 1900 *G. D. Thane*, 464.
Desirable to minimise experiments on animals susceptible to, *Sir J. Russell*, 607.
Difficulty of locating perception of, *H. Head*, 17983-4.
Diminution of, desirable *Sir H. R. Swanzy, J. N. Langley*, 9767-71, 15272.
Docking of horses only causes superficial, *E. H. Starling*, 3956-8.
Entire absence of, from experiments cannot be certified, *Sir T. Stoker*, 1063-5.
Erroneous views of medical men as to comparative insensibility of animals to, *S. F. Smith*, 13046-51.
Evidence of Dr. Klein before previous Royal Commission admitting his indifference to, *Mrs. K. Cook, J. W. Graham, Hon. S. Coleridge, Sir G. Kekewich*, 1919, 2064-7, 5883, 10656-74, 10852-78, 20450.
Experiments involving, *G. D. Thane, Sir J. Russell*, 457, 473, 541-3.
Experiments never performed under circumstances in which animal is necessarily sensitive to, *E. H. Starling*, 4063.
Experiments objected to on grounds of infliction of, *J. H. Levy, A. G. Scott, Sir F. Banbury*, 18484, 19508-11, 19498-9.
Experiments under Certificate B involve some, *G. D. Thane*, 1550.
Experiments under Certificates B, B, E E, and B, F. not necessarily followed by, *G. D. Thane*, 471, 474-6.
Eye is sensitive, and injection of foreign substances into eye for experimental purposes likely to produce, *Sir H. R. Swanzy*, 9951-4.
Eye's sensitiveness to, varies in different parts *Sir H. R. Swanzy*, 9974-8.
Few experiments involve, *W. P. Byrne, G. D. Thane, Sir J. Russell, E. H. Starling, Sir L. Brunton, J. N. Langley*, 4, 463, 471, 577-9, 1700-4, 3445, 3883, 7122, 15102.
Fistulas cause varying degrees of, *G. D. Thane*, 1640.
Fistulas in dogs would cause discomfort but not, *G. D. Thane, E. H. Starling, Sir L. Brunton*, 1233, 3762-7, 7029-40.
General Medical Council should have power to put a stop to infliction of unnecessary, in vivisection *Col. E. Lawrie*, 16931-4.
Home Secretary does not decide as to question of, in experiments *W. P. Byrne*, 129-30.
Indications of, after injections do not appear for considerable time—and no prolonged period of suffering *G. D. Thane*, 452-6.
Indications of, in dogs *Sir J. Russell*, 715-19.

PAIN—*cont.*
Indifference and callousness to, characterise teaching of physiologists *Miss Lind-af-Hageby*, 7354-7b, 7375-9.
Inoculations attended by little, *Sir J. Russell*, *S. Stockman*, 708-9, 25605-7, 2614.
Inoculations involve great, *Rev. L. S. Lewes*, 8719-20.
Inoculations of plague in rats attended by, *Sir J. Russell*, 720.
Inoculation of toot in animals produces, but in men not necessarily attended by, *Sir J. Russell*, 646-8.
Internal organs are not sensitive to, *Sir R. D. Powell*, 5584.
Interpretation of, throughout administration of Act taken in wide sense *Sir J. Russell*, 515.
Intestines not subject to, and reasons for, in colic and cholera *A. R. Cushny*, 5058-67.
Limit of range between disappearance of, and disappearance of reflex action is far wider in animals than in man, *J. N. Langley*, 15120-9.
Local Government Board's experiments do not generally involve, *W. H. Power*, 4353-4.
Local Government Board's experiments have to be notified to Board's medical inspector if involving, *W. H. Power*, 4521-6, 4529-31.
Loss of appetite and high temperature of animal after experiment indicate, *Sir J. Russell*, 550, 580-4.
Mice inoculated with cancer probably suffer, *Miss A. Kenealy*, 5495-503.
Monkeys show no sign of, after brain operations *E. A. Schäfer*, 10127-31.
Morally wrong to cause, unnecessarily to any animal *J. Hughes*, 17369-87.
Nerves, division of, does not produce, *G. D. Thane*, *E. H. Starling*, 1257-9, 1577, 1580-4, 3959-61.
Nerves, excision of, does not involve, *E. H. Starling*, 3667-8.
No disregard of, among keen operators *G. D. Thane*, 1397-8.
No evidence that animals suffer, between operations *G. D. Thane*, 1570-5.
No statutory requirement to kill animal after experiment if in, *G. D. Thane*, 1210-14.
Noises made by animals under chloroform do not indicate, *E. A. Schäfer*, 10226-7.
Objection to causing, varies with regard to sensibility of animals *J. H. Levy*, 18607.
Mr. Pembrey's admissions with regard to infliction of, contradict assertions of other vivisectors *Sir G. Kekewich*, 20439-50.
Progressive loss of sensation to, through stages of anæsthesia *D. W. Buxton*, 12575-6.
"Pithing" of frogs, certain modes of, do not destroy sensation to, *Miss Lind-af-Hageby*, 7403-30.
Possibility of movement and cries without sensation of, under light anæsthetic *H. Morris*, 7996-8002.
Possibility of, under light anæsthesia *Miss Lind-af-Hageby*, 9137-40, 9486-96.
Protective function of, and evils attending modern desire to evade, *M. S. Pembrey*, 14082-8, 14098-105, 14119-23, 14144-9, 14156-8.
Question of, considered before issue of licences and certificates *W. P. Byrne*, *G. D. Thane*, *Sir J. Russell*, 218-20, 422, 686.
Reflex movements without any sensation of, occur in third degree of anæsthesia *D. W. Buxton*, 12400-10.
Results from stones in ducts of gall bladder but not in gall bladder itself, *G. D. Thane*, 1657-62.
Risk of licensees becoming callous towards infliction of, *Hon. S. Coleridge*, 11614.
Secondary to object of experiment but efforts should be made to safeguard against, *Sir H. R. Swanzy*, 9866-8, 9929.
Sense of, probably more acute in animals than in man *S. F. Smith*, 13038-44, 13535-8.
Spinal cord of frogs, dogs, and monkeys sensitive to, *Miss Lind-af-Hageby*, 9563-84.
Starvation experiments not attended by, *E. H. Starling*, 3686-7.
Success of physiological experiment demands elimination of, *E. H. Starling*, 3451-4, 3935-8.
Sufferings of animals after return to consciousness *Mrs. K. Cook*, 1908-10.
Surgical wounds, majority of, heal without, *Sir H. R. Swanzy*, *F. Hobday*, 9930-1, 16352-6.

PAIN—*cont.*
Susceptibility of animals to, varies with their intelligence *Sir T. Stoker*, *Sir J. Russell*, 761, 606, 671-2, 747-50.
Torture, definition of from point of view of animal *Hon. S. Coleridge*, 11302-13.
Viscera have no sense of, *E. H. Starling*, 3677-80
as to Vitiation of experiments by element of, *J. W. Graham*, 5933-7.
See also under ETHICAL STANDPOINT.

PANAMA CANAL, control of yellow fever and malaria will enable building of, *W. Osler*, 16541-2.

PARALYSIS ,use of diphtheria anti-toxin followed by, *Miss A. Kenealy*, 6166-70, 6384-91.

PARASITIC DISEASES :
Actinomycosis, past errors in diagnosing, *H. Snow*, 2129.
Identity of various, can only be demonstrated by experiments *S. Stockman*, 2444.
Tapeworms, knowledge of their development, derived from experiments *S. Stockman*, 2444-70
Trichinosis, measures for preventing, arrived at by experiment *S. Stockman*, 2461-3.

PARIS :
Convention of, shortly to supersede Convention of Venice *W. H. Power*, 4337-8.
Hericourt Hospital, table showing diphtheria case mortality before and after use of anti-toxin *C. J. Martin*, 11711.

PARKE, DAVIS AND CO., MESSRS :
Method of standardising digitalis introduced by, *A. R. Cushny*, 4838.
Sole manufacturers of adrenalin in America *E. H. Starling*, 3564.

PARLIAMENT :
Acts :
Anatomy Act :
Administration of, Sir J. Russell concerned with, *Sir J. Russell*, 511.
Contagious Diseases of Animals Act :
Prohibition of experiments on animals would seriously hamper administration of, *S. Stockman*, 2845.
Tests for tubercle in milk instituted by Local Government Board under, *S. Stockman*, 3419-22.
Cruelty to Animals Act, 1849, reference, *A. G. Scott*, 19508.
Dogs Act, 1906 :
Clause preventing sale of stray dogs foolish and irrelevant *E. H. Starling*, 3921-33.
Police prevented under, from selling stray dogs for vivisection purposes *Sir J. Russell*, *G. D. Thane*, 670, 1752-4.
Food and Drugs Adulteration Acts, purity of food and drugs insisted on under, *A. R. Cushny*, 5236-8.
Martin's Act, protection afforded to animals under, *Mrs. K. Cook*, 1946.
Public Authorities Protection Act, 1898 :
Prosecutions of licensee under Vivisection Act, 1876 rendered impossible by provisions of, *Sir G. Kekewich*, 20409, 20818-37.
Vivisection Act, 1876 :
Administration :
Certain dependence must be placed on licensee with regard to, *G. D. Thane*, 1390-3.
Effective and satisfactory *Sir J. Russell*, *E. H. Starling*, *D. J. Hamilton*, 513, 3720-1, 20250.
Hinders progress of physiology *Sir V. Horsley*, 16092.
Home Office charged with giving evasive replies to questions on, *Hon. S. Coleridge*, 10614-39.

PARLIAMENT—*cont.*
Acts—*cont.*
Vivisection Act, 1876—*cont.*
Administration—*cont.*
in Ireland:
Humane and satisfactory as regards research experiments *Sir T. Stoker*, 785, 907.
Improvements effected by Mr. Morley *Sir T. Stoker*, 853.
More continuity necessary, *Sir T. Stoker*, 782-3, 854, 1068.
Should be in hands of permanent official *Sir T. Stoker*, 953-5.
Procedure in regard to, *W. P. Byrne*, 1-41.
Secret, and has shielded vivisectors *Hon. S. Coleridge*, 10264, 11091.
Advancement of physiology not seriously hampered by, *J. N. Langley*, 15253-7.
Amendments suggested:
Animals should be allowed to be kept outside laboratory provided address is notified to inspector *E. A. Schäfer, F. Gotch, J. N. Langley*, 10173-8, 13913-15, 15210-16.
Certificates:
A, extension of scope desirable *J. Glaister*, 12833.
A, heads of departments should be allowed wider range of experiments under, *J. Glaister*, 12964-72.
Abolition of, desirable *Sir V. Horsley, W. E. Dixon*, 15767, 16016-25, 19020-4, 19096-7, 19116-26.
B and E E should be replaced by single certificate *J. N. Langley*, 15192-201.
Foreigners should be under no disadvantage as regards obtaining, *Sir J. F. Moulton*, 12751-4, 12766-7.
Inspector's opinion should not overrule advice of authorities recommending grant of, *E. A. Schäfer*, 10172.
Modification with regard to, desirable *A. R. Cushny, J. R. Bradford*, 5142-6, 17789-93.
Two classes of, should be granted and as to qualifications for such, *Sir J. F. Moulton*, 12741-8.
Word "absolutely" should be struck out of expression "absolutely necessary" in clause relating to teaching, *J. N. Langley*, 15202-10.
Cold-blooded animals should not be included in Act *E. A. Schäfer, F. Gotch, Sir V. Horsley*, 10187-8 13824, 13864-9, 15952-4, 16267-74.
Demonstration experiments should be prohibited *Miss Lind-af-Hageby*, 7459.
Home Office control of, over non-painful experiments should only have regard to reliability of experimenter and not to nature of experiment *Sir J. F. Moulton*, 12756.
Inspectors, increase of, desirable *A. G Scott*, 19756-62.
Licences:
Details of proposed experiments should be stated on application for, and licences should be drafted so that certificates could be dispensed with, *Sir V. Horsley*, 15767, 15770-4, 16099, 16016-25.
Foreigners should be under no disadvantage as regards obtaining, *C. J. Martin, Sir J. F. Moulton*, 12153-63, 12751-4, 12766-7.
PARLIAMENT—*cont.*
Acts—*cont.*
Vivisection Act, 1876—*cont.*
Amendments suggested—*cont.*
Licences—*cont.*
Heads of laboratories should be given comprehensive, and certificates then dispensed with *W. E. Dixon*, 19020-4.
Issue of, should be in hands of some responsible body rather than Home Office *W. E. Dixon*, 19098.
Necessity of taking out certificates in addition to, should be lessened *J. N. Langley*, 15192.
Professors of pathology, bacteriology, etc., should have power to sign applications for, *G. S. Woodhead*, 15565-71.
Should be endorsed after being granted for ten years and necessity of certificates dispensed with, *J. N. Langley*, 15394-5.
Should be given to recognised physiologists to cover all experiments *M. S. Pembrey*, 14093-5, 14150-1.
Special, might be more easily procurable 7050-8.
Special, should only be issued for each set of experiments *H. Snow*, 2235-7, 2414-5.
Students might be permitted to hold, and experiment under careful supervision of heads of departments *J. N. Langley*, 15298-301.
Licensee might be permitted to experiment in unlicensed premises *Sir Lauder Brunton*, 6992-5, 7046-7.
Non-painful experiments and injections of non-irritating substances should not be included in Act *J. N. Langley*, 15369-80.
Penalties should not be imposed for mere technical infringements of Act *J. N. Langley*, 15225-30.
Second operation should be permissible upon animal required to be killed before recovery, *J. N. Langley*, 15216-24.
Section 3:
Sub-section 1, amendment required *G. D. Thane*, 1177-9.
Sub-section 2, amendment required *G. D. Thane*, 1177-9.
Sub-section 5, repeal of, desirable *Sir V. Horsley*, 15606.
Simple inoculations might be done by laboratory assistant *E. A. Schäfer*, 10180-6.
Skilled assistants of licensee should be permitted to perform injections under Certificate A, *H. Morris*, 7806-9.
Students should be permitted to perform experiments for purpose of acquiring surgical technique *Sir R. D. Powell, Sir H. R. Swanzy, Sir V. Horsley, W. Osler*, 5765-7, 9771-81, 9888-90, 15632-5, 15794, 15936-8, 16032, 16036, 16115, 16583.
Students should learn administration of anæsthetics by a course of experiments *Sir V. Horsley*, 16112-114.
Surgeons should not be forbidden to acquire skill by experiments *E. H. Starling*, 4082-91.
Time limit for prosecutions under, should be extended *Hon. S. Coleridge*, 11110-12.
See also Bill drafted by MR. COLERIDGE.

PARLIAMENT—*cont.*
Acts—*cont.*
Vivisection Act, 1876—*cont.*
Amply protective against cruelty to animals and sufficiently free for proper scientific inquiry *H. Morris*, 7805.
Animals well safeguarded against cruelty by, but sometimes unnecessarily killed under regulations, *D. W. Buxton*, 12477-87.
Antagonistic to advancement of physiology, *M. S. Pembrey*, 14090, 14115-6.
Antiseptic precautions not compelled by, *Mrs. K. Cook*, 1915-16.
Bill introducing, was not properly discussed *Sir G. Kekewich*, 20389-98, 20523-7.
Certificates nullifying usual restrictions of, may be granted *W. P. Byrne*, 260-72.
Clumsy, but well administered *E. H. Starling*, 3998.
Condition of things under, an improvement on foreign conditions *Miss Lind-af-Hageby*, 9287-90, 9297-303.
Contraventions:
Evidence concerning infrequency and vagueness of complaints of, contradicted *Miss A. L. Woodward*, 8820-4.
Experiments performed by licensee at place for which his licence not available *G. D. Thane*, 499-500.
Experiments performed by unlicensed persons, *G. D. Thane*, 477.
Experiments requiring Certificate B performed without submitting certificate, *G. D. Thane*, 477.
Injections into cats or dogs without Certificate E, *G. D. Thane*, 477.
Inspector's annual return reports all, *W. P. Byrne, G. D. Thane*, 44, 477.
Inspector notifies all, to Home Office *G. D. Thane*, 1145-7.
Licensee's return generally discloses, if any *W. P. Byrne, G. D. Thane*, 144-7, 179-83, 482-3.
Misunderstanding, ignorance, and carelessness usually responsible for, *G. D. Thane*, 477.
Number of, *W. P. Byrne*, 182.
Number of, small and of a slight character *W. P. Byrne, G. D. Thane*, 36-50, 477-8.
Performance of experiments after lapse of certificate *G. D. Thane*, 477.
Performance of a larger number of experiments than allowed *G. D. Thane*, 477.
Cruelty greater under, than before, *Mrs. K. Cook*, 2030-4.
Curare, its use alone, forbidden by, *G. D. Thane, Mrs. K. Cook*, 1320, 1801.
Drafting of, shows ignorance of conditions surrounding experiments on animals *Sir V. Horsley*, 15762.
Effect of, has not been to reduce number of experiments *W. P. Byrne*, 193, 303-4.
Exhibition of experiments prohibited by, but permitted under Certificate C *Sir J. Russell*, 615.
Experiments for obtaining new serum under control of, *G. D. Thane*, 1730-2.
Feeding experiments, doubts as to their being controlled by, *Sir T. Stoker*, 945.
Framed in accordance with views of medical profession *Sir G. Kekewich*, 20389-98, 20553-6.
Grounds of objection to, *Hon. S. Coleridge*, 10261.
Has acted as great stimulus to vivisection, *Sir G. Kekewich*, 20410.
Has worked well and does not restrict scientific research, *Sir J. Russell, G. D. Thane, H. Snow, Sir R. D. Powell, C. J. Martin, F. Gotch, J. Lorrain Smith*, 566, 1111, 2231, 5608, 12336, 13870, 18275-6.
PARLIAMENT—*cont.*
Acts—*cont.*
Vivisection Act, 1876—*cont.*
Home Secretary's responsibility under, has been abused *Hon. S. Coleridge*, 10264.
Increase of experiments under, and probable consequences of repeal of, *H. Snow*, 2395.
Inspection under, gives real security to public and irregularities cannot occur in licensed places *W. E. Dixon*, 19157-60.
Inspector draws attention of licensee to requirements under, *G. D. Thane, Sir J. Russell*, 443, 601.
Licences and certificates submitted to one of authorities mentioned in, *W. P. Byrne*, 208.
Licensees have contempt for restrictions of, *Hon. S. Coleridge*, 10954-61, 11425-32.
Licensees sometimes have difficulty in grasping requirements of, *Sir J. Russell*, 555.
Licensing and registration principles embodied in, should be preserved *Sir V. Horsley*, 15729.
Meaning of, may be interpreted by Report of previous Commission *Hon. S. Coleridge*, 10968-72.
Monkeys not specified in, *Sir T. Stoker* 775.
Necessary, in view of public opinion but superfluous from physiological standpoint *Sir V. Horsley*, 16091-2, 16096-8.
No limit to suffering that may be inflicted under, *Hon. S. Coleridge*, 10716-9.
No protection afforded to animals by, *Hon. S. Coleridge*, 10264.
Operations on animals for purpose of acquiring manual skill forbidden by, *W. Osler*, 16599-61.
Precludes general public from witnessing experiments, *Hon. S. Coleridge*, 11192-204.
Principle of protection to animals is nullified by exceptions allowed on certificates *Sir G. Kekewich*, 20399-405.
Prosecutions under:
Home Secretary has not instituted any, *W. P. Byrne*, 45-6.
Home Secretary's consent needed for, *Sir J. Russell*, 591.
Made impossible by provisions of Public Authorities Act, 1898 *Sir G. Kekewich*, 20409.
Objection to provision concerning, *Sir G. Kekewich*, 20408.
Repeal of, desirable *Mrs. K. Cook, H. Snow, J. W. Graham, Rev. J. P. Hopps, Miss Lind-af-Hageby, Sir G. Kekewich*, 1943-6, 2032-8, 2336-43, 6039-41, 8614, 9275-8, 20469.
Restrictions under, sufficient *E. H. Starling, S. Stockman, Sir H. R. Swanzy*, 2615-6, 4069-72, 9875-80.
Restrictions under, useless *Mrs K. Cook*, 1785, 1921, 1967.
Satisfactory except as regards method of obtaining certificates *A. R. Cushny*, 4945-7.
Science to a certain extent impeded by, *Sir L. Brunton*, 6830-38.
Section 3:
Sub-Section 1, breach of, defended by Home Office *Hon. S. Coleridge*, 10330-70.
Sub-Section 4:
Experiments abusing provisions of, *Miss L. Lind-af-Hageby*, 7213-22.
Makes obligatory the killing of animal operated on under certificate B, *Sir J. Russell*, 559-61.

Acts—*cont.*
Vivisection Act, 1876—*cont.*
Section 6:
Breach of, defended by Home Office *Hon. S. Coleridge*, 10330-70.
Prosecution under, of Dr. Abrath in 1876 for advertising a public exhibition of experiments and conviction *A. G. Scott*, 19568-75, 19681 5
Section 7:
Experiments in unregistered places licensed under, *W. P. Byrne*, 78-83.
Registration of premises provided for under, *W. P. Byrne*, 53-62.
Section 8:
Contraventions of, *W. P. Byrne*, 246-8.
General powers granted to Home Secretary under, *W. P. Byrne*, 13-15.
Regular exercise of power under, *W. P. Byrne*, 5.
Regulations of Home Secretary under, attached to licence, *W. P. Byrne*, 14.
Section 10, duties of inspector defined by, *G. D. Thane*, 326-7.
Section 11:
Authorities under, have exclusive power to sign applications for certificates, *W. P. Byrne*, 16, 149-52, 241.
Proposal that authorities mentioned under, should confer with Home Office on manner of recording experiments, *W. P. Byrne*, 240.
Section 13, no application to prosecute licensees has been made under, *Hon. S Coleridge*, 11145.
Section 21:
Assent of Home Secretary required for prosecution of licensee who has not fulfilled conditions, *W. P. Byrne*, 230-1.
Impossibility of prosecutions under, because of time limit *Hon. S. Coleridge*, 11146-9.
Security afforded to public and to vivisectors by, and necessity of continuing *W. E. Dixon*, 19130-9.
Series of experiments suspended by introduction of, owing to difficulty of obtaining necessary certificates *W. E. Dixon*, 19130, 19140-4.
Serum production for commercial purposes not controlled by, *G. D. Thane*, *C. J. Martin*, 1730-2, 11845-7.
Shambles of Science, facts disclosed in, constituted breach of, *Miss Lind-af-Hageby*, 7442-5.
Snake poison experiments by Sir Lauder Brunton temporarily suspended by passing of, *Major L. Rogers*, 8043.
State of affairs previous to, *W. P. Byrne*, 1.
Substance of, *W. P. Byrne*, 1.
Supervision of experiments under, totally inadequate *A. G. Scott*, 19724.
Title objected to, *Sir V. Horsley*, 16092-6.
Violation of, never witnessed *Sir J. Russell*, *J. Lorrain Smith*, 585, 18326-7.
Vivisection practised before introduction of, by irresponsible persons *W. E. Dixon*, 19145-51.
Summary Jurisdiction Act, 1848, reference *Mrs. K. Cook*, 1962.

PARLIAMENTARY ASSOCIATION FOR THE ABOLITION OF VIVISECTION:
Castration a question not considered by, *Miss A. Kenealy*, 6305-12.
Complaints to Home Office in respect of cases of cruelty not made by, *Mrs. K. Cook*, 2043-5.

PARLIAMENTARY ASSOCIATION FOR THE ABOLITION OF VIVISECTION—*cont.*
Constitution, object and membership of, *Mrs. K. Cook*, *Sir G. Kekewich*, 1972-9, 20385-8, 20465-9, 20780-4.
Evidence on behalf of, *see* COOK, MRS. K., KENEALY, MISS A., SNOW, H., GRAHAM, J. W., BANTOCK, G. G., KEKEWICH, SIR G., 14530, 20380-965.
Experiments considered unproductive of any beneficial result by, *Sir G. Kekewich*, 20387.
Income of, *Hon. S. Coleridge*, 10260.
Increase of inspection would not meet objections of, *Sir G. Kekewich*, 20465-9.
Open letter sent to Commissioners from, and as to its preparation *Mrs. K. Cook*, 1922-37.
Prosecutions, none instituted by, *Mrs. K. Cook*, 1972-9, 2092.
Vice-presidents of, increased since publication of evidence before present Commission *Sir G. Kekewich*, 20318.
Views of, not yet drafted in a Bill, *Sir G. Kekewich*, 20411-14.

PARLIAMENTARY PAPERS:
Home Office Returns, *see under* HOME OFFICE.
Local Government Board, Medical Officer's Report, *see under* LOCAL GOVERNMENT BOARD.

PARSONS, J. H.:
Experiments on eyes by, and preference for light anæsthesia expressed *Hon. S. Coleridge*, 10381.
Work by, leading to further knowledge of glaucoma *Sir H. R. Swanzy*, 9839.

PASTEUR, M.:
Anthrax experiments of, demonstrated microbic cause of disease and possibility of immunisation *Sir J. F. Moulton*, 12730.
Antiseptic surgery, experiments in connection with, leading to discoveries *H. Morris*, 7664-8.
Hydrophobia treatment:
Buisson bath treatment originated by National Canine Defence League in opposition to, *J. Hughes*, 17235-40.
Deaths occurring during, or within 15 days after completion of, excluded from statistics *C. J. Martin*, 11914-19.
Discovery of, and statistics as to its preventive and curative value *C. J. Martin*, 11658-95, 11910-3.
Efficacy of, undoubted *Sir L. Brunton*, *Sir V. Horsley*, 7147-57, 15808-11.
Objected to, *Miss Lind-af-Hageby*, 9712-15.
Opposition to, founded on contention that the statistics are fallacious *S. F. Smith*, 13136-212, 13400-21.
Rabbits used for propagation of virus and very little pain occasioned *Sir V Horsley*, 15814-22.
Infectious diseases, fundamental conception of their nature due to, *C. J. Martin*, 11643.
Preventive inoculations for anthrax devised by, generally confirmed by consequent reduction of death rate *S. Stockman*, 2510-43, 2740-1, 3140-5
Preventive inoculation for swine erysipelas devised by, abandoned in Germany for newer method *S. Stockman*, 2824-8.
Puerperal Fever, investigations in connection with, *C. J. Martin*, 11648-51.
Rabies, its contagious nature proved by inoculation experiments of, *Sir V. Horsley*, 15603.
Rabies, knowledge of, and efficacy of muzzling dogs for stamping out the disease entirely due to experiments of, *Sir V. Horsley*, 15602-3.
Rabies test devised by, but first practised subcutaneously without success *S. Stockman*, 3130-1, 3137-8.
Rabies treatment:
Acceptance of, by medical profession discreditable and falseness of statistics, *G. G. Bantock*, 14778-800.
Effect on mortality statistics of, by inclusion of all cases treated *C. J. Martin*, 12169-73.
Efficacy of, shown by reduction of death rate *Sir V. Horsley*, 15819-21.

PASTEUR, M.—*cont.*
Work of, in connection with identification of anthrax and septicemia bacilli *H. Morris*, 7694-7701.
Work of, on spontaneous generation is fundamental basis of modern antiseptic and aseptic surgery, *H. Morris*, 7841-2.
References, *Sir R. D. Powell*, *J. W. Graham*, 5584, 5878-82.

PASTEUR INSTITUTE, PARIS, visit to, *S. Stockman*, 3058-9.

PATERSON, DR. :
Cruelty of experiments on eyes of animals by, *Mrs. K. Cook*, 1913-4.
Work by, leading to further knowledge of glaucoma *Sir H. R. Swanzy*, 9839.

PATHOLOGICAL SOCIETY OF GREAT BRITAIN AND IRELAND :
Discussion before, as to nature of Jensen's Tumour *H. Snow*, 2167-72.
Evidence on behalf of, *see* LORRAIN SMITH, J.

PATHOLOGICAL SOCIETY OF LONDON, address before, *Mrs. K. Cook*, 1910.

PATON, MONTGOMERY :
Author of *The New Serum Therapy*, and views of, *Miss A. Kenealy*, 6392-6.
Experiments by, in regard to conferring animal susceptibilities along with immunities by inoculations *Miss A. Kenealy*, 6547-63.
References, *Miss A. Kenealy*, 5356, 5369.

PATON, NOEL, starvation experiments conducted by, and proceedings in connection therewith *Hon. S. Coleridge*, 10514-48, 11044-8, 11161-2, 11173-5.

PAULESCO, OF BUCHAREST, statement by, *re* abnormal conditions brought about by establishment of fistulæ in animals *Miss Lind-af-Hageby*, 7288.

PAULTON, MR., M.P., question asked in House of Commons by, *re* signature of certificates *Hon. S. Coleridge*, 10615-31.

PAVY, DR. :
Demonstration experiments by, reference *H. Morris*, 7753.
Reference *S. F. Smith*, 13049.

PAWLOW, J.P., Director of the Physiological Department of the Institute for Experimental Medicine, St. Petersburg :
as to Accusations of cruelty brought against, *E. H. Starling*, 3634-5.
Admiration expressed by vivisectionists for methods of, *Miss Lind-af-Hageby*, 7276-87.
Cruel nature of experiments by, *Mrs. K. Cook*, 1800.
Digestive processes, knowledge acquired by experiments of, *E. H. Starling*, *Sir L. Brunton*, 3442, 7028.
Experiments of, in connection with fistulas would cause discomfort but not pain, *E. H. Starling*, 3762-7.
Knowledge of digestive processes derived from experiments by, *G. D. Thane*, *E. H. Starling*, 1546-8, 3442, 4226-9.
Lectures published in *Work of the Digestive Glands* by, shows that ideal conditions of experimentation are by no means yet attained, *Miss Lind-af-Hageby*, 7276-87.

PEAT, A. H. M., charges against Mr. Gotch, corroborated by, *Hon. S. Coleridge*, 11454.

PEMBREY, M. S., M.D., Lecturer on Physiology, Guy's Hospital, 13968-14183.
Anæsthetics :
Discomfort arising from administration of, 14160-1.
Pain a protective function and hence desirability of dispensing in some instances with, 14089-90.
Unnecessary both in case of animals and men, pain being a beneficent and protective mechanism 14119-23.

PEMBREY, M. S., M.D.—*cont.*
Asphyxia, meaning of term and conditions giving rise to, 14078-82.
Castration, method of performing, 14162-9.
Cerebral hemispheres of frogs destroyed for purpose of demonstrating continuation of movements after consciousness has been destroyed 13972-3.
Charges brought against, in *The Shambles of Science*, contradicted 14036-56.
Coal-gas poisoning, demonstration of its effects on rats and rabbits and value of such 13971.
Demonstration experiments absolutely necessary for a proper knowledge of physiology in its application to medicine 13971.
Dogs not used by, for demonstration experiments 14173-7.
Evidence referred to :
Circumcision performed without anæsthetics *Sir G. Kekewich*, 20618-20.
Demonstration experiments, criticism of statement *re* witness's non-performance of, this year *Sir V. Horsley*, 16265-6.
Opinion of, as to hampering nature of Vivisection Act not representative of English physiologists *J. N. Langley*, 15396-8.
Pain, its necessary infliction, statements contradicting evidence of other vivisectors *Sir G. Kekewich*, 20439-49, 20535-51, 20931-5.
Experience of, in experimental work 13970.
"Freezing" of animals, fallacious charges brought concerning, and as to actual facts of case 14018-20.
Hibernating animals, reasons for experimenting upon, 14178-83.
Hibernation a natural condition of anæsthesia of which physiologists should be permitted to avail themselves, 14152-55.
Hypnotism, possible to experiment on animals under influence of, and instances in Germany 14071-7.
Licence and certificates held by, 14108-10.
Licences should be given to recognised physiologists to cover all experiments 14150-1, 14093-5.
Marmot referred to in *The Shambles of Science*.
Post mortem examination made of, 14124-7.
Spinal cord had never been divided and other erroneous statements with regard to experiments performed on, actual condition of 13975-14017.
Materialism wrongly attributed to physiologists, 14106.
Pain :
Protective function of, and evils attending modern desire to evade, 14082-88, 14098-105.
a Protective mechanism and in that sense beneficent, 14156-8.
a Protective mechanism and infliction of necessary, justifiable 14144-9.
Painful experiments necessary in certain cases 14067-71.
"Pithing" of frogs :
Distinction between removal of brain and, and reasons justifying belief that purposive movements do not imply consciousness 14128-43.
Term denotes entire decerebration, and as to charges brought against witness concerning, 14021-35.
Sulphur dioxide experiments in connection with destruction of rats on plague ships and position of physiologist compared with that of rat-catcher 14058-66.
Vivisection Act, 1876, antagonistic to advancement of physiology, 14090, 14115-6.

PENSFALL'S FARM, HATFIELD, Imperial Cancer Research Fund laboratory at, *G. D. Thane*, 344.

PERMANGANATE OF POTASH, as antidote for snake poison, *see under* SNAKE POISON.

PERSONAL RIGHTS ASSOCIATION :
Animal right included in sphere of, *J. H. Levy*, 18465.
Evidence on behalf of, *see* LEVY, J. H., 18463-645.
Membership of, *J. H. Levy*, 18467-9.

PFEIFFER, influenza, its cause identified by, *C. J. Martin*, 12190.

PFLÜGER, experiments by, reference *Miss Lind-af-Hageby*, 9582.

PHTHISIS:
- Claims for cure of, *H. Snow*, 2261-2.
- Environment and employment essential questions in combating, *Sir R. D. Powell*, 5807-10.
- a Specific disease, and can only be acquired by introduction of tubercle bacillus *Sir R. D. Powell*, 5779-92.
- Tubercle bacillus of great value in diagnosis of, *Sir R. D. Powell*, 5794-8.

PIDCOCK, G. D., letter to, *re* "incomplete anæsthesia" *Hon. S. Coleridge*, 10993.

PIGEONS:
- Experiments as to anti-pyretic action of aconite on, *Sir L. Brunton*, 6818-23.
- No starvation experiments on, *G. D. Thane*, 1318-9.

PIGS:
- Difficulty of experimenting on, owing to length of intestine *E. H. Starling*, 4032.
- Eggs of tapeworms fed to, for purpose of observing development *S. Stockman*, 2444.
- Experiments on, for study of trichinosis *S. Stockman*, 2461.
- Possibly more useful for experimental purposes than dogs, *W. Osler*, 16732-7.
- Sensitiveness of, probably not different from dogs, *Sir J. Russell*, 747-50.
- Substitution of, for dogs in certain experiments suggested *C. R. J. A. Swan, R. J. Cowen*, 19233-4, 19337-9, 19372-4.
- Tuberculosis inoculations of, involving cruelty *Mrs. K. Cook*, 1919.
- Unsanitary conditions of sties do not generate but foster swine fever *S. Stockman*, 3326-8.

PIONEER ANTI-VIVISECTION SOCIETY, income of, *Hon. S. Coleridge*, 10260.

PIRKIS, MR., Chairman of the National Canine Defence League, dog belonging to, wrongly certified as rabid *J. Hughes*, 17338.

PLEURO-PNEUMONIA:
- Cause of, identified to extent of obtaining virus *S. Stockman*, 2699.
- Demonstration of microbe of, by Professor Nocard and consequent success in inoculating against, *S. Stockman*, 2790-2800.
- Outbreaks of, in Great Britain and cost of stamping out the same *S. Stockman*, 2494-7.
- as to Report of Departmental Committee to inquire into, *S. Stockman*, 2691-98.
- South African method of dealing with, *S. Stockman*, 2494-2506.

PLAGUE:
- Advisory Committee on, in India *see* ADVISORY COMMITTEE ON PLAGUE IN INDIA.
- Alexandria outbreak, and its successful control by sanitary methods without use of plague serum *Sir G. Kekewich*, 20485-90.
- Antitoxin, *see under* SERUM THERAPY.
- Bubonic form not infectious, *C. J. Martin*, 12141-5.
- Foreign Office has to notify to other countries all occurrences of, in England *W. H. Power*, 4301.
- Local Government Board must notify all cases of, to Foreign Office *W. H. Power*, 4301.
- Local Government Board research for prophylactic purposes *W. H. Power*, 4301.
- Knowledge acquired by experimental methods and present investigations in India *C. J. Martin* 11654-6.
- Pneumonic, possible difficulty of diagnosing, *W. H. Power*, 4629.
- Propagated by use of plague serum *Sir G. Kekewich*, 20471-85, 20621-31.
- Rats and guinea-pigs infected with, suffer pain *G. D. Thane, Sir J. Russell*, 457-61, 543.
- Report to Plague Commission in 1899 concerning occurrence of, among individuals in which no microbes were visible *G. G. Bantock*, 14954.

PLAGUE—*cont.*
- Theory that communicability of, is effected by agency of fleas, ridiculous *G. G. Bantock*, 14698-711, 14952, 15071-9.
- Transmission of, by agency of rat flea has been practically established by means of experiments on animals *C. J. Martin, Col. D. Bruce*, 12103-26, 14478-82.

PLAGUE COMMISSION, *see* COMMISSION ON PLAGUE IN INDIA, 1901.

PLAYFAIR, LORD, responsible to some extent for drafting of Vivisection Act, 1876 *Sir V. Horsley*, 15762.

PLIMMER, DR.:
- Unlicensed assistant in chemical physiology at London University *E. H. Starling*, 3539-40.
- Reference *E. H. Starling*, 3539.

PLUNKETT, THE RIGHT HON. SIR H., reference, *Sir T. Stoker*, 858.

PNEUMONIA:
- Caused by excess of oxygen *J. Lorrain Smith*, 18239-42, 18297-303, 18304, 18340-3.
- Digitalis at one time erroneously used in, *A. R. Cushny*, 5214-6.
- Discovery by experimental methods of non-bacterial agent causing, *Lorrain Smith*, 18238-42.
- Experiments with view to discover anti-toxin for, *Sir R. D. Powell*, 5603-5.
- Nature of heart affection in, and value of digitalis as treatment for, *A. R. Cushny*, 4850-8.
- Often cause of death in patients suffering from diphtheria *F. Taylor*, 5829-30, 5833.
- as to Toxin treatment of, *A. R. Cushny*, 5220-1.

POEHL, PROFESSOR VON, reference, *Miss A. Kenealy*, 5284.

POISONING:
- Arsenic:
  - Antidote for, date of its introduction *J. Glaister*, 12888-905.
  - Experimental methods chiefly responsible for discovery of antidote for, *J. Glaister*, 12866-78, 12946-7.
- Arsenulated hydrogen:
  - Cases of, arising in manufacture of bleaching powder *J. Glaister*, 12879.
  - Foreign experiments in connection with, *J. Glaister*, 12879-80.
- Cases of, in Scotland, few, *J. Glaister*, 12948-51.
- Chemical tests insufficient to detect certain alkaloids *J. Glaister*, 12864-5.
- Coal gas, practical value of experiments in, on rats and rabbits *M. S. Pembrey*, 13971.
- Experiments on animals must be final resort in investigating cases of, *J. Glaister*, 13006-14.
- Food, cases in which inability to make experiments on animals has hindered investigation *J. Glaister*, 12983-4.
- Investigations with regard to causes of, require experimental methods *J. Glaister*, 12838-51, 12973-80.
- Knowledge of antidotes with respect to number of mineral and vegetable, derived from experiments on animals *J. Glaister*, 12883-4.
- Meat:
  - Necessary to resort to animal experimentation in cases of, owing to difficulty of identifying Gaertner's bacillus *J. Glaister*, 12931-4.
  - as to Possibility of destroying toxins without recourse to animal experimentation, *J. Glaister*, 12939.
  - Raw meat more likely to contain bacilli than cooked, *J. Glaister*, 12999-13001.
- Ptomaine:
  - Animal experimentation is surest method of diagnosing, *J. Lorrain Smith*, 18227.
- Condition of animal suffering from, *J. Lorrain Smith*, 18444-8.
  - Difficulty in detecting existence of ptomaines, without recourse to experiments, *J. Glaister*, 12986-99.
- Sausage, bacillus in, cannot be recognised without animal experimentation *J. Glaister*, 12935-7.

Poisons :
Chloroform would mark action of, and hence impossible to demonstrate effects of, to students *J. Glaister*, 13024-6.
Toot, effects of, different on men and rabbits *Sir J. Russell*, 543.

Police :
in Edinburgh, practice with regard to stray dogs *Sir J. Russell*, 725-7.
Stray dogs cannot be sold for vivisection purposes by, *G. D. Thane*, 1435-8, 1752-4.

Pollock, Lieut., r.a.m.c., reference *Col. D. Bruce*, 14476.

Ponsonby, *The late* Right Hon. Sir Henry, letter from, on behalf of Queen Victoria, *Hon. S. Coleridge*, 10715.

Poore, Dr., Inspector under the Vivisection Act, 1892-1900 :
Biassed in favour of vivisectors *Hon. S. Coleridge*, 10391-2, 10412-32, 10974-8.
Certificates signed by, while inspector *Hon. S. Coleridge*, 10418-22.
"Complete anæsthesia" defined by, *Hon. S. Coleridge*, 11028-34.
Instructions from, as to visits to registered places *Sir J. Russell*, 529-30.
References *Hon. S. Coleridge*, *Sir V. Horsley*, 10274, 10275, 16068-9.

Portland, The Duke of, letter from as to suggestion to employ lost dogs for vivisection purposes *Hon. S. Coleridge*, 11624-6.

Portuguese, Commission to investigate sleeping sickness in West Africa sent out by, *Col. D. Bruce*, 14321.

POWELL, SIR R. DOUGLAS, BART., K.C.V.O., M.D., F.R.C.P., President of the Royal College of Physicians 5580-834.
Anæsthesia fully secured in all painful operations and length of time possible to maintain it, 5771-3.
Antiseptic methods of surgery have greatly diminished pain, 5761-4.
Antitoxins, values of those discovered by experiments on animals 5584.
Bacteriological observations, influence of, on public health and prevention of disease 5584.
Bacteriology has been developed almost entirely by means of experiments on animals 5583.
Cretinism and myxedema, their pathology established by means of experiments 5684-93.
Cruelty not involved in experiments, 5606.
Curare :
Never administered without anæsthetics 5615-19.
Object and use of, 5774-8.
Demonstration experiments necessary for advanced students 5612-14.
Digitalis, its use in pneumonia largely established by means of experiments 5704.
Diphtheria :
Antitoxin used 5741-3.
Diagnosis of, more correct than heretofore and conditions fostering spread of, 5747-50.
Non-decrease of general mortality from, may be due to fact that antitoxin is not universally used 5645-88, 5716-18.
Pathology of, pretty well known and serious symptoms averted by use of antitoxin 5705-14.
Reduction of case mortality in, undoubtedly due to use of antitoxin 5641-2.
Dogs, prohibition of experiments on, would seriously hinder research, 5610-11.
Drugs could not have been adopted for human beings without experiments on animals 5621-4.
Evidence referred to, *Hon. S. Coleridge*, 10890-4.
Experiments performed by, 5601-3.
Experiments supervised by, with view to discover pneumonia antitoxin 5603-5.
Internal organs are not sensitive to pain, 5584.
Licences and certificates, applications for signature carefully considered by, 5626-36, 5735-9.
Member, ex officio, of Association for Advancement of Medicine by Research 5637-40.

POWELL, SIR R. DOUGLAS, BART, K.C.V.O., M.D., F.R.C.P.—*cont.*
Phthisis :
Diagnosis of, 5794-8.
Environment and employment essential questions in combating 5807-10.
a Specific disease and can only be acquired by introduction of tubercle bacillus 5779-92.
Prohibition of experiments on animals would injure progress of medicine 5733-4.
Represents more or less general opinion of profession 5728-31.
Royal College of Physicians :
Experiments on animals unanimously approved by council of, 5731-3.
Membership of, 5725-7.
Salicylic acid, antipyretic nature of large doses 5703.
Scarlet fever, reduction of case mortality in Metropolitan Asylums Board hospitals 5666-71.
Snake antivenin, as to 5678-83, 5719-21.
Students should be permitted to acquire manual skill by experiments on animals 5765-7.
Suprarenal extract, its value in treatment of Addison's disease 5758-60.
Thyroid extract, value of, in treatment of myxedema 5758-60.
Tuberculin :
Sometimes used as diagnostic agent for human beings 5799-803.
Use of, in treatment for human tuberculosis, and possibility of advantages derived therefrom 5819-28.
Tuberculosis :
As to communicability of bovine, to children in milk 5811-15.
Marmoric serum for, still under trial 5804-5.
Vivisection Act, its restrictions have not hampered scientific research 5608.

Power, H., experiments by, in connection with transplanting cornea from eye of rabbit to man, *Sir H. R. Swanzy*, 9816.

POWER, W. H., C.B., F.R.S., Chief Medical Officer of the Local Government Board 4281-640.
Annual report of, shows details of all experiments performed for Local Government Board 4339-42, 4347.
Antitoxins, character of all, essentially the same 4557-61.
Board of Agriculture conduct research in respect of animal diseases 4576.
Cholera prophylactic, recommended by Local Government Board 4310-12.
Comma bacillus now accepted as distinctive test of cholera 4427-9, 4495-8.
Diagnosis of diseases :
by Inoculations of guinea-pigs or rabbits 4306-7, 4358, 4382.
Number of experiments in connection with, 4338.
Diphtheria :
Bacillus of, differentiated from other diphtheroid bacilli by experiments 4611-12.
Bacillus of, found in milk 4619.
Bacteriological test of, probably increases cases notified and affects statistics 4613-16.
Case of cow suffering from, 4474-6.
Clinical evidence only aid to diagnosis of, before introduction of antitoxin 4398-402.
Death rate from, lowered in Metropolitan Asylums Board hospitals, and reasons suggested for non-corresponding reduction in country generally, 4541-50.
as to Greater mortality from, outside Metropolitan Asylums Board hospitals 4387-91.
Mortality from, 15 years ago, in Metropolitan Asylums Board hospitals compared with statistics of recent years 4384-5.
Observation of children in public elementary schools has led to detection of, 4395-9.
Transmission of, may be in milk, but insanitary conditions less concerned with its spread than in case of other diseases 4392-4.

POWER, W. H., C.B., F.R.S.—*cont.*
Diphtheria Antitoxin:
Higher level of efficiency reached by, than other prophylactics 4551-2.
Increase in use of, though applications to Local Government Board for supplies of, are diminishing, 4536-40.
Local Government Board no longer manufactures, for curative purposes, and enforces no test 4508-10.
Medical men rarely protect themselves by use of, 4602.
Power of, weakens after certain period and 4504-6, 4562-7.
Recommended by Local Government Board, and supply of, put at disposal of local authorities 4310-12, 4449-51, 4501-3.
Reduction in death-rate in Metropolitan Asylums Board hospitals coincident with use of, 4632-38.
Statistics as to use of, 4607-9.
Value of, and Metropolitan Asylums Board statistics as to use of, 4322, 4361-2.
Evidence referred to, as to remuneration of vivisection for laboratory work *Sir G. Kekewich*, 20494-5.
Experiments essential to discovery of prophylactics 4313-6.
Experiments in connection with testing of antitoxins involve no pain except that which may be caused by disease consequent upon inoculation 4554-6.
Experiments *re* public health administration and prevention of disease—their importance 4405-8, 4425.
Home Office Reports include information contained in Report of, 4348-50.
Instructions issued by, to investigators employed by Local Government Board 4290-1, 4521-22.
Jenner's vaccine, analogy between modern prophylactics and, 4587.
Local Government Board:
Bacteriological investigations not undertaken by medical staff of, 4582-3.
Bacteriologists employed by, diagnosis of diseases 4627-8.
Diphtheria anti-toxin issued by, without specific instructions as to its use, 4624-6.
Foreign Office is notified by, of outbreaks of certain diseases by, 4301, 4337-8.
Inspectors' duties, 4534.
Koch's consumption cure not applied by, to human beings 4467.
Local authorities generally adopt prophylactics suggested by, 4325.
Local authorities notified by, of all new prophylactics discovered 4310.
Medical staff of, 4302.
Procedure of, in outbreaks of disease 4304-5.
Prophylactics not actually recommended by, but notified to and placed at disposal of local authorities 4368-9, 4437-40.
Prophylactics tested before recommendation to local authorities 4318-20, 4440.
Reports received by, from local authorities as to efficacy of prophylactics recommended 4317, 4322-4.
Research work:
Aim of investigations 4423-4, 4578-9.
Animals chiefly used 4343-5.
Experiments essential, 4357.
Experiments with view to discovery of preventive sera 4307-9.
Few experiments of painful character 4526.
Home Office inspection, extent of, 4356, 4519.
Investigators employed in, and as to supervision of such 4284-97.
Investigators make yearly returns to Home Office 4333-6.
Laboratory formerly rented for, but practice now discontinued 4411.
List of investigators employed 4413-14.
Local Government Board inspectors no longer carry out, 4299.
POWER, W. H., C.B., F.R.S.—*cont.*
Local Government Board—*cont.*
Research work—*cont.*
Majority of experiments are subcutaneous inoculations and painless 4351-4, 4532, 4574-5.
Nature of, 4300-1.
Reasons for employing outside investigators 4359-60.
Sir J. Simon's and Mr. Forster's minutes concerning principles governing 4299.
Smallpox inoculations not latterly conducted 4483-5.
Treasury grant for, 4408-10.
Tuberculin, its curative value not yet considered by, 4465-6.
Tuberculosis treatment, recommendations of Board as to, in abeyance until report of Tuberculosis Commission is issued 4455-6.
Vaccine tested and prepared by, and as to derivation of lymph 4477-8, 4482, 4488, 4513, 4591-7.
Medical officer of Local Government Board since 1900, 4297.
Monkeys not used for painful experiments 4528.
Not licensed personally, 4282.
Painful experiments conducted on behalf of Local Government Board would be reported to, 4529-31.
Plague prophylactics:
Experiments with view to discovery of, and encouraging results 4329-31.
Haffkine's, misgivings with regard to, on account of its carbonic acid element 4441.
Not altogether satisfactory 4432.
Small use of, in this country 4569-72.
Tetanus, its occurrence in connection with use of, in India, and explanatory cause, 4435-6, 4500.
Pneumonic plague and pneumonic influenza, possibly difficult to distinguish between 4629.
Public vaccinators must not use arm-to-arm lymph 4515-6.
Recently appointed Chairman of the Tuberculosis Commission *G. S. Woodhead*, 15481-3.
Reports received by, from Local Government Board's scientific investigators as to progress of their research 4288, 4523-5.
Sanitation, value of, in combatting infectious diseases 4631.
Smallpox inoculations of cows and horses in France 4486-7.
Supervision of scientific workers employed by Local Government Board, not work of, 4517.
Typhoid prophylactics, Wright's not recommended 4433-4.
Tuberculin, as to curative value of, 4468-71
Tuberculosis:
Tubercle bacillus the cause of, 4457-63.
Tuberculin test for bovine, of great use 4472.
PRIESTLY, DR., action of respirable gases, and use of vapour in anæsthesia established by experiments on mice carried out by, *Sir V. Horsley*, 15652-3.
PRITCHARD, W., M.R.C.V.S., evidence of, before previous Royal Commission as to chloroforming of dogs *Sir J. Russell*, 697, 753.
PROSECUTIONS UNDER VIVISECTION ACT, 1876, *see under* VIVISECTION ACT.
PUERPERAL FEVER:
Discovered to be infectious, and preventive methods adopted, *C. J. Martin*, 11647-51.
Serum treatment not always satisfactory *C. J. Martin*, 11967-8.
PURSER, PROFESSOR, Dublin University:
Private laboratory of, reason for allowing, *Sir T. Stoker*, 770.
Testimony of, as to high nervous system of monkeys *Sir T. Stoker* 808.
Reference *Sir T. Stoker*, 1048
PYEMIA, experiments upon, still being conducted, *Sir T. Stoker*, 844-5.

THE QUEEN, Her Majesty, letter from, conveying her disapproval of Professor Schäfer's drowning experiments, *J. Hughes*, 17218-22.

QUEEN VICTORIA, Her late Majesty, letter from, sympathising with anti-vivisection cause, *Hon. S. Coleridge*, 10714-15.

RABBITS :
- Acid-poisoning experiments on, gave rise to successful treatment of diabetic coma *E. H. Starling*, 3814.
- Alleged cruelty of experiments on, *Mrs. K. Cook*, *J. W. Graham*, 1793-5, 1913-4, 1919, 5849-55, 6141-2.
- Arygol, its use as remedy for disease of conjunctiva discovered by experiments on, *Sir H. R. Swanzy*, 9843-8.
- "Baking" of, consisted merely in maintaining temperature of, during narcosis *Sir L. Brunton*, 6906A-16, 6785-98.
- "Baking" of, said to have been performed *J. W. Graham*, 5844-9, 6131-40.
- Bred for laboratory purposes, *G. D. Thane*, 1431-4.
- Canine distemper, possible effects of inoculating, *S. Stockman*, 3373-8.
- Chloral injected into, for purposes of discovering its soporific action, *A. R. Cushny*, 4713.
- Chloral or urethane used in anæsthetising, *G. D. Thane*, *A. R. Cushny*, 1635-8, 5048-55.
- Chloroform not the anæsthetic generally used for, *Sir J. Russell*, 729.
- Cocaine, its anæsthetising properties first tested on, *A. R. Cushny*, 4751.
- Digitalis, action of, tested on, *A. R. Cushny*, 4657.
- Disease diagnosed by inoculations of, *W. H. Power*, 4306-7.
- Drugs, their general action, and toxic dose per unit of body weight tested on, *A. R. Cushny*, 4824.
- Experiments in connection with transplantation of cornea to human eye from, *Sir H. R. Swanzy*, 9816-18.
- Inoculations of, for rabies, tests and after effects, *S. Stockman*, 2590-7, 2863-4, 2912-9, 3011-25, 3125-8.
- Inoculations of, for rabies, tests not painful *G. D. Thane*, 1670-3.
- Paraldehyd used as anæsthetic in experiments upon *A. R. Cushny*, 5184-7.
- Physiological conditions prevent substitution of, for dogs or cats in certain experiments *G. D. Thane*, 427.
- Rabies inoculations of, for propagation of virus, and little pain occasioned *Sir V. Horsley*, 15814-22.
- Rabies inoculation of, performed without necessary certificates *W. P. Byrne*, 38.
- Sleeping sickness experiments on, *G. D. Thane*, 1311-2.
- Toot administered to, and its effects *Sir J. Russell*, 543.
- Tracheotomy performed on, without anæsthetics *Col. E. Lawrie*, 17072-9.
- Tuberculous aqueous humour injected into eye of, for purpose of diagnosis *Sir H. R. Swanzy*, 9819.
- Use of, for demonstration experiments *Sir J. Russell*, 602-3.
- Use of, in physiological investigations *E. H. Starling*, 3445.

RABIES :
- Abolition of, in England due to muzzling order and quarantine imposed by Board of Agriculture *Sir V. Horsley*, 15597-8, 15880-3.
- Abolition of, in England without recourse to Pasteur's treatment *C. J. Martin*, 12164-8, 12241-57.
- Control of, by muzzling dogs, due to knowledge of its infectious nature acquired by Pasteur's experiments *Sir V. Horsley*, 15602-3.
- Diagnosis of, unreliable methods adopted, *J. Hughes*, 17338-42.
- Diagnostic Tests of :
  - Anæsthetics required for inoculations of rabbits in connection with, *S. Stockman*, 2590-7, 2912-4.
  - Certificate B only used by Board of Agriculture for inoculations in connection with, and methods adopted *S. Stockman*, 2590-7, 2858-70.
  - Conducted by Board of Agriculture *S. Stockman*, 3125-8.
  - First practised by subcutaneous inoculation without success *S. Stockman*, 3137-8.
  - Not painful *G. D. Thane*, 1670-3.
  - Reliability of, *S. Stockman*, 3371-2.
- Existence of, to extent to which it was returned by Board of Agriculture doubted *J. Hughes*, 17296-342, 17343-8, 17351-8, 17585-6.
- Infectious not otherwise than by contact or by bite *Sir V. Horsley*, 15876-9.
- Microbe of, not visible *S. Stockman*, 3130-1.
- Muzzling of dogs for preventing spread of, objected to as being cruel and ineffective *J. Hughes*, 17120-7, 17591-9.
- Muzzling order in connection with suppression of, was compulsory over whole country *Sir V. Horsley*, 16026-30.
- Pasteur's inoculation experiments proved the contagious nature of, *Sir V. Horsley*, 15603.
- Pasteur's treatment for :
  - Efficacy of, shown by reduction of death rate *Sir V. Horsley*, 15819-21.
  - Mortality statistics affected by inclusion of all cases treated *C. J. Martin*, 12169-73.
- Suppression of, in Ireland *Sir T. Stoker*, 777, 860-1.

RABIES ORDER, drowning of stray dogs under, *Sir J. Russell*, 670.

RAM, A. J., K.C. (a Member of the Commission) :
- Letter to, with reference to insertion of qualifying adjective to "pain" in Mr. Coleridge's Bill *Hon. S. Coleridge*, 19975-8.

RATS :
- Alleged cruelty of experiments on, *Mrs. K. Cook*, *J. W. Graham*, 1990-3, 5871-3.
- Cancer inoculations of, *G. D. Thane*, 465-6.
- Cancer said to have been communicated between, *H. Snow*, 2180.
- Experiments on, for study of trichinosis *S. Stockman*, 2461.
- Experiments on, in connection with investigation of sleeping sickness *G. D. Thane*, 1311-2.
- Experiments on, in connection with powers of permanganate of potash as a tetanus preventive *Major L. Rogers*, 8183-5.
- Inoculated with plague suffer pain *Sir J. Russell*, 543, 720.
- Local Government Board Report on method of destroying, in plague-infected ships *W. H. Power*, 4301.
- Sulphur dioxide experiments in connection with destruction of, on plague ships and position of physiologist compared with that of rat catcher *M. S. Pembrey*, 14058-66.
- Used chiefly for inoculation experiments *E. H. Starling*, 3445.

RAYLEIGH, THE RIGHT HON. THE LORD, O.M., President of the Royal Society, 5530-79.
- Applications for licences or certificates not referred to, 5554-5.
- Evidence referred to *Hon. S. Coleridge*, 10880-4.
- Physiological optics, as to advance made by experiments 5558-62.
- Physiology no exception to principle that science is advanced by experimentation 5551-2.
- Remarkable development of science due to experimental methods of investigation 5532-7.
- Restrictions to further limit experiments should be carefully considered before being embodied in law 5532, 5539-41.
- Royal Society has been concerned in investigation of Mediterranean fever at Malta and sleeping sickness in Africa 5557.
- Royal Society often consulted in questions of public health in foreign parts 5570-1.
- Royal Society :
  - Duty of advising Home Office in issue of licences and certificates could hardly be undertaken by, 5564-5.

RAYLEIGH, THE RIGHT HON. THE LORD O.M.—*cont*

Royal Society—*cont.*

Number and *status* of Fellows 5550, 5573-5.
Resolution of, to present statement as to their views 5531-2.

Statement presented by, submitted to and approved unanimously by Council of Royal Society 5545-50.

READ, DR. WALTER, member of United States Commission to investigate cause of yellow fever in Havannah *W. Osler*, 16531.

REDWATER DISEASE, advance made in prevention of, *S. Stockman*, 2568-70.

REES, M. F., letter to, *re* incomplete anæsthesia *Hon. S. Coleridge*, 10993.

REGISTERED PLACES:

Accommodation in towns scarce at, for large animals *Sir J. Russell*, 617-19.
Government laboratories, *G. D. Thane*, 342-5.
Inspector visits only, *G. D. Thane*, 334.

Inspectors' visits to:

Instructions from Dr. Poore as to, *Sir J. Russell*, 529-30.
Notice not given *G. D. Thane*, 441.

Laboratories unconnected with teaching institutions *G. D. Thane*, 339.
Licensees allowed to experiment, in connection with certain investigations outside, *W. P. Byrne, G. D. Thane*, 78-83, 368, 372-3.
Minimum number of visits to, *Sir J. Russell*, 605.
Municipal laboratories *G. D. Thane*, 346-51.
Nature of premises and investigations made before registration *G. D. Thane*, 337-56.
Number and nature of, *W. P. Byrne*, 53-62.
Number of, in assistant inspector's district *Sir J. Russell*, 595.
Private, not registered without strong cause *W. P. Byrne, G. D. Thane*, 62, 74-7, 356, 1382-4, 1399-1404.
Private houses not registered, but occasional experiments allowed in private laboratories *W. P. Byrne*, 281-2.
Private laboratories in Ireland, and reasons for allowing *Sir T. Stoker*, 767-74.
Private premises *G. D. Thane*, 335-6.
Public laboratories preferable to private *Sir T. Stoker*, 977-9.
Registration protects vivisectors from prosecutions *Mrs. K. Cook*, 1962-3.
Research institutions, *G. D. Thane*, 344.
Satisfactory condition of. in Ireland *Sir T. Stoker*, 835.
Specified in licence and offence in performing experiments where licence is not available *G. D. Thane*, 499-500.
Statistics of, in Ireland *Sir T. Stoker*, 764-5.
Time limit not imposed in registration *G. D. Thane*, 1341-2.
Unlicensed experiments cannot be performed in, without knowledge of inspector *Sir J. Russell*, 587-8.

REISINGER, experiment by, in transplanting cornea from eye of rabbit to man *Sir H. R. Swanzy*, 9816.

RETURNS OF EXPERIMENTS:

Certificate B classified among certificates dispensing with anæsthetics in, *Hon. S. Coleridge*, 10329.
Certificates for experiments on dogs and cats, number reported in, *J. Hughes*, 17174.
Home Office charged with putting forward, asserting absence of pain in experiments *Hon. S. Coleridge*, 10262, 10640.
Home Office charged with suppressing signatories of certificates dispensing with anæsthetics in, *Hon. S. Coleridge*, 10262, 10573-80.

Home Office:

All experiments recorded in, *G. D. Thane, Sir J. Russell*, 481, 659-60.
Details of painful experiments given in 1900 *G. D. Thane*, 464.
Experiments occasionally reduplicated in, *Sir J. Russell*, 659-60.

RETURNS OF EXPERIMENTS—*cont.*

Home Office—*cont.*

Nature of experiments now required to be distinguished *G. D. Thane*, 1334-5.
1904, shows number of licensees who performed no experiments *G. D. Thane*, 1460-1.
Table showing number and nature of experiments performed *W. P. Byrne*, 106-28.

Increase in number of experiments reported in, *Sir G. Kekewich*, 20804.

Licensees:

Contraventions of the Act generally disclosed by, *W. P. Byrne*, 144-7.
Enlargement of, as to possibility of, *W. P. Byrne*, 238-40.
Home Secretary may require greater detail in, *W. P. Byrne*, 103.
Licensees make up their own, *W. P. Byrne, Sir J. Russell*, 188, 278-80, 657-8.
Obligatory *W. P. Byrne*, 89.
Occasional neglect in forwarding, *W. P. Byrne*, 90-4.
Two forms sent in, with details of all experiments *Sir J. Russell*, 657-8.

References, *Mrs. K. Cook, Hon. S. Coleridge*, 1919, 10477.

REW, R. H., erroneous views put forward by, with regard to milk consumption and prevalence of tabes mesenterica *G. G. Bantock*, 14547-50.

RHODESIA, Koch's preventive inoculation for S. African coast fever not successful in, *S. Stockman*, 3331-50.

RHODESIAN FEVER:

Koch's errors in experiments *re*, and as to present knowledge of, *S. Stockman*, 3336-50, 3403-8.
Transmitted by agency of blood-sucking ticks *S. Stockman*, 3410-4.

RICHARDSON, SIR B. W.

Experiments by, in connection with amyl nitrate *A. R. Cushny*, 4895-902.
Statements by, with regard to action of amyl nitrite *Sir L. Brunton*, 6888-97.
Reference *Sir L. Brunton*, 7019.

RICHET, PROFESSOR CHARLES, opinion of, as to uselessness of morphia as an anæsthetic *Miss Lind-af-Hageby*, 7342.

RINDERPEST:

Cause of, not yet satisfactorily demonstrated *S. Stockman, G. S. Woodhead*, 2684-5, 15496.
Control of, dealt with by inoculation, owing to prejudice against slaughter *S. Stockman*, 2717-20.
Control of, method suggested *S. Stockman*, 2994-7.
Cost of various outbreaks of, and study of preventive inoculation for, *S. Stockman*, 2480-90.
Government laboratory in India for study of, *Major L. Rogers*, 8222-5.
Immunity from, knowledge of how to acquire, demands experimental investigation *S. Stockman*, 2476-84.
Koch's inoculations against, not successful in Transvaal *S. Stockman*, 3331-50.
Mortality from, and reduction after preventive inoculations *Major L. Rogers*, 8226-43.
Native objection to slaughter in India makes it impossible to stamp out, *Major L. Rogers*, 8245-9, 8270-2.
Origin of contagion and as to immunity produced by preventive inoculation *Major L. Rogers*, 8282-98.
Outbreaks of, in India and successful inoculation against, *Major L. Rogers*, 8226-43, 8264-9.
"Simultaneous serum" method of inoculation used whenever possible *Major L. Rogers*, 8252-5.
Successful inoculation against, reported by Transvaal Department of Agriculture *S. Stockman*, 2686-7.

RING, MRS. G. A. M., statement by, as to proceedings at meeting of Church Anti-Vivisection League in Bradford *Miss A. L. Woodward*, 8800.

RING, REV. T. P., statement by, as to proceedings at meeting of Church Anti-Vivisection League in Bradford *Miss A. L. Woodward*, 8800.

RINGER, DR. S., Professor of Therapeutics in University College, London:

Drug experiments on children conducted by, *Rev. L. Lewis*, 8766-75.
Reference, *J. W. Graham*, 5890.

RITCHIE, *The late* LORD:

Alleged disingenuous statement in House of Commons, 1902, *Hon. S. Coleridge*, 10469.
Regulation as to inspection of records of experiments made by, *Sir V. Horsley*, 15770.
Writings of, referred to *J. W. Graham*, 5887.

ROBIN, PROFESSOR A., reference, *G. H. Burford*, 9018.

ROGERS, DR. J. G., Director General of the Sanitary Department, Egypt, member of Egyptian Plague Commission and views as regards inefficacy of plague serum *Sir G. Kekewich*, 20485-90.

ROGERS, MAJOR LEONARD, M.D., F.R.C.P., I.M.S., Professor of Pathology at Medical College, Calcutta, 8029-8311.

Experiments of, in connection with antidotes for snake poison *Sir L. Brunton*, 6862-5, 6879-85.
Kasauli Institute, working of, 8299-306.
Permanganate of potash useful in cases of hydrophobia 8186.
Permanganate of potash useful preventive for tetanus and experiments in connection with its use 8183-5, 8189-98, 8220.

Rinderpest:

Government laboratory in India for study of, 8222-5.
Impossible to stamp out in India owing to native objection to slaughter 8245-9, 8270-2.
Method of inoculating against in India and success of same 8226.
Method of preparing serum, and origin of contagion 8282-98.
Outbreak of, in United Provinces, India, when inoculated animals did not suffer as uninoculated 8264-9.
Serum is protective but not curative, 8280-1.
"Simultaneous serum" method of inoculation used whenever possible 8252-5.
Two chief methods of inoculating against, prevalent in India 8226.

Snakes, coloured plates of different poisonous, issued to Indian dispensaries for training surgeons to identify 8051-3.

Snake Poison:

Antidotes:

Present knowledge of, founded on results of experiments 8031.
Reputed, tested with negative results 8161-2.

Antivenins:

Chemical evil obviated by, 8150-3.

Cobra:

Discovery and use of, 8034-9.
Useless against other snake poisons 8034, 8157-9.

Intravenous injections more efficient than subcutaneous 8207-10.
Practical use of, small until polyvalent serum can be obtained 8211.
Production of, entirely due to experiments on animals, and preparation of, 8177-20.

Clinical investigations pursued for many years but successful antidotes discovered by experiments 8138-40.
Different actions of different classes of, and work in connection with 8033.
Experiments conducted not in official capacity and reports published in medical journals 8098-8100.
Horses have been made immune by injection of, 8143-5.
Ligature not sufficient treatment in itself 8093-5, 8212-16.
Mortality from, depends upon amount of venom injected, and clothing may protect from bite 8172-8.

ROGERS, MAJOR LEONARD, M.D., F.R.C.P. I.M.S.—*cont.*

Snake Poison—*cont.*

Mortality from, depends upon amount of venom injected, and period elapsing between bite and treatment 8103-8.
Mortality from, in India, and returns 8071-80, 8089-92.
Nature and chemical composition of, 8082-6.

Permanganate of potash antidote:

Calmette's treatment and, should be combined 8114-15.
Difficult to induce Indian native to carry, and lancet for injection 8273-6.
Method of application and advisability of its speedy use after bite, 8040-70, 8121-7, 8146-7, 8166-70.
Most practical remedy, and adopted by Indian Government 8040-70, 8109-12, 8128-32, 8217.
Successful use of, in Egypt 8179-80.

Snake charmers immunise themselves by small inoculations 8206.
Theory that immunity from, can be acquired by swallowing venom disproved 8202.
Viperine, fall of blood pressure due to, counteracted to some extent by adrenalin 8133-7.

Tetanus antitoxin, no danger from use of, 8199-201.
References *Sir L. Brunton*, 6833.

ROKINTANSKY, PROKOP, experiments *re* action of strychnin by, *Sir L. Brunton*, 6898.

ROMER, serum prepared by, for treatment of ulcer of cornea *Sir H. R. Swanzy*, 9819.

ROMNEY MARSH, outbreak of sheep disease at, and uncertainty in diagnosing, *D. J. Hamilton*, 20155-9.

RONTGEN RAYS:

Infinite possibility in discovery of, for physiological investigation and treatment of disease *Miss Lind-af-Hageby*, 9726-7.
Study of intestinal movements of animals under, are conducted under normal conditions and should be encouraged *Miss Lind-af-Hageby*, 9242.

ROSCOE, SIR H., bill introduced by, for universal collaring of dogs, in connection with rabies outbreak *Sir V. Horsley*, 15884.

ROSENBACH, DR., reference *Miss Lind-af-Hageby*, 9682.

ROSS, MAJOR RONALD, C.B., F.R.C.S., F.R.S.:

Experiments on birds by, identified organism causing malaria *W. Osler*, 16747-9.
Licence not now held by, *G. D. Thane*, 1327-32.

ROUX, PROFESSOR, anthrax treatment devised by, *S. Stockman*, 3309.

ROY, DR., witness in Ferrier Yeo case, *Hon. S. Coleridge*, 10559.

ROYAL COLLEGE OF PHYSICIANS:

Applications for licences and certificates submitted for signature of President of, *W. P. Byrne*, 208.
Cancer Research Fund under direction of, *H. Snow*, 2113.
Evidence on behalf of, *see* POWELL, SIR R. D., TAYLOR, F., 5580-5834.
Evidence put forward by, agreed with *W. Osler*, 16529.
Experiments on animals unanimously approved by, *Sir R. D. Powell*, 5728-31.
Membership of, *Sir R. D. Powell*, 5725-7.
Reference *G. D. Thane*, 1091.

ROYAL COLLEGE OF PHYSICIANS OF EDINBURGH, alleged cruelty of experiments on eyes of animals at laboratory of, *Mrs. K. Cook*, 1913-4.

ROYAL COLLEGE OF SURGEONS IN IRELAND:

Constitution of, *Sir H. R. Swanzy*, 9752-6.
Evidence on behalf of, *see* SWANZY, SIR H. R., 9752-979.
Views of, on subject of experiments on animals *Sir H. R. Swanzy*, 9762-81.

ROYAL COLLEGE OF SURGEONS OF ENGLAND:
Applications for licences and certificates submitted for signature to, *W. P. Byrne*, 208.
Cancer Research Fund under direction of, *H. Snow*, 2113.
Evidence on behalf of, *see* MORRIS, HENRY, 7651-8028.
Evidence put forward by, agreed with, *W. Osler*, 16529.
Reference *G. D. Thane*, 1091.

ROYAL COMMISSION ON TUBERCULOSIS:
Experiments authorised by, in connection with transmission of disease *G. S. Woodhead*, 15481-3.
Experiments on behalf of, *W. P. Byrne, G. D. Thane*, 88, 1116-8, 1205, 1679.
Farms held by, for research work *G. D. Thane*, 342-4.
Inquiry as to communicability of bovine tuberculosis to man being conducted by, *S. Stockman*, 3100-3.
Koch's views concerning non-transmissibility of disease from men to animals contrary to conclusions of, *G. S. Woodhead*, 15499-502.
Local Government Board waiting for Report of, before adopting measures for treatment of tuberculosis *W. H. Power*, 4455-6.
Research work of, conducted by licensees *G. D. Thane*, 352-3.
Report of, as to tuberculin tests in Denmark *S. Stockman*, 3209-18.
Work of, impossible without recourse to animal experimentation *G. S. Woodhead*, 15440-8.
References *Miss A. Kenealy, C. J. Martin*, 6403-4, 12222.

ROYAL COMMISSION ON VIVISECTION, 1875:
Appointment, nature of evidence before and consequent legislation on Report of, *W. P. Byrne*, 1.
Condemnatory correspondence between Dr. Klein and Secretary of, *Hon. S. Coleridge*, 10852-78.
Correction of evidence before, as to possibility of studying heart and circulation with removal of brain, *E. A. Schäfer*, 10060-3.
Evidence before, as to insensibility of animals to pain, *S. F. Smith*, 13046-8.
Evidence before, as to unnecessary repetition of experiments unwarrantable *Sir V. Horsley*, 16254-6.
Evidence before, *re* regulations as to qualification for Fellowship of Royal College of Surgeons *H. Morris*, 7754.
Evidence of Charles Darwin before, *E. H. Starling*, 3442, 3776-9.
Evidence of Mr. Jesse before, *Mrs. K. Cook*, 1785.
Evidence of Dr. Klein before, admitting his indifference to animal suffering *Mrs. K. Cook, W. H. Power, J. W. Graham, Hon. S. Coleridge, Sir G. Kekewich*, 1919, 2064-7, 4418-22, 5883, 10656-74, 10852-78, 20450.
Evidence of Sir James Paget before, as to value of clinical observation *E. H. Starling, H. Morris, Sir V. Horsley*, 3776-9, 7899, 16164-9.
Evidence of Mr. Pritchard before, as to chloroforming of dogs *Sir J. Russell*, 697.
Evidence of Mr. Schäfer before, manifesting indifference to pain inflicted on frogs *Miss Lind-af-Hageby*, 9430.
Evidence of Royal Society for the Prevention of Cruelty to Animals before, *A. G. Scott*, 19602-5.
no Evidence before, as to "inhumanity" in this country *Sir V. Horsley*, 16129.
Humane recommendations of, *Hon. S. Coleridge*, 10265.
Report of, throws light on interpretation of Act *Hon. S. Coleridge*, 10968-72.
Sheep-pox, cause of, incorrectly stated to have been discovered, in evidence before, *S. Stockman*, 2732-33A.
References *W. P. Byrne, Sir R. D. Powell*, 140, 5583.

ROYAL MEDICAL AND CHIRURGICAL SOCIETY, reference *G. D. Thane*, 1751.

ROYAL MEDICAL SOCIETY OF EDINBURGH, Sir Dyce Duckworth's speech to, *G. D. Thane*, 1471-5.

ROYAL SOCIETY:
Consulted in questions of public health in foreign parts *Lord Rayleigh*, 5570-1.

ROYAL SOCIETY—*cont.*
Cost of experiments concerned with investigation of function of thyroid gland partly defrayed by, *Sir V. Horsley*, 15688.
Duty of advising Home Office in issue of licences and certificates could hardly be undertaken by, *Lord Rayleigh*, 5564-5.
Fellows of, their numbers and *status Lord Rayleigh*, 5550, 5573-5.
Investigations into sleeping sickness on behalf of, *Col. D. Bruce*, 14315-14321.
Statement on behalf of, *see* RAYLEIGH, THE RIGHT HON. THE LORD 5530-5579.

ROYAL SOCIETY FOR THE PREVENTION OF CRUELTY TO ANIMALS:
Castration, a question not taken up by, *A. G. Scott*, 19695-700.
Castration, question of, should be dealt with by, *Hon. S. Coleridge*, 11298.
Constitution and membership of, *A. G. Scott*, 19490-5.
Definition of cruelty as held by, *A. G. Scott*, 19631-4.
Evidence of, before Vivisection Commission, 1875, *W. P. Byrne, A. G. Scott*, 1, 19602-5.
Evidence on behalf of, *see* SCOTT, A. G., and BANBURY, SIR F., BART., M.P., 19484-19851.
No cases of the practice of unnecessary cruelty in laboratories brought forward by, *A. G. Scott*, 19568, 19576.
Object of, to prevent unjustifiable pain, *A. G. Scott*, 19642-60, 19686.
Prosecution of Dr. Abrath by, for advertising public exhibition of experiments, *A. G. Scott*, 19568-75, 19681-5.
Statement of, represents views of entire Council, *A. G. Scott*, 19628-30.
Statement of views, *A. G. Scott*, 19486-8.
Work done by, *Hon. S. Coleridge*, 10800-1.
Works under Martin's Act, *Mrs. K. Cook*, 1946.

ROYAL SOCIETY OF EDINBURGH:
Constitution and work of, *E. A. Schäfer*, 9983-8.
Evidence on behalf of, *see* SCHAFER, E. A., 9980-10250.
Resolution submitted by, *E. A. Schäfer*, 9990-5.

ROYAL SOCIETY OF MEDICINE, evidence on behalf of Therapeutical Section, *see* DIXON, W. E., 18646-10191.

RUBINI, DR., homeopathic investigations by, leading to discovery of cactus for cardiac affections, *G. H. Burford*, 8924.

RUCKER, SIR A. W., F.R.S., letter from, to Home Office in connection with statements contained in *The Shambles of Science, A. D. Waller*, 18094-7.

RUFFEH, ARMAND, cancer parasite proclaimed by, *H. Snow*, 2281.

RUSKIN, JOHN, anti-vivisection cause supported by, *J. W. Graham, Hon. S. Coleridge*, 5887, 10262.

RUSSELL, SIR JAMES, LL.D., F.R.C.P. (Edinburgh), Assistant Inspector under Vivisection Act, 1876, 505-755.
Accommodation for large animals in towns scarce, 617-19.
Anæsthesia during experiments tested by, 547-8, 549.
Anæsthetics:
Animals can be kept under, without difficulty, 733-6.
Animals recover rapidly from effects of, 540.
Efficiency of, in experiments 637-9, 700-1.
Great improvements since 1875 in administration of, 729.
Anti-toxins not manufactured in Scotland but procured from England 721-2.
Appointment, of, date 510.
Callousness to suffering on part of licensees not witnessed by, 620-1, 655-6.
Cats:
Scandal in connection with the Wellcome Research as to procuring, for vivisection purposes, 682.
Susceptibility of, to pain makes it desirable to minimise experiments on, 607.

RUSSELL, SIR JAMES, LL.D., F.R.C.P. (Ed.)—*cont.*

Certificates :

A :

Applications for, refused on various grounds 519-20.
Local anæsthetics might be allowed under, but possible difficulty 555-6, 624,-7, 730.
Not allowed for severe operation and advisability of permitting use of cocaine 622-4.

B :

Length of operations under, 545.
Obligation to kill animal under, a hardship 557-61.
Useless for demonstration purposes, 614.

C :

Demonstration experiments require use of, 611-14.
Exhibition of experiments permitted under, 615.

D, one case of issue, 573.
E and F not in themselves operative, 630.
Issue of, procedure as to, 737.
Specification of animals necessary in all, 631-2.

Concerned with administration of Anatomy Act 511.
Demonstration experiments sometimes witnessed by, 567-8.
Difficulty in distinguishing between animals which have and have not undergone experiments, 536.

Dogs :

Calves or goats might be substituted for, in some experiments, but use of, in certain experiments essential 608.
Condition of some, after operations 552-3.
Indications of suffering in, 715-19.
as to Obtaining of, for experimental purposes 667-9, 676-80.
Practice of police in Edinburgh with regard to stray, 725-7.
Relative development of various senses in, 741.
Statements as to danger in chloroforming, not consistent with experience 753.
Strapped down during lengthy operation, but only to prevent movement 640-2.
Suggestions to breed, for laboratory purposes, 674-6.
Susceptibility of, to pain makes it desirable to minimise experiments on, 607.

Drowning, sensations during, 741.
Drowning experiments, for purpose of studying methods of resuscitation, 687-91.
Drowning experiments, reasons for choice of dogs in, 739-40.
Edinburgh Veterinary College, frequency of experiments on dogs at, 754-5.
Evidence of Mr. Pritchard before previous Vivisection Commission as to chloroforming of dogs not confirmed by, 697.
Evidence of, *re* susceptibility of animals to pain referred to *S. F. Smith*, 13055.
Experiments on thyroid gland, opinion as to, 571-2.
Frogs and rabbits chiefly used for class experiments and some dogs, 662.
Guinea-pigs bred in laboratories and also brought from outside, 673-4.
Home Office returns contain record of all experiments 659-60.
Home Secretary may reduce number of experiments under Certificate B, on advice of inspector 633-4.
Inoculations involve little pain 708-9.
Inspection essential, but no safeguard against wilful transgression 602-3.
Inspection, time given to, 596-8.
Inspector of Anatomy for Scotland, 511.

Inspectors :

Increase of, unnecessary 604.
Licences, annual renewal adds to work of, 598-9.
Visits of, do not permit witnessing of many experiments 517-18, 565.
Visits of, prevent irregularities 555, 601.

RUSSELL, SIR JAMES, LL.D, F.R.C.P. (Ed.)—*cont.*

Licensees fill up two forms in recording experiments 657.
Licensees frequently have difficulty in understanding Act and powers conferred by certificates 555.
Licensees increasing in number 600.
Licensees' laboratory book always inspected by, 554.
Licensees' publications, inspection of, 528.

Licences :

Applications for, never refused in witness's area 519-20.
Considerations in recommending applications for, 686.
Issue of, procedure as to, 516.
Refusal of one to American lady on grounds of unsuitability and not being permanent resident, 522-4.

Monkeys :

Removal of thyroid gland from, followed by no painful symptoms 543.
Susceptibility of, to pain makes it desirable to minimise experiments on, 607.

Municipal and magisterial experience of, 507.
Number of experiments witnessed by, *G. D. Thane*, 563-4, 1234-6.

Pain :

Animals' susceptibilities to, varies with their intelligence 606, 671-2, 747-50.
Indications of, in animals 550, 580-4, 714.
Majority of experiments involve no, 577-9.

Painful experiments, 541-3.
Prolonged nature of some experiments 692-5.
Prosecutions, law of, different in Scotland and England, 589-91.
Recommendation of Association for Advancement of Medicine by Research not necessarily accepted by inspector 683.

Registered Places :

Appointments as to visits to, rarely made 533.
Instructions from Dr. Poore as to visits to, 529-30.
Minimum number of visits to, 605.
No obstacles in way of inspection of, 530.
Number of, in witness's district, 595.
Number of visits to, 530-1.
Unlicensed experiments cannot take place in, without inspector's knowledge 587-8.

Repetition of experiments for testing results, 574.
Report as to grafting of kidney or blood vessels in neck of dog, 685-6.
Report of, independent of that of Association for Advancement of Medicine by Research, 525-7.
Students, majority do not study abroad and few research scholarships given 704-7.
Unlicensed experiments in Scotland, allegations as to, unfounded 586

Vivisection Act, 1876 :

Administered carefully 513.
Legitimate research not hampered by, 566.
No wilful violation of, experienced 585.
"Pain" interpreted in wide sense throughout, 515.

References *W. P. Byrne*, *G. D. Thane*, 32-33, 133, 319, 339, 1434.

RUSSIA, tables showing case mortality from diphtheria in before and after employment of antitoxin treatment *C. J. Martin*, 11711.

RUTHERFORD, W., M.D. :

Evidence of, before Vivisection Commission, 1875, as to insensibility of animals to pain *S. F. Smith*, 13054.
Evidence of, before Vivisection Commission, 1875, as to unanæsthetic powers of morphia *S. F. Smith*, 13317.
Experiments by, as to action of amyl nitrate led to its use as remedy for angina pectoris *Sir L. Brunton*, 6888-97.
Tracheotomy not performed before administration of anæsthetics by, *J. Lorrain Smith*, 18431-2.
Tracheotomy performed before anæsthetics were administered in laboratory of, *Col. E. Lawrie*, 16801-7, 16838-53.

ST. ANDREWS, Gatty Marine laboratory at, reference *G. D. Thane*, 344.

ST. BARTHOLOMEW'S HOSPITAL:
Laboratory at, formerly rented by Local Government Board *W. H. Power*, 4411.
Local Government Board investigator's work at laboratory of, *W. H. Power*, 4284.
Sclavo's anthrax serum employed at, *H. Morris*, 7868-9.

ST. LADISLAUS HOSPITAL, Buda-Pesth, table showing case mortality from diphtheria at, before and after employment of antitoxin treatment *C. J. Martin*, 11711.

ST. PETERSBURGH HOSPITAL, Rauchfuss, Russia, table showing case mortality from diphtheria in, before and after employment of antitoxin treatment, *C. J. Martin*, 11711.

ST. MARTIN, ALEXIS, case of, *E. H. Starling, Sir L. Brunton, Sir V. Horsley*, 3470, 7028, 15686.

SALOMONSEN, experiments of, *re* cause of caseous pneumonia *C. J. Martin*, 11646.

SANARELLI, work of, in connection with yellow fever unsubstantiated *W. Osler*, 16611-14.

SANDERSON, SIR J. BURDON, M.D., F.R.S.:
Demonstration experiments to students strongly advocated by, *Sir V. Horsley*, 15607-11.
Formerly medical inspector and investigator for Local Government Board *W. H. Power*, 4300.
Opinions of, with reference to origin of tuberculosis *W. H. Power, C. J. Martin*, 4458, 4462, 12206-8.
Use of handbook by, in Oxford laboratories *C. R. J. A. Swan*, 19259-61.
References, *W. H. Power, S. F. Smith*, 4413, 13049.

SAVORY, SIR W., Listerian methods of surgery opposed by, *G. G. Bantock*, 14752-4, 15080-2.

SAVOY, endemic cretinism in, *W. Osler*, 16691-3.

SCARLET FEVER:
Bacillus of, not yet discovered *Sir R. D. Powell, C. J. Martin*, 5666-71, 11905.
Case mortality of, reduced in Metropolitan Asylums Board hospitals *Sir R. D. Powell*, 5666-71.

SCHÄFER, E. A., LL.D., Sc. D., F.R.S., Professor of Physiology at Edinburgh University, Royal Society of Edinburgh, 9980-10250.
Adrenalin discovered by means of experiments of, *E. H. Starling, A. R. Cushny*, 3442, 3555-60, 4808-9, 10083-4.

Anæsthetics:
Complete unconsciousness always secured during experiments 10047-53.
Completeness of, secure against all pain 10069-71A.
Measures taken to resuscitate animal if anæsthesia is pushed too far 10072-82.
Nature of, generally used 10228.
Purposive movements and cries of animals under, do not occur in experiments 10213-21.
Sensation disappears before power of movement, 10222-4.

Animals after experiments might be removed from laboratory to registered place in country 10247-9.
Antiseptic surgery and aseptic surgery, distinction between, and definition of Listerism 10141-51.
Certificate held by, confusion as to actual signatory of, *Hon. S. Coleridge*, 10580-99, 11092-7.

Certificates:
B:
Animals experimented on under, might be kept outside laboratory 10173-8.
Conditions illegally assumed by successive Home Secretaries to modify character of, 10172.
Delay in granting, 10172.
Inspector's opinion should not override advice of authorities recommending grant of, 10172.

SCHÄFER, E. A., LL.D, Sc. D., F-R.S.—*cont.*
Chloroform:
Atropin counteracts any fatal effects of, in dogs 10088, 10152-4, 10229-31, 10238-40.
Noises made by animals under, do not indicate pain 10226-7.

Cold-blooded animals should not be included in Act 10187-8.
Continuance of experiments necessary 10132.
Curare infrequently used, but apparatus employed for administering chloroform in case of its use 10086-7.

Demonstration experiments:
Advocated, and as to *status* of students attending, 10155-70.
Necessary, for students to be properly impressed with fundamental physiological facts 10003-10009, 10017-30, 10209-12.
Students show no levity at, 10013-16, 10209-12.

Directions for Class Work in Practical Physiology by, shows lack of humane teaching *Miss Lind-af-Hageby*, 7223.

"Drowning" experiments performed by:
Choice of dogs, reasons for, *Sir J. Russell, E. H. Starling*, 739-40, 4039-40.
Home Office condemned for permitting, *Hon. S. Coleridge*, 10915-37.
Home Secretary petitioned to prohibit, *J. Hughes*, 17218.
Number of dogs used and value of new resuscitory methods arrived at 10106-10, 10194-201.
Object of, *Sir J. Russell, G. D. Thane, E. H. Starling*, 687-91, 1749-51, 3569-84.
Object of, now attained and unnecessary to repeat experiments *E. H. Starling*, 4078-81.
Questions asked in House of Commons as to, *Hon. S. Coleridge*, 11049-53.
Strongly disapproved of, *Hon. S. Coleridge, J. Hughes*, 10264-5, 17498-504.
Undertaken with view to determine exact effect of death by drowning and best method of resuscitation 10104-5.

Drugs, testing of, on animals necessary 10202-8.
Evidence of, before Vivisection Commission, 1875, showed callousness with regard to experiments on frogs *Miss Lind-af-Hageby*, 9430.
Experiments on brain performed by, reference 10111-16.
Experiments performed by, on action of chloroform described in Report of Suspended Animation Committee 10089-101.

Frogs:
Always "pithed" before experiments and nature of "pithing" 10055-8.
Decerebration of, destroys all consciousness to pain 10063-7, 10232-5.

Legal restriction of experiments, no further, should be imposed 10172.
Letter from, as to "incomplete anæsthesia" *Hon. S. Coleridge*, 10308-11.

Licences:
Exclusion of physiologists from obtaining, on ground of no medical qualifications would be ridiculous 10192-4.
Justifiable to permit Home Secretary to impose conditions on, 10241-6.

Monkeys:
Analogy between men and, close enough to make experiments valuable 10126.
No sign of pain after operations shown by, 10127-31.

Morphia, sufficient dose of, entirely removes consciousness to pain 10189.
New surgical operations require to be tested on animals before attempting them on human beings 10031-46.
No disregard of animal suffering among physiologists 10172.

Royal Society of Edinburgh:
Constitution and work of, 9983-8.
Evidence on behalf of, 9997-10002.
Resolution submitted by, 9990-5.

SCHÄFER, F. A., LL.D., Sc.D., F.R.S.—*cont.*
Simple inoculations might be done by laboratory assistant 10180-6.
Suprarenal extract, discovery of active principle of, 10250.
Witness before previous Commission and correction of evidence therein as to possibility of studying heart and circulation with removal of brain 10060-3.
References *G. D. Thane, S. F. Smith, Sir V. Horsley*, 1300, 13049, 15688.

SCHÄFER'S SPLEEN BOX, used for applying plethysmographic observation to liver *Mrs. K. Cook*, 1800.

SCHANDIN, syphilis investigations by, *C. J. Martin*, 12235.

SCHARLIEB, DR. H. J., investigations on action of chloroform, by, *E. A. Schäfer*, 10088.

SCHARPI, DR., reference, *Sir L. Brunton*, 7019.

SCHARTAU, MISS LEIZA K., co-author of *The Shambles of Science* with Miss Lind-af-Hageby *G. D. Thane, E. H. Starling*, 1280, 3545, 3552-3.

SCHERCK, DR., paper by, *re* value of tetanus antitoxin in America *H. Morris*, 7740.

SCHMIDT, digestive processes, knowledge obtained by experiments of, *Sir L. Brunton*, 7028.

SCHMIEDEBERG:
Experiments by, with regard to action of digitalis and paraldehyd *A. R. Cushny*, 4654-67, 4734-5.
Urethane built up from formula invented by, 18889-92.

SCHROEDER, VON, caffein discovered to be a pure diuretic by means of experiments on animals by, *A. R. Cushny*, 4813-4893.

SCHULZ, PROFESSOR, opinions of, as to desirability of testing drugs on human beings *A. R. Cushny*, 5240-2.

SCLAVO, anthrax serum derived by, *S. Stockman*, 3309-14.

SCOTLAND:
Antitoxins not manufactured in, *Sir J. Russell*, 721-2.
Prosecution, law of different in England and, *Sir J. Russell*, 589-91, 594.
Sheep farming in, terribly hampered by prevalency of louping-ill and braxy *D. J. Hamilton*, 19996-20004.
Unlicensed experiments in, charges as to, unfounded *Sir J. Russell*, 586.

SCOTT, ARTHUR GUILLUM, Chairman of the Royal Society for the Prevention of Cruelty to Animals, 19484-19851.
Anæsthetics, all severely painful experiments should be carried out while animal is completely under, 19507-8.
"Brown Dog of Battersea," particulars of case suggest that pain was inflicted 19513-22, 19775-7.
Certificate B, subsequent pain attending operations under, and necessity of increase of inspectors 19792-7.
Mr. Coleridge's Bill, clause concerning qualifications of signatories to applications for certificates not considered 19556-8.
Cruelty defined as infliction of unnecessary and excessive pain 19743-55.
Cruelty, no specific cases of, to bring forward 19607-11, 19731.
Experiments justifiable, for purpose of curing disease or advancing knowledge 19783-6.
Experiments justifiable so long as they do not involve infliction of pain 19508-11.
Experiments under licence alone not objected to, 19710-11.
Inoculations not considered painful and therefore not objected to, 19527-38.
Inspectors:
Impracticability of requiring, to watch all possible painful developments of inoculation experiments, admitted 19702, 19708.
Insufficient number of, and they should be present at all painful experiments 19502, 19544-51, 19577-86, 19666-70, 19673-80, 19756-62, 19798-836, 19591-601.

SCOTT, ARTHUR GUILLUM—*cont.*
Inspectors—*cont.*
Necessary qualifications of 19544-51.
Objection to second experiment upon animal after recovery from anæsthetic 19732-42.
"Painful Experiments":
Definition difficult, but they obviously occur 19512.
Should be prohibited except in presence of an inspector 19529-43.
Prosecution of licensee, necessity of obtaining Home Secretary's consent for, should be abolished 19559-67.
Regulation that animals must be kept in licensed place after experiment unnecessary 19837-8.
Royal Society for the Prevention of Cruelty to Animals:
Castration, a question not considered by, 19695-700.
Constitution and membership of, 19490-5.
Definition of cruelty as held by, 19631-4.
Evidence of, before previous Royal Commission 19602-5.
Object of, to prevent unjustifiable pain to animals 19642-660, 19686.
Prosecution of Dr. Abrath by, for advertising public exhibition of experiments 19568-75, 19681-5.
No cases of the practice of unnecessary cruelty in laboratories brought forward by, 19568, 19576.
Statement of, represents views of entire council 19486-8, 19628-30.
Sport not disapproved of, 19687-94.
Vivisection Act, 1876, supervision of experiments under, totally inadequate 19724.

SCOTT, PROFESSOR, Carmichael College, Dublin, Certificate C allowed to, against inspector's advice *Sir T. Stoker*, 794.

SCOTTISH SOCIETY FOR THE SUPPRESSION OF VIVISECTION, income of, *Hon. S. Coleridge*, 10260.

SECRETARY OF STATE, *see under* HOME SECRETARY.

SELIGMANN, DR., Frimley heather licensed for grouse experiments by, *G. D. Thane*, 364.

SEMMELWEIS, no connection between Listerism and work of, *G. G. Bantock*, 14759-60.
Persecution of, in Vienna, *C. J. Martin*, 12202.
Puerperal fever, its infectious nature noted by, *C. J. Martin*, 11647.

SEMPLE, vaccine against typhoid devised by, *C. J. Martin*, 11793.

SEPTICEMIA, antiseptic precautions cannot be imposed in investigations of, *G. D. Thane*, 469-70.

SERUM THERAPY:
Antitoxins:
Anthrax:
Dr. Legge's testimony to success of, *H. Morris*, 7741-2.
Statistics of successful use of, in Japanese Army *H. Morris*, 7742-9.
See also Sclavo's serum *below*.
Character of all, essentially the same *W. H. Power*, 4557-61.
Cholera (Haffkine's):
Recommended by Local Government Board *W. H. Power*, 4310-12.
Successful use of, *W. H. Power*, 4324.
Tested before recommendation to local authorities *W. H. Power*, 4318-20.
Degree of success obtained by, in laboratory work not to be confidently anticipated in its application to human body *W. H. Power*, 4447-8, 4535.
Diphtheria:
Animals inoculated with, show as a rule no signs of suffering, *G. D. Thane*, 452.
Case mortality reduction undoubtedly due to use of, *Sir R. D. Powell, F. Taylor*, 5641-2, 5643.

SERUM THERAPY—*cont.*
Antitoxins—*cont.*
Diphtheria—*cont.*
Composition of, possible improvements in *G. S. Woodhead*, 15470.
Cost per unit of, *C. J. Martin*, 11836-43.
Diminution of disease greatly due to use of, *G. S. Woodhead*, 15557-60.
Discovery of, investigations leading to, *C. J. Martin*, 11652.
General mortality, non-decrease in, may be due to relatively small use of, *Sir R. D. Powell*, 5716-18.
Higher level of efficiency reached by, than by other curative agents *W. H. Power*, 4551-2.
and Hydrophobia vaccine, distinction between principles of, *C. J. Martin*, 11920-2.
Immediate application of, would abolish mortality *C. J. Martin, G. S. Woodhead*, 11763, 11766-91, 15540-5.
Licence not required for preparation of, *G. S. Woodhead*, 15550.
Local Government no longer manufacture, for curative purposes and enforce no test *W. H. Power*, 4508-10.
Local Government Board recommends, and places supplies at disposal of local authorities without much resulting use *W. H. Power*, 4310-12, 4449-51, 4501-3, 4604.
Loses its power after a time, and Local Government Board notification of such a fact to purchasers *W. H. Power*, 4504-6, 4562-7.
Mortality of laryngial cases affected by, *C. J. Martin*, 11730.
No confidence in, owing to fallacy of statistics and errors in diagnosis *S. F. Smith*, 13422-34.
No reliable figures, coinciding in time, of London cases treated with, and without *C. J. Martin*, 12252-6.
Objection to, and to whole principle of serum therapy on humanitarian and hygienic grounds *Miss Lind-af-Hageby*, 9216-24.
Objection to, based solely on its inutility, *G. G. Bantock*, 14930-4.
Paralysing effect of, statement as to, untrue *Sir L. Brunton*, 7128-35.
Paralysis caused by use of, *Miss A. Kenealy*, 6166-70.
Paralysis following use of, statistics as to *C. J. Martin*, 12316-24.
Procurable from most large chemists *W. H. Power*, 4539-40.
Production and test of, require use of animals *G. S. Woodhead*, 15473-6.
Reduced demand for, from Local Government Board, but great increase in general use of, *W. H. Power*, 4536-40.
Speculative objections to, *S. F. Smith*, 13229.
Statistics hardly point to beneficial effect of, *Hon. S. Coleridge*, 10755-8.
Statistics rélating to, fallacious *S. F. Smith*, 13359-65.
Statistics showing curative value of, and conclusions drawn from such *C. J. Martin*, 11711-35.
Statistics showing decrease in mortality due to use of, *W. H. Power, F. Taylor, G. S. Woodhead*, 4361-2, 5588-93, 15457-64, 15520-4, 15530-41.
Statistics showing influence of early or late administration of, upon case mortality, and summary *C. J. Martin*, 11733-7.
Study and preparation of, undertaken on behalf of Metropolitan Asylums Board *G. S. Woodhead*, 15449-54.
Success of, and reliability of bacteriological diagnosis afforded by use of, *C. J. Martin*, 11985-12030.
Successful use of, in Cambridge outbreak *G. S. Woodhead*, 15528-9.

SERUM THERAPY—*cont.*
Antitoxins—*cont.*
Diphtheria—*cont.*
Use of, averts serious symptoms *Sir R. D. Powell*, 5705 14.
Use of, based on proof that the Klebs-Loeffler bacillus is cause of disease *G. S. Woodhead*, 15512-18.
Use of, in Metropolitan Asylums Board hospitals has probably greatly reduced mortality *W. H. Power*, 4387-91, 4632-8.
Value of, as curative agent *W. H. Power, F. Taylor, Sir R. D. Powell, Sir L. Brunton, C. J. Martin, J. Glaister, G. S. Woodhead, J. R. Bradford*, 4322, 5744-6, 5813, 7128-35, 11739, 12356-7, 13018-23, 15465-9, 15470-1, 15546-9, 17718-21.
Valueless, and opinions supporting this view, *Miss Lind-af-Hageby*, 9675-88.
Dysentery:
Not used to any great extent in India *C. J. Martin*, 12031.
Practical value of, predicted *C. J. Martin*, 11764.
Preventive and curative properties in animals, possessed by, but no extensive data as to its value in man yet available *C. J. Martin*, 11755-9.
Enteric fever, not altogether satisfactory *W. H. Power*, 4432.
Expectations of perfecting efficiency of all, *W. H. Power*, 4553.
Experiments in connection with testing of, involve no pain except that which may be caused by disease consequent upon inoculation *W. H. Power*, 4554-6.
Homeopathic preparation of, *G. H. Burford*, 8997-8.
Local Government place supplies of, at disposal of local authorities *W. H. Power*, 4437-40.
Manufacture of, not carried out in Scotland, but procured from England *Sir J. Russell*, 721.
Pneumonia, not popular, *C. J. Martin*, 11969.
Rinderpest:
Preparation of, *Major L. Rogers*, 8282-98.
Protective, but not curative, *Major L. Rogers*, 8280-1.
Standardisation of, necessary *G. D. Thane*, 356-8.
Tendency of medical mind to be diverted to study of, *Miss A. Kenealy*, 6261-3.
Tetanus:
Criticism of Mr. Paget's statements as to use of, 13132-5.
Curative powers of, doubtful and expensive nature of, *S. Stockman*, 2644-9, 3276-9.
Evidence as to efficacy of, *S. Stockman*, 3289-92.
First used for curative purposes, and length of immunity conferred by, *S. Stockman*, 3296-3302, 3384A.
Has not fulfilled expectations *S. F. Smith*, 13132-5.
Immediate application of, a certain remedy *C. J. Martin*, 11760-2.
Immunity conferred by, *S. Stockman*, 2830-4, 3384A.
Injected in castration, docking and other surgical operations *S. Stockman*, 3281-2, 3287.
Inoculations followed by no bad effects and duration of immunity conferred by, *S. Stockman*, 2975-80.
No danger from, and symptoms produced by, *Major L. Rogers*, 8199-201.
Production of, no pain involved *C. J. Martin*, 12065-70.
Prophylactic, chiefly *C. J. Martin*, 11970-6, 12038-49.
Protective nature of, opinion based on statistics *S. Stockman*, 3280.

SERUM THERAPY—*cont.*

Antitoxins—*cont.*

Tetanus—*cont.*

Standardising of, not difficult *S. Stockman*, 3293-5.

Value of, as a curative and prophylactic agent, *C. J. Martin*, 11740-54.

Valuable immunising properties of, and statistics as to its use in America *H. Morris*, 7851-64.

Typhoid:

17th Lancers inoculated with, and successful results *Col. D. Bruce*, 14528.

Statistics showing incidence of disease not diminished by use of, *S. F. Smith*, 13109-13.

See also Wright's Anti-Typhoid Vaccine *below*.

Anti-Venins:

Calmette's testimony to success of, *Sir R. D. Powell*, 5678-83, 5719-21.

Chemical evil of snake poison obviated by, *Major L. Rogers*, 8150-3.

Cobra:

Discovery and use of, *Major L. Rogers*, 8034-9.

Useless against viperine and other snake poisons, *Major L. Rogers*, 8034, 8157-9.

Discovery of all, due to experiments *Major L. Rogers*, 8117-20.

Experiments with view to discovery of, hindered by conditions of Vivisection Act *Sir L. Brunton* 6833-8.

Horses immunised by injection of, *Major L. Rogers*, 8143-5.

Intravenous injections of, more efficient than subcutaneous, *Major L. Rogers*, 8207-10.

Practical use of, small until polyvalent serum can be obtained *Major L. Rogers*, 8211.

Commercial aspect of, *Sir G. Kekewich*, 10494-516.

Haffkine's Plague Vaccine:

Discovery and statistics as to use of, *C. J. Martin*, 11792.

as to Effect of, in preventing spread of disease *C. J. Martin*, 11925-39.

Egyptian Plague Commission opposed to use of, as prophylactic *Sir G. Kekewich*, 20485-90.

Encouraging results of use of, *W. H. Power*, 4329-31.

Experience in this country of, small but Indian statistics of its value, as preventive *W. H. Power*, 4570-2.

Gradual inoculation with, involves no discomfort *C. J. Martin*, 12097-102.

Impurity of, *Col. E. Lawrie*, 17107.

as to Inefficacy of, and results of inoculations at Byculla jail *Sir. G. Kekewich*, 20640-75.

Inefficacy of, for conferring permanent immunity *Sir G. Kekewich*, 20861-7.

Investigations in connection with, *C. J. Martin*, 12080-95.

Local Government Board recommend use of, *W. H. Power*, 4311-12.

Local Government Board report on nature of, *W. H. Power*, 4301.

Misgivings with regard to, on account of its carbonic acid element *W. H. Power*, 4441.

Not altogether satisfactory *W. H. Power*, 4432.

Precautions taken as to purity and strength of, *C. J. Martin*, 12071-3.

Preparation of, *W. H. Power*, 4590.

Preparation of, suffering caused in *Sir. G. Kekewich*, 20471.

Prophylaxis conferred by, no accurate data as to, *C. J. Martin*, 12128-33.

Success of, on rat gave assurance of considerable efficacy if administered to men *W. H. Power*, 4366-7.

Tetanus following use of, at Malkowal, India *C. J. Martin*, 12295-9.

Tetanus, its occurrence with use of, in India explained *W. H. Power*, 4435-6, 4500.

Use of, *F. Taylor*, 5597-9.

SERUM THERAPY—*cont.*

Haffkine's Plague Vaccine—*cont.*

Use of, in India has propagated disease and contributed to unrest *Sir G. Kekewich*, 20472-5, 20485, 20621-31, 20571-5.

Valuable influence of, in checking spread of plague in India and statistics *C. J. Martin*, 12300-310.

Pasteur's treatment for hydrophobia:

Case against, founded on contention that statistics as to, are fallacious *S. F. Smith*, 13136-212, 13154-213, 13400-21.

Opposition to, *Miss Lind-af-Hageby*, 9712-15.

Success of, *Sir L. Brunton*, 7147-57.

Plague Prophylactics:

Haffkine's, *see* Haffkine's Plague Vaccine *above*.

Local Government Board procedure in recommending, *W. H. Power*, 4369.

New, not as yet used on human beings in this country, and further experiments desirable before adoption, *W. H. Power*, 4443.

Use of, other, than Haffkine's, *C. J. Martin*, 11939-41.

Principle of, objected to, as useless and immoral *Miss A. Kenealy, Miss Lind-af-Hageby*, 5356-71, 5418, 6171-51, 6355-67, 6369-75, 6392-411, 6564-77, 9347-53, 9717-18.

Sclavo's serum for anthrax, *S. Stockman, H. Morris*, 3309-12, 7868-70.

Sera and vaccines should be prepared by a Government institute *G. D. Thane*, 1355, 1358-64.

Serum production not under control of Act *G. D. Thane*, 1444-6.

Serum production, precautions taken in, *G. D. Thane, C. J. Martin*, 1348-53, 11696-710.

in Suppuration and Blood Poisoning, criticisms of Mr. Paget's statements as to, *S. F. Smith*, 13121-9.

Swine erysipelas, nature of preventive serum, *S. Stockman*, 2556-67.

Swine fever, preventive inoculation against, *S. Stockman*, 2752-6, 2824-8.

Testing of sera, not a Government responsibility *G. D. Thane*, 1377-81.

Tuberculin, *see that title.*

Tuberculosis, marmoric serum for, still under trial *see also* Tuberculin *Sir R. D. Powell*, 5804-5.

Vaccination against smallpox, *see that title.*

Wright's Anti-typhoid vaccine:

Local Government Board do not recommend, *W. H. Power*, 4433-4.

Use of, and statistics as to success *C. J. Martin*, 11793-813, 11942-6, 11952-7.

17TH LANCERS, successfully inoculated with anti-typhoid serum *Col. D. Bruce*, 14528.

SEWELL, A. E., F.R.C.V.S.:

Morphia not an anæsthetic for dogs stated by, *Miss Lind af Hageby*, 7316.

Reference *Miss Lind af Hageby*, 9736.

SHAFTESBURY, LORD, anti-vivisection cause supported by, *Hon. S. Coleridge*, 10262.

SHAKESPEARE:

Writings of, support anti-vivisectionists *Rev. L. S. Lewis*, 8726.

Reference *J. W. Graham*, 5887.

SHARPE, H. S., Keble College, Oxford:

Apology from, with reference to charges against Mr. Gotch made in letters to Mr. Coleridge *F. Gotch*, 13668-701.

Letters from, describing howling of animals in University Museum, Oxford, and charges against Mr. Gotch brought by, *Hon. S. Coleridge*, 11444-67.

References, *Hon. S. Coleridge*, 19861, 19862.

SHARPEY, DR., reference *Sir L. Brunton*, 7019.

SHARPEY, PROFESSOR, statement by, as to needlessness of repeating experiments with regard to functions of spinal nerves, *E. H. Starling*, 3847-50.

SHATLOCK, DR. S., typhoid bacilli found in blood of horse by, *Miss A. Kenealy*, 6559.

SHAW, *The late* ALEXANDER, reference *H. Morris*, 7901.

SHAW, C. E., M.D., M.A. :
- Allegations *re* jequirity experiments performed by, untrue *J. Lorrain Smith*, 18402-23.
- Circumstances suggesting no licence was held by, for jequirity experiments on eye of rabbit *Hon. S. Coleridge*, 10481-513.
- Cruelty of jequirity experiments on rabbit's eye performed by, and without licence *J. W. Graham*, 5849-55, 6044-6, 6641-2.
- Jequirity experiments performed by, in connection with study of sympathetic ophthalmia *Sir H. R. Swanzy*, 9921-8.
- References, 11137, 11150.

SHEEP DISEASES :
- All, are acute febrile diseases *D. J. Hamilton*, 20250-3.
- Bactericidal properties of sheep's blood introduce a most confusing element into problem of discovering prophylactic for, *D. J. Hamilton*, 20166-70.
- Black quarter diagnosed frequently as braxy, and remedy for latter disease does not meet case of, *D. J. Hamilton*, 20112-3.
- Board of Agriculture experiments in connection with investigation of, *D. J. Hamilton*, 20114-7.
- Braxy :
  - and Anthrax possibly related *D. J. Hamilton*, 20146.
  - Average percentage of deaths from, in years 1901-3 *D. J. Hamilton*, 20119-20.
  - Bacillus of, discovered by Nielsen and corroborated by experimental investigation *D. J. Hamilton*, 20033-9, 20331-9.
  - Bacillus of, revealed by microscopical examination *D. J. Hamilton*, 20140-2.
  - Bacillus of, voided in soil *D. J. Hamilton*, 20130-2.
  - Better fed sheep are more susceptible to, *D. J. Hamilton*, 20291.
  - Essentially a disease of first year sheep, and hence suggestion that immunity is acquired through some agency in the soil *D. J. Hamilton*, 20059-63, 20219-20.
  - Experiments in connection with investigation of, *G. D. Thane*, 1141-4.
  - Experiments with preventive remedy discovered showed that death of drenched animals was not due to, *D. J. Hamilton*, 20134-7.
  - Failure of certain subcutaneous inoculations of, to produce immunity *D. J. Hamilton*, 20247-8.
  - Immunity from, conferred by preventive treatment generally lasts the lifetime *D. J. Hamilton*, 20183-4.
  - Lambs immune to, while suckling *D. J. Hamilton*, 20280-4.
  - Mortality from, considerably lower among drenched than undrenched sheep *D. J. Hamilton*, 20226.
  - Not primarily a blood disease, and therein differs from anthrax *D. J. Hamilton*, 20250A-6.
  - Origin and meaning of name, *D. J. Hamilton*, 20041-2.
  - Other diseases often diagnosed erroneously as, *D. J. Hamilton*, 20171.
  - Period of incubation *D. J. Hamilton*, 20293.
  - as to Risk in eating carcasses of animals that have died from, *D. J. Hamilton*, 20353-5.
  - Symptoms of malignant œdema often mistaken for, and hence results of preventive methods vitiated *D. J. Hamilton*, 20162.
  - Symptoms of, not in the least similar to those of ptomaine poisoning *D. J. Hamilton*, 20272-3.
  - as to Weather effects on outbreaks of, *D. J. Hamilton*, 20292.
- Clinical investigation had failed to discover cause of, *D. J. Hamilton*, 20214-5.
- Conditions of pens or folds as affecting, *D. J. Hamilton*, 20295-301.

SHEEP DISEASES—*cont.*
- Cure for, not claimed to have been discovered, but preventive remedy obtained *D. J. Hamilton*, 20127-9.
- Date of first drenching methods adopted *D. J. Hamilton*, 20181-2.
- Departmental Committee appointed to investigate, *D. J. Hamilton*, 19990-5.
- Distinction between different, sometimes confused *D. J. Hamilton*, 20154, 20268.
- Essential that experiments should be performed where the disease is found, and not in laboratory *G. D. Thane, D. J. Hamilton*, 373-3, 20207-8.
- Experimental investigations pursued have been approved in Scotland *D. J. Hamilton*, 20196-200.
- Experiments in connection with, all conducted under licence *D. J. Hamilton*, 20122.
- Experiments in connection with, were inoculations and caused no pain *D. J. Hamilton*, 20118.
- Experiments with object of obtaining immunisation from, and remedy arrived at *D. J. Hamilton*, 19987-9, 20056-8, 20064-83.
- Farmers have given every encouragement to drenching method of immunisation *D. J. Hamilton*, 20230.
- Immunisation from, secured by drenching throats of animals and success of remedy in particular instance *D. J. Hamilton*, 20083-110, 20185-94, 20238-47.
- Inoculation with bacilli of, attended with risk, but its administration by drenching process at proper season of year safe *D. J. Hamilton*, 20311-14.
- Inoculation with virus of, produced all the symptoms of the disease *D. J. Hamilton*, 20233-4, 20269-70.
- Louping Ill :
  - Bacillus of, not found by microscopical examination, but invariably discovered after incubation of peritoneal liquid *D. J. Hamilton*, 20259-61.
  - Best mode of investigating, was by allowing animal to die and examining peritoneal fluid *D. J. Hamilton*, 20179-80.
  - Caused by specific bacillus inhabiting intestine and method of its spread *D. J. Hamilton*, 20029-32.
  - Derivation of name, *D. J. Hamilton*, 20279.
  - Experiments in connection with investigation of, *G. D. Thane*, 1141-4.
  - Experiments to test theory that ticks communicated, were negative except in instance where tick was swallowed *D. J. Hamilton*, 20174-8.
  - First investigations into, carried out in valley of the North Tyne *D. J. Hamilton*, 20006-7.
  - Inoculations of blood and cerebro spinal fluid produced negative results *D. J. Hamilton*, 20016-19.
  - Liquid in peritoneal cavity of sheep suffering from, injected into healthy animals with fatal results *D. J. Hamilton*, 20020-8, 20212.
  - *Post-mortem* examinations revealed nothing as to cause of, *D. J. Hamilton* 20012-16, 20126.
  - Pyemia, no evidence of *D. J. Hamilton*, 20262-6.
  - Symptoms and fatal results of *D. J. Hamilton*, 20008-11.
- Mortality statistics not always reliable owing to difficulty of differentiating between, *D. J. Hamilton*, 20340-8.
- Popular remedies for, quite useless *D. J. Hamilton*, 20050-3.
- Prevalency of, and disastrous effects on sheep farming in Scotland *D. J. Hamilton*, 19996-20004.
- Prophylactic acting simultaneously against all, as to possibility of discovering, *D. J. Hamilton*, 20147-9, 20163-4.
- Prophylactic, its preparation and as to charge for its distribution *D. J. Hamilton*, 20350-1.
- Prophylactic method of drenching not new, *D. J. Hamilton*, 20320-4.
- Prophylactic treatment, how suggested *D. J. Hamilton*, 20329-30.
- Prophylactic treatment, its general success *D. J. Hamilton*, 20349.
- Romney Marsh outbreak, uncertainty as to specific nature of, *D. J. Hamilton*, 20155-9.

Sheep Diseases—*cont.*

Several contagious, between which it is neccessary to discriminate by bacteriological investigation *D. J. Hamilton*, 20139, 20143-5.

Sheep-pox:

Alleged discovery of its cause invalid and organism not yet identified *S. Stockman*, 2732-3A.

Experiments upon pathology of, *Sir J. Russell*, 575-6.

Sherrington, Professor:

Address to chemists and druggists by, and alleged subsequent illegal exhibition of experiments *Hon. S. Coleridge*, 10330-70.

Brain experiments by, and their value *E. A. Schäfer*, 10009.

Chemist and Druggist case, action in, *Hon. S. Coleridge*, 10330-70.

Experiments by, alleged cruelty *Mrs. K. Cook*, 1793, 1910, 2083-5.

Exhibition of rabbit with ligature round optic nerve by, *Mrs. K. Cook*, 1793.

Experiments in connection with brain localisation by, *E. A. Schäfer*, 10112.

Experiments on nerves by, of great value *H. Head*, 17836-65, 17926-7, 17971.

Physiological classes of, *F. Gotch*, 13820-1.

References *Miss Lind-af-Hageby*, *F. Gotch*, 7411, 13575.

Shiga, bacillus of bacterial dysentery first isolated by, *C. J. Martin*, 11755.

Shipman, Dr., question asked in House of Commons by, *re Hon. S. Coleridge*, 10559-64.

SHORE, L. E., M.D., Lecturer on Physiology at Cambridge University, 19428-19483:

Anæsthesia, personal experience of, resulting in conclusion that painful sensation is first to be abolished under, 19479-81.

Chloroform:

Cross circulation experiments performed by:

Circumstances attending performance of, laboratory assistant's evidence, *W. Hall*, 21581-35.

Dogs insufficiently anæsthetised in, morphin alone being given, *Lieut.-Col. Lawrie*, *Sir G. Kekewich*, 16810-21, 16922, 16969-74, 20457-62, 20966-21372.

Object of, circumstances attending, and contradiction of allegations *re* cruelty of, *L. E. Shore*, *H. K. Anderson*, *W. H. Gaskell*, 19430-1, 19437-63, 19472-7, 21636-704, 21373-580.

Shuttlefast Farm, municipal laboratory at, *G. D. Thane*, 342.

Sibson, Dr., evidence of, before previous Royal Commission as to insensibility of animals to pain *S. F. Smith*, 13049-56.

Simon, experiments on human beings by, *E. H. Starling*, 3899-901.

Simon, Sir J., late Medical Officer of the Local Government Board:

Caution by, to investigators employed by Local Government Board against engaging in painful experiments *W. H. Power*, 4419-22.

Experiments under a Government Health Department first instituted by, *W. H. Power*, 4405-8.

Explanatory minute by, as to functions of Local Government as regards experiments *W. H. Power*, 4299.

Simon of Heidelberg, kidney removed from dog by, previous to performing similar operation upon female patient *H. Morris*, 7786-8.

Simple Continued Fever, decrease in prevalence of, in Malta after adoption of preventive measures *Col. D. Bruce*, 14381-93.

Simpson, Professor, anæsthetic properties of chloroform discovered by, *Sir L. Brunton*, 7118-9.

Simpson, Sir J. Y., M.D., D.C.L., action of drugs investigated by, *A. R. Cushny*, 5149

Skolberg, Mr., measures adopted by, in treatment of pneumonia *Sir L. Brunton*, 7176.

Slade School of Art, memorial presented to University College by students of, concerning hindrance to studies caused by cries of vivisected animals *Miss A. L. Woodward*, 8824, 8856-61.

Sleeping Sickness:

Anatomical change in brain brought about by, *Col. D. Bruce*, 14329-35.

Blood and cerebro spinal fluid of natives suffering from, found by microscopical examination to contain the suspected trypanosome *Col. D. Bruce*, 14324, 14500-1.

Blood of natives outside area of, examined and found free from trypanosomes *Col. D. Bruce*, 14324-5.

Cerebro spinal fluid in investigation of, examined because of effect of, on nervous system *Col. D. Bruce*, 14326-9.

Cerebro spinal fluid of natives suffering from, injected into animals and resulting symptoms were those of, *Col. D. Bruce*, 14325-9.

Claim put forward for a streptococcus as cause of, previous to discovery of trypanosome *Col. D. Bruce*, 14424-30.

Emaciation, not caused by, *Col. D. Bruce*, 14516-7.

Experiments in connection with the distribution of, by tsetse fly were valuable and essential, *Col. D. Bruce*, 14351-9.

Experiments on monkeys absolutely necessary in the investigation of, *Col. D. Bruce*, 14350-1.

Experiments on rats and rabbits in connection with investigation of, *G. D. Thane*, 1311-12.

Experiments proving that tsetse flies are carriers of, and as to distribution of the disease *Col. D. Bruce*, 14335.

Filaria perstans at one time asserted to be cause of, *Col. D. Bruce*, 14431-5.

Investigations into, on west coast of Africa, *Col. D. Bruce*, 14321-9.

Khartoum dog, case of, *C. J. Martin*, 12137-40.

Monkeys inoculated with, do not undergo pain *Col. D. Bruce*, 14514-5.

Monkeys inoculated with blood of persons suffering from, and disease thereby produced *Col. D. Bruce*, 14502-3.

Parasite in, closely related to malarial parasites and easily affected by drugs *Col. D. Bruce*, 14319-20.

Previous investigations of, especially by Portuguese *Col. D. Bruce*, 14321.

Reasons justifying conclusion that trypanosome is cause of, *Col. D. Bruce*, 14329-35.

Royal Society, investigations into, *Lord Rayleigh*, *Col. D. Bruce*, 5557, 5567-8, 14315, 14321.

Suggested remedies for, and as to their value *Col. D. Bruce*, 14318.

Tsetse fly not cause of, *G. G. Bantock*, 15032-5.

Smallpox:

a Bacillus not cause of, *G. G. Bantock*, 14545-6, 14636-8, 14897-902.

Local Government Board have not of late years experimented with view to inoculating cows with, *W. H. Power*, 4483.

No specific bacillus of, yet discovered *Sir R. D. Powell*, *C. J. Martin*, 5666-71, 11904.

Vaccination against, *see* Vaccination against Smallpox.

Smidovich, Dr.:

Experiments on human beings with syphilis quoted by, *J. H. Levy*, 18543-5.

Quotation from book of, with reference to necessity of being indifferent to animal suffering *J. H. Levy*, 18497, 18538-9.

Reference *J. H. Levy*, 18643-5.

Smith, Dr. G., diphtheria outbreak at Cambridge controlled by precautionary methods and use of antitoxin by, *G. S. Woodhead*, 15528-9.

SMITH, J. LORRAIN, M.A., M.D., Professor of Pathology in the Victoria University, Manchester, Pathological Society of Great Britain and Ireland: 18168-18462.

SMITH, J. LORRAIN, M.A., M.D.—*cont.*

Anæsthesia maintained throughout all cutting experiments, and no cruelty ever witnessed 18280-3.

Arterial sclerosis:

Experiments on animals justifiable in order to define cause of, 18435-6.
Discovery that adrenalin will cause, gives means of studying development of, 18288-96.
Investigation of, especially demands experimental methods 18236.
Not yet known whether that induced by adrenalin in animals is similar to that found in human beings 18436-9.

Certificates A and B held by, 18362-7.
Certificate B, anæsthetics used throughout experiment under, 18368-9.
Difficult to say whether identical disease found in diseased animal can be induced in another animal 18437-8.
Diphtheria, diagnosis of, in guinea-pig after inoculation possible within forty-eight hours 18449-51.
Experience of, in experimental work 18328.
Experiments in connection with investigation of conjunctivitis performed by, 18215-26.
Experiments on animals necessary to test conclusions arived at by study of morbid anatomy 18310-11.
Jequirity experiments performed by, on behalf of Dr. Cecil Shaw, and explanation of case 18402-423.

Joint diseases:

Research into, especially requires experimental investigation 18267-74.
Rheumatoid arthritis, nothing definite with regard to, has yet been discovered 18457.

Licences, further restrictions in obtaining, would hamper research 18277-8.
Manchester, steps taken in, to test milk and diminish tuberculosis approved by medical officer of health 18344-7.

Manchester University:

Demonstration experiments not performed at, but would be very valuable 18424-8.
Mr. Graham did not give evidence on behalf of, 18372-9.
Public Health Laboratory, diagnosis experiments conducted in, nature of investigations and animals used 18175-209.
Statement as to general views of, 18174.

Nervous diseases:

Due to a form of tissue degeneration and advance in knowledge concerning cause of, owing to experiments 18262-7.
Experimental research bearing upon cause and possible prevention of, 18312-19, 18388-90.

Pathological investigation requires direct observation in early stages of disease, and hence necessity of recourse to experimental methods 18235-6.
Pathological Society of Great Britain and Ireland; Evidence on behalf of, 18172.
Membership and aims of, 18228-35.

Pneumonia:

Caused by submitting animal to atmosphere of pure oxygen 18239-42, 18297-303.
Discovery by experimental methods of non-bacterial agent causing, 18238-42.
Fact that excess of oxygen can produce, implies caution as to its use in treatment 18304-9.
That caused by oxygen is progressive, and tends to fatal issue though germ free 18340-3.

Professional and hospital work of, 18370-1.

Ptomaine poisoning:

Animal experimentation is surest method of diagnosing, 18227.
Condition of animal suffering from, 18444-8.

SMITH, J. LORRAIN, M.A., M.D.—*cont.*

Starvation experiments:

Conducted for purpose of investigating fatty degeneration of the heart 18242-62, 18440-3.
Knowledge acquired from, has borne upon treatment for fatty degeneration of heart 18391-401.
Performed in Germany, and no similar investigations in this country 18320-5.

Tracheotomy never performed on animal before administration of anæsthetics to knowledge of, 18431-2, 18460-1.

Tuberculosis:

Diagnosis of, after inoculating guinea-pig possible within six weeks 18452.
Inoculation experiments have successfully detected existence of, in cows in Manchester 18353-7.
Microscopical examination of milk unreliable, and fails to discover bacilli of, 18349-51.

Unnecessary to give further publicity to names of those engaged in experimental work 18329.

Vivisection Act, 1876:

Anti-vivisectionist's statements regarding cruelty and pain inflicted under, are misrepresentations of fact 18330-7.
No objection to, 18275-6.
No violation of, ever witnessed 18326-7.

PYE-SMITH, DR., reference, *S. F. Smith*, 13049.

SMITH, STEPHEN FRANCIS, M.R.C.S., 13030-538.

Anæsthesia:

Disbelief in statements that movements of animals under, may be reflex actions 13469-72.
Reasons for supposing sharp dividing line between consciousness and, 13082-3.

Anæsthetics more difficult to administer to dogs than to human beings 13082.

Anti-vivisection Hospital:

Origin of name 13033-7.
Personal appointment at, and size of staff 13476-80.
Sera or antitoxins not used in, 13473-5.

Anthrax, bacteriological origin of, admitted 13446.

Curare:

Admissions before last Royal Commission as to experiments performed under, 13054.
All indications of anæsthesia are absent under, 13084-98.
Anæsthesia is impossible in curarised animals and as to general use of, 13498-504, 13519-26.
Experiments in which it was used 13068-77.
Pain intensified by, 13078-82, 13295-302.
Proportion of experiments reported in *Journal of Physiology*, in which is used, 13290-4.

Diphtheria:

Antitoxin:

Fallacies of statistics relating to, 13359-65, 13422-34.
Speculative objections to, 13229.

Conditions necessary before reliable statistics can be obtained 13244.
Fallacies underlying statistics and comments on such, 13235-59.
Klebs-Loeffler bacillus is not cause of, and opinion supporting this contention 13229-31, 13436-42.
Probability of varieties of, and doubts as to communicability between men and animals 13336-43.

Drug experiments, their useless nature, 13000-105, 13386-9.
Experience of, in physiological laboratories, 13265-89.
Experiments objected to on ground of pain inflicted 13448-61.

SMITH, STEPHEN FRANCIS, M.R.C.S.—*cont.*

Experiments on Animals, by Stephen Paget, criticism of accuracy of statements made in, 13099-132.

Foreign experiments, difference in nature of, and those in England admitted to certain extent 13486-97.

Hydrophobia, no personal experience in treating, 13215-6.

Malaria, experiments on birds not essential in proving that mosquitoes convey, 13114-117.

Morphia, views concerning unanæsthetic powers of, now modified 13515-17.

Myxedema:

Connection between thyroid gland and, could have been discovered without experiments 13325-335.

Criticism of Mr. Paget's statements with regard to, 13130-1.

Pain:

Amount of sensibility of animals to, as compared with men 13038-44.

Animals may suffer without vocal manifestations of, 13061-4.

Erroneous views of medical men as to comparative insensibility of animals to, 13046-51.

Evidence of, inflicted by experiments derived only from reports 13065.

Physiologists' sensibilities to, blunted 13061.

Sensitiveness of animals to, 13535-8.

Seventy-one per cent. of experiments published in *Journal of Physiology*, from 1896 to 1900 were cutting experiments 13065-8.

Statements with regard to absence of, in experiments doubted 13464-8.

Pamphlet on diphtheria and antitoxin by, statistics in, do not go beyond year 1900 13527-34.

Pasteur's Treatment of Hydrophobia:

Case against, founded on contention that the statistics are fallacious 13400-21.

Pasteur's case mortality compared with case mortality of text books, and internal evidence showing latter to be wrong 13154-213.

Statistical objections to curative value of, 13136-13212.

Scientific Research, by:

Experiment performed at University College with insufficient anæsthesia, described in, 13303-15.

Indications of anæsthesia are absent in curarised animals, 13316-18.

Object of writing 13261-4.

Statement in, as regards unanæsthetic powers of morphia 13316-18.

Serum treatment in suppuration and blood poisoning, criticism of statements made by Mr. Paget as to, 13121-9.

Surgical cleanliness in experiments on animals, difficulties in ensuring 13068, 13365-72.

Tetanus antitoxin, criticism of Mr. Paget's statement as to use of, 13132-5.

Typhoid fever, inoculation against, does not diminish incidence of disease as shown by statistics 13109-113, 13394-9.

Vivisection Act, 1876, has not made any practical modifications of practice of vivisection 13455-61.

SMITH, NOBLE, letter to, *re* "incomplete anæsthesia" *Hon. S. Coleridge*, 10993.

SNAKES, Indian surgeons trained to identify, *Major L. Rogers*, 8051-3.

SNAKE POISON:

Antidotes advocated, futility of certain, *Major L. Rogers, C. J. Martin*, 8202, 12271-82.

Antidotes efficiently tested by experiments on animals *Sir L. Brunton*, 7169-73.

SNAKE POISON—*cont.*

Antidotes for, may be justifiably used if not in themselves products of vivisection *Rev. L. S. Lewis*, 8741-5.

Antidotes, present knowledge of, founded on results of experiments which have shown principal action of, *Major L. Rogers*, 8032.

Charmers immunize themselves by small inoculations *Major L. Rogers*, 8206.

Clinical investigations have failed to discover successful antidotes for *Major L. Rogers*, 8138-40.

Cobra, experiments with, led to discovery of principal action and antidote *Major L. Rogers*, 8032.

Experiments with object of discovering anti-venins disapproved of, *Mrs. K. Cook, J. W. Graham*, 1990-3, 5847-55, 6059-69.

Ligature not sufficient treatment for, *Major L. Rogers*, 8093-5, 8212-16.

Mortality from, depends upon amount of venom injected and period elapsing between bite and treatment *Major L. Rogers*, 8103-8, 8172-8.

Mortality from, reduced owing to introduction of anti-venin *Sir L. Brunton*, 6870-9.

Mortality in India from, and returns *Major L. Rogers*, 8071-80, 8039-92.

Nature and chemical composition of, *Major L. Rogers*, 8082-6.

Permanganate of potash antidote:

Acts against all snake poisons and method of applying, *Sir. L. Brunton*, 6833-7, 6861-5, 6868-9.

Calmette's treatment and, should be combined *Major L. Rogers*, 8114-15.

Difficult to induce Indian natives to carry, and lancet for injection *Major L. Rogers*, 8273-6.

Effects of, *Major L. Rogers*, 8146-7.

Injection of solution not efficient *Major L. Rogers*, 8121-7.

Method of applying, and adoption of treatment in India *Major L. Rogers*, 8040-70, 8109-12.

Method of applying, and advisability of its speedy use after bite *Major L. Rogers*, 8040-70, 8121-7, 8146-7, 8166-70.

Most practical, and adopted by Indian Government *Major L. Rogers*, 8040-70, 8109-12, 8128-32, 8217-18.

Success of, when used, but universal distribution of, difficult *Sir L Brunton*, 6870-8.

Successful use of, in Egypt *Major L. Rogers*, 8179-80.

Viperine, adrenalin to some extent counteracts fall of blood pressure due to, *Major L. Rogers*, 8133-7.

See also Anti-Venins *under* SERUM THERAPY.

SNOW, H., M.D., Parliamentary Association for the Abolition of Vivisection 2097-422.

Actinomycosis coccidial tumour, errors in diagnosing, 2133

Anæsthesia, general, of human beings sometimes prohibited by patient's condition 2399-400

Anæsthesia, maintenance of, in human operations 2379-91.

Animals should not be differentiated with regard to their exemption from experiments 2238-41, 2397-8.

Cancer:

Ample supply of living cells of, obtainable from human beings 2206-8.

Autositic theory the only valid theory of, 2152-6.

Bacillus of, not yet found 2347-54.

Causal bacillus of, no evidence as to 2248-9, 2272-87.

Clinical characteristics of, and importance of such 2301-12.

Clinical experience necessary for proper investigation of, 2139, 2190, 2194-8.

Communicable only with great difficulty between men and animals 2176.

Communicable with difficulty between human beings 2247.

as to Communicability of, between animals of the same species 2178-81.

Congress for investigation of, suggested by, 2210-10A.

SNOW, H., M.D.—*cont.*
Cancer—*cont.*
"Control" experiment neglected in investigation of, 2127-8.
Definition of, 2144-9.
Diagnosis of, importance of examining individual cells 2201-2.
Diagnosis of, should rest mainly on clinical symptoms, but may be confirmed by microscopical examination 2250-4, 2403-4, 2416-8.
Disappearance of, in human subject, no authentic cases 2215.
Distinction between species and genera of, almost wholly ignored 2127, 2139.
Errors in diagnosing external, should be rare 2419-22.
Exists in a few domestic animals and experiments in connection with tumours in other animals require verification 2265-7.
Failure in research due to lack of clinical knowledge 2344-6.
as to Foreign experiments with view to communicate, to human beings 2258-9.
Main feature of, is multiplication of cells by division 2157.
Mortality from, increasing 2405-9.
Negative results of research 2410-12.
Numerous experiments in connection with investigation of, and useless conclusions of such 2221-3, 2243-6.
Reproduction of, no progress made in, 2175.
Research Fund:
Authorities directing, 2113.
Causal organism of cancer never proclaimed by, 2246A.
Experiments of, no personal knowledge as to, 2187.
Reports of, on specimens of tumours, not founded on clinical bases 2194-8.
Title of article on "Transplantation of Malignant New Growths" in Report of, not warranted by substance 2108-19, 2265-7.
Unsatisfactory conclusions of, 2118-20.
Work of, useless as far as concerned with investigations of Jensen's tumour 2163.
Research into, its proper nature 2138-9.
Serum advocated in France for treatment of 2256-7.
Systematic tabulation of knowledge of, already acquired, necessary 2413.
Curare objected to, and should be prohibited 2229-30, 2235, 2328-9, 2357-75, 2392-4.
Demonstration experiments unjustifiable 2233-5.
Endothelioma, doubts as to its cancerous nature 2172.
Evidence of, given at request of Parliamentary Association for Abolition of Vivisection 2334.
Experiments on animals desirable only under certain conditions 2263-4.
Experiments on animals not witnessed by, as medical student 2217-20.
Experiments on animals should only be allowed under exceptional conditions 2227-8.
Formerly Senior Surgeon to Cancer Hospital, Brompton, 2098.
Jensen's tumour, doubts as to cancerous nature of, 2295-300.
Letter from, as to "incomplete anæsthesia" *Hon. S. Coleridge*, 10313.
Licences, special, should only be issued for each set of experiments 2235-7, 2414-5.
May claim to be an authority on subject of cancer, 2140-4.
Mice:
Cancer in, totally different from that in human beings, and consequent uselessness of experiments on, 2105, 2121.
Jensen's tumour predominates in, 2120-1.
Tumour in, doubts as to its cancerous nature 2125, 2127.
Tumour in, incorrectly diagnosed as cancer 2134-7A, 2188-9.
Phthisis, claims for cure of, 2261-2.
Took no part in International Congress for cancer research 2212-14.
SNOW, H., M.D.—*cont.*
Tumour in dog incorrectly diagnosed as cancer 2127-34.
Tubercle baccillus discovered soon after foundation of bacteriology 2355-6.
Vivisection Act, 1876:
Increase of experiments under, and possible consequences of its repeal 2395.
Restrictions of, have not hindered scientific research 2231.
Should be abrogated with reservations 2336-43.
Work of, ignored by medical profession 2160-2.

STARLING, E. H., M.D., F.R.S., Professor of Physiology at University College, London, Committee of Medical and Scientific Societies, 3430-4280.
as to Abnormal conditions imposed by experiments 4217-20.
Adrenalin:
Discovered by experiments on animals 3555-60, 3567A, 3886-8.
Experiments have still to be performed for satisfactory means of synthetising 3561.
Obtainable at present only from manufacturing chemists and expensive 3564-6.
Preparation and testing of, 3818-22.

STARLING, E. H., M.D., F.R.S.—*cont.*

"Advancement of physiological knowledge" sufficient certification in applying for Certificate B 4005-16.
All experiments conducted under anæsthetics in laboratory of, 3944-7.

Anæsthesia :
Complete, can be maintained for long periods 3470.
Condition of patient under profound, 3755-7.
Different degrees of, in different operations, 3889-90, 4062.

Anæsthetics :
Absence of, would not justify no experimentation but would limit number of operators 4160.
Effectiveness of, determined by blood pressure, 4053-4.
Method of administering, and completeness of anæsthesia 3603-6, 3828-35, 3878-80, 4154-9, 4242-52.
More given to animals than to man and former occasionally overdosed 3601-2.
Narcotics administered as well as, and reasons 3607.
Statement as to neglect of, during experiments, untrue 3639-56.
Use of, implies certain deviation from normal conditions, but their effect can be allowed for in judging experiment 4202-10.

Animals do not show apprehension in laboratories 3885, 4024-6.
Animals sometimes killed after experiment by blowing into veins 3912-16.
Animals speedily killed if found to be in pain after operation 4017-21.
Antiseptic precautions, occasional failure of, in operation necessitate killing of animal 3952-3.
Antiseptic treatment, statement that pain is not diminshed by, untrue 4110.
Antivivisectors, unjustifiable methods adopted by, to excite public feeling 3707-8, 4273.
Applications for licence or certificate not signed by, without knowledge of applicant and proposed experiments, 3739-43.
Aseptic treatment of wounds has abolished pain 4105-10.

Association for the Advancement of Medicine by Research :
Constitution, aims and functions of, 3859-77.
Procedure adopted by, in considering applications for certificates 4184-8.

Mr. Bayliss' experiments referred to by Mrs. Cook conducted under efficient anæsthetics 3639-55.
Benefit conferred on mankind by experiments on animals 4271-2.
Drs. Brodie and Halliburton's experiments referred to by Mrs. Cook performed under complete anæsthesia 3657-8.
"Brown Dog," as to alleged contravention of Act in performance of second experiment on, 3659-60, 3695-705.
"Brown Dog," experimented upon by, and breach of Act occasioned by not killing it immediately after operation *Hon. S. Coleridge*, 10470-6, 11158-9.
Caisson Disease, nature of experiments in connection with investigation of, 3902-910.
Cancer, trial of new remedy for, now being demanded 3993-4.
Carelessness in experiments or omission to kill animal when required, no evidence as to, 3919-20.

Certificates :
B, development of physiology likely to necessitate increase in applications for, 4119.
D never used 3851-3.
Refusal of certain, by Home Office 3948-51.

Choice of animals for physiological investigation, 3445.
"Classical experiments," meaning of term 3446-51.
Committee of Medical and Scientific Societies, object of forming, 3727-32.
Dr. Crile's experiments, conducted under efficient anæsthesia 4142-52, 4237-9.

STARLING, E. H., M.D., F.R.S.—*cont.*

Curare :
Anæsthesia well established before administration of, 4251-3.
Nature and action of, 3614-26.
Never administered with anæsthetics under Certificate B 4056-61.
Never regarded as an anæsthetic, 4115.
Statement that pain is intensified by, untrue 4111.
Use of, and as to suggested restrictions 3975-80.

Demonstration Experiments :
Importance of, in teaching physiology 3479-80, 4050-2.
No impediment in way of medical men desirous of attending, 4161-3.
Qualifications of students desirous of attending, 3541-54.

Diabetic coma, treatment of, is direct outcome of experiments 3813-17.
Difficulty of keeping pigs, sheep and goats in neighbourhood of laboratories renders them less available for experiments 4029-30.
Digestive processes, knowledge acquired by experiments 3842-5.
Digitalis, its action on heart revealed entirely by experiments 4262.
Docking of horses only causes superficial pain 3956-8.

Dogs :
Bacterial inoculations of, rare but dangerous to forbid same 4174-5.
Clause in Dogs Act forbidding sale of stray, foolish 3921-22.
Diabetes produced in, and resulting symptoms 4042-8.
Experiments on, essential and conducted without suffering 3966-9.
Method of anæsthetising, and apparatus employed 3585-88.
More difficult to anæsthetise than men 3481-4.
Number and nature of experiments on, at University College 3470, 3527-33.
Number of experiments on, at University College 4033-4.
Prohibition of experiments on, would irredemiably hinder advance of medical science 3479.
Psychical condition of, referred to in Huxley lecture 4230-4.
Purchase of for laboratory purposes 3519-22.
Prohibition of experiments on, would seriously hinder physiological research, 4035-6, 4235-6.
Professor Schäfer's experiments required use of 3569-84, 4039-40, 4078-81.

Drugs :
All, with one exception, introduced by means of experiments 4093.
Tested on animals before their adoption in Pharmacopeia 3991-2.

Elements of Human Physiology by, makes callous references to production of pain in experiments *Miss Lind-af-Hageby* 7354-63.
Enforced killing of animal on failure of antiseptic precautions for healing of wound 3477-9.
Engaged in work at Guy's Hospital and University College 3439-41.
Evidence of, agreed with *Sir H. R. Swanzy, W. Osler*, 9786-9, 16529.

Evidence referred to :
Admission as to necessity of pursuing scientific investigation in spirit of pure curiosity *J. H. Levy*, 18497.
Brown dog, contradictory statements as to health of, *Miss Lind-af-Hageby*, 9730-51.
Dogs, number of experiments performed on, *J. Hughes*, 17561-4.
Dogs, statement as to their behaviour in laboratories *J. Hughes*, 17582-4.
Home Office policy of consulting Association for the Advancement of Medicine by Research *Hon. S. Coleridge*, 11049.
Morphia, statement as to fatal dose for dog disagreed with *Miss Lind-af-Hageby*, 9262-9.

STARLING, E. H., M.D., F.R.S.—*cont.*
Evidence referred to—*cont.*
Pain, statement as to absence of, in experiments disputed *J. Hughes, Sir G. Kekewich*, 17575-9, 20428-33, 20533-47.
Prof. Pawlow's experiments, admiration expressed for, *Miss Lind-af-Hageby*, 7276.
Reference *J. W. Graham*, 5883.
Experiments conducted by, mainly for demonstration in teaching or pure scientific research 3502-24.
Experiments on animals are necessary preliminaries to knowledge of diseases 4200.
Experiments on animals, objects of, and as to past results of scientific research 3442-5.
Experiments on animals should be permitted for acquisition of surgical skill 3982-90.
Experiments on men both impracticable and undesirable 3791-5, 3799-805, 3899-901.
Experiments performed by, on gasserian ganglion of cats and alleged cruelty *Mrs. K. Cook*, 1919.
Experiments performed by, on action of fifth nerve and gasserian ganglion confused and misrepresented by Mrs. Cook 4132-40.
Experiments performed by, on superior cervical ganglion, carried out under complete anæsthetics and object of experiment 3666-76.
Experiments performed previous to 1840, before general use of anæsthetics 3445-9.
Failure to discover object of experiment does not condemn experiment 3692-3.
Fistulae:
Establishment of, cause discomfort but no pain 3762-7, 4222-5.
Nature of operation for establishment of, 3470-5.
Glaucoma, research in connection with, 4169-70.
Gout, pathology of, not yet known, 4272.
Government appointment not held by, 4171-2.
Harley and Barratt's experiments referred to by Mrs. Cook were not painful as alleged 3677-84.
Illegal use of dog for second experiment by, *Mrs. K. Cook*, 2014-18.
Immorality of law forbidding surgeons to acquire technical skill by experiments on animals 3490-4.
Inoculation experiments, few carried on in laboratory of, nor production of painful diseases 3940-3.
Inspection of experiments by *bonâ fide* laymen not objected to, 4164-7.
Inspection of laboratories, further, not objected to 3724-5, 3893-6, 4064-8.
Inspector's visits, as to number of, 3897-8.
Internal organs, as to afferent or sensory nerves in, 4101-4.
Professor Langley's experiments referred to by Mrs. Cook conducted under efficient anæsthetic *E. H. Starling* 3627-8.
Licence held by, since 1889 3437.
Licences and Certificates, method of granting, might be simplified 3723, 3981.
Medical science, aim of, and advances made by means of experiments 4192-9, 4260-1.
Methods adopted for killing animal at close of experiment 3488.
Moral objections of anti-vivisectionists, as to 3796-7.
Moral right to take animal life in interests of man, 3470.
Morphia:
Action of, 3836-40.
a Complete anæsthetic if given in large doses, 3610, 3759-60, 3970-3.
Narcotics, action of, 3836-40.
Necessity for so-called purely scientific research 4002-3.
No logical distinction but that of value can be drawn between use of men and animals for experiments 3995-7.
Number of licensed assistants working under, 3534-39.
Omnivorous animals, necessity of experimenting upon 4030-2.
Pain:
Capacity for, proportionate to grade of consciousness 3963-5.
Consciousness of, destroyed by removing cerebral cortex 3462-70.
STARLING, E. H., M.D., F.R.S.—*cont.*
Pain—*cont.*
Experiments never performed under circumstances in which animal is necessarily sensitive to, 4063.
Majority of experiments do not involve, 3445, 3883.
Movement under light anæsthesia does not indicate sensitiveness to, 3589-93.
Success of experiments demand elimination 3462-70, 3935-8, 4129-31.
Pancreas, fatal diabetes produced by extirpation of, 4124.
Professor Pawlow, unjust accusations of cruelty by Mrs. Cook against 3634-5.
Professor Pawlow's experiments on digestive processes, their results practically accord with those of, 4226-9.
Physiological investigation, as to places for pursuit of, 3445.
Physiological laws can be traced with same accuracy as chemical or physical laws 4211-15.
Physiological research, chief results of, published in medical journals 4180-1.
Physiology, advanced by experiments on living animals 3715-18, 3768-75.
Physiology, its scope and aims 3442.
Poisoning by coal gas and charcoal fumes, method of treating, arrived at by experiments 3809-10.
Repetition of experiments, danger of making general statements as to unnecessity for, 3846-50.
Research by purely scientific men necessary for advancement of medical and surgical knowledge, 3733-8.
Responsibility in experiments on animals increases with their kinship to men 4128.
Revival of over anæsthetised animal, methods adopted 3481-7.
Shambles of Science, as to allegation of cruelty contained in, 4274-80.
Starvation experiments not attended by pain 3686-7.
Students are taught to adminster anæsthetics 3750-2.
Students should be permitted to acquire surgical skill by experimenting on animals 3744-9, 3751-4, 4255-6.
Dr. Thompson's experiments, misrepresented by Mrs. Cook 3636.
Valuable physiological knowledge has been attained without experiment 3781-9.
Viscera have no sense of pain 3677-80.
Vivisection Act, 1876:
Clause forbidding surgeons to acquire skill by experiments under Certificate B should be removed 4082-91.
Clumsy but administered well 3720-21, 3998.
Vivisection not unfairly protected under, 4069-72.
Unnecessary to alter, to any great extent 4073-7.
Work abroad of, and observations as to greater humanity with regard to animals in England 3709-13.
Work of regarding secretion and excretion of eye, *Sir H. R. Swanzy*, 9839.
References, *G. D. Thane, Sir R. D. Powell, E. A. Schäfer*, 1546, 5610-11, 10054.
S.S. Joshua Nicholson, Malta fever on board, traced to goats' milk *Col. D. Bruce* 14400-4.
S.S. St. Nicholas, cases of Malta fever on board, arising from drinking milk of goats imported from Malta *Col. D. Bruce* 14283-7.
Steiner, experiments by, referred to *Miss A. Kenealy, Miss Lind-af-Hageby*, 5288, 9582.
Stephen, Leslie, anti-vivisection cause supported by, *Hon. S. Coleridge*, 10262.
Stevenson, Dr., Home Office Analyst:
Certificate signed by Home Office Inspector, held by, *Hon. S. Coleridge* 10418-22.
Detection of poison in Lamson case by experiments *J. Glaister* 12844-50.

STEWART, G. N.:
Experiments performed by, under curare and no mention made of anæsthetics used *Hon. S. Coleridge*, 11053-70.
Manual of Physiology by, shows lack of humane teaching and preference for light anæsthesia *Miss Lind-af-Hageby*, 7223, 7234, 7253-62.

STEWART, SIR MARK, candidature of, at General Election opposed by National Canine Defence League *J. Hughes* 17212-3, 17287-95.

STILLING, cornea transplanted from eye of rabbit to man by, *Sir H. R. Swanzy* 9816.

STOCKMAN, S., M.R.C.V.S., Chief Veterinary Officer of the Board of Agriculture and Fisheries, 2423, 3429.
Animals used for preparation of anti-toxins show no visible signs of pain 2902-7.
Anthrax:
Blood in cases of, tested by veterinary surgeons, 3117-9.
Destruction of carcasses and careful disinfection not best method of dealing with, 2743-5.
Diagnosis of, depends on finding bacillus anthracis 2667-8.
Diagnosis of, difficult without recourse to experiments 2819-23.
Difficult in some cases to find bacillus of, after death 3120-4.
Outbreaks of, notified by Board of Agriculture to local authorities 2633.
Pasteur's preventive inoculations for, generally confirmed 2740-1, 3140-5.
Post-mortems in cases of, forbidden 3110-11.
Prevalence of, and inoculations against, with consequent reduction of death-rate, 2524-43.
Rival methods for prevention and cure of, 3308-14.
Sources of, in man 2634-41.
Bacterial and parasitic diseases of animals, distinction between, 2442-3.
Blackquarter fever, successful results of preventive inoculations 2544-55.
Board of Agriculture:
Annual number of experiments performed on behalf of, 2852-5.
Certificate B only used by, for rabies cases 2858-70.
Contagious diseases of animals, investigations at present conducted by, 2572-5, 2871-2.
Diagnosis of disease by experiments conducted by, but use made of work done by local authorities 3112-16.
Has no power at present of enforcing use of sera, as curative or diagnostic agent 3003.
Instructions as to use of tuberculin and mallein not issued by, 3248.
Knife and anæsthetics rarely used in experiments of, 2579-84.
Rabies tests conducted by, 3125-8.
Castration:
Attended by considerable pain 3626-31.
Certificates B and F would be required for, if performed for scientific purposes 2884-7.
Nature of operation on horses 2873-87.
Certificates held by, 2856-8.
Contagious Diseases of Animals:
All discoveries with regard to, due to experiments 2599-604, 2626-32, 2654, 2665-6.
Causal microbes of certain, can be demonstrated but others remain invisible 3061-66.
Clinical observation for diagnosis of, insufficient 2788-9.
Clinical observation of, not prejudiced by experiments 2655.
Correct diagnosis of, of utmost importance and in many cases requires confirmation by experiments on animals 2444, 2476-8, 3108-9, 3076-87, 3358-60.
Experiments in connection with diagnosis of, 2464-7.
Immunity from, can only be learnt by experiments 2476-8.

STOCKMAN, S. M.R.C.V.S.—*cont.*
Contagious Diseases of Animals—*cont.*
Inoculation of animals with preventive sera not desirable as matter of routine 2765-9.
Invisible organisms of certain, 3006-10.
Measures taken at ports to prevent importation of, 2466-75.
Official method of checking outbreaks of, is by slaughter 2993-7.
Organisms besides causal one may be sometimes found 3067-9.
Preventive inoculation, evidence against, considered 2747.
Preventive inoculation of great value in controlling spread of, 3320-1.
Slaughter and disinfecting processes for controlling, not desirable to abandon completely 2770.
Slaughter and inoculation as preventive agents 2714-22.
Slaughter for controlling, desirable to find alternative method to, 2944-8.
Slaughter irrational in dealing with sporadic, 2772-8.
Two distinct methods of obtaining immunity from, 3032-5.
Unsanitary conditions do not generate, 3322-8.
Cowsheds, cubic space desirable in, 3203.
Departmental nature of evidence given by, 2652-3.
Distemper:
Paralysis a symptom of, in young dogs 3135-6.
Possible effect of inoculating rabbit with, 3373-8.
Experiments on animals in France for purpose of acquiring surgical skill 3054-7.
Experiments performed by, their nature 2429-40, 2909-11, 2955-63.
First application for licence of, and experience of experiments, 2849-50.
Foreign experience of, 2950-4.
Formerly Principal Veterinary Surgeon in Transvaal Agricultural Department 2428.
Frivolity or cruelty in connection with vivisection, none 2610-3.
Glanders:
Attack of, may confer some degree of immunity 3259.
as to Communicability of, to men 3251-6.
Danger of, in occult form 2703-7.
Diagnosed generally by mallein test but alternative method exists 2941-2.
Knowledge of, entirely based on experiments, and immense value of mallein, 2807-18.
No protective serum against, but disease could be controlled by use of mallein and isolation 3260-4.
See also Mallein *below*.
Horse sickness, fairly accurate knowledge as to, derived from experiments 3388-402.
Inspection of cattle market carried out by local authorities 2462-3.
"Invisible virus," use of term 2841-2.
Mallein:
Curative powers not possessed by, 2981, 3257-8.
Discovery of, 2576-8.
Errors small in diagnosis of glanders by, 3235-45, 3379-83.
Generally accepted as diagnostic agent of glanders 3246.
Horses exported to Continent for horse meat tested on arrival with, 3250.
Preparation of, similar to that of tuberculin 3227-34.
Microbes, claims to identification of, in lesions misplaced 2779-85.
Nature of a pure virus 2502-6.
No foundation for statement that veterinary surgeons experiment on animals in contravention of law 2846-8.
Parasitic diseases of stock in this country a serious question 2643.
Pasteur Institute, visit to, 3058-9.
Pleuro pneumonia:
Cause of, identified to extent of obtaining virus 2699.

STOCKMAN, S., M.R.C.V.S.—*cont.*
Pleuro pneumonia—*cont.*
Microbe of, demonstrated by Professor Nocard 2790-6.
Nocard's researches in, adverse criticism, 2798, 2801-6.
Outbreaks of, in Great Britain and methods adopted for stamping out the same 2494-7.
Report of Departmental Committee to enquire into, 2691-8.
Prohibition of experiments on animals would seriously hinder investigation of disease, 2844-5.
Protective sera, their value 2943.
Protective sera, unnecessary to prepare, from diseased animal but inoculation with pure virus would cause disease 2964-71.
Rabies:
Anæsthetics required for inoculations of, under Certificate B 2590-7.
Inoculation of rabbit only serious experiment performed by, 3011-25.
Inoculation of rabbit with, and resulting symptoms 2912-19.
Microbe of, not visible 3130-1.
Pasteur's treatment for, 3140-5.
Reliability of inoculation test of, 3371-2.
Rhodesian Fever:
Koch's error in experiments re, and present knowledge of, 3331-50, 3403-8.
Transmitted by agency of blood sucking ticks 3410-4.
Rinderpest:
Bacillus of, not yet demonstrated 2684-51.
Cost of various outbreaks of, and study of methods of preventive inoculation 2480-90.
Experiments for investigation of, not in accordance with those conducted by Koch 3358.
Protective inoculations against, reported in Reports of Transvaal Department of Agriculture 2686-7.
Serum from animal which has suffered from infectious disease of little use until after hyper-immunisation of animal 3315-18.
Serum largely obtained from horses on account of quantity and cleanliness 3271-2.
Serum production, amount of blood drawn from horse for, 2618-23.
Serum treatment with regard to animal blood parasites not yet developed 3036-42.
Service of, in Transvaal and India 3329-30.
Sheep-pox, alleged discovery of its cause invalid and organism not yet identified 2732-3A.
Smegma bacillus plentiful in men and animals 3083-5.
Southern Nigeria, indigenous diseases in, practically annihilate domestic animals 2569-71.
Spaying of sows and bitches for non-scientific purposes 2889-7.
Swine erysipelas:
Pasteur's method of inoculating against, abandoned in Germany for newer method 2824-8.
Prevalence of, and nature of preventive serum 2556-67.
Swine fever:
Diagnosis of, difficult 2673-83.
Preventive inoculation the most successful method of dealing with, 2752-6.
Recent experiments have disproved former claim to discovery of organism of, 2835-40.
Tapeworms, experiments with object of acquiring knowledge of, 2445-60.
Tetanus:
Anti-Toxin:
Administered generally in cases of castration, docking and surgical wounds 3281-2, 3287.
Distinction between its uses as curative and preventive agent 2723-8.
First used for curative purposes 3296-302.
Immunity secured by, 2830-4.
Inoculations followed by no bad effects and duration of immunity conferred by, 2975-80, 3384A, 3296-302.
Standardisation of, can be effected without difficulty 3293-5.
Statistics point to value of, as preventive agent 3280, 3289-92.
Success in man, disappointing 2725-31.
Use of, as preventive agent 2507-23.
Value of, as curative agent, small and expensive nature of treatment 2644-9, 3276-9.
Clinical observation without experimentation would not give reliable information 3385-6.
Inoculations against, advisable 2920-39.
Mortality high in cases of, 2949.
Prevalence of, in certain parts of India, 2510.
Trichinosis, preventive measures arrived at by experiments 2461-3.
Tropical diseases:
Are very largely protozoa diseases and anti-serum treatment for such not yet developed 3039-50.
Experiments essential to investigation of, 2568-9.
Many, are insect borne and importance of preventing their importation, 2569.
Prospect of immunising animals against 2757-63.
Tuberculin:
Advisable to exclude all variations from normal conditions of animal during test 3178-89.
Disagreeable symptoms following injection of, may prevent its use as test in human beings 3159-61.
Discovery of, 2576-8.
Errors in use of, small 3379-83.
Farmers' use of, considerable 3197-202.
Koch's preparation of, and as to its rejection as a cure for tuberculosis 3146-55.
Limitations to reliability of, 3167-76.
Process of tuberculinisation in Denmark 3209-18.
Temperature of animal an important feature in test 3162-6.
a Test for tuberculosis in cattle 3156-8.
Use of, in Denmark has increased reputation of Danish butter 3204-18.
Used largely for testing animals for exportation 3219-21.
Tuberculosis:
Bacteriologists' opinion as to conveyance of, to children through milk 3095-7.
Common among caged monkeys and care taken to prevent their infection 3225.
as to Communicability of bovine, to man, 3100-3.
Curative sera not yet discovered 2982-7.
Diagnosed in cattle by inoculating guinea pigs with suspected tissue 3073-4, 3415-8.
German inquiries into relationship between human and bovine, 3368-70.
Knowledge of, chiefly based on experiments, 2660-4.
Koch's statement as to relation between human and bovine, 3366-7.
Local authorities conduct examination of cows, for detection of tubercle, 3427-9.
Microscopical examination of market milk not sufficient to detect tubercle bacillus 3363-5.
Microscopic examination of milk not an unreliable method of diagnosing 3361.
Overcrowding and lack of ventilation largely fosters but does not generate spread of, 3191-6.
Stamping out of bovine, can be effected by use of tuberculin and slaughter 3223-4.
Tubercle bacillus not generally found in human beings during early stages of, 3071.
Tubercle in milk diagnosed frequently by microscopic examination 3088-94.
Vivisection Act, 1876, restrictions of, satisfactory 2609, 2615-6.

Stoker, Dr. George, case of chronic ulcer treated by, in which presence of micro organisms in wound had beneficial influence *G. G. Bantock* 14723-7.

STOKER, SIR W. T., M.D., F.R.C.S. (Ireland) Inspector for Ireland under the Vivisection Act, 1876, 756-1070.

Administration of Vivisection Act in Ireland:
Humane and effective as regards research work 785, 907.
Improvements effected by Mr. Morley 853.
More continuity desirable 760-1, 782-3, 854, 1068.

Anæsthesia, complete, not possible in all operations 815-19.

Anæsthetics:
A.C.E. mixture more efficacious for animals than chloroform, 1023, 1025-7.
Chloroform, small doses of, dull pain 1029-36.

Association for the Advancement of Medicine by Research:
Doubts as to wisdom of consulting 1066-7.
No practice in Ireland of submitting applications for licences and certificates to society analogous to, 847.

Certificates:
C:
Annual number of experiments under 934-8.
Difference of opinion with Chief Secretary only in connection with issue of, 789.
Disapproved of, 869-904.
Inspector's advice *re* issue of, frequently over-ruled 796.
Memorandum against, 761.
Number of, in force in Ireland, 765-7.
Table showing cases in connection with issue of, 723-5.

Demonstration Experiments:
Annual Report shows number of, and places where they are performed 820-826.
Cruelty, no evidence of, in but suggested demoralisation of students attending 1042, 1050-1.
Frogs, their use for, not objected to 1056-7.
Unnecessary, and tend to demoralise students 760-1, 776, 802-5, 809-11, 838-43, 980-8, 1008-14, 1017-22, 1049, 1061.

Dogs:
Anæsthetisation of, doubts as to, 862-8, 891-2.
Experiments on, should be conducted with great reserve 807-8.
Extent of witness's experience of operations on, 863-8, 896-9, 1023-8.
Susceptible to death under chloroform 813-14, 836.
Terror of, in laboratories 1048.

Dublin University, vivisection not permitted at on time in, 770-4.

Evidence referred to:
Demonstration experiments disapproved of, *Sir G. Kekewich* 20519.
Demoralisation of students at demonstration lectures, statements as to, unfounded *Sir V. Horsley* 15606.

Experience of, in teaching students, 1058.
Experience of, in witnessing experiments, 947-52.
Experiments carried on for public institutions in Ireland, 776-7.
Experiments conducted by unlicensed persons, 913-15.
Experiments in Ireland, number of, and animals used 767, 914-4.
Experiments upon cholera, tubercle and pyemia still being conducted, 844-5.
Inoculation experiments, as to pain in connection with, 25605-7, 2614.
Inspection efficient in Ireland 966-7.
Inspection in certain places in Ireland conducted by Medical Inspector from the Local Government Board, 971-5.
Inspector assisted in places by Local Government Board Inspector's report, 831.

STOKER, SIR W. T., M.D., F.R.C.S.—*cont.*
Inspector's salary quite insufficient 787.
Inspects twice a year and no irregularities noted 796-7, 800.

Licences:
Applications for, go direct to Inspector and then to Chief Secretary 848-9, 924-5.
Inspector's advice as to issue of, sometimes over-ruled by Chief Secretary 932.
Issue of, procedure similar to that in England 789, 832-3, 920.
Number of, for class purposes in Ireland, 762.
Veterinary surgeons holding, 1043-4.

Licence and certificate issued for observation of prostate gland in dogs, 909-10.
Licensing authority in Ireland, change as regards, desirable 778-80.
Local Government Board should be licensing authority in Ireland, 855, 953-5.

Monkeys:
Act does not specify, 775.
Experiments on, should be conducted with great reserve 807-8.

Pain, entire absence of, in experiments cannot be certified 1063-5.
Prosecution of licensee requires consent of Chief Secretary 917-18.
Rabies successfully suppressed in Ireland 777, 860-1.

Registered places in Ireland:
List of, and statistics 764-767.
Private laboratories, reasons for their registration 770-4.
Public laboratories preferable to private 977-9.
Satisfactory condition of, 835

Sensitivenesss to sight of suffering increases with age, 1060.
Struggles of animals in severe operations are often reflexes, 1062.
Students witnessing operations in hospitals, no objection to, 989-1008.
References *G. D. Thane* 1089.

Stricker, Professor:
Experiments by, as to effect of chloral on rabbits *Sir L. Brunton*, 6785-6.
First experiments *re* action of strychnin made in laboratory of, *Sir L. Brunton*, 6898.
Reference *Sir L. Brunton*, 6953.

Sudbury, laboratory of Board of Agriculture at, *S. Stockman*, 2435-9.

SWAN, C. R. J. A., M.B., M.R.C.S., L.R.C.P., National Canine Defence League, 19192-19363.
Benefits obtained from experimental research admitted 19251-3, 19269-71.
Certificate B disapproved of, on grounds of subsequent pain after experiment 19302-9.
Clinical observation should supplement experimental observation, 19269.

Dogs:
All necessary experiments on, should be conducted under anæsthesia and morphia should be given to dull pain after recovery from anæsthetic 19254-6.
Anæsthetisation of, not doubted 19281.
Blood pressure experiments could be performed equally well on rabbits as on, 19214-20.
Canine diseases investigations may require experiments on, but other means preferred 19353-63.
Diffidence in opposing views as to necessity of experiments on, held by some members of the medical profession 19273.
Digestive processes can be tested by syphonage and no necessity of experimentation for this purpose 19221-30, 19317-25.
Digestive processes of absorption and secretion could be showed in pigs instead of, 19231-4.
Experiments on, justifiable for sake of discovering remedy for distemper 19291-7.

SWAN, C. R. J. A., M.B., M.R.C.S., L.R.C.P.—*cont.*

Dogs—*cont.*

Experiments on, justifiable if same can be proved to be of direct value to humanity 19289-19290, 19326-9.
Experiments on kidneys of, objected to 19246.
No reason to believe in ill-treatment of, in physiological laboratories 19286-7.
Not opposed to vivisection except as regards experiments on, 19199.
Objection to experiments on, met by guarantee of anæsthesia and consequent painlessness of operation 19262-3, 19282-5, 19326-9.
Objection to experiments on, mainly based on sentiment 19264-7.
Other animals should be substituted for, in experiments whenever possible 19256-8, 19332-9.
Pain anticipated by, instance of 19236-45, 19312-16.
Should be excepted from experiments on sentimental grounds 19199-203.
Students could be taught rise and fall of blood pressure by aid of diagrams and without recourse to experiments on, 19214-15.
Suggestion that stolen, are used for experiments 19347-9.
Utility of, for experiments over-rated and other animals could be substituted for, 19204 6.
Vivisectors themselves may have same feeling as witness with regard to desirability of excluding, from experiments whenever possible 19344-6.

No personal experience of experiments of recent years 19274-8, 19340-3.

SWANZY, SIR H. R., M.D., President of the Royal College of Surgeons in Ireland: 9752-9979.

Certain animals should not be exempted from experiments 9879-80.
Demonstration experiments should not have any further restrictions 9788-90, 9860-5.
Evidence referred to, *re* unnecessity of students acquiring operative skill by experiments on eye *Sir G. Kekewich* 20517-19.
Evidence tendered by, represents unanimous opinion of Royal College of Surgeons in Ireland 9881-7.
Eye specialist and traces success to knowledge gained by experiments 9757-9, 9853-9.

Eye-surgery:

Antiseptics abandoned for aseptic treatment in, 9955-61.
Cocaine chiefly used in, but animals would require general anæsthesia 9913-18.
Skill is progressive but would not be benefited by permission to students to operate on animals, 9891-7, 9968-70.
Transplantation of cornea in developmental stage 9904-5.

Eyes:

Ciliary body, functions discovered by means of experiments and clues afforded thereby to knowledge of disease 9799-804.
Clinical observation could not have obtained knowledge decided from experiments on, 9813-15.
Cornea transplanted successfully owing to previous experiment on rabbit 9816-18.
Endothelium, functions discovered and value of such knowledge in optical operations 9805-12.
History of experimental research and value of knowledge attained by experiments on, 9795-8.
Injection of suspected tuberculous aqueous humour into rabbit, for diagnostic purposes, 9819, 9941-7.
Knowledge of inflammatory processes gained by experiments on, 9791-4.
Sensitive to pain and injection of foreign substances for experimental purposes likely to produce pain 9951-4.
Sensitiveness to pain varies in different parts 9974-8.

SWANZY, SIR H. R. M.D.—*cont.*

Finsen light, possibility of utilising it, as eye bacteriacide suggested by experiments 9849-52.
Gain to intestinal surgery if students could operate on animals for purpose of acquirng skill, 9971-3.

Ophthalmic Diseases:

Cataract, knowledge of, gained by experiment 9841.
Conjunctiva disease, argyrol a remedy for, discovered by experiments on rabbits 9843-8.
Generally common to men and animals 9898-903.

Glaucoma:

At present only curable in early stages 9937-40.
Clinical observation has increased knowledge of, 9836.
Leber's experiments demonstrated reason of, and have led to use of eserin as remedy 9836-40.

Jequirity a remedy for, 9820-30.
Serum therapy now utilised for, 9819.
Successful treatment of, could not have been arrived at without experiments 9869-71.
Sympathetic ophthalmitis, experiments on animals with view to discover precise nature of, 9831-5.
Trachoma, nature and frequency of, 9907-12.

Pain is secondary to acquiring knowledge but effort should be made to safeguard against it, 9866-8, 9929.

Royal College of Surgeons in Ireland:

Constitution of, 9752-6.
Views of, on subject of experiments on animals 9762-81.

Dr. C. Shaw's experiments in connection with sympathetic ophthalmia 9921-8.
Vivisection Act, should be amended to permit surgeons and students to acquire manual skill by experiments 9786-9, 9875-80, 9888-90.
Wounds heal without pain, under aseptic conditions 9930-1.

Swine Erysipelas:

Diagnosis of, by experiment necessary *S. Stockman* 2464-7.
Pasteur's method of inoculating against, abandoned in Germany for newer method *S. Stockman* 2824-8.
Prevalence of, and nature of preventive serum, *S. Stockman* 2556-67.

Swine Fever:

Diagnosis of, by experiment necessary *S. Stockman* 2464-7, 2673-83.
Preventive inoculation the most successful method of dealing with, *S. Stockman* 2732-6.
Recent experiments in connection with have disproved former claims to discovery of organism, *S. Stockman* 2835-40.

Sylvester Method of Artificial Respiration, useless, *E. A. Schäfer* 10107.

Symes, Mr., method of administering chloroform employed by, quite satisfactory and based on clinical experience *Col. E. Laurie* 16963-5.

Syphilis:

Application to perform experiments as to, in monkeys would require to be urged by strong reasons, *Sir J. Russell* 684.
as to Cause of, *C. J. Martin* 12229-40.
Communicated to monkeys for purposes of experiment *J. H. Levy* 18544.
Discovery by means of experiments of a coccus in, *F. Taylor* 5831-2.
Experiments on men with, recorded by Dr. Smidovich *J. H. Levy* 18544.
Mercury a specific for, *A. R. Cushny* 5259-62.

Szymonowicz, adrenalin discovered by means of experiments by, *A. R. Cushny* 4808-9.

Tait, *The late* Mr. Lawson:

Anti-vivisectionists' misrepresentation of views of, *re* bacteriological experiments *H. Morris, Sir V. Horsley*, 7896-8, 15672-3.

TATE, *The late* MR. LAWSON—*cont.*
Listerian methods of surgery opposed by, *G. G. Bantock*, 14752-4.
Utilitarian results of experiments on animals denied by, *G. H. Burford*, 9097.
Reference, *G. D. Thane*, 1585.

TAKAKI, BARON, statement by, *re* successful inoculations against tetanus in Japanese Army, *H. Morris*, 7744-5.

TANNER, DR., fasting experiences of, *Hon. S. Coleridge*, 11048.

TARCHANOFF, PRINCE, views of, *re* danger of serum therapy *Miss A. Kenealy*, 6219.

TAYLOR, DR. C. BELL, Vice-president of National Canine Defence League *J. Hughes*, 17246.

TAYLOR, FREDERICK, M.D., M.R.C.S., Senior Physician to Guy's Hospital, Royal College of Surgeons, 5580-834.
Advanced students might be permitted to acquire manual dexterity by experiments on animals 5769-70.
Anti-pyretic nature of quinin and salicylic acid if given in large doses 5701-2.
Bacteriology, study of, impossible without animal experiments 5585.
Diphtheria:
Antitoxin:
Efficacy of, unanimity as regards, 5744-6, 5818.
Statistics showing decrease of case mortality due to use of, 5588-93, 5643.
General mortality from, as to non-decrease of, 5654-5.
Pneumonia is often cause of death in patients suffering from, 5829-30, 5833.
Drugs, necessity of testing, on animals before adoption in Pharmacopeia, 5585.
Experiments on animals essential to advance of medicine 5585.
Haffkine's experiments in connection with plague in India, 5597-9.
Mallein, success of, as diagnostic agent 5722-4.
Manual of Practice of Medicine written by, 5596.
Presidential address to London Clinical Society by, *Miss A. Kenealy*, 6165.
Regard and sympathy for suffering held by medical profession generally, 5834.
Syphilis, coccus of, discovered by means of experiments 5831-2.
Tuberculin:
Failure of, as curative agent might have been obviated by further experiments with regard to properties of, 5695-700.
Influence of, in treatment of tuberculosis 5594.

TENNYSON, *The late* LORD, anti-vivisection cause supported by, *Rev. L. S. Lewis*, *Hon. S. Coleridge*, 8276, 10262.

TETANUS:
Antitoxin, *see under* Antitoxins, *under* SERUM THERAPY.
Clinical observation without experimentation would not give reliable information in cases of, *S. Stockman*, 3385-6.
Excision of thyroid gland in man, dogs, and cats, followed by *G. D. Thane*, 1233.
Experiments in relation to bacterial origin of, and immunising and curative influence of culture sera *H. Morris*, 7726.
Inoculations against, advisable *S. Stockman*, 2920-39.
Knowledge of, acquired by experimental methods *C. J. Martin*, 11653.
Mortality from, high *S. Stockman*, 2949.
Occurrence of, in connection with use of plague prophylactic in India *W. H. Power*, *C. J. Martin*, 4435-6, 4500, 12295-9.
Permanganate of potash a useful preventive, and experiments on rats demonstrating this *Major L. Rogers*, 8183-5, 8189-98, 8220.

TETANUS—*cont.*
Prevalence of, in certain districts, and method of producing, *S. Stockman*, 2597-23.
Sanitary conditions chief preventive *C. J. Martin*, 11984.
in South African War, few cases of, and consequent small use of antitoxin *C. J. Martin*, 11977-81

THANE, G. D., LL.D., M.R.C.S., H. M. Inspector under the Vivisection Act, 1876. Professor of Anatomy in University College, London, 307-504, 1234-1779.
Address by Sir Dyce Duckworth, no reference in, to experiments 1709.
Anæsthesia, complete, necessary for success of operation 1596-8.
Anæsthetics:
Administration of, a special branch of medical practice 1718-9.
Administration of, in midwifery cases 1720-2.
Animals effectually kept under, 1617-22.
Chloroform and air administered to animals by means of Woulff's bottle 1615-16.
Inspector does not advise as to nature of, to be used 1166-9.
Local, used in some cases 1171-6.
Nature of, generally used 1170.
Overdose of, generally adopted for killing animal 1325-6.
Regular and measured administration of, at all experiments 1588-96, 1765-8.
Urethane or chloral used for anæsthetising rabbits 1635-8.
Animal killed when result of experiment achieved, 1315-6.
Anti-septic precautions enforced for all experiments, except those connected with sepsis and septicemia, 469.
Association for the Advancement of Medicine by Research:
Constitution of, 1086-93.
Report of, read by Inspector before writing his own 1094-7.
Board of Agriculture and Local Government Board experiments supervised by, 1339-40.
Caisson Disease, conditions giving rise to, and experiments in connection with 378-82, 383-4.
Cancer inoculations, methods pursued, 1688-91.
Cancer investigations abroad 1684-5.
Cancer not communicable between animals of different species 1680-3, 1687.
Cancer research, experiments 465-6.
Certificates:
Authorities concerned with granting of, 1483-4.
B:
Experiments under, 1639.
Experiments under, involve some pain 1550.
Obligation to kill animal after experiment under 1301-2.
B, B,EE, and B,F, Nature of experiments under, 467, 471, 474-6.
C:
Desirable for effective teaching 1121.
Experiments under, 1490-1.
Objection to enforced destruction of animal operated on under, 1757-62.
Considerations before issue of, 422-4.
Dispensing with anæsthetics, issue of, 440.
Home Office sometimes disallow, 1154-8.
Nature and usefulness of experiments investigated by, before issue of, 439.
No contravention of Act for animal operated on under Certificate B to be further used under Certificate C 1560-2.
Procedure in obtaining, similar to that for licences 420.
Refusals to grant 1098-100.
Responsibility of advising Home Secretary as to grant of, 1466-8.
Special, required for experiments on domestic animals 423.

THANE, G. D., LL.D., M.R.C.S.—*cont.*

Choice of Animals for Experiments:

Experiments on cats and dogs not sanctioned if substitution of other animals possible 432, 1197-205.

Physiological conditions prevent substitution of rabbits and guinea pigs for dogs or cats in certain experiments 425-9.

Complaints of cruelty in experiments would be referred by Home Office to, 1260.

Condition of animals after experiments 1209-12.

Contraventions of Act:

All recorded in annual report, 477-8.

Experiments performed by licensee in premises for which he was not licensed 495-500.

Experiments performed by unlicensed persons, 484-6.

Licensee's return discloses any, 482-3.

Misuse of licensee's authority, detection of, and steps taken to prevent 488-493.

Reported by Inspector to Home Office 1145-7.

Wilful, not met with and none of a serious nature 477-9.

Curare:

Administered in addition to anæsthetic to prevent reflex movements 1599-605.

Method of administering, with an anæsthetic 1321-3, 1600-17, 1705.

Demonstration Experiments:

Cinematograph could not take place of, 1526-30.

Major, performed to small number of students and object of such 1533-6, 1543-8.

Nature of, 1519, 1521-2.

Physiology cannot be taught without 1492-3.

Unnecessary for knowledge of spinal, cerebral and optic nerves 1126.

Digestion, recent experimental research into physiology of, 1546-8.

Distinction between animals "in stock" and those under experiment 443.

Dogs:

Anæsthetics, manner of administering, to, 1230-1.

as to Apprehension shown by, in laboratories 1424-6.

Dr. Bain's experiment on gall bladder of, 1650-69.

Breeding of, for experimental purposes objected to 1440-2.

Chloroforming of, not attended by pain 1219, 1222-8.

Distemper symptoms in, 1674-6.

Experiments requiring use of, 1232-3.

Foxes, as to possibility of substituting, for, 1428-30.

Laboratory attendants procure, for experimental purposes 1421-3.

Sale of stolen, to laboratories, police responsible for prevention of, 1435-8.

Stray might be utilised for laboratory purposes instead of being destroyed in lethal chambers 1763-4.

Dogs Act, effect of, 1752-4.

Drowning experiments, object of, and special sanction from Home Office required for, 1287-97, 1749-51.

Evidence referred to:

re Complaints, their infrequency disputed *Miss A. L. Woodward*, 8820-4.

Observations on *Shambles of Science*, objected to *Miss Lind-af-Hageby*, 7432-3, 7534-60, 9148-53, 9354-86, 9634-50, 9651-7, 9730-51.

Statement made by, as to absence of pain in experiment, based on insufficient experience *Sir J. Kekewich*, 20433-9.

Statement made by, pointing to fact that experiments performed by Sir V. Horsley were only ones inspected last year by, *Sir G. Kekewich*, 20433-8.

Experiments referred to in text-book, *Practical Physiology* 1499-1515.

THANE, G. D., LL.D., M.R.C.S.—*cont.*

Fistulae, establishment of, in animals, not painful 1233, 1640-9.

Frequent inspection by, *Sir V. Horsley*, 15982-4.

Frimley heather registered for experiments in connection with grouse disease 358-63.

German chemical laboratories, circulars from, 1710.

Glands enlarged in tuberculosis not painful 1694.

Guinea pigs and rabbits bred for laboratory purposes 1431-34.

Has free access to Home Office 1149-50.

Dr. Head's experiments on nerves of cat, and inspection of animals after operation by, 1247-59.

Home Office represents the public in matter of inspection 1777-9.

Horses:

Healthy condition of, for serum production, care taken to ensure, 1443-7.

Inoculation of, for serum production not controlled by Act 1444-6.

Humane conduct of experiments 1162.

Inoculated animals, difficulty in distinguishing, from uninoculated 1576.

Inoculations frequently witnessed by, 1163-5.

Inoculations of calves for vaccination purposes not under control of, 1336.

Inoculations with toxins and antitoxins, symptoms following, 453-6.

Inspection of laboratories by other than Government officials impracticable 1408-10.

Inspection:

Amount of, sufficient 1188-93.

No irregularities found in course of, as regards use of anæsthetics and aseptic treatment 450.

Time given to, 1071-4.

Visits paid without notice, and methods pursued 441-3.

Inspectors:

Duties of, defined by Act 1085.

Home Secretary's minutes as to duties of, 1085.

Laboratories of manufacturing chemists 344.

Licences:

All applications for, referred to Inspector after submission to Association for Advancement of Medicine by Research 393-5.

Difficult to forbid use of knife when issuing, for inoculation purposes 412.

Experiments without anæsthetics may be performed under licence alone 410-11.

Home Office and Inspector do not disagree *re* issue of, 1151-3.

Inspector does not communicate with Association for the Advancement of Medicine by Research *re* issue of, 397.

Issue of, to students, with condition that experiments shall be performed under supervision 415-18.

Licensee tacitly accepts conditions attached to, though giving no actual undertaking 494.

No restrictions as to animals except horse, ass, or mule, under, 434.

Number of, in Great Britain 369-70.

Qualifications for obtaining, 399-403, 1449-51, 1706-7.

Refusals to grant, cases of, 1098-1100.

Licensees are informed of all requirements of Act and Home Secretary by, 443.

Licensees *in statu pupillari*, 1453-6.

Licensees must be trusted to certain extent to administer Act properly 1390-3.

Manometer, its use in experiments, 1524.

Marmot referred to in *Shambles of Science*, examined and reported on by, *M. S. Pembrey*, 13985-90.

Monkeys, nervousness of, 1427.

Morphia:

Dose of, to secure complete anæsthesia probably fatal, 1631-3.

Injected frequently before operations, 1624-5.

Prolonged action of, 1634.

Rarely used as an anæsthetic alone, 1626-32.

THANE, G. D., LL.D., M.R.C.S.—*cont.*
Number of experiments witnessed by, during year 447, 1106-9.
Pain:
Certain experiments followed by, 457.
Irritation of cutaneous and mucous surfaces results in, 473.
Not a necessary sequence of all operations 1700-4.
Not disregarded by experimenters 1397-8.
Painful experiments, details given in 1900 report 464.
Premises for experimental purposes reported on by, previous to their registration *W. P. Byrne*, 54-6.
Public spirit in England more humane than abroad, 1395.
Publications *re* physiological research, impossible to read all 1075.
Rabbit deprived of food for four days, but no starvation of pigeons, 1315-9.
Rabies inoculations of rabbits not painful 1670-3.
Registered Places:
Cambridge, Pathological and Physiological laboratories licensed as a whole 501-3.
Certain experiments sanctioned outside, 368, 372-3, 1137-44.
Complaints as to work in, none 1283-5.
Condition of animals kept in, most satisfactory 451-2.
Government laboratories 342-5.
Joyce Green Hospital, permission of Metropolitan Asylums Board required for registration of, 1743-6.
Laboratories unconnected with teaching institutions 339, 1389.
Municipal laboratories, officials attached to, and work done at 346-351.
Nature of premises 339.
No complaints as regards nearness of, to dwelling houses 1343-6.
No serious complaints of, 1083-4.
Private pharmaceutical laboratories, reasons for registration 1348-54,1366-70.
Private premises only registered in exceptional cases 335-6, 1382-4, 1399-1404.
Research Institution laboratories 353-5.
Research Institutions, list of, 344.
Registered premises only, visited by, 334.
Registration of premises, procedure in regard to, 337-8, 356.
Reports presented annually by, 319-324.
Returns of Experiments:
All experiments recorded in, 481.
Alteration in form of, 1755-6.
Distinction formerly made in, between painful and painless experiments, of no value 1723-9.
Licensees, make annual, 1464-5.
Licensees practically give assurance of complete precaution in operating, 1771-6.
Made up from licensees' returns 480.
Nature of experiments now have to be distinguished 1333-5.
1905, number of licensees who performed no experiments 1460-1.
Second experiment for testing result of first experiment conducted always under anæsthetics 1216-8, 1570-5.
Sera and vaccines should be prepared by a Government institute 1358-64.
Serum manufacture requires no licence 1373-4.
Serum production for commercial purposes not under Act 1730-2, 1747-8.
Serum production, precautions necessary 1355.
Serum testing, no Government responsibility *re*, 1377-81.
Shambles of Science:
Allegations contained in, without foundation 1261-82.
as to Withdrawal of, from publication 1276-80.
Sleeping sickness experiments on rats and rabbits, 1311-12.
THANE, G. D. LL.D., M.R.C.S.—*cont.*
"Standardising," meaning of term 357-8.
Students not licensed to perform experiments without supervision 1194-5.
Table showing annual numbers of experiments, and those witnessed by, 1234-6.
Thyroid gland, excision of, followed by different results in different animals 1233.
Travelling duties of, 331-3.
Sir F. Treves' statement *re* experimental methods misrepresented by anti-vivisectionists 1711-16.
Tuberculosis Commission, research work conducted on behalf of, 352-3.
Tuberculosis injections into peritoneum not painful 1678-9.
Two series of experiments on same animal, deprecated 1561-7.
Vivisection Act, 1876:
Amendments suggested, 1177-87.
Physiological and pathological progress not retarded by provisions of, 1111, 1697.
Wellcome Research Laboratory, Khartoum, no knowledge of alleged cruelty to dog in, 1306-10.
Work at University College, 1237-46.

TRUMAN, BASIL W. Keble College, Oxford, charges against Mr. Gotch, corroborated by, *Hon. S. Coleridge*, 11454.

TSETSE FLIES:
Carriers of sleeping sickness disease, as well as nagana, though latter is not communicable to man *Col. D. Bruce*, 14336, 14418, 14342-3.
Curious distribution of, in Uganda *Col. D. Bruce*, 14344-9.
Destruction of, best method of stamping out sleeping sickness *Col. D. Bruce*, 14444-8.
Experiments proving that bites of, were responsible for nagana or tsetse-fly disease *Col. D. Bruce*, 14307-11.
See also NAGNA *and* SLEEPING SICKNESS.

TUBERCLE PYEMIA, continuance of experiments upon, *Sir J. Russell*, 575-6.

TUBERCULIN:
Board of Agriculture do not issue instructions as to use of, *S. Stockman*, 3248.
Cattle tested with, on exportation *S. Stockman*, 3219-21.
Danish methods of diagnosing bovine tuberculosis by use of, *S. Stockman*, 3209-18.
Derivation of, and as to its rejection as curative agent *S. Stockman*, 3146-55.
a Diagnostic agent of tuberculosis in cattle *S. Stockman*, 3156-8.
a Diagnostic agent merely, and has no curative powers, *S. Stockman*, 2981.
Diagnostic value of its injection into eyes *Sir H. R. Swanzy*, 9819.
Disagreeable symptoms following injection of, may prevent its use as test in human beings, *S. Stockman*, 3159-61.
Discovery of, *S. Stockman*, 2576-8.
Curative powers of, in treatment of human beings not yet considered by Local Government Board *W. H. Power*, 4465-6.
as to Efficacy of, in treatment of phthisis *W. H. Power*, 4468-71.
Failure of, as curative agent *F. Taylor*, *Miss Lindaf-Hajeby*, *G. G. Bantock*, 5695-700, 7634-8, 14663-8.
Further experiments should have been performed before administering, as treatment for tuberculosis *F. Taylor*, 5594-5.
Homeopathic method of preference, *G. H. Burford*, 8975-80.

TUBERCULIN—*cont.*
Much used, and as to possibility of fraudulent use, *S. Stockman*, 3197-202.
Reliability of, as diagnostic agent, limitations as to, *S. Stockman*, 3167-76.
Sometimes used as diagnostic agent in human beings *Sir R. D. Powell*, 5799-803.
Temperature of animal an important feature in test *S. Stockman*, 3162-6.
Test must be conducted carefully, and all variations from normal conditions excluded *S. Stockman*, 3178-89.
Tuberculosis can be stamped out by means of slaughter and, *S. Stockman*, 3223-4.
Use of, as curative agent *C. J. Martin*, 12209-12, 12373-82.
Use of, in treating human beings and possibility of advantages therefrom *Sir R. D. Powell*, 5799-803, 5819-28.
Value of, and small proportion of errors in its use as diagnostic agent *S. Stockman*, *W. H. Power*, *D. J. Hamilton*, 3379-83, 4472, 20357-72.

TUBERCULOSIS:
Alleged cruelty in inoculations for, on pigs, cats, rabbits, and mice *Mrs. K. Cook*, 1919.
Animals after infection with, show no indications of suffering *G. D. Thane*, 452.
Bacillus of, discovered soon after foundation of bacteriology *H. Snow*, 2355-6.
Bacillus not present in all stages of, *G. G. Bantock*, 14622-30, 14678-82.
Bacterial cause of, erroneous views, etc., *G. G. Bantock*, 14547.
Bacteriologists' opinion as to conveyance of in milk to children, *S. Stockman*, 3095-7.
Cause of, discovered by experiments and knowledge acquired as to its different manifestations *C. J. Martin*, 11644-6.
Causal bacilli of, do not exist and opposition to Koch's theories, *G. G. Bantock*, 14550.
Cause of, discovered by means of experiments on animals and as to prospects of stamping out disease *Sir Lauder Brunton*, 6999-7004.
Communicability of, ignorance as to, dispelled by series of experiments on guinea pigs *Sir J. F. Moulton*, 12709-15.
Commission, *see* ROYAL COMMISSION ON TUBERCULOSIS.
as to Communicability of bovine, to man *S. Stockman*, *Sir R. D. Powell*, 3100-3, 5811-15.
Communicability of, from animals to men proved by recent experimental research *C. J. Martin*, *Sir J. F. Moulton*, 12219-24.
Contended, at one time, to be no specific disease *C. J. Martin*, 12206-8.
Curative sera for, not yet discovered, *S. Stockman*, 2982-7.
Departmental Committee on, minority report of, *Sir V. Horsley*, 16243-53.
Diagnosis of, after inoculating guinea pig possible within six weeks *J. Lorrain Smith* 18452.
Diagnosis of, carried out by inoculations of animals *J. R. Bradford*, *J. Lorrain Smith*, 17762-4, 18188, 18202-4.
Experimental diagnosis of, necessary *S. Stockman*, 2464-7.
Experiments in connection with bovine, carried on by Condensed Milk Company *Sir T. Stoker*, 765.
Guinea pigs inoculated with milk for testing purposes *Sir J. Russell*, 711.
Identity of various forms of, only established by experiment *S. Stockman*, 2444.
Injections of, into peritoneum not painful, *G. D. Thane*, 1678-9.
Inoculation experiments have successfully detected existence of, in cows in Manchester *J. Lorrain Smith*, 18353-7.
Inoculation of guinea pigs with suspected matter is only satisfactory method of accurately diagnosing, *J. R. Bradford*, 17630-5, 17644-61.
Inoculation test a far more positive one than the microscopic test *J. R. Bradford*, 17652-3.
Knowledge of, chiefly based on experiments *S. Stockman*, 2660-4.
Koch's statement as to relation between human and bovine, and German inquiries into same *S. Stockman*, 3366-7.

Tuberculosis—*cont.*
Koch's views concerning non-transmissibility of, from men to animals contrary to results of recent experiments *G. S. Woodhead*, 15499-502.
Local authorities responsible for detection of, in milk *S. Stockman*, 3427-9.
Local Government Board waiting for Report of Tuberculosis Commission before adopting measures of treatment of, *W. H. Power*, 4455-6.
Microscopic examination of market milk not sufficient to detect bacillus of, *S. Stockman*, 3363-5.
Microscopic examination of milk not an unreliable method of diagnosing, *S. Stockman*, 3361.
Microscopic examination of milk unreliable and fails to discover bacilli of, *J. Lorrain Smith*, 18349-51.
Necessity of using dogs or cats for experiments in connection with, *G. D. Thane*, 1205.
Not communicable from men to animals, *G. G. Bantock*, 14683-9.
Organisms besides causal one may be found in, *S. Stockman*, 3067-8.
Overcrowding and lack of ventilation largely fosters but does not generate spread of, *S. Stockman*, 3191-6.
Prevalence of, erroneously attributed to consumption of milk *G. G. Bantock*, 14547.
Sanitary conditions, enforcement of, best preventive against *C. J. Martin*, 1221-16.
Stamping out, can be effected by use of tuberculin and slaughter, *S. Stockman*, 3223-4.
Susceptibility of calves to, *Miss A. Kenealy*, 6401-11.
Testing of cases, in municipal laboratories, *G. D. Thane*, 346-7.
Tests for, in milk instituted under Diseases of Animals Act *S. Stockman*, 3419-22.
Tubercle bacillus not proved to be cause of, *Miss A. Kenealy*, 6500-11.
Tubercle bacillus the cause of, *W. H. Power*, 4457.
Tubercle in milk, possibility of error in certifying, *S. Stockman*, 3091-4.

Tuckett, Ivor, Physiological Laboratory, Cambridge. experiments on suprarenal gland by, *Miss A. Kenealy*, 5322-5.

Tumours :
Coccidial, errors in diagnosis of, 2133.
Endothelioma, cancerous nature of, doubted, *H. Snow*, 2172.
Jensen's :
Cancerous nature of, disputes as to, *G. D. Thane*, 1681.
Cancerous nature of, doubted *H. Snow*, 2295-300.
Not a malignant growth and differences of opinion concerning nature of *H. Snow*, 2166-73.
Predominates in mice, *H. Snow*, 2120-1.
Spontaneous disappearance of, differentiates the growth from cancer in human beings *H. Snow*, 2125.
Work of Cancer Research Fund useless with regard to, *H. Snow*, 2163.
in Mice, study valueless in diagnosing growth in human subject, *H. Snow*, 2134-37A, 2188-9.
Sarcoma, errors in diagnosis of, *H. Snow*, 2133.
Table of, examined by Cancer Research Fund, *H. Snow*, 2182.
See also Cancer.

Turner, Inoculations against rinderpest devised by, *Major L. Rogers*, 8226.
Twain, Mark, anti-vivisection cause supported by, *Hon. S. Coleridge*, 10262.

Typhoid Fever :
Antitoxin, *see under* Serum Therapy.
Case mortality, proportion of, compared with Malta fever *Col. D. Bruce*, 14380.
Inoculation against, does not diminish incidence of, *S. F. Smith*, 13109-113.
17th Lancers inoculated against, and successful results *Col. D. Bruce*, 14528.
Statistics shewing effect of inoculations against, inaccurate *S. F. Smith*, 13394-9.

Typhus Fever, no exact bacteriological knowledge as regards, *Sir R. D. Powell*, 5666-71.

Tyrrell, Walter, letter to, *re* "incomplete anæsthesia" *Hon. S. Coleridge*, 10993.

Uganda :
Atoxyl used as remedy for nagana or tsetse fly disease with good results in, *Col. D. Bruce*, 14314.
Curious distribution of tsetse fly in, *Col. D. Bruce*, 14344-9.

United States of America :
Absence of legal restrictions of vivisection in, does not induce carelessness for pain inflicted in experiments *W. Osler*, 16653-64.
Chemical firms in, have introduced number of new drugs, *A. R. Cushny*, 5246.
Christian Scientists in, *A. R. Cushny*, 5248.
Commission sent to Havannah in 1900 by, to investigate cause of yellow fever *W. Osler*, 16531.
Drug taking in, large amount of unauthorised *A. R. Cushny*, 5248.
Experiments performed in, *J. W. Graham*, 5871-3, 5857-60, 6047-8.
Law against cruelty to animals alone restricts experiments in, and anti-vivisection movement there *A. R. Cushny, J. W. Graham*, 5019-27, 5100-114, 6049-53.
New York, statistics as to success of tetanus antitoxin treatment in, *H. Morris*, 7727-40.

United States Yellow Fever Institute, monograph published by, *W. Osler*, 16561.

Vaccination against Smallpox :
Act does not control inoculations for vaccine purposes *G. D. Thane*, 1336.
Analogy between modern prophylactic methods and, *W. H. Power*, 4587-8.
Difference between lymph used for, and other protective sera *C. J. Martin*, 11867-76, 11902-3.
Homeopathic administration of vaccine equally satisfactory as usual process *G. H. Burford*, 9053-70.
Jenner's discovery involved no experiments on animals *C. J. Martin*, 11859-62.
Knowledge acquired by experiments on animals with regard to vaccine *G. S. Woodhead*, 15485-93.
Licence not required for production of vaccine, *G. S. Woodhead*, 15550-1.
Lymph, as to its origin and preparation by Local Government Board *W. H. Power*, 4477-82, 4488, 4513, 4591-7.
Objection to, *Miss A. Kenealy, Miss-Lind-af-Hageby, Sir G. Kekewich*, 6565-71, 9216-19, 20787.
Protective effect of, admitted *G. G. Bantock*, 14925-7.

Vegetarianism, doubts as to question of *Rev. J. P. Hopps*, 8377-8, 8471-5.

Venereal Diseases, *see* Syphilis.

Venice, Convention of :
Convention of Paris shortly to supersede, *W. H. Power* 4337-8.
Obligation of Foreign Office under, to notify outbreaks of certain diseases to foreign countries *W. H. Power*, 4337-8.

Veterinary Surgeons :
Breaches of Act committed by, *W. P. Byrne*, 288-9.
Licences in Ireland held by, *Sir T. Stoker*, 1043-4.
Section 11 of Act controls issue of licences to, and similar procedure as in other licences, *W. P. Byrne*, 70-2.

Vincentini, Dr., views upheld by *G. G. Bantock*, 14631-5.

Vienna, table showing case mortality from diphtheria before and after employment of antitoxic treatment, *C. J. Martin*, 11711.

Vincent, Swale, animals used by, in experiments on thyroid glands *Miss A. Kenealy*, 6165.

VINCI, eucaine introduced by, *A. R. Cushny*, 4753, 4758.

VIRCHOW, work of, referred to, *E. H. Starling*, 3692.

VIVISECTION ACT, 1876 *see under* Acts *under* PARLIAMENT.

VIVISECTION COMMISSION, 1875, *see* ROYAL COMMISSION ON VIVISECTION, 1875.

VOLTAIRE, anti-vivisection cause supported by, *Rev. L. S. Lewis*, 8726.

VON, *see under various names.*

VULPIAN, experiments by, referred to *Miss A. Kenealy*, 5288.

WACHS, DR. P., views of, *re* danger of serum therapy *Miss A. Kenealy*, 6219.

WADE, DR., experiments on methods of destroying rats by *W. H. Power*, 4631.

WAGNER, anti-vivisection cause supported by, *Hon. S. Coleridge*, 10252.

WAKEFIELD, municipal laboratory at, *G. D. Thane*, 342.

WALKER, DR. T. J., M.R.C.S., correspondence with, *re* "incomplete anæsthesia" *Hon. S. Coleridge*, 10308, 10993.

WALLER, A. D., M.D., LL.D., F.R.S., lecturer at London University, 17996-18167.

Anæsthesia:

Conjunctival reflex is most practical test of sufficiency of, 18144-9.

"Light," does not imply sensitiveness to pain 18081-5.

Maintained fully in all laboratory experiments 18077, 18079-80.

Cats anæsthetised for twelve hours by, *E. H. Starling*, 3629.

Chloroform:

Action of, diminishes blood pressure apart from any connection with respiration 18087A-90.

Method of administering, devised by *Sir L. Brunton*, 6833, 6989.

Curare:

Animal immobilised by, can be anæsthetised 18130-7.

No experience of, in combination with an anæsthetic 18129-30.

Dogs can be anæsthetised without difficulty 18152-8.

Exercises in Practical Physiology, by:

Caution against use of anæsthetics in, referred to by Miss Hageby is merely statement of fact 18086.

Humane teaching lacking in, and preference for light anæsthesia expressed in, *Miss Lind-af-Hageby*, 7223, 7234-51.

Experience as a physiologist 18111-12.

Experiment of "frozen rabbit" referred to by Mrs. Cook imaginary 18159-67.

Licences, distinction between medical and physiological qualifications of applicants should not be made in issue of, 18120-5.

London University:

Evidence submitted to Physiological Committee of, 18101.

Resolution passed by, in favour of giving evidence, and witnesses appointed 18091-3.

Morphia, a narcotic, but can produce profound anæsthesia 18150-1.

WALLER, A. D., M.D., LL.D., F.R.S.—*cont.*

Nerve degeneration consequent on separation from nutritive centre discovered by, and value of such knowledge *H. Head*, 17806-7.

The Shambles of Science:

Anæsthesia fully maintained throughout experiments described in, and movements seen were merely reflex ones 18109-10.

Curare not used in any of experiments described in, 18128.

"a Dog injected with a substance derived from a lunatic":

Animal fully anæsthetised in, 18048-56.

Method of killing dog referred to in, 18139-41.

"an Experimental Production of blood clotting by injection of a nucleo proteid," complete anæsthesia maintained throughout 18034-42.

"an Experiment that is not supposed to be useful," animal was not curarised in, and absolutely anæsthetised 18043-7.

Highly coloured representation of what took place 18010-13.

Laboratory at which experiments described in, were conducted 18102A-8.

Lecture given immediately after publication of, answering allegations contained in, 1810, 18077-8.

Letter from Sir A. Rücker to Home Office in connection with statements contained in, 18094-7.

Marmot, episode of and actual facts in connection therewith 18142-3.

"Painless experiments":

Frozen rabbit, actual facts of case 18019-31.

No vivisection was performed at lecture described in, 18025, 18032 3.

Notes on statements contained in, 18014.

Present at a good many of the operations described in, 17999.

"The only completely satisfactory method," curare not used as stated in, and students are not necessarily aware of every fresh dose of anæsthetic 18066-76.

"A Troublesome Dog," lecture described in, did not take place as stated, at London University, 18001-8, 18058-65.

Students at London University not under practical tuition of, 18126-7.

Tracheotomy never performed before administering anæsthetic, in experience of, and would be illegal 18115-19.

WALLER, DR., explanation of statement made by, that vivisection is a narrow and restricted province in physiology *Sir V. Horsley*, 15806-7.

WALPOLE FARM, laboratory at, held by Tuberculosis Commission *G. D. Thane*, 342-4.

WALTHER, PROFESSOR, experiments on acid poisoning in rabbits gave rise to successful treatment of diabetic coma *E. H. Starling*, 3814.

WALTON SEWAGE FARM, official experiments not performed at, *G. D. Thane*, 339-42.

WARD, DR., bill introducing Vivisection Act, 1876, its rejection moved by, *Sir G. Kekewich*, 20553-6.

WARREN, T. H., Vice-Chancellor of Oxford University, letter from making public an apology from Keble College undergraduates in connection with charges brought against Professor Gotch *F. Gotch*, 13668.

WASHBOURNE, DR., J. W., Physician to Guy's Hospital:

Statement by, as to inefficacy of inoculation in cases of typhoid fever *S. F. Smith*, 13109.

Views of, as regards value of serum treatment in cases of suppuration and blood poisoning, *S. F. Smith*, 13121-4.

WATTEVILLE, DR. de, morality of experimental investigation argued by, *J. H. Levy*, 18497.

Watson, Dr., B.A., experiments in dropping dogs from heights performed by, *J. W. Graham, Sir V. Horsley*, 5857, 16225-9.

Watson, John B., Chicago University, Alleged cruelty of experiments on rat performed by, *J. W. Graham*, 5871-3.

Watson, Sir T.:
- Statement by, in 1847 as to difficulties and obstacles in treatment of nervous system is typical of ignorance then prevailing *H. Head*, 17804-5.
- Reference *A. R. Cushny*, 4920-30.

Wehr, Professor, reference *H. Snow*, 2129, 2132.

Weir, Mr., M.P., misleading answer of Home Secretary to question in House of Commons by, as to number of persons holding certificates dispensing with anæsthetics *Hon. S. Coleridge*, 10317-29.

Wellcome, Messrs.:
- Brockwell Hall laboratory of, *G. D. Thane*, 344.
- Private laboratory of, reasons for registration, *G. D. Thane*, 356.

Wellcome Research Laboratory, scandal in connection with, as to procuring cats for vivisection purposes *Sir T. Russell*, 682

West African Boxwood, experimental investigation showing that alkaloids contained in, had curare like action and affected workmen employed in reel making *W. E. Dixon*, 18709-12, 18717-30, 18912-15, 19057-61, 19113-15.

West Derby Sewage Farm, official experiments not performed at, *G. D. Thane*, 339-42.

Westcott, Dr., anti vivisection cause supported by, *Rev. L. S. Lewis*, 8728.

White, Prof., Dublin, certificate C not allowed to, *Sir T. Stoker*, 794A.

White, Mr., case of curare poisoning described in *British Medical Journal* by *Sir V. Horsley*, 15918-24, 15965.

Whitler, Dr., *Dictionary of Treatment* by, *see under* Journals and Publications.

Whooping Cough, specific bacillus of, not yet discovered, *C. J. Martin*, 11907.

Wickham Legge, *see under* Legge.

Wilks, Sir Samuel, statement by, as to decrease of death rate after operations, owing to improved methods of dressing wounds, *H. Morris*, 7750.

Williams, Roger, opinion of, as to non-malignant nature of Jensen's Tumour *H. Snow*, 2168-71.

Wilson, Dr. G., M.D., LL.D., allusion to commercial aspect of serum therapy by, *Sir G. Kekewich*, 20494-5.

Winmarleigh, Lord, member of the Vivisection Commission, 1875 *W. P. Byrne*, p. 1.

Wood, *The late* Dr. Alexander, hypodermic medication introduced by, *Sir L. Brunton*, 6972-4.

Wood, H. C., experiment *re* susceptibility of dog to morphia by, *Miss Lind-af-Hageby*, 9266.

WOODHEAD, G. SIMS, M.D., Professor of Pathology in University of Cambridge 15426-582.
- Alleged cruelty of experiments referred to by, *Mrs. K. Cook*, 1921.
- Animals should be allowed to be kept outside laboratories 15572.
- Applications for licences not signed by, 15565-6.
- Contagious Diseases, specific organisms of certain, not yet demonstrated 15552-4.
- Curare, certificate authorising more vigilance on part of inspector in experiments involving use of, not objected to 15576-80.
- Demonstration experiments, not performed before junior students, but senior students witness certain, 15561-3.

WOODHEAD, G. SIMS, M.D —*cont.*
- Diphtheria:
  - Antitoxin:
    - Composition of, possible improvement in, 15470.
    - Death rate lower in consequence of use of, 15520-4.
    - Injection of, in first stage of disease would reduce mortality to nil 15540-5.
    - Licence not required for preparation of, 15550.
    - One of causes contributing to diminution of the disease 15557-60.
    - Production and test of, require use of animals 15473-6.
    - Statistics *re* use of, carefully recorded and decreasing death rate attributed to use of, 15457-64, 15530-40.
    - Study and preparation of, undertaken for Metropolitan Asylums Board 15449-54.
    - Success of, in reducing mortality 15470-1.
    - Use of, based on proof that the Klebs-Loeffler bacillus is cause of disease 15512-18.
    - Value of, as prophylactic 15546-9.
    - Value of, from personal observation 15465-9.
  - Diagnosis, area enlarged by modern bacillary test 15226-8.
  - Toxic symptoms of, though not local symptoms can be produced in animals 15506-11.
- Dogs essential for certain experiments 15582.
- Inspectors' visits have caused no trouble 15574-5.
- Jensen's tumour, opinion *re* cancerous nature of, *H. Snow*, 2297-300.
- Licence held by, for 24 years, and large number of experiments performed 15428-30.
- Licences, professors of pathology, bacteriology, etc., should have power to sign applications for, 15565-71.
- Member of the Royal Commission on Tuberculosis, 15433.
- Malaria, value of experiments in connection with investigation of, 15477-80.
- Physiological research, its dependence on experiments 15439-41.
- Rinderpest, organism of, not yet discovered 15496.
- Transmission of disease, necessity of experiments in investigating, 15481-2.
- Tuberculosis Commission, circumstances leading to its appointment 15499-502.
- Vaccine, knowledge as to, acquired by experiments 15485-93.
- Wide experience in pathological laboratories in United Kingdom 15431-2.
- Work has been chiefly in connection with diagnosis of diseases and preparation of antitoxins 15437.
- Yellow fever:
  - Experiments valuable in investigating cause of, 15477-80.
  - Stamping out of, in Havanna, undoubtedly due to measures taken for destroying the mosquitos 15555-6.

WOODWARD, MISS A. L., Church Anti-Vivisection League, 8786-8898.
- Alleged illegality of experiments conducted by Messrs. Burroughs and Wellcome 8820, 8881-4.
- *Animal Physiology*, by W. Furneaux, experiments recommended to students in, expurgated after exposure by Church Anti-Vivisection League 8824-6, 8867-80.
- Animals for purposes of vivisection obviously stolen 8824.
- Boy employed in Professor Victor Horsley's laboratory testifies to cruelty of vivisection 8824.
- Dr. Hime:
  - Church Anti-Vivisection meeting at Bradford in 1898, and charges then brought against, 8789-810, 8828-55.
  - Home Secretary's unjustifiable action in connection with charges brought against, 8829-55.
  - Object of experiments performed by, ignorance as to, 8885-93.

WOODWARD, MISS A. L.—*cont.*

Lecture on Physiology by Dr. Langdon Down, and allegations concerning vivisection of frog thereat, 8811-23.

Memorial presented to University College by Slade School students concerning hindrance to their studies caused by cries of vivisected animals 8824, 8856-61.

Refutation of statement by Dr. Thane as to infrequency of complaints concerning alleged breaches of Act 8820-4.

Shambles of Science not withdrawn from publication, but copies offered for sale at Church Congress 8826-7, 8894-8.

WORLD LEAGUE OF OPPONENTS OF VIVISECTION:

Evidence on behalf of, *see* BURFORD, G. H., 8899-9104.

Income of, *Hon. S. Coleridge*, 10260.

WOOLSORTERS' DISEASE, *see* ANTHRAX.

WORCESTER, municipal laboratory at, *G. D. Thane*, 342.

WRIGHT, DR., anti-typhoid serum devised by, not recommended by Local Government Board *W. H. Power*, 4433-4.

WRIGHT, PROFESSOR:

Apomorphin formed from morphin by, *A. R. Cushny*, 4819.

Tuberculin, its efficacy upheld *C. S. Martin*, 12375-7.

WRIGHT, SIR ALMROTH:

Prophylactic methods devised by, of destroying invading organisms of disease by stimulating natural agencies of resistance *Sir J. F. Moulton*, 12732.

Serum treatment of, for tuberculosis of urinary tract *J. R. Bradford*, 17766-73.

WURTEMBURG, statistics in, with regard to swine erysipelas *S. Stockman*, 2563.

YELLOW FEVER:

Animals in infected districts other than anthropoid apes, not susceptible to, *W. Osler*, 16695-6.

Controlled by preventing breeding of mosquitoes and careful isolation of early cases of, *W. Osler*, 16553-65, 16623-4, 16703-4.

Discovery of mosquito as cause of infection not directly due to experiments on animals *W. Osler*, 16697-700.

Discovery of relation of mosquito to, and consequent success in controlling spread of, will enable Panama Canal to be built *W. Osler*, 16541-2.

YELLOW FEVER—*cont.*

Experiments have shown that apes can be infected with, *W. Osler*, 16545.

Experiments in connection with investigation of, though on man, could never have been devised without investigators' previous experience of experiments on animals *W. Osler*, 16544.

Experiments prior to those carried out by United States Commission *W. Osler*, 16611-13.

Experiments proved that mosquitoes communicated infection *W. Osler*, 16535-9.

Failure to discover cause of, before 1900 *W. Osler*, 16531.

History of, illustrates enormous benefits conferred on mankind by experiments on animals *W. Osler*, 16530.

Mosquitoes are capable of transmitting after biting infected persons *W. Osler*, 16548-9.

Natives have it in a mild form *W. Osler*, 16546-7.

Organism not yet discovered *W. Osler*, 16540-1, 16620-2.

Period of incubation *W. Osler*, 16538-9.

Reasons for suspecting that mosquito propagated, *W. Osler*, 16694.

Reduction in numbers of mosquitoes owing to methods adopted for their extermination, very remarkable *W. Osler*, 16562-8.

Sanarelli's work in connection with, unsubstantiated *W. Osler*, 16611-14.

Stamping out of, in Havanna undoubtedly due to measures taken for destroyal of mosquitoes *G. S. Woodhead*, 15555-6.

Theory and practice previous to 1900 based on bacillus as cause of, is erroneous *W. Osler*, 16615-20.

United States Commission:

Appointed in 1900, methods adopted and work of, *W. Osler*, 16531-6.

Experiments carried out by, were on men who voluntarily submitted themselves to infection *W. Osler*, 16543, 16608, 16667-9.

Value of experiments in connection with transmission by mosquitoes of, *G. S. Woodhead*, 15477-80.

YEO, PROF., alleged cruelty of experiment by, *Mrs. K. Cook*, 1790.

YERSIN, plague bacillus discovered by, *C. J. Martin*, 11654.

YOUNG, DR., reference *Sir L. Brunton*, 6786.

ZIRM, transplantation of the cornea, recorded by, *Sir H. R. Swanzy*, 9948.

EYRE &
POTTISWOODE
Bookbinders
